of his face. In the constituent assembly he strenuously opposed giving the king a suspensive veto power, resisted the decree of martial law, pleaded for the remission of sundry disabilities against the Jews and comedians, and advocated abolition of the compulsory celibacy of priests. After the adoption of the declaration of the rights of man he was continually recalling the assembly to the principles of that formula. On June 19, 1790, he was elected one of its secretaries. He had no means beyond his pay as deputy, 18 francs a day, of which he sent one fourth to his sister. He occupied a retired and ill furnished lodging, and Michelet describes him as entering the tribune dressed in a threadbare olive-green coat, his only one. After Mirabeau's death (April 2, 1791), Robespierre rose to a more commanding position. He was studious and abstemious, and constant in attendance at the Jacobin club and the assembly. He at length began to be feared. Duport and Bigot, who had been named president and vice president of the criminal tribunal, with Robespierre for public accuser, refused to serve on account of his extreme views. This office he held from June, 1791, till April, 1792. He thought that "in general there is nothing so just nor so good as the people, when not irritated by the excesses of despotism." He still advocated the abolition of capital punishment, and the admission of all citizens into the national guards and upon juries. He claimed for the blacks in the colonies a participation in political rights, and exclaimed: "Let the colonies perish rather than a principle." He was one of the leaders of the mob in the riot of July 14 and 17, 1791, intended to overawe the assembly and drive it into accepting the abdication of the king, and showed himself a coward on this occasion. At the close of the constituent assembly, Sept. 30, 1791, the people of Paris received him with rapture. By a decree of the assembly, proposed by Robespierre, no member was eligible to the next legislature which convened on the dissolution of its predecessor. He took advantage of the occasion to revisit his native town, where he was welcomed with an ovation. After seven weeks' rest he returned to Paris, and during the sitting of the legislative assembly was in constant attendance upon the meetings of the Jacobin club. When the assembly voted a sum for martial preparations, he alone opposed the measure. He began in the spring of 1792 a journal entitled *Le défenseur de la constitution*, which closed with the 12th number. In the conspiracy which culminated in the bloody events of Aug. 10 he does not appear to have participated, though he afterward spoke of that day as one of the most glorious in the annals of the world. He was made one of the new municipality following this insurrection, and a day or two afterward appeared before the assembly as the spokesman of a deputation from the commune to demand the establishment of a new criminal court for the summary

trial of the enemies of liberty. This court, afterward remodelled as the revolutionary tribunal, was promptly organized, and Robespierre was named for presiding judge; but he declined, on the ground that it was not just for him to be judge of those whom he had already denounced as enemies of the country. He remonstrated with Danton against the frightful massacres in the prisons on Sept. 2-5; and after that he ceased to appear at the commune. He became a member of the national convention, being elected to represent Paris. On Oct. 29 Louvet denounced him before the convention as aspiring to the dictatorship; but he defended himself triumphantly. He published every Friday a newspaper, entitled *Lettres de Maximilien Robespierre à ses commettants*. He led the Jacobins in the condemnation of the king and in demanding his death. After this event (Jan. 21, 1793) he proposed the decree establishing the committee of public safety, clothed with executive powers above the convention. He was not made a member of it until July 27 following, though on March 26 he was elected a member of what was called the committee of general security, which was only an auxiliary of the committee of public safety. His first great act as a member of this committee was the institution of the reign of terror. The condemnation of the Girondists he defended by saying that "there are periods in revolutions when to live is a crime." The feast of reason, decreed by the convention, disgusted him as the degradation of the revolution. In opposition to Hébert and his adherents, he seems to have sincerely wished the reign of peace and justice, and thereby incurred from them the accusation of moderatism, while he was at the same time preaching terror as the necessary instrument of the revolution. Fanatically bent on ridding the republic of its enemies and wavering friends, and naturally suspicious and envious, he readily caused or allowed the slaughter of innocent victims. He sacrificed Hébert and others of "the impure" to make himself master of the commune, and Danton to make himself master of the convention; while at the Jacobin club his supremacy had long been undisputed. The knife of Charlotte Corday had delivered him of an unworthy rival, Marat. Though he formed a kind of triumvirate with Saint-Just and Couthon, all eyes were now riveted upon him. His commanding influence was signalized by the extraordinary spectacle of June 8, 1794, the festival of the Supreme Being, which he had caused to be decreed, and in which he was the principal actor. But he lacked the courage as well as the genius to organize a dictatorship. On June 10 he proposed through Couthon the law for the reorganization of the revolutionary tribunal, his object being to rid the nation of "the great culprits" in the convention. That body now became alarmed for its own safety. Being unable to control the committees, he withdrew

from them and sought to overthrow them. For the last six weeks of his life he had little voice in the government. In his speech in the convention on July 26 he asked if in that interval "faction had been less audacious, or the country been happier." A tumult followed the speech, and the convention, now led by Tallien and his friends, refused to publish it. This was equivalent to his overthrow. He returned to the Jacobins, and announced himself doomed. They rallied round him, and besought him to head an insurrection against the convention. This he refused to do, and on the following day (the 9th Thermidor) he reappeared in the convention, where his arrest, and that of his brother Augustin, Couthon, Lebas, and Saint-Just, was decreed. The commune instantly organized an insurrection, and rescued him; but the insurrectionists were soon overpowered, and at the hôtel de ville Robespierre was seized. At this time he was wounded in the face by a shot from his own pistol, or, as some assert, from one of the soldiers. The form of trial was quickly enacted, and early in the evening of July 28 the guillotine terminated his existence and that of his most devoted supporters.—See *Histoire de Robespierre*, by Tissot (2 vols., Paris, 1844); "Life of Robespierre," by Lewes (London, 1850); *Histoire de Robespierre*, by Hamel (3 vols., Paris, 1865-'7); and *Leben Robespierre's*, by J. Herzmann (Berlin, 1871 *et seq.*).

ROBIN, a name applied in the old world to several small dentirostral birds of the family of warblers, and subfamily *erythacinæ*. In these the bill is short, slender, tapering, depressed at the base, slightly curved and notched at the tip, and the gape and basal portion of the nasal groove covered with bristles; the tarsi are long and slender, covered in front with an entire scale, occasionally showing marks of division; the toes are moderate, the hind one and claw usually the longest, and the claws curved and sharp; tail usually short and broad, and wings moderate and rounded. Gray mentions 15 genera, most of which are inhabitants of the eastern hemisphere, over which they are very generally distributed; they feed on worms, insects, seeds, and fruits, which they seek on the ground or in trees, and when hard pressed approach familiarly human habitations; the nests are large and carefully lined with soft materials, and the eggs generally pale blue. The only genus that can be mentioned here is *erythacus* (Cuv.), and the single species the robin redbreast (*E. rubecula*, Cuv.). It is about 5½ in. long, with an alar extent of 9 in.; the prevailing color above is olive-green; the forehead, cheeks, fore neck, and part of breast, light yellowish red. It is a permanent resident in temperate Europe, Asia Minor, and North Africa, and is the most familiar of the small birds. The song is sweetly modulated, plaintive, and not loud, heard through spring, summer, and autumn, and even in dull and rainy weather when most other song birds are silent;

it is one of the latest birds to retire at night, and one of the earliest in the morning; it never congregates in flocks; the food consists of worms (which it beats to death and cleanses

Robin Redbreast (*Erythacus rubecula*).

before eating), insects, and their larvæ. Generally, and especially in the breeding season, it is very pugnacious, driving off all small birds coming near its favorite resorts, and attacking even cats and large birds. The nest is often made in outbuildings which are daily used, and sometimes in situations where there is great confusion and noise; it is made of moss, leaves, and grasses, lined with hair and feathers; the eggs are five or six, white, with pale reddish brown spots.—Birds of very different families in various parts of the world bear this name, as is the case with the American robin, which is one of the thrushes, *turdus migratorius* (Linn.); the generic characters are given under THRUSH. This well known bird is nearly twice the size of the European robin; the general color above is olive-gray, with the top and sides of the head black, chin and throat

American Robin (*Turdus migratorius*).

white, black-streaked, breast red, and the under parts chestnut brown; there is considerable variation in the plumage, which is more

or less marked with white, even to albinism. It is distributed over North America, as far as Mexico on the west and to lat. 60° N., breeding over most of this extent. This is one of the first birds seen in the spring, a few in sheltered places remaining all winter as far north as New England, and many arriving there from the south before the snow has disappeared; but most migrate during winter to the southern states, where they are very common, occurring in flocks, and killed in immense numbers. The food of this robin, in spring, consists of insects, worms, and grubs; in summer, of the smaller fruits, like cherries and strawberries, whence its persecution; and in autumn, of wild berries and insects. The song is simple but pleasing and lively, though not to be compared to that of many other thrushes; it much resembles that of the European blackbird (*T. merula*, Linn.). Much of the regard in which the robin is held here is derived from that accorded to the English robin, which ours resembles in its red breast, familiar disposition, and cheerful notes; it is generally protected, except during the shooting season in the southern and middle states, where it is slaughtered indiscriminately; in Massachusetts the laws forbid its destruction at any time of year. The nest is often built near houses and in very noisy locations; a robin has been known to build on the timbers of a railroad bridge over a wide sheet of water, on which trains passed at least every hour. The eggs are four to six, bluish green and unspotted; they are rarely molested; two broods are raised in a season, even in New England; the parents are very anxious in regard to the young, uttering a shrill and plaintive cry when the nest is approached; they sometimes breed year after year on the same spot. The flight is rapid, and at times high and long sustained. It is often kept as a cage bird; it is fed on bread soaked in milk or water, fruits, and insects; it is long-lived in captivity, but liable to suffer and die during moulting. The flesh is tender, savory, and easily digested, and a favorite article of food in the middle and southern states.—The golden robin has been described under BALTIMORE BIRD.

ROBIN, Charles Philippe, a French physiologist, born at Jasseron, department of Ain, June 4, 1821. He studied in Paris, and won in 1844 a prize at the *école pratique de médecine*, where he established a museum of natural history and anatomy, for which he was deputed by Orfila to collect specimens on the coast of Normandy and in the island of Jersey. He took his degree in 1846, and in 1847 became professor of general anatomy, and in 1862 of the new department of histology in the faculty of medicine. He is regarded as the leader, if not the founder, of the school of microscopic physiology, and has greatly promoted anatomical, physiological, and pathological researches. Since 1864 he has edited the *Journal de l'anatomie et de la physiologie*. In 1866 he was elected to the academy of sciences. His works

include *Du microscope et des injections dans leur application à l'anatomie et à la pathologie* (8vo, 1849; 2d ed., 1870); *Tableaux d'anatomie* (4to, 1851); *Traité de chimie anatomique et physiologique, normale ou pathologique*, written by him jointly with Verdeil (3 vols. 4to, with atlas, 1853); *Histoire naturelle des végétaux parasites* (8vo, 1853); *Anatomie microscopique* (1868); and a series of *Leçons* on special subjects (1866-'7). With Littré he recast successive editions of Nysten's *Dictionnaire de médecine*, and the 12th edition (1865) so thoroughly that at the request of Nysten's widow the tribunal of the Seine decided in 1866 to strike out her husband's name as its author.

ROBINSON. I. Edward, an American Biblical scholar, born at Southington, Conn., April 10, 1794, died in New York, Jan. 27, 1863. He graduated at Hamilton college, Clinton, N. Y., in 1816, and served for a year as tutor there. In 1821 he went to Andover, Mass., to procure the printing of an edition of the first six books of the Iliad, which he had prepared. While there he assisted Prof. Stuart in his Hebrew grammar and translations from the German, and was finally appointed assistant instructor. From 1826 to 1830 he studied and travelled in Europe, and on his return was appointed professor extraordinary of sacred literature at Andover, which chair he resigned in 1833 and removed to Boston. In 1837 he was appointed professor of Biblical literature in the Union theological seminary in New York. Before entering upon this office he visited Palestine, of which, in company with the Rev. Dr. Eli Smith, he made a minute survey, and published "Biblical Researches in Palestine, and in the Adjacent Countries, a Journal of Travels in the Year 1838" (3 vols. 8vo, Halle, London, and Boston, 1841). He entered upon his professorship in 1840, and held it till his death. In 1852 he again visited Palestine, and published the results of this tour in 1856 ("Later Researches," 1 vol. 8vo), with a revision of his previous researches (3d ed. of the complete work, 3 vols., London, 1867). He was a member of the American geographical, oriental, and ethnological societies. He received the degree of D. D. from Dartmouth college in 1831 and from the university of Halle in 1842, and that of LL. D. from Yale college in 1844. In addition to the works above enumerated, he published a translation of Buttmann's Greek grammar (Andover, 1832; new translation from the 18th German ed., New York, 1850); "A Greek and English Lexicon of the New Testament" (Boston, 1836; new ed., entirely rewritten, New York, 1850); "The Harmony of the Four Gospels," in Greek (Boston, 1845), and in English (1846); and a memoir of his father, the Rev. William Robinson (1859). His "Physical Geography of the Holy Land" was published posthumously (8vo, Boston, 1865). He edited from 1831

to 1834 the "Biblical Repository," a theological quarterly, subsequently united with the "Bibliotheca Sacra," which he established and edited for one year in New York. He also edited Calmet's "Biblical Dictionary" and other works, and published several revisions of his translation of Gesenius's Hebrew lexicon.—See his "Life, Character, and Writings," by Henry B. Smith, D. D., and Roswell D. Hitchcock, D. D. (New York, 1864). After his death his library was purchased for Hamilton college. **II. Therese Albertine Louise von Jakob**, wife of the preceding, born in Halle, Germany, Jan. 26, 1797, died in Hamburg, April 13, 1869. In 1807 she accompanied her father (see JAKOB, LUDWIG HEINRICH VON) to Russia, where she studied the Slavic languages and literature, and wrote her first poems. In 1816 she returned with her father to Halle, and in 1822 published, under the signature of Ernst Berthold, translations of Scott's "Old Mortality" and "The Black Dwarf." She wrote a few tales, which were published in 1825 under the title of "Psyche," and others appeared under the signature of "Talvj" (Talvi), formed from the initial letters of her maiden name. She translated a number of poems from the Servian language, which were published under the title of *Volkslieder der Serben* (2 vols., Halle, 1825-'6). In 1828 she was married to Prof. Robinson, and in 1830 accompanied him to America. Here she translated into German Mr. John Pickering's work on the Indian tongues of North America (Leipsic, 1834). In 1834 she wrote for the "Biblical Repository" a "Historical View of the Slavic Languages," which was revised and published as "Historical View of the Languages and Literature of the Slavic Nations, with a Sketch of their Popular Poetry" (1850). During her husband's first visit to Palestine (1837-'40) she was in Germany, and published *Versuch einer geschichtlichen Charakteristik der Volkslieder germanischer Nationen* (Leipsic, 1840), and *Untersuchung über die Authenticität des Ossian* (1840). After her return to New York she wrote a history of Capt. John Smith in German, followed by *Die Colonisation von Neu England* (Leipsic, 1847), of which work the younger Hazlitt made a translation into English (2 vols., London, 1851). Her other works, originally published in Germany and translated into English by her daughter, include "Heloise, or the Unrevealed Secret" (New York, 1850), "Life's Discipline, a Tale of the Annals of Hungary" (1851), and "The Exiles" (1853), republished in 1856 as "Woodhill, or the Ways of Providence." After the death of her husband she resided in Hamburg, where her son was American consul, and there continued her literary activity. Her last work, "Fifteen Years, a Picture from the Last Century," has been published in this country since her death.

ROBINSON, Ezekiel Gilman, an American clergyman, born at Attleborough, Mass., March 23,

1815. He graduated at Brown university in 1838, at Newton theological institution in 1842, and was ordained and settled as pastor of a Baptist church in Norfolk, Va., in November, 1842. In 1846 he accepted the professorship of Hebrew in the theological seminary at Covington, Ky., but lost it in 1848 when during the anti-slavery troubles the legislature changed the charter. In 1853 he became a professor in the Rochester theological seminary, of which he was subsequently made president. In 1872 he became president of Brown university, which office he still holds (1875). He edited the "Christian Review," quarterly, from 1859 till 1864, when it was merged in the "Bibliotheca Sacra." He has published a translation of Neander's "Planting and Training of the Christian Church" (8vo, New York, 1865), and "The Relation of the Church and the Bible" (1866). He is noted as a powerful and popular preacher and an effective political orator.

ROBINSON, John, an English clergyman, born in 1575, died in Leyden, March 1, 1625. He was educated at Cambridge, and held for a time a benefice near Yarmouth in Norfolk, but in 1602 became pastor of a dissenting congregation at Norwich. In 1607 its members, on account of persecution, attempted to leave England for Holland, but were prevented by the civil officers, who kept the whole company under arrest for a month. In 1608, however, they went to Amsterdam, and in 1609 removed to Leyden. Here they remained 11 years, and their numbers were largely increased by arrivals from England. In 1613 Robinson had a controversy on free will with Episcopius, professor in the university of Leyden. In 1617 another removal was contemplated, and the pastor favored the plan of forming a settlement in America. A minority of the congregation, under the lead of Brewster, the ruling elder, set out in 1620 in two ships, the *Speedwell* and the *Mayflower*. It was the intention of Robinson to follow with the rest of the congregation, but he died before the consent of the association of English merchants who controlled the enterprise could be obtained. The remainder of his church emigrated not long after his death, and his sons John and Isaac followed in 1629 or 1630. He was an acute controversialist, and highly versed in classical learning. He published "A Justification of Separation from the Church of England" (1610); "Of Religious Communion" (1614); *Apologia Justa et Necessaria* (1619), which in 1644 was translated into English; "A Defence of the Doctrine propounded by the Synod of Dort" (1624); "Essays or Observations, Divine and Moral" (1628); and "A Treatise of the Lawfulness of Learning of the Ministers in the Church of England" (1634). His complete works, with a memoir by Robert Ashton (3 vols.), were published in London and at Boston in 1851.

ROBINSON, John, a Scottish writer on natural philosophy, born at Boghall, Stirlingshire, in

1739, died in Edinburgh, Jan. 30, 1805. He graduated in 1756 at the university of Glasgow, and in 1758 went to London, became private tutor to the son of Admiral Knowles, and entered as midshipman on board the Royal William, his pupil being lieutenant, under whom he served two and a half years. He was then sent to Jamaica to test Harrison's chronometer. In April, 1763, he resumed his studies at the university of Glasgow, and in 1766 succeeded Dr. Black as lecturer in chemistry. In 1770 he went to St. Petersburg as secretary to Admiral Knowles, who had been invited thither to suggest reforms in the Russian navy, and in 1772 he was made inspector general of the corps of marine cadets at Cronstadt. From 1774 till his death he was professor of natural philosophy in the university of Edinburgh. His works, including his contributions to the "Encyclopædia Britannica," were published under the title "A System of Mechanical Philosophy," with notes by David Brewster (4 vols. 8vo, London, 1822); besides which he was the author of numerous scientific papers, and of "Proofs of a Conspiracy against all the Religions and Governments of Europe" (8vo, Edinburgh, 1797).

ROB ROY (literally, Robert the Red), a Scottish outlaw, born about 1660, died about 1738. His true name was Robert Macgregor, which, after the outlawry of the clan Macgregor by the Scottish parliament in 1693, he changed for that of his mother, Campbell. Previous to the rebellion of 1715 he was a dealer in cattle; but having joined the pretender, he gave his enemy, the duke of Montrose, an excuse for seizing his lands. He retaliated by a war of reprisals upon the duke. For many years he continued to levy blackmail upon his enemies in spite of the presence of a British garrison near his residence at Aberfoyle. His name and exploits have survived chiefly through Scott's novel, "Rob Roy."

ROCHAMBEAU. I. Jean Baptiste Donatien de Vimeur, count de, a French soldier, born in Vendôme, July 1, 1725, died at Thoré, near that city, May 10, 1807. He entered the army in 1742, and distinguished himself in various campaigns, reaching the rank of lieutenant general. In 1780 he was placed in command of the French army sent to America, and in 1781 he actively cooperated with Washington in the movements which led to the capitulation of Cornwallis at Yorktown. Congress presented him with two pieces of cannon captured from the English, and on his return to France in 1783 he was made governor of Picardy and Artois, and in 1791 marshal. In 1792 he commanded the army of the north, but soon resigned. During the reign of terror he was imprisoned, and only escaped the guillotine by the death of Robespierre. Bonaparte named him grand officer of the newly created legion of honor and pensioned him. He left *Mémoires*, which were edited by Luce de Lancival (2 vols., 1809; translated into Eng-

lish by M. W. E. Wright (1838). **II. Donatien Marie Joseph de Vimeur**, viscount de, a French soldier, son of the preceding, born in 1750, killed at Leipsic, Oct. 18, 1813. He early entered the army, became general in 1792, and fought the negroes in Santo Domingo. In the following year he defeated the allied English and French royalists in Martinique; but the former being reinforced, he was obliged to surrender, March 22, 1794, after holding out for nearly two months at St. Pierre. In 1796 he became governor general of Santo Domingo, but a conflict with the civil authorities resulted in his being carried as a prisoner to France. In 1800 he was placed at the head of a division in Italy. At the close of 1801 he went with Leclerc to Santo Domingo, co-operated in the defeat of Toussaint l'Ouverture, and on Leclerc's death (Nov. 2, 1802) succeeded him as governor. He imposed onerous taxes upon the rich to enable him to put down the insurgents, but was overpowered and obliged to return to France in 1803. Contrary to a convention with the British squadron, he was taken prisoner on the French coast and detained in England till 1811. He distinguished himself in the campaign of 1813.

ROCHDALE, a town of Lancashire, England, on both sides of the river Roch, 10 m. N. N. E. of Manchester; pop. in 1871, 44,559. A parliamentary act in 1872 extended the municipal borough over the district comprised within the limits of the parliamentary borough, making the population of the present limits 63,485. Within a few years the town has been much improved, the new parts presenting wide, well paved streets, lighted with gas, and lined with buildings of brick and stone. There are more than 20 places of worship and numerous schools, and a fine town hall was built in 1865. The parish church dates from the 12th century. The Roch is here crossed by five bridges. Woollen manufacture was introduced by Flemish immigrants in the time of Edward III., and the town is now noted for its extensive manufactories of flannel, baize, blankets, and kerseys. There are also cotton warp and yarn mills, calico printing works, hat manufactories, machine shops, and brass and iron foundries. Coal and iron are mined, and slate, flag, and free stones are quarried in the vicinity. Rochdale is the seat of the most successful of the English coöperative associations, called the equitable pioneers' society; it was founded in 1844 by a few flannel weavers, with a capital of £28 to start a small store for supplying the members with the necessities of life at cost; at the close of 1870 it had 5,560 members, a share capital of £81,232, several shops and factories, a library of 7,000 volumes, and a sick and burial society, and had largely invested in cottages for members.

ROCHEFORT, or **Rochefort-sur-Mer**, a fortified town of France, in the department of Charente-Inférieure, on the right bank of the Charente, about 9 m. from its mouth, and 18 m.

S. S. E. of La Rochelle; pop. in 1872, 28,299. It was a place of no importance till 1666, when it was made a naval station by Louis XIV., the harbor was enlarged, and the city was fortified by Vauban. It has extensive docks, magazines, cannon foundries, and a marine hospital; and it ranks among the first naval establishments of France. It is also a commercial centre of importance. Napoleon here surrendered to Capt. Maitland, of the British man-of-war *Bellerophon*, July 15, 1815.

ROCHEFORT-LUÇAY, **Victor Henri**, count de, popularly known as **HENRI ROCHEFORT**, a French journalist, born in Paris, Jan. 30, 1830. In early life he was one of the writers of the *Charivari*. He held for some time an office in the department of fine arts, but after 1861 devoted himself wholly to journalism. After contributing to various papers, he was engaged to write for the *Figaro* at an annual salary of 30,000 francs, but in 1868 retired to save that journal from prosecution, and established the *Lanterne*, which was soon stopped by the government on account of its violent attacks upon the imperial family. He fled to escape imprisonment, and continued to publish the *Lanterne* at Brussels till August, 1869, when on his election to the legislative body he was permitted to return to Paris. In the same year he founded the *Marseillaise* newspaper, in which Victor Noir was a collaborator. After the assassination of the latter by Prince Pierre Bonaparte, Jan. 10, 1870, the paper was seized, and Rochefort was arrested. On the proclamation of the republic (Sept. 4) he was taken from prison by the populace. For a short time he was connected with the government of national defence. During the siege of Paris he was president of the commission of barricades, and he established the *Mot d'Ordre*. On Feb. 8, 1871, he was elected as one of the representatives of Paris in the national assembly. At the establishment of the commune (March 18) he was in Paris, and he immediately took its side in the *Mot d'Ordre*, vehemently assailing the government of Versailles and M. Thiers personally. After an ineffectual attempt to escape shortly before its fall, he was sentenced to imprisonment for life. In September, 1872, he was temporarily released to enable him to legitimate his children by marrying their mother, who was dying, and was then transported to New Caledonia. He escaped in March, 1874, and lectured in New York for the benefit of his fellow exiles. In Ireland he was rescued by the police from the mob, who regarded him as one of the murderers of the archbishop of Paris. He attempted to revive the *Lanterne* in London, and then in Geneva, but with no success. In conjunction with others he has written plays, and he is the author of many pamphlets and of several books, chiefly collections of his newspaper articles. In 1875 he published at Geneva *Les dépravés* and a satire on MacMahon.

ROCHEFOUCAULD. See LA ROCHEFOUCAULD.

ROCHEJAQUELEIN. See LA ROCHEJAQUELEIN.

ROCHELLE, La, a fortified town of France, capital of the department of Charente-Inférieure, situated on the bay of Biscay, opposite the island of Ré, 245 m. S. W. of Paris; pop. in 1872, 19,506. Among the principal buildings are the cathedral, hôtel de ville, and exchange. The *place d'armes* is considered one of the finest squares in France. Ship building is carried on, and pottery, glass, and cotton goods are manufactured. La Rochelle fell into the hands of the Huguenots in 1557, and was gallantly defended in 1573, when a favorable peace was extorted from the Catholics; it continued an important centre of the Protestants till 1628, when, feebly supported by England, they surrendered it after a most obstinate siege of 14 months. The mole is still visible that was constructed by Richelieu to close the harbor on this occasion. Vauban afterward built extensive fortifications.

ROCHELLE SALT, or Salt of Seignette (tartrate of potash and soda, sodic-potassic tartrate), a double tartrate of potassium and sodium, discovered by Seignette, an apothecary of La Rochelle. By neutralizing cream of tartar (bitartrate of potash, $\text{KH}_2\text{C}_4\text{H}_4\text{O}_6$) with carbonate of soda, its basylous atom of hydrogen may be replaced by sodium. By evaporation the tartrate of potash and soda separates in large transparent rhombic prisms of the formula $\text{KNaC}_4\text{H}_4\text{O}_6 + 4\text{Aq}$. The crystals melt in this water of crystallization between 160° and 176° F., and dissolve in 2 parts of water at 42° , and in 0.3 part at 100° . Acids precipitate cream of tartar from the solution. The salt is a mild cooling purgative, in doses of from two drachms to an ounce. In small and repeated doses it does not purge, but is absorbed and renders the urine alkaline. It is the principal component of Seidlitz or Rochelle powders.

ROCHESTER, a city, port of entry, and the capital of Monroe co., New York, on the Genesee river, 7 m. from its mouth in Lake Ontario and 229 m. by railroad W. N. W. of Albany; pop. in 1815, 331; in 1820, 1,502; in 1830, 9,207; in 1840, 20,191; in 1850, 36,403; in 1860, 48,204; in 1870, 62,386; in 1875, 81,673. Of the gain in population during the last five years, 8,136 were brought in with annexed territory. The extreme length and breadth

are each $4\frac{1}{2}$ m.; area, $17\frac{1}{2}$ sq. m. The city is divided into about equal portions by the Genesee river, which has a rapid descent soon after it enters the city, a perpendicular fall of 96 ft. near the centre, and two others of 25 ft. and 84 ft. near the northern limit. The site of the city is nearly level, and below the great fall the river flows through a deep narrow gorge. The streets are nearly all laid out at right angles, and are from 66 to 100 ft. wide; many of them are well paved with stone, and most of them are bordered with shade trees. The city has a thorough system of sewerage, and is lighted with gas. There are six public squares, of from four to eight acres each. Nearly all the dwellings are built separate from each other and surrounded by a little cultivated or ornamented ground. The New York Central railroad passes through the city, with two branches to the east (Syracuse and Auburn) and two to the west (Buffalo and Niagara

View in West Main Street, Rochester.

Falls), and has also a branch to Charlotte, at the mouth of the river. The Genesee Valley railroad (a branch of the Erie) enters the city from the south, and the Rochester and State Line railway, now (1875) completed from Rochester to Le Roy, will ultimately connect the city direct with the bituminous coal region of Pennsylvania. The Erie canal also passes through from east to west, crossing the river on a fine aqueduct of ten arches, 848 ft. long, with a channel 45 ft. wide, which cost \$600,000. The Genesee Valley canal here unites with the Erie. The river is crossed by five highway and two railroad bridges. Mount Hope cemetery, on a group of rounded hills in the southern part of the city, contains 188 acres, and is one of the most beautiful in the country. The new city hall is of gray limestone, with interior walls of brick, fire-proof throughout; it is 138 ft. long, 80 ft. wide, and four stories high, with a tower 175 ft. high,

and cost \$335,000. The court house is of brick, with limestone trimmings, three stories high. The new free academy is 136 ft. long, 80 ft. wide, and four stories high, built of brick, with sandstone trimmings, and cost \$125,000. Water for extinguishing fires is pumped from the river by machinery on the Holly system. Works designed to bring pure water from Hemlock lake, 28 m. S. by E. of the city, will probably be completed about the close of 1875. The cost for both systems has been \$3,200,000. A street railroad runs through the principal avenues. There are 59 religious societies, all but two of which have edifices of their own, viz.: 5 Baptist, 1 Christadelphian, 1 Congregational, 7 Episcopal, 5 German Evangelical, 2 Friends', 2 Jewish, 2 Lutheran, 9 Methodist, 10 Presbyterian, 1 Reformed church in America, 11 Roman Catholic, 1 Second Advent, 1 Unitarian, and 1 Universalist. The finest church edifice is St. Patrick's cathedral (built in 1864-'9), which is in Gothic style, of red sandstone trimmed with gray limestone, 170 ft. long, 112 ft. wide in the transept, and 76 ft. high; it cost \$150,000. The city hospital, sustained by the contributions of Protestants, has property to the value of \$105,000, including a fine building; it can accommodate 120 patients, and has an average of 60. St. Mary's hospital (Roman Catholic) has property valued at \$200,000, including a large building of gray sandstone; it accommodates 300 patients, and has an average of 200. Other charitable institutions are: a Catholic orphan asylum, with property valued at \$30,000; Protestant orphan asylum, \$157,000; industrial school, \$34,000; home for the friendless, \$50,000; church home (Episcopal), \$40,000; and house for idle and truant children, \$40,000. The county jail, the county penitentiary, a state arsenal, and the western house of refuge are all within the city limits. The last named, opened in 1849, has real estate to the value of \$500,000, including a farm of 42 acres. It was opened in 1850, and on Dec. 31, 1874, had 386 inmates, all boys; at that date it had received in all 4,083 boys, and had cost the state \$986,492. A department for girls has recently been authorized, and will be constructed at once. There are 20 public schools (including the free academy), employing 183 teachers and having in 1875 11,275 pupils, and two public libraries, containing 20,000 and 7,000 volumes respectively. The university of Rochester was established in 1850 by the Baptists, and in 1875 had nine professors, 160 students, and about 600 graduates. It discarded the dormitory system from the beginning, and claims no control over the students out of recitation hours. Several denominations are represented in the faculty and board of trustees. It has both a classical and a scientific course. It is situated in the eastern part of the city, where it has 23½ acres of ground, beautifully laid out, and occupies a massive building of dark red sandstone (com-

pleted in 1861), which is 150 ft. long, 80 ft. in extreme width, and three stories high. The library contains 11,500 volumes; and the geological cabinets, collected by Prof. Henry A. Ward, are said to be the finest in the country. For the library and cabinets a fire-proof building, 140 by 80 ft. and two stories high, is now (1875) nearly completed; its cost will be about \$100,000, and on its completion the library is to be free to the public for consultation. The university holds property to the amount of \$377,000, and has productive funds aggregating about \$200,000. The Rochester theological seminary, founded in 1850 by the Baptists, in 1875 had 7 professors, 80 students, and upward of 300 graduates. Its library numbers more than 10,000 volumes, including 4,000 which constituted the library of Neander, the German church historian. The seminary occupies a fine building, erected in 1869 at a cost of \$42,000, which is four stories high and is of brick trimmed with limestone. Another building has recently been added for lecture rooms and a gymnasium. It has property worth \$100,000, and productive funds to the amount of \$260,000.—The city is divided into 16 wards, and is governed by a mayor and a common council consisting of two aldermen from each ward. The board of education consists of one commissioner from each ward, chosen by the people for three years. There are a paid fire department, a fire telegraph, and a police force of 80 men. The assessed valuation of property in 1875 was \$61,351,700 (\$905,000 of this being personal), which is about three fourths of the true value. The rate of general city tax on assessed valuation is 1.33 per cent. The city debt in March, 1875, was nearly \$5,000,000, and the city owns property, exclusive of water works, valued at \$2,000,000. The exports at the port of Genesee during the year ending June 30, 1875, were valued at \$784,979; the imports at \$331,609; entrances, 714; clearances, 705. The manufactures of Rochester are extensive and varied, including nearly all that are mentioned in the article on Monroe county. The largest industries are those of clothing, boots and shoes, beer, flour, agricultural implements, furniture, cooperage, steam engines and boilers, locomotive building and repairing, edge tools, garden and flower seeds, and trees. The regular publications include 4 daily newspapers (1 German), 1 tri-weekly, 2 semi-weekly, 7 weekly (2 German), and 3 monthly periodicals. There are five banks of discount and circulation, with an aggregate capital of \$850,000, four savings banks, and a trust company.—The first permanent settlement on the site of Rochester was made in 1810. In 1812 a village was laid out by Nathaniel Rochester and two associates from Maryland. It was incorporated as a village in 1817, and as a city in 1834. It owes its rapid growth to the immense water power furnished by the river, the facilities for transportation, and the remarkable fertility of the

surrounding country, which is now largely occupied by nurseries, some of them being among the most extensive in the world. In March, 1865, owing to encroachments upon the bed of the river, a sudden freshet overflowed the banks, and for three days almost the entire business portion of the city was from three to six feet under water. Several large buildings were undermined and destroyed; the total damage was estimated at \$250,000.

ROCHESTER, a city of Kent, England, on the right bank of the Medway, near Chatham, 12 m. from the Nore, and 28 m. S. E. of London; pop. in 1871, 18,352. On an abrupt eminence are the ruins of Rochester castle, and along the shores of the river are works connecting with the Chatham fortifications. The city has no manufactures of consequence, but considerable trade, and it is a port of entry. Many of the inhabitants find employment in the adjoining naval establishments, and there is some ship building. Among the public institutions are a cathedral grammar school, founded by Henry VIII. in 1542, and the "Poor Traveller's House," founded by Richard Watts in the reign of Elizabeth. The cathedral, originally a priory founded about 604, rebuilt about 1076, and recently restored, is principally Norman and early English in style. St. Nicholas church dates from 1420, and was partially rebuilt in 1624. Among the interesting ruins is Bishop Gundulph's keep.

ROCHESTER, John Wilmot, second earl of, a wit of the court of Charles II., born at Ditchley, Oxfordshire, in 1647 or 1648, died July 26, 1680. He travelled in France and Italy, and in 1665-'6 served at sea, distinguishing himself on several occasions; but on returning to London he would not fight duels and lost reputation. The king made him a gentleman of the bedchamber and ranger of Woodstock park. He became addicted to intemperance, and was famous for debauchery and buffoonery. When prostrated by disease, he was converted from infidelity, and on his deathbed directed the destruction of all his profane and licentious writings. But shortly after his death appeared a volume of his "Poems on several Occasions" (reprinted in 1685, '91, and '96), followed by his "Familiar Letters" (1697). In the edition of 1731-'2, which includes poems by Roscommon, Dorset, and others, much that is attributed to Rochester is probably spurious. Dr. Burnet published "Some Passages of the Life and Death of John, Earl of Rochester" (1681), and Dr. Johnson wrote his biography in "Lives of the Poets." His only son died a minor in 1681, when the title became extinct.

ROCHESTER, Nathaniel, an American pioneer, born in Westmoreland co., Va., Feb. 21, 1752, died in Rochester, N. Y., May 17, 1831. In early life he became a merchant at Hillsboro, N. C., and was a major of militia. In 1775, at the head of his command, he captured the British Gen. McDonald and the thousand Scotch recruits whom he was endeavoring to

embark at Wilmington. In 1776 Rochester was a member of the convention which framed the constitution of North Carolina, and was appointed commissary general. After the war he became a merchant and manufacturer at Hagerstown, Md. About 1800 he made large purchases of land in the Genesee valley; and in 1818 he removed to Rochester, which in 1812 had been named after him.

ROCHET, Louis, a French sculptor, born in Paris, Aug. 24, 1813. He studied under David d'Angers, and exhibited his first work in 1835. Among his principal works are: "Madame de Sévigné," at Grignan (1857); a colossal statue of Pedro I. of Brazil, unveiled at Rio de Janeiro in 1862; an equestrian statue of Charlemagne (1867); and "Raphael" (1868).

ROCHETTE, Désiré Raoul (called RAOUL-ROCHETTE), a French archæologist, born at St. Amand, near Bourges, about 1790, died in Paris, July 5, 1854. He was educated at the college of Bourges, went to Paris at the age of 21, and became substitute for Guizot in the professorship of modern history at the faculty of letters in 1815, member of the academy of inscriptions and editor of the *Journal des Savants* in 1816, keeper of the cabinet of medals in the royal library in 1818, royal censor of newspapers in 1820, assistant of Quatremère de Quincy in the chair of archæology in 1824, and his successor in 1826, a member of the scientific commission to the Morea in 1828, and perpetual secretary of the academy of fine arts in 1839. A volume of his lessons was translated into English by H. M. Westropp ("Lectures on Ancient Art," London, 1854). Among his numerous other works are: *Histoire critique de l'établissement des colonies grecques* (4 vols. 8vo, 1815); *Lettres sur la Suisse* (3 vols. 8vo, 1820-'22, and fol., with plates, 1823-'7); *Monuments inédits d'antiquité figurée grecque, étrusque et romaine* (fol., 1828); *Peintures antiques inédites* (4to, 1836); and *Sur les antiquités chrétiennes des catacombes* (4to, 1839).

ROCK. L. A S. county of Wisconsin, bordering on Illinois, intersected N. and S. nearly in the middle by Rock river, and drained by its branches; area, about 750 sq. m.; pop. in 1870, 39,030. Its surface is nearly level, with much prairie, especially E. of Rock river, which is nearly all occupied by Rock prairie; and the soil is very fertile. It is intersected by the Wisconsin division of the Chicago and Northwestern railroad, the Western Union, and the Prairie du Chien division of the Milwaukee and St. Paul railroad. The chief productions in 1870 were 865,048 bushels of wheat, 120,965 of rye, 1,137,304 of Indian corn, 1,173,714 of oats, 204,998 of barley, 26,864 of buckwheat, 442,151 of potatoes, 52,122 tons of hay, 645,508 lbs. of tobacco, 264,446 of wool, 1,043,169 of butter, 36,110 of cheese, 12,785 of hops, and 20,653 of honey. There were 13,995 horses, 12,852 milch cows, 14,861 other cattle, 62,193 sheep, and 23,438

swine; 8 manufactories of agricultural implements, 23 of carriages and wagons, 6 of cheese, 5 of furniture, 4 of iron castings, 3 of machinery, 8 of brick and stone, 3 of sash, doors, and blinds, 3 of woollen goods, 8 flour mills, and 4 distilleries. Capital, Janesville. **II.** The S. W. county of Minnesota, bordering S. on Iowa and W. on Dakota; area, 432 sq. m.; pop. in 1870, 138. It has a rolling surface, and is drained by tributaries of the Big Sioux and Rock rivers.

ROCKBRIDGE, a central county of Virginia, intersected by North river, a branch of the James, and bordered S. E. by the Blue Ridge; area, about 700 sq. m.; pop. in 1870, 16,058, of whom 3,890 were colored. It has a mountainous surface and very fertile soil. The Chesapeake and Ohio railroad crosses the N. W. corner. The county derives its name from the natural bridge in the S. corner. (See **BRIDGE, NATURAL**.) The chief productions in 1870 were 214,800 bushels of wheat, 119,518 of Indian corn, 85,564 of oats, 6,022 tons of hay, 186,469 lbs. of tobacco, 9,156 of wool, 131,092 of butter, and 3,290 gallons of sorghum molasses. There were 2,288 horses, 2,378 milch cows, 4,493 other cattle, 3,481 sheep, and 6,986 swine; 1 manufactory of cement, 2 of tin, copper, and sheet-iron ware, 4 of tanned and 4 of curried leather, and 16 flour mills. Capital, Lexington.

ROCK CASTLE, a S. E. county of Kentucky, bordered S. E. by Rock Castle river, by the branches of which and Dick's river it is drained; area, about 350 sq. m.; pop. in 1870, 7,145, of whom 369 were colored. It has an uneven surface and a not very fertile soil. It is intersected by the Louisville and Nashville and Great Southern railroad. The chief productions in 1870 were 10,539 bushels of wheat, 216,816 of Indian corn, 35,077 of oats, 23,445 lbs. of tobacco, 10,949 of wool, 92,675 of butter, and 11,702 gallons of sorghum molasses. There were 1,638 horses, 1,648 milch cows, 2,314 other cattle, 6,625 sheep, and 7,189 swine. Capital, Mount Vernon.

ROCKDALE, a N. county of Georgia, bounded S. W. by South river, a branch of the Ocmulgee, and drained by other branches of that stream; area, 200 sq. m. It has been formed since the census of 1870. The Georgia railroad traverses it. The surface is diversified, and the soil good. Iron, gold, and other minerals are found. Capital, Conyers.

ROCKET, a projectile which is set in motion by a force residing within itself, thus performing the twofold functions of piece and projectile. Rockets are used as night signals, missiles of war, and in pyrotechnic displays. They are said to have been invented about the close of the 9th century, and to have been used for war purposes in India and China even before the invention of gunpowder. Their inferior force and accuracy limited their use by Europeans to incendiary and signal purposes till 1804, when Sir William Congreve turned his

attention to their improvement. He substituted sheet iron for paper cases, made the guide stick shorter, and attached it to the centre instead of the side of the base. He prepared and used them successfully at the siege of Boulogne and the battle of Leipsic, and is said to have increased the range of the six-pounder rocket from 600 to 2,000 yards. Rockets are now constructed of cylindrical cases composed of paper or wrought iron, according to the use for which they are intended, and are filled with a composition of nitre, charcoal, and sulphur, like gunpowder, except that the ingredients are compounded for a slower rate of combustion. If penetration and range are required, as in the case of war rockets, the head is surmounted by a solid shot; if explosion or incendiary effect, by a shell or a case shot with a fuse attached, which is ignited by the flame of the composition. The base is perforated by one or more vents for the escape of the gas generated within, and sometimes with a screw hole into which a guide stick is fastened. A rocket is set in motion by the reaction of a rapid stream of gas escaping through the vents and impinging against particles of the air, although the reaction of the escaping gas would cause it to move also *in vacuo*. The velocity of the flight depends upon the size and shape of the vents and the velocity with which the gas escapes, and it has been found in practice that the best results are obtained by conical vents. As the composition burns in parallel layers of uniform thickness, the amount of gas generated in a given time or the velocity of its escape from the case depends on the extent of the inflamed surface; and experience shows that to obtain the required surface of inflammation it is necessary to form a long cavity in the mass of the composition. This cavity is called the bore, and in small rockets it is obtained by driving the composition around a spindle, which is afterward withdrawn, while in large rockets the composition is driven in solid, and afterward bored out; the bore is made concentric with the case, and slightly conical. The propelling force of a rocket changes its direction with the axis along which it acts, so that without means of giving stability to this axis the trajectory will be very irregular. Instances have been known where these projectiles have returned to the point whence they started; the "serpent," a species of small rocket, owes its peculiarity to this fact. The two means used to give steadiness to the flight of rockets are rotation, as in the case of a rifle ball, and the resistance of the air, as with an arrow. The first is exemplified in Hale's rockets, where rotation is produced by the escape of the gas through vents situated obliquely with reference to the axis. The common signal rocket is guided by a long stick projecting from its base in the continuation of its axis, or by four shorter ones attached to the side of the case at its base, and each making a small angle with the axis.

Congreve's war rocket is guided by a long wooden stick attached to its base. Rockets are generally fired from wooden tubes or gutters, but where they have four sticks, these, forming a pyramid, permit them to be fired from the ground, by standing them on end. The advantages claimed for war rockets over cannon are unlimited size of projectile, portability, freedom from recoil, rapidity of discharge, and the terror which the noise and fiery trail produce upon troops, especially cavalry or mounted infantry. The numerous conditions to be fulfilled in the construction in order to obtain accuracy of flight, and the difficulty of preserving the composition uninjured, have restricted their usefulness for military purposes. They were not used at all during the civil war in America, though two sizes are prescribed for service, namely, the 2-inch (interior space) weighing 6 lbs., and the 3-inch, weighing 16 lbs., and having with an elevation of from 4° to 5° a range of 500 or 600 yards, and with an elevation of 47° ranges of 1,760 and 2,200 yards respectively. They have also fallen into disuse in Europe, and hereafter, except in peculiar cases, they will probably be confined to the uses of signalling and pyrotechny.—See Benton's "Ordnance and Gunnery" (3d ed., New York, 1867).

ROCK FISH. See Bass, vol. ii., p. 368.

ROCKFORD, a city and the county seat of Winnebago co., Illinois, on both sides of Rock river, here crossed by a fine iron bridge, and at the intersection of the Chicago and Northwestern railroad, the Kenosha division of that line, and the Chicago, Rockford, and Northern railroad, 80 m. in direct line N. W. of Chicago; pop. in 1860, 6,976; in 1870, 11,049, of whom 3,041 were foreigners; in 1875, estimated by local authorities at 15,000. It is surrounded by a rich agricultural region, and has a healthy situation. The streets and private grounds are well shaded, and there are many fine residences. The city is one of the handsomest in the state. It is lighted with gas, and is supplied with water by works on the Holly plan, recently completed at a cost of about \$225,000. The river supplies abundant water power, which is extensively used in manufacturing. There are two paper mills, four extensive flour mills, two cotton factories (producing batting, seamless bags, and yarn), five reaper and mower factories, two machine and mill-casting shops, two pump factories, five extensive plough shops, four sock-knitting establishments, a tuck factory (the only one W. of Pittsburgh), two furniture factories, extensive malleable iron works, a woollen mill (producing cloth and yarn), and various manufactories of agricultural implements. An extensive watch factory has been recently established, with a capital of \$150,000. There are four national banks, a state bank, and a private bank, with private deposits on May 1, 1875, to the amount of \$1,350,000. The city has two high and seven ward schools; a female seminary, founded in

1849, and attended by about 200 pupils; several private schools; and a public library containing 6,500 volumes. Five weekly newspapers and a monthly periodical are published. There are 16 churches, viz.: 2 Baptist, 2 Congregational, 1 Disciples', 1 Episcopal, 1 Liberal Christian (church of the Christian Union), 4 Methodist Episcopal, 2 Presbyterian, 1 Roman Catholic, 1 Swedish Lutheran, and 1 Swedish Methodist.—Rockford was settled in 1836, and incorporated as a city in 1852.

ROCKINGHAM. I. A S. E. county of New Hampshire, bordered E. by the Atlantic and S. by Massachusetts, and separated from Maine on the northeast by the Piscataqua river; area, about 700 sq. m.; pop. in 1870, 47,297. It is watered by the Lamprey, Exeter, Beaver, and Spigot rivers. Great bay, a body of water communicating with the Piscataqua, is on the N. E., and Massabesic lake on the W. border. Its surface is uneven, and the soil fertile. It is intersected by the Manchester and Lawrence, the Concord and Portsmouth, the Boston and Maine, the Eastern, and the Nashua and Rochester railroads. The chief productions in 1870 were 8,065 bushels of wheat, 165,843 of Indian corn, 51,316 of oats, 21,003 of barley, 456,227 of potatoes, 65,604 tons of hay, 28,240 lbs. of wool, 674,208 of butter, and 74,226 of cheese. There were 4,771 horses, 20,129 milch cows, 4,326 working oxen, 7,336 other cattle, 7,960 sheep, and 4,337 swine; 4 manufactories of boats, 34 of boots and shoes, 12 of brick, 12 of carriages and wagons, 12 of men's clothing, 4 of cotton goods, 5 of hosiery, 3 of engines and boilers, 5 of tin, copper, and sheet-iron ware, 5 of woollen goods, 2 flour mills, 70 saw mills, 9 tanneries, and 2 distilleries. Capitals, Portsmouth and Exeter. II. A N. county of Virginia, bordered S. E. by the Blue Ridge and N. W. by the Shenandoah mountains, and drained by the Shenandoah river and its branches; area, about 850 sq. m.; pop. in 1870, 23,668, of whom 2,516 were colored. It occupies part of the great valley of Virginia, and has an uneven surface and fertile soil. The chief productions in 1870 were 375,688 bushels of wheat, 36,251 of rye, 251,754 of Indian corn, 140,896 of oats, 16,459 tons of hay, 27,571 lbs. of wool, 307,688 of butter, and 16,540 gallons of sorghum molasses. There were 6,505 horses, 5,401 milch cows, 9,335 other cattle, 8,061 sheep, and 17,949 swine; 14 flour mills, 1 distillery, and 2 woollen mills. Capital, Harrisonburg. III. A N. county of North Carolina, bordering on Virginia, intersected by the Dan and drained by the head waters of the Haw river; area, about 600 sq. m.; pop. in 1870, 15,708, of whom 6,215 were colored. It has an elevated and hilly surface and a fertile soil. The Richmond and Danville railroad passes through it. The chief productions in 1870 were 53,295 bushels of wheat, 218,469 of Indian corn, 103,528 of oats, 16,159 of Irish and 16,057 of sweet potatoes, 1,441,971 lbs. of tobacco, 7,101 of wool, 92,523 of but-

ter, and 29,457 of honey. There were 1,237 horses, 817 mules and asses, 2,722 milch cows, 3,082 other cattle, 4,759 sheep, and 12,474 swine; and 12 manufactories of chewing tobacco. Capital, Wentworth.

ROCKINGHAM, Charles Watson Wentworth, marquis of, an English statesman, born May 13, 1730, died July 1, 1782. Distinguished by wealth and character, he succeeded in 1765 George Grenville as first lord of the treasury and premier, and henceforth was the leader of the liberal branch of the aristocracy. Although his ministry contained members who had voted against the passage of the stamp act, it did not undertake to repeal it, but made preparations to execute it in all the colonies; but this proving impracticable, the repeal took place in March, 1766, accompanied by an act declaring the supreme power of parliament over America in all respects. Rockingham retired from the premiership on July 12, but resumed it in March, 1782, on the resignation of Lord North.

ROCK ISLAND, a N. W. county of Illinois, separated from Iowa on the N. W. by the Mississippi river, and intersected by Rock river; area, about 350 sq. m.; pop. in 1870, 29,783. The surface is rolling and the soil very fertile. Coal and limestone occur in large quantities. Several railroads centre at the city of Rock Island. The chief productions in 1870 were 245,820 bushels of wheat, 1,459,653 of Indian corn, 276,575 of oats, 36,980 of barley, 192,531 of potatoes, 17,239 lbs. of wool, 563,122 of butter, and 31,299 tons of hay. There were 7,985 horses, 7,471 milch cows, 12,877 other cattle, 5,667 sheep, and 26,625 swine; 7 manufactories of agricultural implements, 10 of brick, 15 of carriages and wagons, 16 of clothing, 12 of cooperage, 3 of iron castings, 7 of lime, 1 of paper, 18 of saddlery and harness, 2 of sash, doors, and blinds, 2 of woollens, 2 tanning and currying establishments, 2 distilleries, 4 breweries, 10 flour mills, and 10 saw mills. Capital, Rock Island.

ROCK ISLAND, a city and the capital of Rock Island co., Illinois, on the Mississippi river, at the foot of the upper rapids, opposite Davenport, Iowa, 3 m. above the mouth of Rock river, and 160 m. W. by S. of Chicago; pop. in 1850, 1,711; in 1860, 5,130; in 1870, 7,890; in 1875, estimated by local authorities at 12,000. It is opposite the W. extremity of Rock island, from which it derives its name. This island, the property of the United States, is 3 m. long, covering 960 acres, is well timbered, and has graded avenues and handsome drives. During and previous to the Black Hawk war it was the site of Fort Armstrong, a series of block houses, and during the civil war an extensive prison for the detention of confederate prisoners of war was situated upon it. Here is the Rock Island arsenal and armory, intended to be the central United States armory. The design embraces ten immense stone workshops, with a storehouse in the rear of each, besides officers' quarters, magazines, offices, &c. Four

of the workshops are already completed (1875). The shops will be supplied with motive power from the Moline water power, three fourths of which is owned by the government. The main channel of the Mississippi is N. of the island. Across the S. channel, from the upper end of the island to Moline, Ill., a dam has been constructed by the United States government, affording extensive water power. The Moline water power is 2 m. E. of the city of Rock Island; the Milan water power in Rock river, 3 m. S. of it. Rock Island is the headquarters of the Rockford, Rock Island, and St. Louis railroad, the S. W. terminus of the Western Union railroad, the W. terminus of the Peoria and Rock Island railroad, and a station on the Chicago, Rock Island, and Pacific, and the Chicago and Southwestern railroads, which here cross the Mississippi on the railroad and wagon bridge built by the government in connection with the arsenal. The railroads and river afford excellent facilities for shipment, and the abundant water power gives ample opportunity for manufactures. The principal establishments are a plough and cultivator factory, a stove foundry, a window-glass establishment, a cotton factory, three lumber mills, and three breweries. There are three national banks, a private bank, four large public school buildings, four denominational schools, two newspapers with daily and weekly editions, and 13 churches, viz.: African Christian, Baptist, Christian, Episcopal, German Lutheran, Methodist, Presbyterian (2), Roman Catholic (2), Swedish Baptist, Swedish Lutheran, and United Presbyterian. Augustana college, a Swedish Lutheran institution, is situated here.

ROCKLAND, a S. E. county of New York, bordered E. by the Hudson river and S. W. by New Jersey, and drained by the Hackensack and Ramapo rivers and several smaller streams; area, 208 sq. m.; pop. in 1870, 25,213. It has a rough and mountainous surface, the highest summits having an elevation of 1,000 ft., and the soil is fertile. Red sandstone is extensively quarried, and immense quantities of lime and brick are made. Rockland lake, about $\frac{1}{2}$ m. from the Hudson, and 160 ft. above the river, is noted for its yield of ice. The county is intersected by the Erie and Northern New Jersey railroads. The chief productions in 1870 were 12,944 bushels of rye, 57,046 of Indian corn, 30,781 of oats, 11,987 of buckwheat, 85,694 of potatoes, 11,188 tons of hay, and 144,588 lbs. of butter. There were 1,604 horses, 2,271 milch cows, and 1,420 swine; 5 manufactories of boots and shoes, 34 of brick, 1 of cotton thread and twine, 1 of gold leaf and foil, 4 of iron castings, 2 of machinery, 4 of brick and stone, 1 of wooden ware, 1 of woollen goods, and 1 brewery. Capital, New City.

ROCKLAND, a city and the county seat of Knox co., Maine, on the W. side of Penobscot bay, at the terminus of the Knox and Lincoln railroad, 40 m. S. E. of Augusta, and 50 m. S. S. W. of Bangor; pop. in 1870, 7,074. The har-

bor is broad and deep, and there is a very active trade, particularly in the exportation of lime, made from immense quarries of limestone in the vicinity. There are about 80 kilns, employing 1,000 men, and producing 1,200,000 barrels annually. Ship building is also carried on, and there are manufactories of boots and shoes, carriages, cooperage, edge tools, iron castings, harness, machinery, trunks, &c. The city has a fire department, water works, three hotels, two national banks with a joint capital of \$250,000, a state bank with a capital of \$50,000, a savings bank with about \$900,000 deposits, graded public schools, two weekly newspapers, and eight churches, viz.: Baptist (2), Congregational, Episcopal, Freewill Baptist, Methodist, Roman Catholic, and Universalist.—Rockland was set off from Thomaston and incorporated as a town, with the name of East Thomaston, in 1848. The name was changed in 1850, and in 1854 a city government was organized.

ROCKS, in geology, the solid mineral masses which make up the earth's crust. These may be considered both geologically and mineralogically; mineralogy is the natural history of all such bodies as do not belong to the organic kingdoms of nature. In the geological investigation of rocks two questions arise: first, as to their structure and attitude and the mode of their arrangement in the earth's crust, whether stratified or unstratified, whether occurring in beds, veins, or intruded masses; and second, their origin and mode of formation. The geognostical relations of rocks, and the distinctions of crystalline and uncrystalline, of stratified and unstratified, of indigenous, exotic, and endogenous rocks, have been defined in the article **GEOLOGY**. Mineralogically rocks may be homogeneous or heterogeneous; that is to say, they may consist of one or of two or more mineral species. Thus a pure white marble is made up entirely of calcite, a form of carbonate of lime, and quartzite consists of the mineral quartz, both homogeneous; while granite is heterogeneous, consisting of a mixture of quartz and feldspar, sometimes with the addition of mica or of hornblende. (See **GRANITE**.) These component mineral species are sometimes so arranged as to show that the rock has resulted from an original crystallization, as in the case of granite or vitreous quartzite; and at other times, as in the case of sandstones and conglomerates, the aggregate is seen to be composed of the ruins of such rocks rearranged and cemented together. Hence the great distinction between original and derived rocks, the former including all exotic or eruptive rocks and all endogenous rocks or veinstones, as well as the crystalline indigenous rocks. Certain rocks owe their origin directly to the accumulations of organic structures; such are coal, which consists of vegetable remains, many limestones, which are made up of corals, shells, or encrinurites, and certain silicious beds composed of the

shields of diatoms. We have thus a distinction, which is sometimes made, of chemically, mechanically, and organically formed rocks. The chief mineral species of original rocks are calcite, dolomite, gypsum, anhydrite, rock salt, quartz, orthoclase, albite and the related triclinic feldspars, nepheline and certain zeolites, the micas, chlorites, talc, serpentine, olivine, pyroxene, hornblende, garnet, epidote, staurolite, kyanite, andalusite, tourmaline, graphite, magnetite, hematite, corundum, and pyrite. A few of these form rocks by themselves; others are essential ingredients of composite rocks; while others occur as accessory though characteristic minerals in certain rock masses. The compound or heterogeneous rocks can be accurately defined only by describing the component minerals, their proportions and mode of arrangement, and the texture and structure of the mass. Arbitrary names have been given to certain types of composite rocks, but the student soon learns that there are many intermediate varieties and admixtures which it is difficult to name or to classify. In describing rock masses the geognostical distinctions of indigenous, exotic, and endogenous are to be disregarded, as in very many cases it is impossible from the study of a specimen to say to which division it belongs. Thus we have indigenous and endogenous crystalline limestones, and in the case of granitic rocks the characters of indigenous, endogenous, and exotic are often so similar that it is only by study of the rock *in situ* that it can be determined to which class it belongs. The structure of original rocks is not always crystalline; some, like pearlstone and obsidian, being glass-like and amorphous. Others, though crystalline, are so finely grained as to be compact, and are designated as crypto-crystalline. To rocks in which distinct crystals are imbedded in a compact or crypto-crystalline base the name of porphyry is given, and this is sometimes extended to rocks in which the base enclosing the crystals is not compact. The terms gneissic and granitic, or gneissoid and granitoid, are sometimes employed to designate rocks which, although unlike in composition, resemble gneiss or granite in structure and texture. The principal homogeneous original rocks are those composed of quartz, of carbonate of lime, and of dolomite. Gypsum, the ores of iron, and occasionally certain silicates, such as labradorite, serpentine, talc, and chlorite, form by themselves considerable rock masses. The most important indigenous rocks are heterogeneous, and foremost among these may be named those essentially made up of quartz and orthoclase feldspar, constituting the granitic rocks, which generally include mica or hornblende as an accessory mineral. The indigenous banded rocks of this composition take the name of gneiss, and are either hornblende or micaceous, the latter passing into mica schist, so common with gneiss in the Montalban or White mountain series. By the

admixture in the hornblende varieties of a triclinic feldspar (albite, oligoclase, or labradorite), which finally replaces the orthoclase, and the disappearance of the quartz, we get the rock known as diorite; and the substitution in such a rock of some form of pyroxene for hornblende produces what are known as dolerite and diabase. To these last named three rocks belong most of the so-called traps, basalts, and greenstones, which are generally intrusive or exotic rocks, although indigenous rocks, composed of triclinic feldspars with a greater or less admixture of hornblende or of pyroxene, are abundant. Chlorite often accompanies the hornblende of these rocks, or replaces it, especially in the Green mountain or Huronian series, where such rocks are associated with strata in which a soft hydrous mica prevails, forming the so-called talcose slates, which seldom contain talc. Rocks composed chiefly of labradorite, sometimes without admixture, and at other times with small portions of hypersthene or of pyroxene, predominate in the Norian series. Under the title **VOLCANO** will be considered the history of volcanic rocks, and there and under **WATER** will be discussed the chemical agencies which have produced the various rocks, the genesis of which cannot be well understood without a reference to the chemico-geological effects of fire and of water. Much has been done of late in the minute study of the crystalline rocks, and here the microscope has been used with much success.—Among the best works on the subject of lithology are those of Bernhard von Cotta, Senft, and especially Zirkel.

ROCKWALL, a N. E. county of Texas, watered by affluents of Trinity and Sabine rivers, formed since the census of 1870. It consists chiefly of undulating prairies, and has a good soil. Capital, Rockwall.

ROCKY MOUNTAIN LOCUST, an insect belonging to the same family (*locustidae* of Westwood, *acrididae* of later authors) as the locusts of the old world and of Scripture. It is the only species in this country, E. of the Rocky mountains, that has the same migratory habit and great power for harm which characterizes those whose ravages are described by the prophet Joel, and which have figured so largely in the history of southern European and Asiatic nations. A species often complained of on the Pacific slope is probably the same, or a variety of the same. The Rocky mountain locust, first specifically characterized by Prof. Cyrus Thomas, in his "*Acrididae of North America*" (1873), as *caloptenus spretus*, is popularly known as the grasshopper, a term loosely applied to most large hopping insects. During 1873, 1874, and 1875 this insect attracted unusual attention, and in the unprecedented amount of injury and suffering which it entailed on the farmers of the west it proved a national calamity. In 1873 Minnesota and Iowa were sorely scourged by it in their western counties, and had to appeal to the nation

for assistance to relieve the consequent suffering; in 1874 Nebraska and Kansas suffered to such an extent that the efforts of the state authorities and the contributions of people from all parts of the Union were insufficient to prevent a vast amount of distress; while in

FIG. 1.—Rocky Mountain Locust (*Caloptenus spretus*).

the spring of 1875 parts of Missouri and Kansas were again terribly smitten. It has been estimated that \$50,000,000 would not cover the loss occasioned to the country by this insect during these three years. The species measures on an average about $1\frac{1}{2}$ in. from the head to the tip of the closed wings, and the wings extend about one third their length beyond the tip of the abdomen. The color is variable, but the more common specimens are yellowish white beneath; glaucous across the breast and about the mouth parts; pale bluish glaucous, often with shades of purple, on the sides of the head and thorax and on the front of the face; olive-brown on the top of head and thorax; pale beneath, more or less bluish above and marked with black, especially toward base, on the abdomen. The front wings have the ground color pale grayish yellow, inclining to green, and their spots and veins brown; the hind wings, except a yellowish or brownish shade at apex and along the front edge and a green tint at base, are transparent and colorless, with the veins brown. The front and middle legs are yellowish. The hind legs have the thighs striped with pale glaucous and reddish on the outside and upper half of inside, with four broad black or dusky marks on the upper edge, the terminal one extending beneath around the knee. The shanks are coral-red with black spines; the feet somewhat paler, with black claws; antennae pale yellow; palpi tipped with black. In the dead specimens all these colors become more dingy and yellow. It very closely resembles, and is often confounded with, the red-legged locust (*caloptenus femur-rubrum*, De Geer), a species common to the whole central portion of the continent

FIG. 2.—Red-legged Locust (*Caloptenus femur-rubrum*).

from the Atlantic to the Rocky mountains, which, though capable of short flights, never commits the same havoc. This last is, on an average, smaller, darker, with shorter and less conspicuously spotted wings (seldom extending more than one sixth of their length be-

yond the tip of the abdomen), and the last abdominal joint of the male is bluntly cut off at the top, and not tapering and notched as in

spretus. There is a third species, *caloptenus Atlantis* (Riley), occurring more particularly in the mountain regions of the Atlantic, which in many respects is intermediate between the two, and which often migrates in large swarms from place to place, and proves injurious during very hot dry years. All three approach each other so closely through divergent individuals that entomologists are at variance as to whether they should be considered distinct species, or mere varieties or geographical races of the same species. But compared with the Rocky mountain species, the others are harmless. This species seems to be subalpine by nature, and to breed and flourish only in the high plains and plateaus of the Rocky mountain region; and Prof. C. V. Riley is of opinion that those which devastate S. W. Dakota, Nebraska, Kansas, and the western portions of Minnesota, Iowa, and Missouri (in all of which country the species is not indigenous), come principally from the mountain regions of Wyoming, Dakota, Montana, and British America. According to his seventh annual "Report on the Insects of Missouri," "the insect is at home in the higher altitudes of Utah, Idaho, Colorado, Wyoming, Montana, N. W. Dakota, and British America. It breeds in all this region, but particularly on the vast hot and dry plains and plateaus of the last named territories and on the plains W. of the mountains; its range being bounded, perhaps, on the east by that of the buffalo grass. William N. Byers of Denver, Colorado, shows that they hatch in immense numbers in the valleys of the three forks of the Missouri river and along the Yellowstone, and how they move on from there, when fledged, in a S. E. direction at about 10 m. a day. The swarms of 1867 were traced, as he states, from their hatching grounds in W. Dakota and Montana, along the E. flank of the Rocky mountains, in the valleys and plains of the Black hills, and between them and the main Rocky mountain range. (See Hayden's "Geological Survey of the Territories," 1870, pp. 282-'3.) In all this stretch of country, as is well known, there are vast tracts of barren, almost desert land, while other tracts for hundreds of miles bear only a scanty vegetation, the short buffalo grass of the more fertile prairies giving way, now to a more luxurious vege-

tation along the watercourses, now to the sage bush and a few cacti. Another physical peculiarity is found in the fact that while the spring on these plains often opens as early, even away up into British America, as it does with us in the latitude of St. Louis, yet the vegetation is often dried and actually burned out before the first of July, so that not a green thing is to be found. Our Rocky mountain locust, therefore, hatching out in untold myriads in the hot sandy plains, 5,000 or 6,000 ft. above the sea level, will often perish in immense numbers if the scant vegetation of its native home dries up before it acquires wings; but if the season is propitious and the insect becomes fledged before its food supply is exhausted, the newly acquired wings prove its salvation. It may also become periodically so prodigiously multiplied in its native breeding place that, even in favorable seasons, everything green is devoured by the time it becomes winged. In either case, prompted by hunger, it rises in vast clouds in the air to seek for fresh pastures. Borne along by the prevailing winds that sweep over these treeless plains from the northwest, often at the rate of 50 or 60 m. an hour, the darkening locust clouds are soon carried into the more moist and fertile country to the southeast, where they fall upon the crops like a plague and a blight. Many of the more feeble or of the more recently fledged perish, no doubt, on the way; but the main army succeeds, with favorable wind, in bridging over the parched country which offers no nourishment. The hotter and drier the season, and the greater the extent of the drought, the earlier will they be prompted to migrate, and the further will they push on to the east and south." These vast flights never extend E. of a line drawn at a rough estimate along the 94th meridian; nor do they remain permanently in the low Mississippi valley country. The sudden change from the attenuated and dry atmosphere and general climatic conditions of 5,000 or 6,000 ft. above the sea, to the more humid and dense atmosphere of 1,000 ft., affects them injuriously, and they either leave, die, or disappear through degeneration or miscegenation, until no trace of them is left by the second or third generation. These incursions into the more fertile country to the east occur at irregular intervals, and are most frequent in the country toward the northwest, nearest the native home of the species. Thus, locust ravages are more to be feared in Colorado and W. Minnesota than in Missouri or Texas. A chronological study of these incursions shows that there have been during the present century only three as extended as that of 1874, when the insects reached into the western counties of Missouri. But we find records of a dire visitation in Guatemala as far back as 1632, in Gage's "West Indies," and the early Jesuit missionaries of California have left numerous records of locust injuries on the Pacific coast during the present and preceding

centuries.—The natural history of the Rocky mountain locust is similar to that of all true locusts. The female is furnished at the end of her abdomen with two pairs of horny valves, which open and shut, and which enable her to drill a hole in the ground in which to deposit her eggs. These, to the number of from 50 to 100, are voided in a glutinous fluid, which hardens and holds them together, and which, in

FIG. 5.—Anal Characters of Female of Rocky Mountain Locust, showing horny valves.

combination with particles of earth, covers them with a sort of pod. The eggs are deposited in the invaded country during the latter part of the growing season, and while some few may hatch prematurely the same season,

FIG. 6.—a. Female depositing eggs. b. Egg pod with end broken open. c. Eggs. d, e. Earth partially removed, showing an egg mass in place and one being placed. f. Place where such a mass has been covered up.

the great bulk of them do not hatch till the following spring. The young locust has the general characteristics of the mature insect, and differs principally in lacking wings. After shedding its skin at four different periods, the

FIG. 7.—a. Newly hatched larvæ. b. Full-grown larva. c. Pupa.

wings are acquired in from six to eight weeks from the time of hatching. It is doubtful whether in their native home the insects show any tendency to migrate except when forced by necessity. They are sluggish in the cooler parts of the day, and fly principally between

the hours of 10 A. M. and 4 P. M., and then only when the wind is in the direction they wish to go. Their life is limited by the spring and autumn frosts, and all that hatch in the spring perish at the approach of winter, soon after the eggs are laid. The young "hoppers" in the invaded country often abound to such an extent that they totally destroy all crops. In the spring of 1875, in several of the western counties of Missouri, especially in the middle portion of the state, and in the adjacent part of Kansas, the ground was kept as bare as in midwinter for nearly two months after spring opened, nothing green being left but the leaves on the forest trees, and a small glossy-leaved plant, the *amarantus blitum*, which they invariably left untouched. When not too hard pressed for food, they will pass by most species of milkweed (*asclepias*), as also the wild grass on low prairies. The distress caused by these insects in the part of Missouri mentioned, combined with previous short crops from drought and the chinch bug, made public measures of relief necessary; and, although the state entomologist insisted that the infliction was temporary and limited to its present area, many persons emigrated, and a day of fasting and prayer was appointed by the governor. These young hoppers travel during the hotter hours of the day in immense schools, not in any particular direction, but in search of food. They walk and hop alternately, moving at the rate of about three yards a minute. Toward evening they go to feeding, and generally collect afterward on fences or other objects away from the ground, so as to avoid moisture. As they grow older their numbers are continually reduced, not only by the attacks of enemies and by climatic influences, but by devouring one another; for when they are swarming to so unnatural an extent this cannibalistic propensity is fully developed. Those which acquire wings instinctively go toward their native home, or in the direction whence their parents had come the previous year. This exodus begins in Missouri early in June, and reaches its acme about the middle of that month. They generally leave in time to enable the farmers to raise a good crop of corn and of most vegetables. Indeed, the distress and devastation is not unfrequently followed, as in 1875, by great abundance. The incursions generally take place after two or three years of excessive drought, and are likely to be followed by a comparatively wet season. Aside from this somewhat uncertain cause, the total destruction of the vegetation during the first six or eight weeks of spring well nigh exterminates many other insect pests, such as the chinch bug; and the manure left by the locusts, in the very best condition to be appropriated, increases in many cases the fertility of the soil. Not only is there no danger of this plague ravaging the country E. of the 94th meridian, but there is none of its becoming a permanent evil in any part of the Mississippi valley proper.

Some curious changes often follow the wake of these locusts, where they denude a country of its vegetation. Thus, the common purslane gets a start over other weeds, and the large green and black larvæ of a common and pretty hawk moth (*deilephila lineata*), which feed upon it, abound to such an extent as to frequently cause unnecessary alarm. But the most striking change is the appearance of a fine grass unnoticed during ordinary seasons, which furnishes abundant and nutritious food for stock. This grass is the *vilfa vaginæflora*, an annual which is common from the Atlantic to the Rocky mountains. The locusts kill out the blue grass by gnawing it down too closely, and the changed conditions give the *vilfa* temporarily the advantage in the struggle for existence; but in a year or two the normal relations between species are restored.—The parasites which aid man in subjugating

FIG. 8.—Locust Mite, greatly enlarged.

FIG. 9.—Silky Mite. Natural size at side.

this locust consist mainly of four species, two mites and two flies. The silky mite (*trombidium sericeum*), a small scarlet animal about two lines long, attacks the egg underground; while the locust mite (*astoma gryllaria*), a still smaller species, of similar color, fastens in numbers on the body at the base of the wings of the mature insect. The anonymous tachina fly (*tachina anomyma*), an insect twice

as large as a house fly but somewhat resembling it, fastens its eggs to both the young and the mature locusts; the maggots hatched from these penetrate the body and devour the vitals of their victim, soon causing its death. Finally the common flesh fly (*sarcophaga car-*

naria) deposits living maggots under the wings of the locust, which also in time succumbs to them.—A partial remedy against the locust, in regions where it is not indigenous, is found in natural agencies. Climatic conditions are often unfavorable, and many animals and insects prey upon it. Almost all the birds of the western plains feed upon the locust and its eggs. The protection of the prairie chicken and quail would be an excellent measure. A better means of preventing its ravages is the destruction either of the eggs or of the unfledged young. The eggs being laid in masses just beneath the surface of the soil, usually on high, dry ground, simple harrowing or shallow ploughing will break up the masses and expose the eggs to the desiccating and bleaching effects of the atmosphere, which are fatal to them. If deeply turned under by the plough, many of the eggs will rot, and the rest will hatch too late for the young to do serious damage. Ground thus treated should not be turned again in the spring. A few days' excessive moisture is also fatal to the eggs, and where irrigation is practised they may be very easily destroyed. The eggs, however, are often placed where none of these means can be employed. After hatching, the young hoppers may be destroyed by heavy rolling, by collecting them into heaps and burning them with coal oil, or into windrows of straw, which is then set on fire. The most effectual way of destroying them is by ditching, especially where there is no hay or straw in which to burn them, as in western Missouri in 1875. A ditch 2 ft. wide and 2 ft. deep, with perpendicular sides, is an impassable barrier to the young insects. They tumble in, and as they accumulate die at the bottom. To prevent the intolerable stench, pits or side ditches should be dug into which they may be swept and buried. Hogs and poultry may also be turned out to feed upon them. Prof. Riley urges as a possible means of preventing locust incursions, that a thorough study of the insect in its Rocky mountain breeding places be made by the national government; for "by learning just when and how to strike the insect so as to prevent its undue multiplication there, . . . we may hope to protect the fertile states to the east from future calamity."—From time immemorial locusts have been used as food in oriental countries, and it has been found that the Rocky mountain species makes a very good soup or bisque.

ROCKY MOUNTAINS, a name applied indefinitely to a long series of mountain ranges west of the Mississippi, of a great variety of form and structure. The term Stony mountains was originally used without the intention of applying it to any one range or group of ranges. From the eastern slope, westward, we pass over range after range for 1,000 m. or more, until we descend the western slope of the Coast range to the Pacific. At least two thirds of the United States, an area of over 2,000,000

sq. m., lies west of the Mississippi, and this vast area may be defined as the Rocky mountain region. This great group of ranges extends southward through Mexico and Central America to the isthmus of Darien, and northward into British America and Alaska to the Arctic ocean. The great chain of the Andes of South America is an extension of the same group, and in a general view they all form one great system. Not till within the present century was there any definite understanding of the geography of the Rocky mountains. Upon the old maps the mountain ranges were shown by a single line of hachures, with a few minor ranges branching off, the whole trending nearly N. and S., or rather W. of N. and E. of S. The first important government expedition was that of Lewis and Clarke, which in 1804-'6 passed up the Missouri river to its source, crossed the main divide of the Rocky mountains, and followed the Columbia to its entrance into the Pacific ocean. Although this expedition was a great achievement in a geographical point of view, taking into consideration the time and the means at its command, yet much of the information it obtained was very vague and limited to a narrow belt across the northern portion of the country. Lewis and Clarke, however, fixed pretty well the positions of the Missouri and Columbia rivers. The next explorer was Major Z. M. Pike, who in 1805-'7 crossed the country further south, and discovered the head waters of the Arkansas and the lofty peak which now bears his name. He crossed the divide into the Great Basin. In 1819-'20 S. H. Long was sent out by the government with a well equipped party, comprising not only topographers, but also geologists and naturalists, including Thomas Say. After Long came Bonneville, Ross Cox, Schoolcraft, Nicollet, Fremont, and others, all of whom added to the store of knowledge in regard to this great area. From 1844 to 1860 more than 20 expeditions were sent out, with the object of determining the best route for a railroad to the Pacific. In 1853 congress passed the bill making appropriations for the determination of the most practicable route for a railroad from the valley of the Mississippi to the Pacific coast. No expense was spared in equipping expeditions, which traversed the country from E. to W., at various points from lat. 49° to the southern boundary of the United States. The information thus obtained was embraced in a large series of maps and reports (13 vols. 4to). Yet up to 1865 no portion of the great Rocky mountain region had been examined with such care and detail as to render the maps anything more than approximately correct. The information thus obtained could only be placed on a map projected on a small scale, where an error of five or ten miles would be overlooked. Within the past ten years several expeditions have been organized with the object of working out certain areas with considerable detail, including topography, geology,

and natural history; and more definite knowledge of the Rocky mountain region has been obtained within that period than in all the previous years.—To convey an idea of the plan and growth of the development of the great area west of the Mississippi, it is only necessary to suppose it to have been originally a vast plateau, out of which have been evolved the different ranges of mountains as if they had been lifted by volcanic action. Indeed they appear as wrinkles on the earth's surface, and were probably produced by the contraction of its crust in the process of cooling. This may be understood more clearly by examining some of the barometrical profiles which have already been constructed across the continent. In proceeding westward along the Missouri river, the ascent is gradual, at first not more than one foot in a mile, but steadily increasing until the base of the mountains is reached, when the rise becomes suddenly 50 to 100 ft. or more in a mile. The profile of the Pacific railroad shows that Omaha on the Missouri river is 1,060 ft. above sea level, while at Columbus, 91 m. by rail westward, the elevation is 1,470 ft., showing an ascent of about 4½ ft. in a mile. At Cheyenne, 516 m. W. of Omaha, the elevation is 6,075 ft., showing an ascending grade from Omaha of nearly 10 ft. in a mile. This entire distance is over an apparently level plain, most of the way by the valley of the Platte. From Cheyenne to the highest point along the line of the railroad, at Sherman, 8,271 ft., the distance is 33 m., when the grade suddenly increases to over 66 ft. in a mile. The profile along the Kansas Pacific railroad, from Kansas City on the Missouri to Denver, shows similar results. At Kansas City the elevation is 764 ft.; at Denver, 639 m. W., 5,197 ft., making an average ascent of nearly 7 ft. per mile across an apparently level, treeless plain. A few miles W. of Denver, the great Colorado or Front range seems to rise abruptly out of the plains, its summits reaching the line of perpetual snow.—The great mass of the Rocky chain lies W. of the 105th meridian. The united ranges trend about 20° W. of N. Along the eastern slope the smaller or minor ridges have a trend more to the northwest, so that they constantly die out in the plains, giving to the eastern side the appearance of an echelon arrangement. As the small ridges run out, they often present a fine example of an anticlinal, as seen on the Cache à la Poudre river. From the notches in the outline of the ranges, the Platte, Arkansas, and many other rivers open into the plains. About the source of the Missouri the main chain is 9° of longitude further W. than in Colorado. In this broad space and to the eastward are numerous outliers, as the Black hills, Big Horn, Bear's Paw, Judith groups, &c., all more or less distinctly connected with the main chain. The Black hills are connected with the Laramie range, near the Red Buttes, by an anticlinal valley, while the Big Horn

is related in the same way, showing that they are all the product of one uniform cause. The Black hills are in Dakota territory, extending into Wyoming, E. of the Big Horn range, between lat. 43° and 45° , and lon. 103° and 105° , and are quite isolated from the main chain; they are a sort of huge puff from out of the plains, occupying an area of about 100 m. in length and 60 m. in breadth. The mass is elliptical, and the major axis trends about 20° W. of N. The base of the hills is 2,500 to 3,000 ft. above the sea, while the highest peaks are not more than 6,000 or 7,000 ft. They are covered with a dense growth of pine, which gives them a black appearance in the distance. The two forks of the Cheyenne embrace the Black hills, and have their origin in the plains far to the westward; hence they give rise to no important stream. The nucleus of the hills is composed of feldspathic granites and slates surrounded with the full series of the sedimentary strata known in this region, inclining at various angles from the central mass, as if originally their sedimentary beds had formed an unbroken communication across the entire area; or in other words, they form a fine example of an anticlinal on a large scale. There is some good pasture and timber land in the vicinity of the Black hills, but the mineral resources have been extravagantly overrated. Like the Black hills, the Big Horn range does not give rise to any important stream. The largest river in this region, which gives name to the mountains, rises in the Wind River range, passes through the Big Horn mountains, and flows into the Yellowstone about 70 m. to the northward. The central mass of this range is coarse granite also, with a series of Silurian, carboniferous, Jurassic, cretaceous, and tertiary strata, inclining from the sides. The highest peak is Cloud peak, supposed to be about 7,300 ft. We may separate the nuclei of the mountain ranges roughly into three divisions: those with a granitic and those with an igneous nucleus, and those with a combination of the two. Usually the volcanic material has come up through the granitic mass and flowed over it, in some instances almost entirely concealing it. Still further W. is the Wind River chain, the loftiest peak of which Fremont, whose name it bears, found to be 13,570 ft. The central mass of the mountains is also a coarse, massive granite, overlaid by metamorphic slates, in which the gold mines are found. This chain forms a portion of the main divide. —To the north of the Wind River mountains, in the N. W. corner of Wyoming territory, is one of the most interesting and remarkable regions in the world. The Yellowstone national park occupies an area of 65 m. from N. to S. and 55 m. from E. to W., or 3,575 sq. m., the whole of which is more than 6,000 ft. above the sea. The Yellowstone lake, the source of the Yellowstone river, is 22 m. long and 12 to 15 m. wide, and is 7,788 ft. above the sea. The ranges of mountains that hem it

in on every side are all of volcanic origin, and are covered with snow all the year. There is frost here every month of the year, and in June, July, and August the thermometer frequently sinks to 25° . (See WYOMING.) In a geographical point of view this park will always be of the highest interest, as constituting the apex of the continent, and giving origin to three of the largest rivers in North America. On the N. side are the sources of the Yellowstone; on the W. those of the three forks of the Missouri; on the S. W. and S. those of Snake river, flowing into the Columbia and thence into the Pacific ocean, and those of Green river, rushing southward to join the great Colorado, and finally emptying into the gulf of California; while on the E. side are the numerous sources of Wind river. —Southward from the Wind River chain, the mountainous character of the divide is interrupted for a short distance by comparatively level plateaus, while to the east are the Laramie plains, bounded by a comparatively low range, of which Laramie peak is about 10,000 ft. high, and, on account of its isolation and the insignificance of the mountains in the vicinity, is one of the great landmarks of the west. Still further S. are the remarkable mountain regions and the parks of Colorado. The Colorado or Front range rises up before the traveller on the plains like a gigantic wall, with Long's peak at the north and Pike's peak at the south, as high bastions. West of this range are three great depressions, North, Middle, and South parks. In the Front range are several peaks over 14,200 ft. high (according to the latest surveys): Long's, 14,271 ft.; Evans, 14,330 ft.; Rosalie, or Rosa, 14,340 ft.; and Gray's and Torrey's, twin peaks with an interval of less than a mile, 14,341 and 14,336 ft. In this range are the oldest known silver and gold mines of Colorado. On the W. side of the parks is the Park range, in which are several peaks of over 13,000 ft., and a few, as Mt. Lincoln, of over 14,000 ft. In this range are many important gold and silver mines. From Mt. Lincoln, on the W. side of the South park, one can look down into the valley of the Upper Arkansas and across to the Sahwath range, one of the most remarkable in the west. At its N. end is the Holy Cross group, in lat. $39^{\circ} 30'$, lon. $106^{\circ} 33'$, composed of gneiss and coarse massive granite. For 80 m. to the southward this range literally bristles with peaks, many of which rise over 14,000 ft.; Harvard, Yale, and Princeton are respectively 14,384, 14,150, and 14,199 ft., and many others are over 13,000 ft. The rocky mass is mostly granite, intersected with igneous dikes. The general trend of this range is about 20° W. of N., and it forms one of the most gigantic anticlinals in the entire Rocky mountain region. Vast ranges of massive granitic rock, capped with limestone and sandstone, incline from either side, with broad valleys intervening. The proofs of ancient glacial action on both sides of the range are wonderful. In the val-

ley of Roches Moutonnés creek, which flows into Eagle river from its N. E. base, are very remarkable rounded masses of granite, such as have long been called sheep backs or *roches moutonnés* in the glacial regions of central Europe. Here they are shown on a grand scale. In the valley of the Arkansas and the Gunnison are marvellous examples of lateral and terminal moraines, and there are numerous lakes whose basins have been scooped out by some extended glacial action. The Twin lakes are beautiful sheets of water on the E. side of the Sahwatch range, 2 to 3 m. in diameter and about 80 ft. deep. These are true glacial lakes. The proofs of glacial action are common throughout the Rocky mountain region, but they are nowhere shown to such a marked extent E. of the Sierra Nevada as in the vicinity of the Sahwatch range. From the W. side of this range flow the Gunnison river and southern branches of the Grand, which, after cutting deep cañons or gorges, unite near the western boundary of Colorado; and cutting a still deeper cañon, the stream flows into the great Colorado of the West.—West of the Sahwatch or great "Mother" (Madre) range is another remarkable group in the drainage that leads to the great Colorado, called the Elk range. It is about 50 m. in length, with a trend about N. W. and S. E., and differs from any of the others mentioned both in form and structure. In this range are seven peaks of the first order, rising to an elevation of nearly 14,000 ft., and many others ranging from 12,000 to 13,000 ft. The geological structure is very peculiar. It appears that the vast thickness of sedimentary strata once rested upon a floor of igneous granite in a pasty or semi-pasty condition, and that these high peaks were thrust up through the overlying beds, in many instances completely overturning them for miles in extent. There are faults 2,000 ft. in extent, and dikes without number, where the igneous material seems to have been squeezed through fissures in the thousands of feet of overlying strata, vertically as well as horizontally. Deep gorges and amphitheatres meet the eye on every side. Snow Mass peak, 13,961 ft. high, is so called from the immense mass of perpetual snow on its sides. At its immediate base, on all sides, are beautiful lakes. The surface is remarkably rugged, and as far as the eye can reach on every side are high peaks with deep gorges in one continuous succession, while the sedimentary rocks are thrown into chaos. On the N. W. end of the range is a remarkable peak which forms an excellent landmark, known among the miners and prospectors for years as Sopris peak, 12,972 ft. high. From this point the land slopes off into the remarkable plateau country bordering on the Colorado river, literally gashed as it were by the little streams which have cut innumerable cañons through it. There is probably no country in the world that presents more obstruction to the traveller.—At first glance the

Park range appears to be connected with the Sangre de Cristo range, which bounds the E. side of the San Luis valley, but the former is separated from the latter by the Arkansas valley, and really lies parallel with it. It begins in lat. $38^{\circ} 26'$, lon. 106° , trends S. 30° E., and shows on its summit a continuous series of sharp peaks. Parallel to it, on the east and bordering the plains, is the Wet mountain range. The interval is known as the Wet mountain valley and Huerfano park, one of the most beautiful and fertile districts in Colorado. These mountains extend far down into New Mexico. Southward the Sierra Blanca and Spanish peaks are lofty landmarks. Fort Garland, an old military post in the San Luis valley, is near the base of the Sierra Blanca. The San Luis valley, though nearly surrounded with high ranges, is not a park, but a valley 30 to 50 m. wide, through which the Rio Grande flows after emerging from the San Juan mountains, cutting a gorge through its basaltic floor 1,000 to 1,500 ft. in depth for 60 to 80 m.—Immediately W. of the upper portion of the San Luis valley, in S. W. Colorado, is a most interesting as well as lofty group of mountains, forming what is now called the San Juan district. These mountains form the sources of a great number of streams. On the north are many branches of the Gunnison, on the east the Rio Grande, and on the south and west the various branches of the Rio San Juan, which flows S. W. and W. and unites with the Colorado. Within an area of about 4,000 sq. m. is the most important and rugged group of peaks in Colorado, and probably in the first division of the Rocky chain. More than 100 points are above 13,000 ft., and about 10 peaks over 14,000 ft. On the N. side of the group is the lofty Uncompahgre or Uncapahgre peak, with its dome-shaped summit rising to a height of 14,235 ft. Large areas here are composed entirely of quartzites, and others wholly of igneous rocks. Toward the south, in southern Colorado and in New Mexico and Arizona, the volcanic action seems to have been very great, and the area covered with igneous rocks increases; sometimes they occupy several thousand square miles, to the exclusion of all others. What are called the broad table lands or mesas of New Mexico are simply floors of basalt. Colorado may be regarded as the culminating area of lofty points in the eastern division of the Rocky chain, as California is in the western, in its Sierra Nevada ranges. Within the limits of Colorado are 50 or more points exceeding 14,000 ft. in height, and more than 250 of over 13,000 ft., while the number reaching 12,000 ft. is unknown. The average elevation of Colorado is greater than that of any other state or territory in the Union, being 6,600 ft., while California with its magnificent group of peaks in the Sierra Nevada averages only 2,800 ft.—To the west, and walling in the great interior basin on the east, is the Wahsatch range,

which is unsurpassed for beauty of form. The scenery in the vicinity of this range has long been celebrated for its grandeur and beauty. Mt. Nebo, one of its prominent peaks and a noted landmark, is 11,992 ft. high. The trend of the range is nearly N. and S., while projecting like a spur toward the east is the Uintah range, with a trend nearly E. and W. and with a number of peaks over 13,000 ft. high. This is one of the most beautiful and symmetrical ranges in the west. The nucleus is composed of quartzites, which are so elevated that the central mass seems to have been lifted up horizontally or nearly so. The entire range is a remarkable example of a huge anticlinal, and on either side of the axis are the numerous pyramidal peaks, rising far above the timber line and covered with perpetual snow. Three distinct belts may be noted in this range: one above the timber line, revealing only the bare, bleak rocks; below, a dense belt of pine timber; and near the base and sloping off into the plains, another comparatively barren belt. The Wahsatch range has a gray granite nucleus, with a great thickness of sedimentary beds lying on the sides and often rising to the very summits. In the Great Basin, between the Wahsatch mountains and the Sierra Nevada, are many smaller mountain ranges lying nearly parallel with each other, some of which seem to rise abruptly out of the surrounding plateau. This great depression was undoubtedly at no remote period, geologically speaking, a lake of several hundred miles in extent, out of whose waters the summits of the mountains projected like islands. In the Shoshone basin, forming the E. portion of Oregon and the W. part of Idaho, are a great number of similar ranges, all lying parallel with each other, appearing like the waves of the sea after a storm. The Salmon River mountains, Blue mountains, and many others are composed of a series of remarkable regular ridges trending mainly N. and S.—The second division comprises the Cascade, Coast, and Sierra Nevada ranges, fronting the Pacific ocean, which were formerly included under the general term Rocky mountains, and are now called by some geographers the Cordilleras. These mountains, in their extension S. into Mexico, have long been known as the Cordilleras of Mexico, and the main ranges of South America bear the name of Cordilleras or Andes. Still, as all the mountains W. of lon. 105° are plainly a unity in a geographical view, they will fall under the general and quite indefinite term "Rocky mountains." North of lat. 49° but little is known of these western ranges; but it is known that they extend without any permanent interruption to the Arctic ocean, with here and there a lofty peak, which from ignorance of its precise character has been assigned what appears a greatly exaggerated elevation. The latest measurement by triangulation makes Mt. St. Elias 17,500 ft. high; Mt. Hood in Oregon and Mt. Baker, both of which are enor-

mous extinct volcanic cones, have an elevation respectively of 11,225 and 11,100 ft. The Cascade range is a continuation northward of the Sierra Nevada, and is separated only by the chasm of the Klamath river. Through the entire length of Oregon and Washington territory, the Cascade range runs N. and S. parallel to, and about 100 m. from, the shore of the Pacific. Near the 49th parallel it is bent northwesterly, conforming with the trend of the coast, and in British Columbia is called the Marine range. The average elevation is 5,000 to 6,000 ft. It obtained its name from the cascades of the Columbia, which are formed by the passage of that river through it. The country along the immediate coast is but a narrow belt, much broken, while the shore is indented with great numbers of bays or inlets, of which the estuary of the Columbia, Shoalwater bay, and Gray's harbor are noted. Promontories and rocky islets are visible everywhere as surviving monuments of the terrific erosion which has swept away entire mountain ranges, leaving at this time only the single group of the Cascade range.—South of Cape Mendocino, in lat. 40° 30', to Point Conception, near lat. 34° 30', the Coast range of California is composed of a succession of parallel ranges, with intervening valleys of great beauty and fertility. Between the Coast range and the Cascades is a longitudinal depression which forms the valley of the Willamette, extending northward to the gulf of Georgia. Similar valleys occur in California, as the San Joaquin and Sacramento. In this northern region the forests are very dense, and the undergrowth so thick that it is difficult to penetrate it. Trees occur of majestic size, of which the yellow fir (*abies Douglassi*) predominates over all others. The cedar (*thuja gigantea*) is also very abundant. The lumber interests of this country are immense. Between the Cascade and the main Rocky chain lies the basin of the Columbia, which is an arid plain covered with artemisia and bunch grass. The surface is cut through by deep cañons, through which the large rivers flow between huge walls of basalt. Although there are great varieties of climate in this division, it is extremely mild on the immediate coast. At Puget sound snow seldom falls, and remains but a short time. Rains are very abundant, reaching 60 inches during the year. According to Mr. J. D. Whitney, the Coast range inosculates with the Sierra Nevada both N. and S. Near Tejon pass, in lat. 35°, the ridges are topographically undistinguishable from each other, and it is only by carefully studying the position of the strata that it can be determined where one system begins and the other ends. The Coast ranges are composed of newer formations than the Sierra, and have been subjected to greater disturbances up to a recent period; and they contain no rocks older than the cretaceous. There are no lofty points in the Coast ranges, according to Whitney, the central portions rarely rising above 4,000 ft.,

while in approaching the Sierra N. and S. the highest points are as much as 8,000 ft. The well known Monte Diablo is only 3,856 ft. above the sea, although a very conspicuous object from San Francisco.—The Sierra Nevada or Snowy range forms the western border of the great continental plateau, corresponding with the main Rocky chain on the east. While the base of the eastern mass is everywhere 4,000 to 5,000 ft. above sea level, and the descent to the sea imperceptible to the eye, the Sierra slopes rapidly, so that the sea level is reached within 100 m. So far as now known, the highest peak of the United States is in the Sierra group, viz., Mt. Whitney, 14,887 ft. The scenery of the Sierra group is of surpassing beauty and grandeur. There is not such a vast number of high peaks as in the Colorado group, but it may fairly claim the highest; and inasmuch as the surrounding country has a much lower altitude, there is a massiveness about this magnificent range that even the Sawatch of Colorado cannot boast. The Sierra chain is about 450 m. in length, and averages about 80 m. in width, supposing its northern terminus to be at Lassen's butte, lat. $40^{\circ} 30'$. The central mass or core is chiefly granite, with metamorphic slates on either side, capped with basaltic and other kinds of lava and heavy beds of ashes and breccia. All these rocks are visible from the Central Pacific railroad between Truckee and Sacramento. The evidences of very modern volcanic action are visible everywhere. Even now there are numerous hot springs and geysers, as well as occasional earthquake shocks. The height of some of the dominating peaks is as follows: Mt. Shasta, 14,442 ft.; Mt. Tyndall, 14,386 ft.; Mt. Kaweah, 14,000 ft.; Mt. Brewer, 13,886 ft.; Red Slate peak, 13,400 ft.; Mt. Dana, 13,277 ft. On the mountains snow falls to the depth of 40 or 50 ft., and much of it remains all the year. Enormous glaciers exist here even at the present time, and the evidences of ancient glacial action are wonderful. The worn and rounded granites of the Sierra Nevada were well adapted to preserve the records of the old glaciers, and they everywhere testify to the intensity of their former power. These glaciers have been continued down to the present time in a modified condition. All the glaciers occur on the north side of the mountains, and are very numerous, now estimated at 65. The number known in the Alps is 1,100, of which about 100 may be considered as primary. Some of the Sierra glaciers are nearly as large as the Alpine, as the Lyell, North Ritter, and others not yet named. Although the existence of glaciers in the Rocky mountains is a very modern discovery, enough is already known about them to invest the subject with the highest interest. Moraines and morainal lakes occur in the Sierras in great numbers. Lake Tenaya, at the head of the Merced river, or a branch of the same name, is a conspicuous example. Traces of the existence

of an immense flow of ice are shown here in the valley occupied by the lake, according to Whitney, and the ridges on either side of the trail are so worn by glacial action that the rocks are slippery, rendering travel dangerous. Four pretty well marked belts of forest vegetation have been observed by Whitney. The lowest is the foot hills, with oaks, buckeyes, and small digger pines; the second belt lies between 4,000 and 5,000 ft., and consists of pitch pine (*pinus ponderosa*), bastard cedar, and Douglas spruce; the third zone, between 7,000 and 9,000 ft., is that of firs, as *picea grandis* and *amabilis*, tamarack pine, &c.; and on the highest belt, above 9,000 ft., where vegetation begins to dwindle, a dwarf pine (*pinus cristata*) is seen up to the limit of perpetual snow. There are great numbers of beautiful lakes in the Sierras, fed by the melting of the snows, among which are Lake Tahoe and Donner lake. The Yosemite valley, so remarkable for its rugged scenery, and which has been set apart by legislative action as a pleasure ground, is in the Sierra. Through this valley flows the Merced river, and at its source is a fine group of peaks, 13,000 ft. high, called the Merced group.—So far as structure and topography are concerned, the great mountain system extending along the western borders of the western hemisphere, from the Arctic ocean to Patagonia, may be regarded as a unit, and due to one great cause. North America has its lofty Rocky group opposite the deep North Pacific ocean, and its small Appalachian group opposite the shallower North Atlantic. So South America has its still higher Andes opposite the deeper South Pacific, and the smaller Brazilian ranges opposite the South Atlantic. This fact, stated by Dana, is founded on a deep-seated structural cause. The elevation of a portion of the earth's crust requires in close proximity a corresponding depression. The Rocky system may be primarily divided into two portions, the Sierra Nevada and Coast ranges fronting the Pacific ocean, and the main Rocky chain which forms the great water divide of the continent. Each of these chains or groups is made up of a great number of smaller ranges, in the aggregate apparently possessing a considerable degree of regularity, but when studied in detail showing very little regularity or system. Sometimes, as in the Great Basin, the main ranges seem to lie parallel for the most part, but usually the minor ridges branch off in every direction. More commonly the trend is about N. E. and S. W.; but sometimes it is due N. and S. or E. and W. The Wahsatch range in Utah trends nearly N. and S., while the Uintah range, which seems to branch off from it, trends nearly E. and W. The area W. of the Mississippi may be divided into mountain and prairie or plain country. The belt of plains on the E. slope averages about 500 m. in width, and gradually rises to the base of the mountains. The mountain portion has its greatest breadth between the 36th

and 41st parallels, where it varies from 800 to 1,000 m. In this belt are the greatest number of lofty peaks, including the highest portion of the Sierra Nevada.—Among the numerous ranges of the Rocky chain are many valleys and plateaus, varying from a few acres to hundreds or even thousands of square miles. Sometimes they are formed by erosion or by depression; many of them are ancient lake basins. In all the great mountain districts of the west are thousands of these openings, into which settlements have already penetrated. In the San Juan mountains is Baker's park, with an extensive settlement of miners, and in the surrounding mountains are some of the richest silver mines in America. The North, Middle, and South parks, in Colorado, are areas of depression underlaid with sedimentary strata and walled on every side by lofty mountain ranges; they are really old lake basins. The North park has a comparatively level surface, and an average elevation of 8,000 ft. S. of this, and only separated by a rather low mountain range, is the Middle park, which is much larger and far more rugged; indeed, there is very little of what might be called plain country, but a succession of high ridges, many of which are of volcanic origin. The average elevation is about 7,500 ft. Still further S., but separated by a much wider belt of mountainous district, is the South park, which is mostly a plain, with an average elevation of about 9,000 ft. In these parks there is frost every month of the year. (See COLORADO.) San Luis valley, in southern Colorado and northern New Mexico, has an average elevation of 7,000 to 8,000 ft. The Llano Estacado of Texas and New Mexico averages 3,200 to 4,700 ft. above sea level; the Colorado plateau in Arizona, 5,500 ft.; Salt Lake valley, Utah, 4,200 to 4,500 ft.; Laramie plains, Wyoming territory, 7,000 ft.; Snake river plain, in Idaho, 4,000 to 4,500 ft.; Sevier lake basin, Utah, 4,700 ft.; Humboldt river basin (Lassen's meadows), Nevada, 4,200 ft.; Carson river basin, 3,800 ft.; Walker's river basin, 4,100 ft.; and Mojave river basin, California, 1,100 ft. Comparing the mountain plateaus or basins of the Rocky mountain region with some of those in the Andean region of South America, the difference of elevation is very great. The Antisana plateau of South America is 13,451 ft.; the basin of Santa Fé de Bogotá, 8,413 ft.; and the basin near Lake Titicaca, 12,853 ft. Perhaps as great an extent of plateau is comprised in the belt between the 38th and 44th parallels of latitude as in any other portion of the Rocky area. Through this belt the Pacific railroad passes. From Omaha to Cheyenne the track lies nearly all the way on the most modern tertiary formations. From Cheyenne westward the road crosses the Laramie range, the highest point, Sherman, being 8,271 ft. After passing over about 15 m. of granite rocks, it descends into the Laramie plains. Thence to the Wahsatch range in Utah no more granitic

rocks are met with, only cretaceous or tertiary. In crossing the water divide at Creston, 7,030 ft. high, the stranger would not suspect that he was passing from the Atlantic to the Pacific slope. The road runs through the Wahsatch range at right angles, in the channel of the Weber river, with only 4 m. of granitic rocks, so that from Omaha to Ogden only about 18 m. of metamorphic rocks are met with. Thence the Central Pacific crosses the Salt lake basin, enters the Humboldt valley, and really meets with no mountains until it reaches the Sierra Nevada, where a most formidable obstacle presents itself in a massive granite mountain range, which however is crossed at an elevation of only 7,042 ft.—According to Messrs. Blake and King, there are seven longitudinal zones or belts of mineral deposits in the west, following the prevailing direction of the mountain ranges. Mr. King says: "The Pacific coast ranges upon the west carry quicksilver, tin, and chromic iron. The next belt is that of the Sierra Nevada and Oregon Cascades, which upon their W. slope bear two zones, a foot-hill chain of copper mines, and a middle line of gold deposits. These gold veins and the resultant placer mines extend far into Alaska, characterized by the occurrence of gold in quartz, by a small amount of that metal which is entangled in iron sulphurets, and by occupying splits in the upturned metamorphic strata of the Jurassic age. Lying to the east of this zone, along the E. base of the Sierras, and stretching southward into Mexico, is a chain of silver mines, containing comparatively little base metal, and frequently included in volcanic rocks. Through middle Mexico, Arizona, middle Nevada, and central Idaho is another line of silver mines, mineralized with complicated association of the base metals, and more often occurring in older rocks. Through New Mexico, Utah, and western Montana lies another zone of argentiferous galena lodes. To the east again the New Mexico, Colorado, Wyoming, and Montana gold belt is an extremely well defined and continuous chain of deposits." It has usually been understood that there is no coal in the true coal measures in the Rocky mountain district; but of late years a few thin seams have been reported as occurring in the south and southwest. In Colorado, Wyoming, Utah, Montana, and New Mexico, vast areas are underlaid by thick beds of coal belonging to the cretaceous and tertiary groups. In southern Colorado, New Mexico, and the interior of Utah, thick and important beds of coal are found in the cretaceous group, while along the E. slope of the Rocky chain in Colorado, as at Raton hills, Cañon City, Colorado Springs, Golden City, and northward, are numerous coal beds belonging to the lignitic group, eocene tertiary, which are now wrought to a large extent. In the northwest the lignitic area covers at least 100,000 sq. m. Along the Union Pacific railroad are coal beds of the same age, without which the railroad could not exist. Not less

than 20,000 tons a month are mined at Evanston, Rock Springs, and Carbon, in Wyoming territory, for the use of this road alone. From Coalville, Utah, E. of Salt Lake City, no remarkable beds of coal are found along the immediate vicinity of the Pacific railroad to San Francisco. The scarcity of tree vegetation in the Rocky mountain area renders this coal of vital importance to the present and future industries of the great west.—The timber line or highest limit of tree vegetation does not vary much in the main chain of the Rocky mountains. In Colorado and Utah it is from 11,000 to 12,000 ft.; in northern Wyoming and Montana, from 8,000 to 11,000 ft.; on Mt. Shasta, California, 8,000 ft.; while as far south as San Francisco mountain, Arizona, between lat. 35° and 36°, it is 11,547 ft. According to the observations made up to this time (1875), the timber line is lower to the far north. Between lat. 45° and 46° in Montana, it varies from 8,800 to 9,600 ft., while from lat. 40° to 35° it is quite uniformly from 11,000 to 12,000 ft. These statements may be regarded as approximately accurate, though more observations ought to be made.—The mean elevation along several parallels of latitude has been ascertained approximately. For instance, along the 32d parallel, between lon. 95° and 96°, the mean elevation is 500 ft.; the highest mean between 108° and 110°, in the Sierra Madre plateau, is 5,000 ft.; 35th parallel, first mean 650 ft., highest mean, between lon. 107° and 109°, at Zuñi mountains, 7,000 ft.; 39th parallel, first mean 1,000 ft., highest mean, between lon. 105° and 107°, in the Colorado, Sahwatch, and Elk ranges, 11,000 ft.; 41st parallel, first mean 1,000 ft., highest mean, between lon. 105° and 107°, Laramie range and South park, 8,000 ft.; 45th parallel, first mean 1,000 ft., highest mean, between lon. 108° and 110°, Big Horn mountains and Yellowstone range, 7,000 ft.; 48th parallel, first mean 1,500 ft., highest mean, between lon. 118° and 114°, the main Rocky chain, 4,000 ft. The mean elevation of Arizona is 4,200 ft.; of California, 2,800 ft.; of Colorado, 6,600 ft.; of Idaho, 3,800 ft.; of Montana, 3,950 ft.; of Nevada, 4,900 ft.; of New Mexico, 5,400 ft.; of Oregon, 2,700 ft.; of Washington territory, 1,800 ft.; of Wyoming, 6,450 ft.—In almost every state and territory W. of the Mississippi old lake basins exist, and from the sediments that were deposited in the bottoms of these lakes have been obtained the remains of a great variety of extinct animals, including camels, rhinoceroses, elephants, mammoths, crocodiles, huge saurians, turtles, birds, &c. In the vicinity of the Black hills of Dakota is a large area marked on the maps as Mauvaises Terres, or Bad Lands, so called on account of its ruggedness, in which thousands of extinct vertebrate animals were entombed. It was formerly a vast fresh-water lake, probably dating back at least to the beginning of the miocene period, and continuing through the pliocene nearly to the present time. During

this time at least two distinct faunal groups appeared on the earth, lived out the period of their existence, and perished. The first group, which lived during the miocene period, left not a single species to the pliocene, and the fauna of the latter furnished no species for our present period. In the Sweetwater valley, near the three forks of the Missouri, in Oregon, California, Texas, New Mexico, and Colorado, are similar lake basins filled with the remains of these extinct animals. On the Laramie plains, about Fort Bridger, and far S. on Green river, are lake basins of older date, referred to the lower miocene or upper eocene, in the deposits of which have been discovered the abundant remains of hundreds of extinct forms of vertebrate animals, entirely distinct from those just mentioned as of more recent age. Great quantities of fossil insects, fishes, and plants are found in these lake beds. Over 500 species of extinct forms of plants have been found, mostly in connection with the coal, indicating that at a comparatively modern period, geologically speaking, this great region, occupied with mountains and barren plains, was covered with forests as luxuriant as those of the gulf states. These plants belong mostly to the early tertiary period. The present scarcity of timber in the eastern and central portions of the continent is well known. The principal winds come from the west and northwest, and, as they pass over the summits of the different ranges of mountains from the Pacific coast eastward, laden with moisture, discharge a portion of it from summit to summit, until on the eastern slope the air is almost dry. The absence of timber is due to the absence of moisture, and the inference from the fact of the luxuriant forests existing in the Rocky region during the early tertiary period is that these high summits did not then exist.—The drainage areas of the west are well marked out. The Missouri river and its great branches, the Yellowstone and Platte, have their sources in the eastern portion of the Rocky range, and, gathering their waters from myriads of branches, flow at first E. across the dry plains, and gradually turn S. E. and join the Mississippi; the average rainfall in the upper Missouri drainage is 18 inches. The second drainage is that of the Arkansas further S., which rises in the Sahwatch and Park ranges of Colorado, flows S. to lat. 38° 30' and lon. 106°, then bends E. and flows across the plains to unite with the Mississippi; the average rainfall is 28 inches. The third system of drainage is still further S., that of the Rio Grande, which rises in the San Juan mountains of southern Colorado, flows S. through New Mexico and between Texas and Mexico, and empties into the gulf of Mexico; average rainfall, 16 inches. West of the last is the drainage of the great Colorado of the West, which, rising far north (in its branches the Green and Grand rivers), near the Yellowstone national park, flows S. and S. W. across Wyoming, Utah, and Arizona, and

empties into the gulf of California; the average rainfall in this vast area is only 15 inches. N. and W. of the Colorado drainage is the great interior basin, between the Wahsatch mountains and the Sierra Nevada, with no known outlet, the great rivers sinking; here the average annual rainfall is only 12 inches. To the north is the great drainage of the Columbia, the branches of which rise in the main chain of the Rocky mountains far to the east, in Idaho; the average annual rainfall is only 18 inches. There are several smaller areas of drainage on the Pacific coast. The limited rainfall in all these regions shows that successful agriculture is only possible with the aid of irrigation. E. of the Sierra Nevada the rains are not frequent, the snows are very light, and the amount not great, so that the supply of water from the melting of the snows is not extensive. The difference between high and low water mark is very great. For a short time in May and June the streams are high and large, but they soon dwindle greatly, and even disappear altogether. So little snow falls on the E. ranges that the streams which flow into the plains from the E. slope will not supply water to irrigate more than one fourth of the agricultural area.

RODENTIA (Lat., from *rodere*, to gnaw), an order of mammals characterized by the chisel shape of the incisors, adapted for gnawing the hard vegetable substances upon which they principally feed, such as the wood and bark of trees, hard-shelled nuts, and occasionally bony structures like ivory. Rodents are generally small, numerous in species, very prolific, and found in all parts of the globe. They are ungulated, and in most the hind parts of the body and limbs exceed the front in length, so that they leap rather than walk, in some (as the jerboa) the disproportion being so great that they resemble the kangaroos in their mode of progression; the skull is small and flat, with the jaws, especially the lower one, strong; the snout is usually provided with long moustaches; the opening of the mouth is small, but

Rodent Skull and Incisor.—a. Enamel. b. Dentine or soft tooth substance.

the cheeks often form large pouches in which they convey food to their burrows; the legs are short in most, for walking or climbing, in the flying squirrels provided with a membrane extending from the sides, which answers the purpose of a parachute; many, like the beaver

and muskrat, are excellent swimmers and divers; the thumb is never opposable, when present; the skin is ordinarily covered with soft fur, but sometimes interspersed with bristles or spines; tail hairy, or naked and scaly. It is by their dental character that the rodentia are most clearly defined as a natural order. The bow-shaped incisors, usually $\frac{1}{2}$ - $\frac{1}{2}$, grow from persistent pulps, and are covered with a coat of enamel only in the front; the *leporidae* (hares and rabbits) possess an additional pair of incisors in the upper jaw, situated directly behind the first and larger pair. The superior hardness of the enamel, which much more effectually resists the action of gnawing than the comparatively soft dentine, enables the rodents to retain unimpaired a sharp, chisel-shaped edge to their cutting teeth, the wearing away of the crown being constantly replaced by growth below. The loss or breaking of one of these incisors, leaving the growth of the opposing tooth unchecked by a resisting medium, results disastrously, frequently causing an interlocking of the jaws. There are no canines. The grinders vary in number from four to twelve in the upper jaw, and from four to ten in the lower. When the number in either jaw exceeds six, the supernumerary teeth immediately preceding the last triplet must be regarded as true premolars, supplanting a milk dentition; they are composed of cement, dentine, and enamel, and either form roots (thus limiting the duration of growth) or grow from persistent pulps like the incisors. The summits of their crowns are generally traversed by parallel transverse ridges, placed in opposition to the antero-posterior movement of the lower jaw, thereby greatly facilitating mastication.—The order comprises such animals as the capybara, beaver, porcupine, squirrel, marmot, dormouse, rat, hamster, lemming, jerboa, hare, rabbit, muskrat, Guinea pig, agouti, and chinchilla. Waterhouse divides them into the five families of *leporidae*, *hystriidae*, *muridae*, *sciuridae*, and *sacomyidae*, all represented in North America, and the last peculiar to it. Rodents form nearly one third of all mammals, and in North America one half of all the land mammals, this last containing about one fifth of all the described species; of the squirrels, nearly one third of all known species are found within the limits of the United States; the pouched rats are entirely American; of the rat family, the field mice are best represented in North America; of the porcupine family, more than seven eighths are South American, the capybara, the largest living rodent, being among them, itself greatly surpassed in size by the extinct *castoroides Ohioensis* of North America; while many species of hares are found in North America, only one is met with in South America.—This order is generally considered as displaying very little intelligence, though manifesting (as the beaver) some of the most remarkable instincts; but the rat certainly shows an adaptation of

means to ends, under circumstances often the most unnatural and unexpected, which makes it hard to draw the line between animal instinct and intelligence. There is in many an extraordinary development of the sexual appendages, some of which are very complex and peculiar to the order; the testes are generally larger than the kidneys, and in most are not contained in a scrotum, but beneath the skin of the perineum; the intromittent organ is variously directed, with an internal bone, and in some armed with a formidable apparatus of horns, spines, and serrations; the preputial glands are often largely developed, secreting in the beaver the drug *castoreum*, once much used as an antispasmodic; the uterus is two-horned; the mammary glands vary from 4 in the Guinea pig to 12 or 14 in the agouti. Rodents have existed from the earliest tertiary epoch, presenting genera sometimes different from, and sometimes the same as the present.

RODERIC, the last Visigothic king of Spain, a son of Theodefred, duke of Cordova, fell in battle about the close of July, 711. He became king about 709, after driving Witiza from the throne. The sons of the latter and their uncle Orpas, archbishop of Seville, invoked against Roderic the assistance of the Arabs, who gained possession of Ceuta through the treachery of Count Julian, governor of Andalusia. Roderic roused the people to arms. His forces were vastly superior in number to those of the invaders under Tarik; but in the battle of Jerez de la Frontera, which is said to have lasted eight days, he was betrayed by the sons of Witiza, whom he had placed in command of the wings, and perished on the field.

RODEZ, or **Rhodes**, a city of S. France, capital of the department of Aveyron, situated upon a lofty promontory surrounded by the Aveyron, 310 m. S. of Paris; pop. in 1872, 11,662. It has an institution for deaf mutes, a normal school, lyceum, and diocesan seminary. It contains a fine Gothic cathedral begun in the 13th century, a monastery of the Cordeliers, handsome modern public buildings, manufactures of linen and serge, and a considerable trade in cheese, mules, and cattle.

RODGERS, **John**, an American naval officer, born in Harford co., Md., in 1771, died in Philadelphia, Aug. 4, 1838. He entered the navy as a lieutenant, March 9, 1798, and as executive officer of the frigate *Constellation*, Com. Truxtun, took possession of the French ship *L'Insurgente* captured by her off Nevis, Feb. 9, 1799. In March he was commissioned captain, and made a cruise in the Maryland, 20, upon the West India station. In June, 1803, in the *John Adams*, 28, in company with the *Enterprise*, 12, he successfully attacked a Tripolitan cruiser of 22 guns and several gunboats at anchor in a bay near Tripoli. In 1804 he commanded the frigate *Congress*, 38, in the squadron employed against Tripoli under Com. Barron, whom in 1805 he succeeded in command.

He afterward conducted successful negotiations with Tripoli and Tunis. In the spring of 1811, while lying off Annapolis in his flag ship, the *President*, 44, Capt. Ludlow, Com. Rodgers, received intelligence that a seaman had been impressed from an American brig off Sandy Hook by an English frigate. He sailed for that point without delay, and on May 16, when a few leagues to the southward of New York, discovered a vessel of war and gave chase to her, and a short engagement ensued. He ceased fire when his antagonist proved to be the weaker ship, and boarding her the next morning found that she was H. B. M. ship *Little Belt*, of 22 guns, Capt. Bingham. She had suffered severely, but declined receiving assistance, and the ships parted. The accounts of this affair given by the two commanders differed materially, particularly as to the firing of the first gun, and it widened the breach which already existed between the two nations. On June 21, 1812, on the declaration of war by the United States against Great Britain, Com. Rodgers sailed from New York in command of a squadron consisting of the *President*, the *United States*, 44, *Congress*, 38, *Hornet*, 18, and *Argus*, 16; and on June 23 a British frigate was discovered, to which a general chase was given. The *President* came at 4 P. M. within gun-shot of the English ship, when a running fight took place, in the course of which a gun of the *President* burst, killing and wounding 16, Com. Rodgers being among the wounded; and the enemy's ship escaped. It was afterward found that she was the *Belvidera*, 36, Capt. Byron, which had 7 killed and wounded, Capt. Byron among the latter. The loss of the *President* was 22 killed and wounded. Com. Rodgers extended this cruise for about 70 days, capturing seven British merchantmen. He subsequently captured the British packet *Swallow*, with a large amount of specie, and the schooner *Highflier*. In June, 1814, he was appointed to the new frigate *Guerriere*, and rendered important services in the defence of Baltimore. At his death he was senior officer of the navy.

RÖDIGER, **Emil**, a German orientalist, born at Sangerhausen, Thuringia, Oct. 13, 1801, died in Berlin, June 15, 1874. He studied theology in Halle, and taught there for many years, becoming in 1835 professor of oriental languages. In 1860 he was called to Berlin, where he remained until his death. His publications include *Syrische Chrestomathie* (1838), *Himjaritische Schriftmonumente* (1841), and the continuation of Gesenius's *Thesaurus Lingue Hebraicæ* (1853). After the death of Gesenius Rödiger edited his Hebrew grammar, from the 13th to the 21st edition (1874).

RODNEY. **I. Caesar**, a signer of the Declaration of Independence, born in Dover, Del., about 1730, died there in 1784. His grandfather, William Rodney, came from Bristol to Kent co., Del., soon after Penn became proprietary. Caesar inherited a large estate. He was sheriff of Kent co. in 1758, and soon after

became a member of the provincial assembly, in which he served till 1774, being speaker in 1769 and thereafter. In 1765 he was sent to the stamp act congress at New York. In the colonial assembly he earnestly advocated a bill forbidding the importation of slaves, which failed by only two votes. The colonies entering into correspondence upon the subject of their common defence, he became chairman of the committee of safety for Delaware; and in 1774, meetings of the people having been held at New Castle and Dover to demand the assembling of a convention, he issued a call as speaker of the assembly, convoking the representatives of the people at New Castle on Aug. 1. He was made chairman of the convention, and was elected a delegate to the continental congress, in which he was a member of the general committee to draw up a recital of the rights and grievances of the colonies. In March, 1775, he was again elected to congress. In May he was made colonel, and soon afterward brigadier general of the Delaware militia. In 1776 he was alternately in his seat in congress, and at work in Delaware stimulating the patriots and repressing the loyalists. In response to a special message, he rode with all speed to Philadelphia, just in time to give Delaware's vote for the declaration. After his retirement from congress he went to Trenton, where Gen. Stirling made him post commandant, and then to Morristown, whence by Washington's permission he returned home in February, 1777. He suppressed an insurrection in Sussex, and when in August the British advanced into Delaware, he took the field with what militia he could raise, and annoyed the flank of the enemy as they faced the American position on Red Clay creek. In September he was made major general of militia, and in December he was again elected to congress, but did not take his seat. A few days later he was elected president or executive officer of the state, which post he filled till January, 1782, when he declined reelection. He was then chosen to congress, and again in 1783, but did not take his seat. **II. Caesar Augustus**, an American statesman, nephew of the preceding, born in Dover, Del., Jan. 4, 1772, died in Buenos Ayres, June 10, 1824. He graduated at the university of Pennsylvania, and studied law. In 1802 he was elected to congress as a democrat, and was a member of the committee of ways and means, and one of the managers in the impeachment of Judge Chase. In 1807 he became attorney general of the United States, which place he resigned in 1811. During the war of 1812 he commanded an artillery company. In 1817 he was sent to South America by President Monroe as one of the commissioners to investigate and report upon the propriety of recognizing the independence of the Spanish-American republics, which he strongly advocated after his return. In 1820 he was again elected to the house of representatives, and in 1822 became a member of the United

States senate, being the first democrat who ever sat in that chamber from Delaware. In 1823 Monroe appointed him minister plenipotentiary to the United Provinces of La Plata. With J. Graham he published "Reports on the Present State of the United Provinces of South America" (8vo, London, 1819).

RODNEY, George Brydges, baron, an English admiral, born at Walton-upon-Thames, Surrey, Feb. 19, 1718, died in London, May 21, 1792. At the age of 12 he was taken from Harrow school and sent to sea; in 1739 he became a lieutenant, in 1742 a captain, and in 1748 went to the Newfoundland station as governor and commander-in-chief. In 1752 he returned to England and was elected to parliament, and in 1759 he was created rear admiral. In 1761 he was appointed commander-in-chief at Barbadoes and the Leeward islands, and reduced the islands of Martinique, Santa Lucia, and Grenada. In 1762 he was made vice admiral, in 1764 a baronet, in 1765 master of Greenwich hospital, and in 1768 was returned to parliament. He resigned his governorship of Greenwich hospital in 1771, on being appointed commander-in-chief at Jamaica. In 1774 he returned to England, but was obliged to seek refuge from his creditors in France. Finally he obtained money sufficient to pay his debts, and with the rank of admiral sailed in 1779 for the Barbadoes station, where he had been again appointed commander-in-chief. His squadron consisted of 22 ships of the line and 8 frigates, and after capturing several Spanish transports and ships of war, he fell in with a Spanish fleet off Cape St. Vincent in January, 1780, under Don Juan de Langara. This consisted of 11 ships of the line and 2 frigates, and of these 7 were taken or destroyed. On April 17, 1780, he came up with the French fleet near Martinique, but was prevented from capturing any of their vessels by the refusal of his captains to follow. He however broke through the enemy's lines with a portion of his squadron, and was rewarded with the thanks of both houses of parliament and a pension of £2,000. The same year he was elected to the house of commons from Westminster, and made a K. B. In December, 1780, he made an unsuccessful attack upon St. Vincent. War breaking out between Great Britain and Holland, he took the Dutch island of St. Eustatius without firing a shot, and then Demerara, Essequibo, and Berbice. In the autumn of 1781 he returned home, and was created vice admiral of England, and assigned the command of the West Indies. Returning thither, he went in pursuit of the French fleet under the count de Grasse. A partial action took place on April 9, 1782, and a general engagement on April 12. The battle began at 7 o'clock in the morning, and lasted till 6½ in the evening, and the British took seven ships of the line, including the French flag ship, and two frigates. The whigs meanwhile had come into office, and as Rodney was opposed to that party, an officer was sent to supersede

him; when, however, the news of his victory reached England, an express was sent to bring back his successor, but failed to reach him. Rodney arrived in England, Sept. 21, 1782, and received the thanks of both houses of parliament, with an additional pension of £2,000, and was raised to the peerage as Baron Rodney of Rodney Stoke in Somersetshire.—See "Life and Correspondence of Lord Rodney," by his son-in-law, Gen. Godfrey Basil Mundy (2 vols. 8vo, London, 1830).

RODRIGUEZ, Alfonso, a Spanish religious author, born in Valladolid in 1526, died in Seville, Feb. 21, 1616. He received his degree of doctor of philosophy at the university of Salamanca in 1545, and soon afterward entered the society of Jesus. After teaching for several years at Salamanca, he was appointed rector of the college of Monterey and professor of moral theology, which post he held for 12 years, his fame as a teacher bringing him pupils from every part of the country. He was afterward master of novices at Valladolid and Montilla for 30 years. His "Practice of Christian Perfection" (4to, Seville, 1640) has been translated into all the European languages.

RODRIGUEZ, Island of. See MAURITIUS.

ROE, Azel Stevens, an American novelist, born in the city of New York in 1798. After serving as clerk in a mercantile house in New York, he engaged in business as a wine merchant, and finally retired and settled at Windsor, Conn. His works include "James Montjoy, or I've been Thinking" (New York, 1850); "To Love and to be Loved" (1852); "Time and Tide, or Strive and Win" (1852); "A Long Look Ahead" (1855); "The Star and the Cloud" (1856); "True to the Last" (1859); "How Could He Help it?" (1860); "Looking Around" (1865); "Woman our Angel" (1866); "Cloud in the Heart" (1869); and "Resolution, or the Soul of Power" (1871).

ROE, Edward Payson. See supplement.

ROEBLING, John Augustus, an American engineer, born in Muhlhausen, Prussia, June 12, 1806, died in Brooklyn, N. Y., July 22, 1869. He was educated at the polytechnic school in Berlin, and emigrated to America and settled near Pittsburgh in 1831. He was assistant engineer on the slack-water navigation of the Beaver, and on the Sandy and Beaver canal and a feeder of the Pennsylvania canal, after which he spent three years in surveying the route across the Alleghenies adopted by the Pennsylvania Central railroad. He introduced the manufacture of wire ropes, first at Pittsburgh, afterward removing his establishment to Trenton, N. J., and their use in the construction of suspension bridges, his first work being the suspended aqueduct of the Pennsylvania canal across the Alleghany river, completed in May, 1845. He afterward constructed the Monongahela suspension bridge at Pittsburgh, and some suspension aqueducts on the Delaware and Hudson canal. In 1851

work was begun upon the Niagara bridge (see BRIDGE, vol. iii., p. 274), and in 1867 he completed the Cincinnati suspension bridge, which has a clear span of 1,057 ft. His last design was for the East river bridge, connecting the cities of New York and Brooklyn. (See BRIDGE.) Mr. Roebling published "Long and Short Span Bridges" (New York, 1869).

ROEBUCK, a small European deer of the genus *capreolus* (H. Smith), the *O. caprea* of Gray, and the *chevreuil* of the French. The horns are small, nearly erect, cylindrical, slightly branched, with a very short peduncle and three short branches; the skull has a very small, shallow suborbital pit; the muzzle broad and naked; tear bag indistinct; hoofs narrow and triangular, and a tuft of hair rather above the middle of the metatarsus. The color in summer is reddish brown, in winter olive with paler shades; inside of the ears fulvous, and a black spot at the angles of the mouth; the tail

Roe buck (*Capreolus caprea*).

is short, and the anal disk is large and white; the hair in winter is thick and harsh, and in summer thinner and more flexible. It is about 4 ft. long, 2½ ft. high at the shoulder and 2½ ft. behind. It is one of the most graceful and active of the deer family, frequenting the woods and copes of the rocky regions of Europe from the Scottish highlands to the Tyrol, but in less wild districts than the stag. Its agility and speed are astonishing, 20 ft. being sometimes cleared at a single bound. They are not polygamous, and a pair generally has two young at a birth, which are treated with the utmost tenderness by both parents, and often remain attached to each other after quitting the old ones; they congregate in small families, but not in herds, feeding on herbage and the buds and tender shoots of trees, from the latter habit often doing much mischief in a forest. The flesh is considered better than that of the stag, when the animal is properly killed. The horns are used for knife handles, &c.; they are

dropped after the breeding season in November, and are reproduced during the winter. The period of gestation is five months. From their strong scent they are easily hunted, though they frequently escape by their speed, doublings, springing to cover, and other artifices to baffle the hounds. In northern Asia is found the alu or Tartarian roebuck (*C. pygargus*, Sundev.); this is larger, with longer and more prickly horns, and coarser and longer hair; the color is brownish above and yellowish below; there is no tail. The roebucks are represented in North America by the Virginia deer (*cariacus*, Gray), and in South America by the brockets (*coassus*, Gray).

ROEBUCK, John Arthur, an English politician, born at Madras in December, 1802. From 1815 to 1824 he resided in Canada, and in 1832 he was admitted as a barrister in London. In the same year he was elected to parliament for Bath, and he soon became prominent as a radical reformer. In 1835 he was appointed agent for the assembly of Lower Canada during the contest between that house and the executive. He soon after published a series of political pamphlets, which involved him in a bloodless duel with the editor of the "Morning Chronicle," Nov. 19, 1835. In 1837 he lost his seat in parliament in consequence of his attack upon the whigs, but was reelected in 1841. In 1847 he was defeated again, and in 1849 was elected for Sheffield, which he represented till 1869. In the election of February, 1874, he was again returned as a liberal from Sheffield. On Jan. 29, 1855, the passage of his motion to inquire into the state of the army in the Crimea caused the resignation of the Aberdeen ministry; and he was chairman of the committee subsequently appointed for that purpose, and also of the short-lived "Administrative Reform Association," organized in 1856. He is the author of "Plan for the Government of our English Colonies" (1849), and of a "History of the Whig Ministry of 1830" (2 vols. 8vo, 1852).

ROERMOND (Fr. *Ruremonde*), a town of the Netherlands, in the province of Limburg, at the junction of the Maas and Roer, 27 m. N. N. E. of Maestricht; pop. about 9,000. It is the seat of a bishop, and contains a handsome cathedral of the middle ages and a parochial church with fine works of art. Its manufactures include woollens, cotton, and paper, and a considerable trade is carried on. The town has been frequently taken in various wars.

ROESKILDE. See RÖSKILDE.

ROGATION DAYS (Lat. *rogare*, to ask), in the Roman Catholic ecclesiastical calendar, the three days immediately preceding Ascension day, when public litanies or supplications are made for a blessing on the fruits of the earth. The custom of assembling in public to recite litanies or solemn supplications existed in the primitive church; but Mamertus, bishop of Vienne (died about 474), was chiefly instrumental in fixing for this purpose the three days before Ascension, and in giving them

an unusual degree of solemnity. They were thenceforward called *litanie majores*, the great litanies, were accompanied with solemn processions, and were held throughout the Latin church. A remnant of this custom in the cities and towns of England consists in the parochial clergy's visiting some part of the parish boundaries accompanied by the church wardens and people.

ROGER I., count of Sicily, 12th son of Tancred de Hauteville, born in Normandy in 1031, died in Mileto, Calabria, early in the summer of 1101. In 1058 he undertook, in conjunction with his brother Robert Guiscard, the conquest of Calabria, and afterward that of Sicily. In 1060 he took Messina, and in 1061 defeated the Saracens at Enna with great slaughter. A disagreement between Roger and Robert, owing to the refusal of the latter to divide the country, was settled in 1071 by the acknowledgment of Roger as count of Sicily; but it was not till 1072 that he came into possession of the island, by the conquest of Catania and Palermo. In 1085 he succeeded Robert as chief of the Normans in Italy. In 1090 he subdued Malta. He established Christianity throughout Sicily in 1096, but allowed his Saracen subjects liberty of conscience. In 1098 Urban II. made him apostolic legate.

ROGER II., first king of Sicily, son of the preceding, born in Mileto, Calabria, about 1095, died Feb. 26, 1154. He succeeded his father under the guardianship of his mother, Adelaide of Montferrat. On assuming the government, Roger reduced the barons to obedience, and brought Malta back to allegiance. In 1121 he took from his cousin William, duke of Apulia and Calabria, part of his possessions, and on his death in 1127 seized all his dominions in southern Italy. In 1130 he sustained his brother-in-law Anacletus as antipope, received from him the title of king of Sicily, and was crowned at Palermo the same year; and he established Anacletus in Rome, driving out Innocent II. In 1137 he was defeated by the German emperor Lothaire II., who had been called in by his revolted vassals; but he at once recovered his ground on the emperor's departure. Innocent II. falling into his power in 1139, Roger compelled him to remove his excommunication and to confirm his kingly title, in return recognizing his right to the papacy. He took Naples from Duke Sergius, and Capua and Aversa from Prince Robert. In consequence of insults from the Greek emperor Manuel Comnenus in 1146, he ravaged Epirus and Dalmatia, captured Corfu, and devastated Greece, bringing back an immense booty. In 1147 he attacked the empire of the Zoraides in Africa, and extended his sway over a large part of the Barbary coast. He introduced the sugar cane and the manufacture of silk into Sicily.

ROGER, Gustave Hippolyte, a French singer, born near Paris, Aug. 27, 1815. He studied at the conservatory, and was engaged as a tenor at the opéra comique from 1838 to 1846,

after which he accompanied Jenny Lind to London. Subsequently he appeared in grand operas, but not as successfully as on the comic stage. In Berlin he won favor in *Les Huguenots* and in *La dame blanche*, in Munich in *La Juive*, and in Hamburg in *Le prophète*, when he sang in German. He was again at the grand opera in Paris from 1855 to 1859, when he lost an arm while hunting. He subsequently appeared with an artificial arm, but never recovered his popularity. In 1868 he became professor of singing at the conservatory.

ROGERS, Charles. See p. 887.

ROGERS, Henry, an English author, born about 1810. He studied at Highbury college, and for some years was pastor of an Independent church. In 1839 he became professor of the English language and literature in University college, London, and was afterward professor of philosophy in Spring Hill Independent college, Birmingham, till 1858, when he became president of the Lancashire Independent college, Manchester. He has published "Life and Character of John Howe, M. A., with an Analysis of his Writings" (1836); a "General Introduction to a Course of Lectures on English Grammar and Composition" (1838); "Essays selected from Contributions to the 'Edinburgh Review'" (4 vols. 8vo, Edinburgh, 1850-'74); "The Eclipse of Faith" (1853); "Selections from the Correspondence of R. E. H. Grayson" (2 vols., 1857); "Vindication of Bishop Colenso" (1863); "Reason and Faith" (1866); and "Essays" reprinted from "Good Words" (1869 and 1874).

ROGERS, I. James Blythe, an American chemist, born in Philadelphia, Feb. 22, 1803, died there, June 15, 1852. He received the degree of M. D. at the university of Maryland, and was successively professor of chemistry in Washington medical college, Baltimore, the medical college at Cincinnati, the Franklin medical school of Philadelphia, and the university of Pennsylvania. For several years he was chemical and geological assistant in the surveys of Virginia and Pennsylvania. He published papers in the scientific journals, and was one of the editors of the last American reprint of Turner's "Chemistry." **II. William Barton**, an American physicist, brother of the preceding, born in Philadelphia in 1805. He first lectured on science in the Maryland institute in 1827, and in 1829 succeeded his father, Dr. P. K. Rogers, in the chair of natural philosophy and chemistry in William and Mary college. From 1835 to 1853 he was professor of natural philosophy and geology in the university of Virginia. In 1853 he removed to Boston, where he has since resided. He examined the region of the mineral springs of Virginia, and analyzed their waters; and in 1835 he organized the state geological survey, at the head of which he remained till it was discontinued in 1842. In 1862 he delivered a course of lectures before the Lowell institute on the application of science to the arts; and from 1862 to 1868 he

was president of the Boston institute of technology. He is the author of a treatise on the "Strength of Materials" (1838), "Elements of Mechanical Philosophy" (1852), and numerous scientific papers. In 1875 he was elected president of the "American Association for the Advancement of Science" for the ensuing year. **III. Henry Darwin**, an American geologist, brother of the preceding, born in Philadelphia in 1809, died in Glasgow, Scotland, May 28, 1866. He became professor of physical sciences in Dickinson college, Carlisle, in 1831, and afterward professor of geology in the university of Pennsylvania, which office he held for many years. He made a geological survey of the state of New Jersey, of which he published a report and map in 1835, and a final report in 1840. From 1836 to 1855 he was engaged in the survey of Pennsylvania, publishing during the first years annual reports of progress. His final report, in two large vols. 4to, with numerous drawings and illustrations, and an atlas (Edinburgh, 1858), is especially valuable in the departments of structural and dynamic geology. In 1857 he was appointed regius professor of geology and natural history in the university of Glasgow, Scotland. He contributed many important papers to the transactions of philosophical societies, and was one of the editors of the Edinburgh "New Philosophical Journal." He published a geological map of the United States and a chart of the arctic regions in the "Physical Atlas," and in conjunction with W. and A. K. Johnston of Edinburgh a geographical atlas of the United States. **IV. Robert Empie**, an American chemist, brother of the preceding, born in Baltimore in 1814. He took the degree of M. D. at the university of Pennsylvania, and in 1844 was appointed to the chair of chemistry in the university of Virginia, which he held till 1852, when he succeeded his brother Prof. J. B. Rogers as professor of chemistry in the university of Pennsylvania. He was associated with the latter in preparing the amended edition of Turner's "Chemistry," and has since edited the American reprint of Lehmann's "Physiological Chemistry." He has been for many years dean of the medical faculty of the university of Pennsylvania.

ROGERS, John, an English clergyman, born about 1500, burned at Smithfield, Feb. 4, 1555. He was educated at Cambridge, entered into holy orders there, and was chaplain to the English factory at Antwerp for several years. There he became acquainted with Tyndale and Coverdale, and from the manuscripts of the former, the published version of the latter, and his own researches, he compiled a complete edition of the Bible in English. The elaborate marginal notes and index are entirely his work. It was published in folio in 1537 under the assumed name of Thomas Matthew. From Antwerp he went to Wittenberg, where he was pastor of a Dutch congregation. On the accession of Edward VI. Bishop Ridley invited him

home, and made him prebendary and divinity reader of St. Paul's. On the Sunday after the triumphal entry of Queen Mary into London, in August, 1553, Rogers preached a sermon at St. Paul's cross, in which he exhorted the people to adhere to the doctrine taught in King Edward's days, and to resist the forms and dogmas of Catholicism. He was summoned before the privy council for this, but defended himself ably, and was released. On Aug. 18, however, he was ordered to remain a prisoner in his own house, and at the end of six months was removed to Newgate. He was tried in January, 1555, before Gardiner, bishop of Winchester, and condemned to be burned. He was the author of several theological works.

ROGERS, John, an American sculptor, born in Salem, Mass., Oct. 30, 1829. He was for two years a merchant's clerk in Boston, and after a voyage to Spain for his health entered in 1848 a machine shop in Manchester, N. H., where he remained seven years. In 1856 he took charge of a railroad machine shop in Hannibal, Mo., in 1857 visited Paris and Rome, and then became a draughtsman in Chicago. He there modelled a group called "The Checker Players," and another called "The Slave Auction," exhibited in New York in 1860. Opening a studio in New York, he became famous for small groups illustrating the civil war and common life, executed in a brownish gray composition. Among the best known of these groups are: "The Picket Guard" (1861); "The Returned Volunteer," "The Wounded Scout," and "Union Refugees" (1864); "Taking the Oath," "The Charity Patient," and "Uncle Ned's School" (1866); "The Council of War" and "Courtship in Sleepy Hollow" (1868); "The Fugitive's Story" (1869); "Coming to the Parson" (1870); a series illustrating the story of Rip Van Winkle (1871); and "The Favored Scholar" (1872). He has more recently modelled some larger statues for garden and lawn decoration, executed in artificial stone, and has also made some anatomical studies of the horse, for the use of art students.

ROGERS, Randolph, an American sculptor, born in the state of New York about 1825. In early manhood he spent several years in Rome studying his art. On his return home he soon became known through his statue of "Nydia, the Blind Girl of Pompeii," his "Boy and Dog," and other compositions. Returning to Rome, where he now resides (1875), he executed a statue of John Adams, now in Mt. Auburn cemetery. In 1858 he designed and modelled the bronze door for the capitol at Washington. The work, which is 17 ft. high and 9 ft. wide, is divided into eight panels, each of which represents in alto relievo a scene in the life of Columbus. Between the panels and on the sides are 16 statuettes of the eminent contemporaries of Columbus. After this he was employed for several years in finishing the designs for the Washington monument at Richmond,

begun by Crawford. Since the civil war he has designed and executed large memorial monuments for the states of Rhode Island and Michigan. The former, which was erected in Providence in 1871, is 50 ft. high; the crowning statue, "America," is 10 ft. high; and on the angles of the pedestal are statues 7 ft. high representing the four branches of the service. The latter, erected in Detroit in 1873, is similar in design, but larger and more elaborate; it is surmounted by a statue representing Michigan. Among Rogers's other works are a colossal bronze statue of Lincoln, unveiled in Philadelphia in 1871, a statue for the Colt monument in Hartford entitled "The Angel of the Resurrection," and ideal statues of "Ruth" and "Isaac."

ROGERS, Samuel, an English poet, born at Newington Green, near London, July 30, 1763, died in London, Dec. 18, 1855. He was educated by private tutors, and entered his father's banking house in his boyhood. In his 18th year he became a prose contributor to the "Gentleman's Magazine," and in 1786 published "An Ode to Superstition, with some other Poems," of which during the next four years only about 20 copies were sold. In 1792 he produced his "Pleasures of Memory," which at once gave him a place among the poets of England. His father at his death in 1793 left him an ample fortune, and he soon after retired from active participation in business, though retaining his interest as a partner. In 1798 appeared his "Epistle to a Friend, and other Poems;" and in 1803 he established himself in a house (No. 22) in St. James's place, which during the next half century enjoyed a wide celebrity as a resort of literary men and the receptacle of choice treasures of art. Rogers's "breakfasts," given in a shady apartment, became in time famous as a sort of social rallying point. His collection of pictures, books, vases, &c., was distinguished by its exquisite taste, and realized after his death upward of £50,000, a sum considerably larger than the original cost. His "Voyage of Columbus" was first published in a new edition of his poems in 1812, and in 1813 his "Jacqueline" appeared in a volume with Byron's "Lara." In 1819 he published a didactic poem entitled "Human Life," and in 1822 "Italy," a collection of pieces in blank verse and in prose. The remainder of his literary life was devoted to the publication of illustrated editions of his "Italy" and his "Poems," the designs for which were furnished by Prout, Turner, and Stothard, and were engraved by the first artists in England. He is said to have expended between £10,000 and £15,000 in this undertaking. On the death of Wordsworth he was offered the laureateship, which, in consideration of his great age, he declined. He retained his physical vigor until near the close of his life. His chief personal blemish was a tendency to ill-natured satire and unreasonable antipathies. Of this and other traits some

idea may be obtained from the volumes of his "Table Talk" published by the Rev. Alexander Dyce (1856), and a similar collection by his nephew William Sharpe (1859).

ROGET, Peter Mark, an English author, born in London in 1779, died there, Sept. 13, 1869. He graduated in medicine at the university of Edinburgh in 1798, and after a tour to the continent settled in 1804 in Manchester, where he was appointed physician to the infirmary, lunatic asylum, and fever hospital. In 1808 he went to London, and was for many years secretary of the royal society, and one of the Fulmerian lecturers on physiology at the royal institution. His best known work is the "Thesaurus of English Words and Phrases" (1852; 9th ed., revised, 1860; American ed. by Barnas Sears, D. D., New York, 1854). He also wrote "Animal and Vegetable Physiology," a Bridge-water treatise (2 vols. 8vo, 1834; 3d ed., 1840), "Electricity, Galvanism, Magnetism, and Electro-magnetism" (1848), &c.

ROHAN, Louis René Édouard, prince de, a French cardinal, born Sept. 25, 1734, died at Ettenheim, Baden, Feb. 17, 1803. He was destined for the church, and became while very young the associate of his uncle the bishop of Strasburg. In 1772 he was ambassador from Louis XV. to Vienna, was recalled in 1774 on account of his giving offence to the empress Maria Theresa by scandalous luxury and political meddling, and appointed after his return to various places of distinction and emolument. In 1778 he was made a cardinal, and in 1779 bishop of Strasburg. He was imprisoned in 1785 for his part in the affair of the diamond necklace, which so gravely compromised Marie Antoinette (see LAMOTTE-VALOIS), and was released in 1786, but dismissed from court utterly disgraced. In 1789 he was a deputy of the clergy of Hagenau to the states general; but being accused of disloyal conduct, he resigned his seat, and retired to his estate on the Rhine beyond the jurisdiction of France. In 1801, in consequence of the concordat, he resigned the bishopric of Strasburg.

ROHILCUND, the country of the Rohillas, in British India, W. of Oude, N. and E. of the Ganges, and S. of Kumaon and Gurhwal, now comprised in a commissionership or administrative division of the Northwest Provinces bearing the same name, and in the native principality of Rampoor, which is surrounded by the six districts composing the division. These districts are Bareilly, Bijnoor, Budaon, Moradabad, Shahjehanpoor, and Terai (Kashi-poor); total area, about 11,500 sq. m.; pop. in 1872, 5,435,550. The country is drained by several tributaries of the Ganges, of which the Ramganga is the largest. Sugar, cotton, cotton cloth, and timber are the principal articles of exportation. A good deal of rice is raised in the Terai region, which is irrigated by a large number of small canals and hill dams.—The Rohillas, from whom this territory derives its name, are descendants of the Afghan sol-

diery who established themselves in the vicinity of Delhi, and on the dissolution of the Mogul empire in the middle of the 18th century became independent. About 1770 they were attacked by the Maharrattas, and sought assistance from the vizier of Oude, who afforded them but little aid, and subsequently demanded an enormous sum in payment for it. In 1774 British troops were sent against the Rohillas by Warren Hastings, to enforce this demand, and the country was brought under subjection to the vizier, who in 1801 ceded to the English the entire territory with the exception of Rampoor. In 1857 the sepoys mutinied at every station in Rohilcund, and the country was a prominent seat of military operations.

ROHLFS, Gerhard, a German traveller, born at Vegesack, near Bremen, April 14, 1834. He studied medicine at Heidelberg, Würzburg, and Göttingen, went to Algeria, enlisted in the foreign legion of the French army, served in the conquest of Kabylia, and attained the highest rank open to a foreigner. Having there learned the Arabic language and the mode of life of the inhabitants, in 1861 he went to Morocco, where in the character of a Moham-medan physician he acquired the friendship of the grand sherif, and under his protection travelled through the country, traversing the Morocco portion of the Sahara from W. to E., and exploring the whole course of the wady Draa. On this journey he was treacherously attacked by his guides, robbed, and left for dead in the desert, with a broken arm. In 1864 he travelled still further in Morocco, and crossed the Atlas mountains to the oasis of Tuat. His description and map of the country were the first ever made from personal observation and with scientific knowledge. After a short visit to Germany in 1865 he returned to Africa, and traversed the continent disguised as an Arab from Tripoli to Lagos, by way of Moorzook in Fezzan, Bilma, Kuka, the chief city of Bornoo, the river Benoowe, the Niger, and the Gomba country. The journey occupied altogether about two years, and obtained him the medal of the royal geographical society of London. Rohlf's detailed account of it is contained in the *Ergänzungsheft* No. 84 to Petermann's *Geographische Mittheilungen* (Gotha, 1872). At the close of 1867, by order of the king of Prussia, he joined the English expedition against Abyssinia. He returned to Tripoli in 1868, and in 1869 traversed the desert from Tripoli to Alexandria, visiting the oasis of Siwah, the ancient Ammonium. In 1873, with an expedition of 100 camels and 90 men, organized under the patronage of the khedive of Egypt, he explored the Libyan desert W. of the chain of oases which skirt the valley of the Nile, and discovered that the depression called the Bahr Bela-ma (river without water) marked on many maps of the desert does not exist. The progress of the expedition S. W. of the oasis of Dakhel was stopped by hills of loose sliding sand, which the camels were un-

able to traverse; and in lat. 25° 11' N., lon. 27° 40' E., the party turned back. In 1875 he visited the United States, and lectured on his travels. His most important publications are: *Reise durch Marokko* (2d ed., Bremen, 1869); *In Abessinien* (1869); *Von Tripolis nach Alexandria* (1871); *Mein erster Aufenthalt in Marokko* (1873); *Quer durch Afrika: Reise vom Mittelmeer nach dem Tschad-See und zum Golf von Guinea* (Leipsic, 1874 et seq.); and *Drei Monate im libyschen Wüste* (Cassel, 1875 et seq.). Winwood Reade edited his "Adventures in Morocco and Journeys through the Oases of Draa and Taflet" (London, 1874).

ROKITANSKY, Karl, a German physician, born in Königgrätz, Bohemia, Feb. 19, 1804, died July 23, 1878. He studied medicine at Prague and at Vienna, where in 1828 he became assistant to the pathological and anatomical establishment. In 1834 he became extraordinary and in 1844 ordinary professor of pathological anatomy, in 1848 honorary rector of the university of Prague and member of the Vienna academy of sciences, in 1849 dean of the medical faculty, and in 1850 rector of the university of Vienna. He resigned his professorship in 1874. He was the projector of the great hospital of Vienna. He is considered in Germany as the highest authority in anatomy and pathology. His principal work is *Handbuch der pathologischen Anatomie* (3 vols., Vienna, 1842-'6; English translation by the Sydenham society, 4 vols., London, 1845-'52), entirely recast under the title of *Lehrbuch der pathologischen Anatomie* (3 vols., 1851-'61).

ROLAND, called by the Italians ORLANDO, a paladin of the court of Charlemagne, and one of the most famous heroes of the chivalric romances of the middle ages. According to tradition, he was a nephew of Charlemagne, and was slain at Roncevalles. The narrative of his defeat and death has been expanded into a history full of picturesque and marvellous details; and in the "Romance of Roncevalles," in the rhymed chronicle *La Spagna*, in the "Grand Chronicles," in Turpin's fabulous chronicle *De Vita Caroli Magni et Rolandi*, and later in the *Orlando innamorato* of Boiardo, the *Orlando furioso* of Ariosto, and the *Morgante Maggiore* of Pulci, he figures as the great exemplar of mediæval chivalry. The "Song of Roland," a metrical narrative of the hero's chief exploits, was a favorite with minstrels of the middle ages. His historical existence rests upon a doubtful passage in Eginhard's *Vita Caroli Magni*, and he is believed to be almost wholly the creation of fiction.—See *Das Rolandslied*, edited by Karl Bartsch (Leipsic, 1874), forming vol. iii. of *Sammlung der deutschen Dichtungen des Mittelalters*.

ROLAND DE LA PLATIÈRE, Jean Marie and Marie or Manon Jeanne, French revolutionists, whose histories are so interwoven that they can be best treated in a single article. M. Roland (born near Villefranche, Feb. 18, 1734, died by his own hand near Rouen in November,

1793) was destined for the church, at which he revolted, and at the age of 19, without resources, travelled on foot over the greater part of France. At Rouen he obtained employment with a relative, and finally received the appointment of inspector of manufactures at Amiens. He devoted his leisure to scientific studies, and was the author of several works on manufactures and rural economy in the series of *Arts et métiers* published by the academy of sciences (1779-'83). In 1776-'8 he travelled in Switzerland and Italy, and addressed to his brother, a prior in Paris, letters containing detailed accounts of manufactures and commerce in those countries, which were afterward published (6 vols. 12mo, 1782). On a visit to Paris in 1776, he had formed the acquaintance of Mlle. Manon Jeanne Philpon (born in Paris, March 17, 1754, executed Nov. 9, 1793). From early childhood she was a diligent reader of such books as fell in her way, among them the "Confessions" of St. Augustine and Plutarch's "Lives." At 11 years of age she obtained permission to spend a year in a convent preparatory to her first communion, and there formed an intimacy with a Mlle. Sophie Canet, with whom after their separation she kept up a correspondence for eight years (published in 1841 in 2 vols. 8vo). She was married to M. Roland in 1780, and in 1784 they visited England, and studied together the workings of its political system. After their return Roland was transferred in his official capacity to Lyons, and there finished his principal work, the *Dictionnaire des manufactures et des arts qui en dépendent*, forming part of the *Encyclopédie méthodique* (3 vols., Paris, 1785). His wife shared in all his labors. They both hailed the revolution with enthusiasm. Roland became a municipal officer of Lyons, and his wife contributed to a new democratic journal. In 1791 they removed to Paris, Roland having been chosen commissioner to the national assembly on behalf of the workmen of Lyons. Mme. Roland's saloon in Paris became the rallying point of the Girondist leaders, to whom her husband attached himself. On March 23, 1792, he became minister of the interior under Dumouriez. It is said that his most important state papers were drawn up by his wife, though she declares that she exercised little influence upon his acts. Louis XVI. having refused his signature to the decrees for the banishment of the priests and for the formation of a camp of 20,000 men, Roland addressed to him a letter written by his wife, warning him that his tenure of the throne depended upon his compliance with the popular will. No answer being returned, Roland read the letter in full council to the king, who by the advice of Dumouriez dismissed him and his two Girondist colleagues. Roland at once read the letter to the assembly, and it was ordered to be printed and distributed to all the 83 departments. The storm thus raised broke forth in the insurrec-

tion of June 20, and paved the way for that of Aug. 10, when the Girondists were restored to the ministry. Danton, who was made minister of justice, incited the Jacobins and the populace against Roland, and scandalous reports were spread about his wife. On Dec. 7 Mme. Roland appeared before the convention to answer a charge of treasonable correspondence with the English ministry. The triumphant manner in which she cleared herself at once silenced and enraged her accusers. During the trial of the king, Roland found important documents bearing against him in a secret closet of the palace, and submitted them to the convention; but as he had examined them without witnesses, it was charged that he had abstracted some of them. The Girondist ministers resigned Jan. 22, 1793, and on May 31 Roland was arrested and held a prisoner in his own house. Mme. Roland rose from a sick bed to demand his release at the bar of the convention; but she failed to get a hearing, and on her return found that he had escaped. She was herself arrested on June 2, and during her imprisonment wrote her memoirs under the title of *Appel à la postérité*, the manuscript of which was preserved by her friend Bosc, who also adopted her daughter and only child, then 12 years old. Her conduct was heroic, and on the way to the scaffold she occupied herself in comforting a despondent old man beside her in the cart. Of her *Œuvres complètes* (3 vols. 8vo, 1800) the first two volumes contain her *Mémoires* (new editions by C. A. Dauban, 4 vols., 1864, and by Prosper Faugère, 2 vols., 1864). Besides her correspondence with the demoiselles Canet, there have been published *Lettres autographes de Mme. Roland, adressées à Bancal des Issarts*, with an introduction by Sainte-Beuve (8vo, 1835). On Nov. 15, 1793, a week after her execution, the body of M. Roland was found four leagues from Rouen (in which city he had lain concealed for five months), pierced with the blade of a sword cane which lay beside him, and with a paper in his pocket protesting his honesty of purpose in all his actions, and concluding: "When I heard that my wife had been massacred, I would not remain any longer in a world stained with crimes." The corpse was carried to Paris and subjected to gross indignities.—See Dauban's *Étude sur Mme. Roland et son temps* (1864).

ROLETTE, a N. E. county of Dakota, bordering on British America, recently formed, and not included in the census of 1870; area, about 1,850 sq. m. The extreme E. part is watered by a stream that empties into Minnawakan or Devil's lake. The N. W. part is occupied by the Turtle mountains. The surface consists chiefly of rolling prairies.

ROLFE, Robert Monsey. See CRANWORTH.

ROLLIN, Charles, a French historian, born in Paris, Jan. 30, 1661, died there, Sept. 14, 1741. He was gratuitously admitted to a school the pupils of which attended classes at the collège

de Plessis. He next studied theology, but did not take orders, and became professor of rhetoric in his college, and in 1688 in the collège de France. He was chosen rector of the university in 1694, and was reelected in 1695. In 1696 he became coadjutor at the collège de Beauvais, where his methods of instruction subjected him on the part of the Jesuits to charges of Jansenism, especially as he had shown sympathy with the Port Royalists. He was dismissed from his rectorship in 1712, but held it again for a short time in 1720. Under Cardinal Fleury he was subjected to indignities on account of his enlightened opinions, and on his death public homage to his memory was prohibited by the government. His most popular work, *Histoire ancienne* (13 vols., 1730-'38), has been frequently reprinted in French and in English; the best known abridgment is by the abbé Tailhié (5 vols., 1853). His other works include *Traité des études* (4 vols., 1726-'38), also often reprinted in French and English, and *Histoire romaine* (9 vols., 1738 *et seq.*, the four last by his pupil Crevier; latest ed. by Didot in 10 vols., 1862; abridged by the abbé Tailhié, 5 vols., 1863).

ROLLIN, Ledru. See LEDRU-ROLLIN.

ROLLO. See NORTHMEN.

ROMAGNOSI, Gian Domenico, an Italian jurist, born near Piacenza in December, 1761, died in Milan, June 8, 1835. He was chief civil magistrate of Trent, and the Austrians arrested him in 1799 on account of his alleged sympathy with the French, but he was acquitted. During his detention he observed the deviation of the magnetic needle under the influence of a galvanic current. His discovery, published in a journal of Trent in 1802, attracted little attention until the discoveries of Oersted in 1819-'20. He was successively professor of law at Parma, Pavia, and Milan. After the fall of Napoleon he lost his position at the Milan university, but continued to lecture till 1817. In 1818 he was again tried for treason at Venice, and again acquitted. His most celebrated work is *Introduzione allo studio del diritto pubblico universale* (2 vols., Parma, 1805; 5th ed., Milan, 1836). Complete editions of his writings have been published at Florence (19 vols., 1832 *et seq.*) and Milan (15 vols., 1836-'45).

ROMAIC. See GREECE, LANGUAGE AND LITERATURE OF, vol. viii., pp. 208 and 210.

ROMANA, Pedro Caro y Sureda, marquis de la, a Spanish soldier, born in Palma, island of Majorca, in 1761, died in Cartaxo, Portugal, in 1811. He entered the naval service, and in 1782 participated in the siege of Gibraltar by the united forces of France and Spain. When the war broke out between these two powers, he joined the army. In 1800 he was appointed captain general of Catalonia, and then a member of the supreme council of war. When Napoleon forced the Spanish government to place an army at his disposal, these troops, 15,000 in number, were intrusted to

the command of La Romana, and sent in 1807 to Pomerania; but the general, hearing of the conduct of Napoleon toward both Charles IV. and Ferdinand, determined to leave at once the service of the conqueror. He communicated with the commander of the English fleet cruising at the entrance of the Baltic, and, availing himself of the troops being then in the island of Fünen, succeeded in embarking them on board some English men-of-war, Aug. 17-20, 1808, and landed them safely at Corunna. He was subsequently prominent in organizing the bands of guerillas which proved so terrible to the French. He left a diary, which was published with some of his letters in the supplementary collection of the French *Mémoires relatifs à la révolution française* (8vo, Paris, 1825).

ROMAN CATHOLIC CHURCH, the name popularly given to the body of Christians throughout the world in communion with the bishop of Rome. It is not assumed by the church herself. The holy Roman church is understood of the local church of Rome; but the term Roman is used, especially in French documents, as one of the characteristics of the church, which is styled Catholic, Apostolic, and Roman, because the see of Rome is its centre. In the congress of Vienna Cardinal Consalvi objected to the joint use of the terms "Roman Catholic," but was willing that they should be separately applied to the church, which is Roman by reason of its necessary dependence on the see of Rome, and Catholic on account of its universal diffusion. It is not confined to those of the Latin rite, but includes all of every rite who acknowledge the bishop of Rome as their head under Christ. Nearly 200,000,000 are estimated to belong to it. About 183 archbishops, 693 bishops, and 122 vicars apostolic compose the hierarchy.—The chief doctrines of the church regard the unity of the divine nature in three distinct divine persons, and the incarnation of the second divine person through the mysterious operation of the Holy Spirit in the Virgin Mary, and his death on the cross for the expiation of the sins of mankind. The belief of the incarnation is the ground and motive of the high veneration which is entertained for the Virgin, who is styled Mother of God, because Christ her son is God incarnate. To her is ascribed all sanctity and perfection which can be bestowed on a mere creature, and she is held to have been free from all stain of sin by a special privilege granted her that she might be worthy of the dignity for which she was divinely chosen. The mystery of the redemption is prominent in the teaching and worship of the church. Christ suffered and died, as man, to atone for the sin of our first parents, and the sins of all mankind. As all humanity fell in the first Adam, so in him, the second Adam, all humanity is restored. His death fully expiated the guilt of sin, and presented an atonement in every respect perfect. Yet all men are not

justified and saved, but those only to whom the redemption is applied by means divinely prescribed. Baptism is believed to be chiefly a remedy for original sin, applicable even to infants. Adults having the use of reason must believe in Christ and repent of sin, in order to receive the benefit of the atonement. From those who have forfeited baptismal grace, fruits of penance are required as evidences of their sincere conversion to God, and as conditions to entitle them to the application of the merits of Christ. Nothing that man can do, unassisted by God's saving grace, can take away the guilt of sin, or prove an adequate satisfaction for it; but God requires the humiliation of the sinner, and accepts his penitential works, which derive value from the ransom offered by Christ. They add nothing to it, but they become acceptable through it. Christ is the essential Mediator, through whose blood we must sue for pardon and salvation.—The worship of the church is given to God only, the one eternal Being in the three divine persons, and the incarnate Word, God consubstantial to the Father. Inferior religious honor, which may be called worship in a qualified sense, is given to the Virgin Mary, on account of the gifts and graces with which God has endowed her, and her exalted dignity as Mother of God incarnate. The angels, that is, incorporeal spirits reigning with God, are honored as his creatures, in whom his perfections are reflected, and as his messengers, through whom he has manifested his will. Saints, those who have proved faithful in the divine service to the end, and are already crowned with glory in the kingdom of God, are venerated likewise for their triumphant virtue; the martyrs especially, who died amid torments rather than deny Christ, and the virgins, who throughout life preserved the purity of their affections, are deemed worthy of high honor. But there is an essential difference between the honor given to the creatures of God and that which belongs to God alone. He receives the submission of the understanding and the will, the homage of the affections. He is acknowledged to be the essential Being, the supreme Lord, the beginning and the end of all things. Sacrifice is given to him only, in token of his being the sole source of being and life. Prayer, in its strict acceptance, can be addressed to him only, the Giver of every good gift. Grace and salvation depend on his bounty and mercy. Litanies and prayers to the saints are only appeals to them to intercede with God for us through Jesus Christ. They are not supposed to be omniscient or omnipresent, but to know in God the pious desires as well as the penitential sighs of the faithful. Respect is paid to the crucifix, which recalls to our mind the sufferings of Christ for our redemption, but it does not terminate in the symbol or material object. The kissing of the image, the bending of the knee, the prostration of the body in the ceremonial of Good Friday, are all directed

to Christ the Redeemer. So the images of the saints awake the remembrance of their virtues. The bowing of the head to a statue, or the burning of incense before a shrine, is referred to the saint whose memory is honored for his love of God and his zeal for the divine glory. Relics, that is, objects used by the saints, or particles of their remains, are venerated for the relation they bear to them.—The fall of the first parents of the human race is the fundamental doctrine on which the belief of the mystery of redemption depends. They were created in innocence, and raised to a state beyond the powers of nature, being constituted just and holy by a communication of divine grace, and rendered capable of immortality. The prohibition to eat of a certain tree in the garden in which they were placed was intended to exercise their obedience, that their dependence on the Creator might be manifested. If they had been faithful, they would have transmitted to their descendants the supernatural gifts with which they had been endowed; but their disobedience involved the forfeiture of them for their posterity, as well as for themselves. Original sin is that transgression which is common to the whole human family, each one being estranged from God and liable to his wrath, in consequence of the act of the heads of the race. The natural powers have been weakened by the fall. The freedom of the human will remains, but it is less vigorous than in our first parents. Our nature is not vitiated and depraved, but it is prone to evil and exposed to violent temptation. It is despoiled of supernatural gifts, cast down from the exalted position to which it had been gratuitously raised, and deprived of the special providence destined to it in the beginning. A redeemer was given us, in the person of Christ, who, being God-man, atoned by his sufferings for the sin of our first parents, and merited for us all grace by which temptation may be overcome.—Actual sin is the wilful transgression of the divine law by individuals having the use of reason. It supposes advertence to the malice of the action and the consent of the will deliberately given, although the advertence and consent may not be full, since sins of ignorance occur. The omission to perform duties positively prescribed is also sinful. The design to do evil is criminal even as the act, and the wilful contemplation of forbidden acts may imply guilt on account of the danger of consenting to them. Mortal sin is any act, speech, desire, or thought grievously opposed to the natural or divine law. Sins which imply no direct or grievous opposition to the law of God are styled venial, because their pardon is easily obtained, since they do not separate the soul from God. Slight impatience, rash words, vain self-complacency, may be venial. Deliberate hatred, gross calumny, acts of violence, not to speak of drunkenness, lust, and murder, are mortal sins. The distinction of sins is not derived from the individual who commits them,

although they may be aggravated by his personal obligations. Forgiveness of sins, even the most heinous, is promised to the penitent. Sorrow for having committed them is a necessary disposition in order to obtain it. Perfect sorrow, which is called contrition, springs from divine love, and leads us to detest sin as opposed to the goodness of God and to his essential perfection. Attrition is sorrow of a less perfect kind, arising from an experience of the evil consequences of sin, and a dread of the punishments which await it hereafter. If it weans the heart from sin, and inspires an effectual detestation of it, so as to be accompanied with a firm resolution of amendment, it is held to be useful and salutary, and such as may dispose for pardon in the sacrament of penance. No degree of anguish of mind can insure our reconciliation with God so long as we are not firmly determined to shun sin and the occasions of relapse. The forgiveness of sin properly belongs to God, who is offended. Christ, as God-man, forgave sin, and authorized the apostles to impart forgiveness or withhold it. In virtue of this commission the power of forgiveness is exercised by bishops and priests, as delegates of Christ. The power is judicial, since they may bind or loose, retain or remit; on which account a confession of sin is required from every applicant for its exercise. When this is made with sincerity, humility, sorrow, a willingness to repair the wrong committed, and a determination to shun the occasions of sin, the priest absolves the penitent. This absolution is a judicial sentence, deriving its force from the divine institution.—The sacraments are rites instituted by Christ our Lord as instruments and means of grace, to apply to our souls the merits of his sufferings and death. They are said to contain and confer grace, technically *ex opere operato*, because they are effectual means divinely chosen to impart it, where no obstacle is presented by the receiver. Certain dispositions, however, are required on the part of adults who desire to partake of them. Faith and compunction are necessary on the part of the applicant for baptism. Sorrow with a firm purpose of amendment is likewise required from the professed penitent. The strengthening grace of the Holy Spirit is granted, by the laying on of hands with prayer, to the baptized believer whose heart is free from wilful sin. Sin is forgiven to the dying man who with penitence and hope receives the mystic unction, and for whom the prayer of faith is offered up. The imposition of hands is available for the communication of sacerdotal power, even to the unworthy candidate; but grace is given to him who is called by God, and who with humility corresponds to the divine vocation. Marriage is a great mystery, the image of the union of Christ and the church, to be celebrated with purity of affection. The eucharist, the chief sacrament, is to be approached with hearts cleansed from sin, under penalty of becoming

guilty of the body and blood of the Lord, and incurring condemnation.—The elevation of man to the rank of adopted child of God, and coheir with Christ to God's kingdom, the beatific vision and the eternal union through it with the Godhead, form a destiny transcending the conception and exigency of nature. All help vouchsafed of God to man toward the attainment of this destiny or end must needs be supernatural, like that end itself. This help is called grace. It is God's free gift, by which the mind is enlightened and the will is strengthened, is necessary to conceive a good thought, and still more to undertake or perform any work directed to salvation. This is proffered to all, but is actually dispensed according to a just yet incomprehensible disposition of Divine Providence, with wonderful variety. It does not interfere with the freedom of the human will, which it moves and aids, without imposing necessity. The grace which moves to prayer, if complied with, is usually followed by the grace of action, which enables us to perform our duty. What is beyond our actual strength becomes practically possible, if not easy, by means of the help thus afforded. To God properly belongs the glory of any good which we perform, because our sufficiency, our power, is from him; but to us the reward is promised, inasmuch as we might resist his impulse by abusing our freedom. It is not easy to reconcile the exercise of free will with the divine foresight. We cannot understand how it is possible for us to act independently, and of our own determination, when God from eternity has foreseen our action. It is sufficient for us to know and feel our freedom, without sounding the depths of divine knowledge: The church, having declared the necessity of grace for all supernatural acts, and for the beginning or first thought directed to such an end, has abstained from deciding the controversies of the schools regarding the modes of reconciling the freedom of the human will with such necessity, and with the divine foreknowledge. It suffices then to admit that without the grace of Christ we can do nothing, and to hold that we can do all things in him who strengthens us. The grace of God is not given to the elect alone, since Christ did not die for them only. God wishes all men to be saved, and grants graces remotely, if not proximately, sufficient for this end. The divine commandments are not impossible. If great difficulty be experienced in their fulfilment, even occasionally by just men, grace can be obtained by prayer by which it may be removed, so that what may appear impossible to nature may be rendered easy by grace.—Everlasting beatitude, consisting in the contemplation and enjoyment of God, is the reward promised by him on condition of the fulfilment of his commandments, and bestowed gratuitously on baptized infants or others incapable of personal acts. The punishment of grievous sin is eternal. All guilty of such, who die

unrepentant, are for ever separated from God, and suffer torments. Those who die guilty of slight faults, or debtors to divine justice, are withheld for a time from the enjoyment of heaven. The glory of heaven is immediately attained by baptized infants dying before the use of reason, by adults dying immediately after baptism, by martyrs, and by all who die with perfect love of God, and free from sin or debt of punishment. The soul only is admitted to happiness. The body is subject to dissolution, but is to be raised at the end of time, in order to be reunited to the soul and made partaker of its glory. The degrees of beatitude vary according to the greater or less love of God which distinguishes each of the elect, even as star differs from star in brightness. All the saints, however, will be perfectly happy, because free from all suffering or pain, from all passion or inordinate desire, and rejoicing in the fulfilment of the divine will. We are not called on to scrutinize the divine decrees with regard to election to glory. Its attainment supposes coöperation and fidelity to grace on the part of adults. It is imparted as a reward. God cannot predestine any to torments without reference to their demerits and offences, since punishment is to be inflicted only for transgression.—The teaching of Christ our Lord becomes known to us especially by the preaching of the ministry, tracing back their commission to his apostles. Solemn definitions of faith are the most authoritative forms of this preaching. They are declarations not merely of doctrines contained in the written word, but of revealed truths, whether written or unwritten. Christ himself left nothing in writing; several of his apostles wrote much, and two other sacred writers composed narratives of his life and teaching; but many things belong to the deposit of doctrine which were not explicitly placed on record. The body of bishops feel themselves authorized to propose as revealed truth whatever has come down from the beginning in the church, and been generally acknowledged to appertain to doctrine. In cases of difficulty, when doubts have been raised with regard to some tenet, they feel themselves competent to examine the evidence, and decide whether the doctrine has been revealed. After a definition, it is no longer allowed to question a truth sealed with their approval. Infallibility in judgment is claimed for the body of bishops in union with their head, the bishop of Rome. By it is meant the providential guidance of the Holy Spirit, by which they are directed and enlightened in doctrinal decisions, that they may not mistake error for truth, or propose as divinely revealed what lacks the seal of divine authority. The same infallibility which Christ promised to the church is claimed for the head of the church, when, in the performance of his office of teacher and pastor of the whole of Christ's flock, he defines *ex cathedra* a doctrine regarding faith or morals to be held by the universal church.

(See INFALLIBILITY.) These doctrinal definitions or judgments of the Roman pontiff are of themselves final, and irreformable even before the acquiescence of the episcopal body.—The divine Scriptures are acknowledged by the church as the word of inspiration, written under the impulse of the Spirit of God, and to be received with all faith and reverence. The books of the Old Testament contained in the Jewish canon are admitted, to which are added certain other books written before the coming of Christ, and known to the Jews, especially those of Alexandria, but not fully recognized as of binding authority. These are accepted by the church on ancient testimony, usage, and tradition derived from the apostles. The books of the New Testament contained in the canon include some of which doubt was entertained in the early ages. The canon of the council of Carthage held in 397, and that of Innocent I. and Gelasius in the following century, are followed in the list of sacred books adopted by the council of Trent. The church claims the supreme authority of determining the meaning of the Scriptures, in conformity with the general teaching of the fathers, that is, the ancient Christian writers.—Faith, according to the Roman Catholic view, is the assent of the human mind to divine truth proposed and attested by the church of God. The fact of revelation is essential, since no persuasion, however strong, can give to opinion the character of a revealed truth. It must be propounded by the church, in order to be regarded as a point of Catholic belief. Revelations made to an individual challenge the assent of his mind to the truth manifested to him; but an authoritative declaration by a divinely appointed teacher, the church, the pillar and ground of the truth, is necessary to afford certainty of the fact of revelation to men generally. The assent of the mind must be given to all revealed truth, for the authority of God is alike vouchsafed for all, and the testimony of the church extends to all. Faith is necessary to salvation, so that without it it is impossible to please God. The wanton and proud rejection of a single point of revealed doctrine involves the wreck of faith. Want of opportunity of instruction, insufficiency of evidence proposed, weakness of understanding, and unavoidable prepossessions arising from birth and education may extenuate or excuse the denial of some doctrine, not recognized as revealed. Hence invincible ignorance is admitted by divines in respect to many not actual professors of Catholic doctrine, although God only can determine with certainty the individuals for whom such plea may be available. The exclusive language of church formularies, which declare that without Catholic faith none can be saved, receives this mild interpretation. All baptized children are claimed by the church as her own, since baptism is the sacrament of regeneration, and they continue such until by their wilful profession of condemned error they

forfeit their birthright.—The natural law, as manifested by reason and declared in the decalogue, is the foundation of moral theology. The development of it in the New Testament guides theologians in their examination of duties and rights. The writings of the fathers illustrate many points. The decisions by popes and councils of matters submitted to their judgment are necessarily followed. Moral theology is the scientific discussion of all matters appertaining to conduct, and is consequently most comprehensive, since it embraces whatever has reference to vice or virtue, to the general principles of right, to the obligations of every station in life, and to the infinite variety of circumstances in which individuals may be placed. Much is necessarily left open for dispute in a science which comprises every imaginable case that may wear a moral aspect, on which account complaints are made of the latitude of theological opinions, favorable to relaxation of morals; but it is considered of no small importance that the great principles of morality should be broadly stated and steadily maintained. Confessors study casuistry, as physicians study maladies and infirmities, to understand human disorders, and apply the remedies.—The principles of the Catholic church with regard to civil duties are highly conservative. She is indifferent to forms of government and social institutions, and is content to exercise a salutary influence on society, by inculcating those maxims of right and order which are found in the gospel. She feels bound to respect established authority, and to enforce by moral suasion obedience to those in high station. The early apologists of Christianity confidently appealed to the persecutors themselves as witnesses of the loyalty and submission of the faithful. In the middle ages the church was occasionally in conflict with the civil power, because, being acknowledged by princes and peoples as the representative of God, she sought to restrain the passions of rulers, who called themselves her children, by the laws and maxims of Christ, and to regulate society by the divine law. In the present state of the world, divided into so many independent kingdoms and states, and into opposite sects, she confines her efforts for the moral control of nations to proclaiming the revealed doctrines, and teaching that religion is the only secure basis and strong bond of society.—By discipline Catholics understand all that appertains to the government of the church, the administration of the sacraments, and the observances and practices of religion. The essential worship consists in the sacrifice of the mass, which, although mystical and commemorative, is real and propitiatory, being a bloodless continuation of the bloody sacrifice of the cross. Vespers, that is, evening prayer, are solemnly sung, the psalms of David being employed in the divine praise, with the song of the Virgin Mary, and pious hymns, and prayers. Other portions of the divine office are sung in the cathedral churches of

Catholic countries at various hours each day, by clergymen called canons, devoted to this duty. Besides the Lord's day, or Sunday, which from the apostolic times has been set apart for divine worship, in place of the Jewish sabbath, festivals are celebrated to honor the divine mysteries, and present them to the devout contemplation of the faithful. Many are solemnized in honor of the Virgin Mary, the apostles, martyrs, confessors, virgins, and saints of every class, whose virtues are thus set before the faithful for their imitation. Fasting is also a part of church discipline. Forty days before Easter are devoted to this exercise, in commemoration of the fast of our Lord during that period. Ember days, namely, Wednesday, Friday, and Saturday, in each of the four seasons, are observed as fasts to obtain the divine blessing for the seasons, and worthy ministers for the church, ordinations being held at those times. The eve of great solemnities is observed by fasting, in order to prepare by penance for their celebration. Abstinence is observed on each Friday of the year, and in many countries on Saturday. All these penitential observances are matters of church law, which admits of dispensation. The rites of the mass, and the ceremonies used in the administration of the sacraments, appertain to discipline, which admits of variety and change, although great deference is shown for ancient usage. This serves to connect ancient and modern times, and to manifest harmony in faith and worship. For this reason the Latin liturgy, used from early times in the Roman church, is still employed by the celebrant, although instructions are given in the vernacular language, and facilities are afforded to the faithful for praying in a manner suited to their capacity. The chief points of practice on which changes have taken place in the course of ages are the manner of administering baptism and the eucharist, as also penitential discipline. The solemn mode of baptism was originally by immersion. The candidates used to descend into fountains or streams, or rivers, and sink beneath the waters under the pressure of the hands of the minister. In cases of necessity and danger, less solemn modes were used, which, from being frequent, at length after the lapse of ages became universal. In like manner the eucharist, having been instituted by our Lord under the forms of bread and wine, was generally administered under both kinds for many ages. Exceptional cases were always admitted, which at length proved so numerous as to supersede altogether the ancient usage. The church claims the right to regulate, at her just discretion, whatever regards the manner of administering the sacraments, while she holds their substance to be inviolable. Penance for sin was always enjoined, and was proportioned to the degree of the guilt. It became a regular system about the 3d century. In the East it received a great check in the time of Nectarius, the predecessor of St. Chrysostom, the office of

public penitentiary having been abolished at Constantinople in consequence of a scandal. In the West it was observed with more or less rigor for several ages, but was effectually set aside by the indulgences granted in the 12th and 13th centuries to volunteers in the wars called the crusades. The penitential canons ceased to be applied even in the tribunal of penance, and milder remedies were offered to those who were found unwilling to submit to the severe injunctions of the ancients. Penitential discipline is now almost exclusively confined to the sacrament. Indulgence, or the relaxation of penitential rigor in favor of fervent penitents, was granted by the bishops on certain conditions regulated by the penitential canons. After the change of discipline, indulgences assumed a new form. They were no longer necessary to release from the obligation of the ecclesiastical law, which had gone into desuetude, and were not directed to the forgiveness of sin, which needed the sacramental remedy; but they were offered to the penitents to aid them in satisfying divine justice, by applying to them the superabundant satisfaction of Christ and his saints. They served as incentives to works of piety, such as almsgiving, fasting, and prayer.—The organization of the church consists in its government by bishops, each in charge of a special flock, or portion of the faithful, with subordination one to another, and the dependence of all on the bishop of Rome, as shepherd of the whole fold of Christ. The episcopal character is the same in all bishops, but governing authority, which is called jurisdiction, is possessed in various degrees—in its fulness by the pope, who is the fountain, the streams of which flow to all others. He alone has apostolic authority, which may be everywhere exercised, with due regard to the local prelate, and which is suited to every emergency. During the vacancy of the Roman see, this plenitude of jurisdiction is believed to reside in the cardinals governing *ad interim*. Each bishop governs his own diocese, not as papal vicar, but as ordinary, that is, proper ruler, although in some things his authority is enlarged as delegate apostolic. Several dioceses form a province, which is governed by an archbishop, who however is not allowed to interfere with his suffragans unless when appealed to, or when a council over which he presides deems a visitation necessary. Many ecclesiastical provinces sometimes are united as a nation by means of a primate, who ranks above other prelates. The title of patriarch was given in the early church to the bishop of Alexandria, the see of St. Mark the disciple of Peter, and to the bishop of Antioch, which Peter had governed for some years. Jerusalem also received this title, and even Constantinople. At present there is scarcely a vestige of patriarchal power in these ancient churches, although the title is given to some bishops *in partibus infidelium*, but rather with a view to keeping up the remem-

brance of the authority than to its exercise. Even the patriarchal prerogative of the pope is swallowed up in his primacy, so that he seldom appears as patriarch of the West, choosing rather to rest on his supreme authority. The six senior cardinals derive their titles from suburbicarian churches. There are, besides Rome, nine patriarchal dignities, viz., Constantinople, Alexandria, Antioch (where there are four, for the Maronite, Melchite, Syrian, and Latin rites respectively), Jerusalem, Babylon (of the Chaldean rite), Cilicia (of the Armenian rite), the East Indies, Lisbon, and Venice. The episcopal sees in both hemispheres are technically distinguished as belonging either to the Latin rite or to the oriental rites. Of the former, some are immediately subject to the see of Rome in its patriarchal capacity, or because the titulars are bishops *in partibus infidelium*. This category comprises 10 archiepiscopal sees in Europe, Amalfi, Camerino, Catania, Cosenza, Ferrara, Gaëta, Lucca, Rossano, Spoleto, and Udine, and two in Asia, Babylon and Smyrna; and 81 episcopal sees, together with Ispahan in Persia, Port Louis in Africa, St. John (Newfoundland) and Harbor Grace in America, and Auckland, Dunedin, and Wellington in Oceania. Of sees not immediately subject to Rome, there are in Europe 84 metropolitan sees, the heads of so many ecclesiastical provinces, with 406 suffragan sees. In Asia, the Latin metropolitan sees of Goa and Smyrna have respectively four and two suffragans. In Africa, Algeria forms a separate province, with an archbishop at Algiers and suffragans at Constantine and Oran. The African sees of Angola, Angra, Funchal, Cape Verd, and St. Thomas (Guinea) are suffragan to Lisbon; the bishopric of the Canaries is suffragan to Seville, and that of Réunion to Bordeaux. The 30 ecclesiastical provinces of North and South America comprise 165 sees, of which 135 are suffragan. British America has 22 bishops with 5 metropolitans, and the United States have 56 dioceses, 10 metropolitan sees, and 6 vicariates apostolic. The episcopal sees of Guadeloupe and Martinique are suffragan to the archbishopric of Bordeaux. Oceania has two ecclesiastical provinces, that of Manila with 4 suffragans, and that of Sydney in Australia with 9. The churches belonging to the various oriental rites in communion with the Roman pontiff comprise 13 Græco-Ruthenian sees, of which 2 are in Russia, 1 in Prussia, and 10 in the Austro-Hungarian monarchy; one Græco-Roumanian metropolis, with 3 suffragan sees, also in the Austro-Hungarian monarchy; an Armenian metropolitan see at Leopoldstadt in Hungary; in Asia, the Armenian patriarchate of Cilicia, with the Armenian metropolitan sees of Aleppo, Casarea, Marash, Mardin, and Melitene (Malatiah), and 11 suffragan dioceses; the Græco-Melchite patriarchate of Antioch, with the archbishoprics of Aleppo, Damascus, Emesa (Homs), and Tyre, and 9 suffragan sees; the patriarchate

of the Syrian rite at Antioch, with metropolitans at Aleppo, Babylon, Damascus, and Mosul, and 8 suffragans in various cities, including Alexandria; the Syro-Chaldean church, with a patriarch at Babylon, 4 archbishops, and 7 bishops; and the Syro-Maronites, with a patriarch at Antioch, 5 archbishops, and 3 bishops, including one in Cyprus. The Egyptian as well as the Abyssinian Copts have no regular hierarchy, but depend respectively on vicars apostolic resident among them. The Bulgarian Greeks are also under the jurisdiction of a bishop consecrated in 1865, with the title of apostolic administrator. Of the Asiatic Catholics, the Melchites are the most energetic and devoted. Besides the above episcopal functionaries, there is a large class of bishops called vicars apostolic, who superintend the spiritual welfare of the Catholics wherever it is not found practicable to establish sees and a regular hierarchy. There are 2 vicariates in the German empire, 1 in Gibraltar, 3 in Scotland, 1 in Sweden, 21 in the Chinese empire, 14 in the adjacent kingdoms, 23 in India and Burmah, and others in Asia Minor, Abyssinia, the Galla country, Madagascar, and among the various tribes and settlements along the entire seaboard of Africa. In America there are vicariates apostolic in the valley of the Mackenzie, British Columbia, Lower California, the Antilles, British and Dutch Guiana, and in the territories and at various other points in the United States. Vicars apostolic also preside over the missionary labors of the chief island groups of Oceania. At other points in European and other countries, where the presence of a bishop is either undesirable or unnecessary, priests with special faculties, denominated prefects apostolic, minister to the wants of scattered Catholics. They are to be found in Iceland, Norway, Schleswig, and Switzerland, on the most dangerous Asiatic and African missions, &c. There is no dependence or connection between the members of the hierarchy in the various portions of the world, under different civil rulers, but all are linked together in unity by means of Rome, the common centre. The general government of the church is carried on at Rome, where the pope is assisted by the body of cardinals, several of whom compose standing committees to examine and prepare the matters for final action. Nearly 30 belong to the congregation of propaganda, which is charged with a general superintendence of missionary countries. The appointment of bishops is made on the recommendation of the local prelates, with the advice of the cardinals. In several monarchies the nomination is given to the sovereign, with a power of rejecting or confirming reserved to the pontiff.—The religious orders in the church are like corporations in a civil government, having special exemptions and privileges. They derive them from the pope, who, in virtue of his apostolical authority, exempts the members from the jurisdiction of the bishops in

what regards their domestic discipline, but leaves them dependent on them for faculties to be exercised in behalf of the faithful. Their privileges, however, are moderated and regulated in such a manner as not to weaken the diocesan authority, or favor insubordination, but only to encourage religious discipline and promote piety. The superior greatly lightens the burden of episcopal solicitude by training and watching over the members of the community, who themselves are rewarded for the restrictions to which they voluntarily subject themselves, by the security which is given them to pursue unmolested the path they have chosen. (See MONACHISM.)—The history of the church begins with the pastoral commission given after Christ's resurrection to the apostle Peter, who, according to Catholic ecclesiastical traditions, sealed his apostolic labors with martyrdom at Rome in the year 67, on the same day as the apostle Paul. This event attached his office to this see. Clement, bishop of Rome, wrote to the Corinthians, in the name of the church, at the close of this century, while St. John was still alive, remonstrating with them on a schism which had broken out among them. The labors of the several apostles are not known in full detail. The apostle Paul labored more than all others, and with marked success. St. James, who is called the brother of the Lord, presided as bishop at Jerusalem, and died a martyr. St. John passed the latter years of his life in Asia, and terminated his course at Ephesus. St. Mark, the evangelist, founded the church at Alexandria. At the close of the apostolic age the Christian religion was widely spread, chiefly throughout Asia Minor and some more distant provinces, Greece, the adjacent islands, Italy, and Egypt. Gaul is believed to have been partially evangelized in that age, and Spain is said to have been visited by the apostle Paul, who purposed making this journey, and, as the national tradition will have it, by St. James. In the early part of the 2d century the countries on the left bank of the Rhine, as far as Belgium, had received the gospel, as St. Irenæus testifies. This bishop succeeded St. Photinus, disciple of St. Polycarp, at Lyons in 178. Britain received missionaries under Eleutherius, bishop of Rome, about the same time. A council of 70 African bishops was held at Carthage toward the end of the century; and 90 bishops assembled in Numidia. The relations of the bishops generally to Rome, on account of its higher chieftaincy, are distinctly stated by Irenæus, who, however, earnestly remonstrated with Pope Victor on his determination to cut off various Asiatic churches from communion for their attachment to the usage of celebrating Easter on the same day as the Jews. In the middle of the 3d century a synod of Spanish bishops deposed Martial of Leon and Basilides of Astorga for criminal weakness in the persecution during the reign of Decius. The acts of various councils of

African bishops are known, especially from the writings of St. Cyprian, who warmly resisted the decree of Pope Stephen by which the repetition of baptism conferred by sectaries was forbidden. The controversy finally resulted in the following century in the acquiescence of the church generally in the decree, which was supported by the council of Nice. The 4th century, after some scenes of persecution, witnessed the triumph of Christianity by the conversion of the emperor Constantine. Although he decidedly favored it, and lent his power to its support, nevertheless he is believed not to have received baptism until the approach of death. By his mandate a council of bishops was called at Nice, where about 318 convened in the year 325, and proclaimed Christ to be God, consubstantial to the Father. Sylvester, the bishop of Rome, was prevented by old age from being present, but Hosius, bishop of Cordova, and two priests represented him. The Nicene symbol met with great opposition on the part of bishops who had received the doctrines of Arius, and were supported by Constantius, the successor of Constantine. A council of bishops at Rimini, under imperial influence and constraint, consented to suppress the term which proved so offensive, and the occasion of so much strife; but on recovering their liberty they retracted, and Pope Liberius annulled their acts by the authority of St. Peter. The 5th century was illustrious for the pontificate of St. Leo, whose prayers were believed to have turned away the wrath of Attila, advancing to destroy Rome. His exposition of the mystery of the incarnation crowned the efforts of his predecessors for the maintenance of the faith, and received the homage of the bishops assembled at Chalcedon. "This," they cried, "is the faith of the fathers. We all have this faith. Peter has spoken by the mouth of Leo." At Nice the fathers developed the meaning of the apostolic symbol by phrases and clauses necessary to meet the subtleties of innovators. At Constantinople a special statement was inserted in the creed to place the divinity of the Holy Spirit beyond dispute. At Ephesus the bishops inflicted excommunication on Nestorius, bishop of Constantinople, for obstinacy in resisting the authority of Pope Celestine, who condemned his errors. At Chalcedon the letter of St. Leo was adopted as the symbol of orthodoxy, and subscription to it was exacted, under the same penalty. Those councils served to define with precision the revealed mysteries, and were generally subsidiary to the papal action. The acts of those of Nice and Constantinople are not preserved in their integrity, but the extant records of those of Ephesus and Chalcedon show that the legates of the pontiff led the way, and the fathers followed his authority. At the close of the 6th century Gregory the Great, bishop of Rome, conceived the idea of evangelizing the Angles, or English, who had settled in Britain without adopting the Chris-

tian faith of its former inhabitants. The mission of the monk Augustin, at the head of a band of his brethren, proved eminently successful. A see was founded at Canterbury, and the church was fully organized with close dependence on the chair of Peter. The 7th century was marked by the general diffusion of the faith in England, and the more perfect organization of the English hierarchy. In the 8th century the Germans in great numbers were brought to the faith by the preaching of Boniface, called also Winifrid, an English missionary. He distinguished himself by his devoted attachment to the apostolic see, to which he made a solemn oath of duty. Various other missionaries, from Ireland especially, preached the faith about the same time with like success. It spread also toward the regions of the north, Denmark, Sweden, Norway, and Iceland. The scandals of the 10th century disfigured the church, since unworthy men struggled to occupy the papal chair, or to place in it their relatives and adherents. The influence of the emperors of the West had greatly declined, and some Italian nobles aspired to the pontificate. The intrusion of one or two youths and of several men of licentious habits disgraced the high office; but after a time men of wisdom and piety were once more at the helm. Hildebrand attained to the pontificate in 1073, under the name of Gregory VII. With all his zeal and the authority of his office, he condemned the marriage of the clergy, which from toleration had become not unfrequent. He resisted the emperor Henry IV., who disposed of bishoprics, abbaies, and other high offices, for corrupt considerations. The inveterate character of these abuses and the imperial influence involved the pontiff in a long and fierce struggle, in which he seemed to succumb, dying in exile, but in reality overcame, leaving his successors to reap the fruits of his labors. The contest between the popes and the emperors continued, with intervals of rest, throughout the 12th and 13th centuries. Investitures were in the beginning of this period the chief subject of disputes, the popes resisting the claims of the emperors to invest bishops with the temporalities of their sees, by delivering to them the ring and crosier, chief symbols of episcopal authority. The opportunity thus furnished for promoting unworthy men, courtiers, and favorites, determined the popes to vigorous resistance; and although Paschal II. yielded for a moment to imperial violence, on the recovery of his liberty he retracted his consent, and humbled himself for his weakness. Innocent IV., in the middle of the 13th century, in the council of Lyons deposed the emperor Frederick II. for various acts of simony, sacrilege, and tyranny, following out the principles and the example of Gregory VII., who was the first to proceed to a similar deposition. The 14th century is remarkable for the removal of the papal chair to Avignon by Clement V., who, in the dis-

tracted state of Rome, accepted the protection of the French king. His example was followed by his successors for nearly 70 years, popularly styled by the Romans the Babylonish captivity. These French popes were bishops of Rome, which they governed by cardinal vicars acting in their name. The restoration of the chair to that city was followed by a schism, formed by French cardinals, who elected Clement VII. in opposition to Urban VI., the pope residing at Rome. An attempt to terminate the rupture by setting aside both claimants resulted in the election of Alexander V. in the council of Pisa, and the three pretendants had their respective followers. At length, in the council of Constance, opened in 1414, Martin V. was chosen (1417) and acknowledged. The Greeks returned for a short time to the communion of the Roman see in the council of Florence held in 1439, but were drawn back by the persevering efforts of Mark, bishop of Ephesus, who resisted every influence employed by his colleagues and by the Greek emperor at the council. Constantinople a few years afterward fell under the power of the Turks, and the degradation alike of the eastern church and empire was consummated. Some popes of doubtful fame appeared in the decline of the 15th century, and one of acknowledged depravity at its close. The warlike career of Julius II. and the golden age of Leo X. were not calculated to restore the high character for austerity and zeal which the pontiffs had generally borne. The bold monk of Wittenberg appeared on occasion of the indulgences which Leo offered to contributors to the grand fabric of St. Peter's. The rivalry of two religious orders added fuel to theological disputes, which on the part of Luther were marked by great boldness. He soon became a leader, and before he was fully aware he was the head of a sect inculcating principles subversive of the papal authority, and more successful than its predecessors in the 13th and 15th centuries, the sects of Albigenses and Husites. A number of minor sects soon appeared, and a vast portion of the Catholic world, perhaps fully a third, was drawn away from obedience to the Roman see. Henry VIII., king of England, from a champion of the faith, became an enemy when his desires for a divorce were thwarted by Clement VII. The progress of the reformation was soon arrested by the zeal of many devoted men, founders of various religious institutes, especially by the followers of Ignatius Loyola, whose labors caused a considerable reaction in favor of the church of Rome. These labors proved more effective than the more violent intervention of Charles V., Philip II., or the inquisition. The saintly Pius V., the stern Sixtus V., and others of less marked character, performed well the duties of their office. The religious wars of the 16th and 17th centuries ended with the triumph of Catholicism in France and a partial victory of Protestantism in the Netherlands and Germany.

The subtleties of Jansenius, bishop of Ypres, annoyed the church in the 17th and 18th centuries, his followers, after his example, employing the authority of Augustine to countenance doctrines decidedly Calvinistic. The French church especially was harassed by these doctrinal disputes. They prevailed throughout the early part of the 18th century, and prepared the way for the triumph of infidelity in the revolution. In the present century there is a manifest reaction. The church of France, after much persecution, is intimately united with the see of Peter. In the German empire since 1870 a serious conflict has arisen with the civil power; but now (1875) a compromise seems likely to be made. (See GERMAN; also ITALY, SPAIN, and SWITZERLAND.)

ROMANCE LANGUAGES, also called *Romantic languages*, tongues developed from Latin through admixture of Germanic, Celtic, and other idioms. They are Provençal, French, Spanish, Portuguese, Italian, Wallachian or Rouman, and perhaps also Romansh. These languages are not direct descendants of the classic Latin, for when the Germanic races settled in the Romance countries Latin was spoken only by the clergy, and in the 6th century Boëthius and Cassiodorus were the only lay writers who still made use of it. Though Latin proper ceased to be a living tongue about the beginning of the 6th century, the *lingua rustica*, or vulgar Latin, the speech of the populace of the Italian peninsula, continued to be spoken both at home and in the Latinized countries, and came to be designated as the *lingua Romana* or Roman language. (See ITALIC RACES AND LANGUAGES, and LATIN LANGUAGE AND LITERATURE.) Raynouard has attempted to show that this *lingua Romana* was the same as the Provençal of southern France, and that French, Italian, and the other Romance languages were its daughters, and not its sisters. This theory was at once assailed and has since been refuted, with different lines of research and argument, by French as well as English and German scholars.—See Sir G. Cornwall Lewis's "Essay on the Origin and Formation of the Romance Languages" (2d ed., London, 1862); Max Müller's "Lectures on the Science of Language" (1st series, London, 1861); and the separate articles on the languages in this Cyclopædia.

ROMANS, Epistle to the, one of the canonical books of the New Testament. The epistle was written by the apostle Paul, according to the opinion of most critics, in A. D. 58, during his abode at Corinth, where he stayed about three months after making a journey through Macedonia and Achaia. Paul despatched the letter by a Cenchrean woman who was traveling to Rome, and sent greetings from an inhabitant of Corinth. Many modern commenta-

tors suppose that the debates mentioned in ch. xiv. and xv. called forth the epistle. Its special bearings are particularly manifest in ch. xiii. to xvi., in which Paul shows to both Jews and gentiles the glory of Christianity as being the only true religion, and especially endeavors to confirm the faith of the converts from Judaism.—As to its contents, the epistle consists of two chief divisions, one of which is argumentative, the other hortatory. In the former, the apostle, after an introduction (i. 1-16) expressing his desire to see the saints at Rome, sets forth the gospel plan of salvation. The gospel is a power unto salvation to every one who believes, both Jew and gentile; it is needed by all, for none, not even the Jew by his law, are justified before God (i. 16 to iii. 20). It is only faith in Christ which works justification, even as Abraham and David were justified by faith (iii. 21 to iv. 25). Those who are justified have peace with God, and rejoice; for through Christ, the reconciler, a new life has begun for mankind (ch. v.). But with reconciliation holiness must be connected, not under law, but under grace (vi., vii.). The spirit of life in Christ overcomes sin and the flesh, and all earthly sufferings, through hope; the believer lives already here below in security (viii.). The apostle then deprecates the rejection of Jews, but finds some consolation in the assurance that it will not be final (ix. to xi.). In the second or hortatory part the apostle enjoins various duties (xii.), in particular duties to magistrates (xiii.). He urges mutual forbearance (xiv.), and especially admonishes the strong to bear with the weak (xv.), and concludes with various salutations and directions (xvi.).—The authenticity of the epistle has rarely been impugned, though Bruno Baur has denied the genuineness of the last two chapters, and Semler, David Schultz, Weisse, and Ewald have maintained that ch. xvi. did not originally form a part of the epistle. Weisse and Ewald consider it a fragment of an epistle addressed to the Ephesians. Renan has supposed that the epistle was written originally as a circular letter, four copies being made with different endings, and sent to the churches in Rome, Ephesus, and Thessalonica, and to some church not known. Lightfoot maintains that it was first written to Rome, but afterward altered by Paul in the address and salutations, and sent out generally.—The literature on this epistle is very copious, and is detailed in De Wette's *Einleitung in das Neue Testament* (8th ed., Berlin, 1869), and in the American edition of Lange's commentary. It is treated in the general commentaries of Estius and Cornelius a Lapide, written from the Roman Catholic standpoint, and of Calvin, Bengel, Olshausen, De Wette, Meyer, Alford, Wordsworth, and Ewald; and in special works by Reiche (Göttingen, 1833-'4), Hodge (Philadelphia, 1835; enlarged ed., 1864), Fritzsche (Leipsic, 1836-'43), Rückert (2d ed., 1839), Turner (New York, 1853), Tholuck (5th ed., Halle, 1855),

Van Hengel (Bois-le-Duc, 1855), Umbreit (Gotha, 1856), Brown (Edinburgh and New York, 1857), Stuart (6th ed., Andover, 1857), Jowett (2d ed., London, 1859), Vaughan (2d ed., 1861), Mangold (Marburg, 1866), Forbes (Edinburgh, 1868), Hofmann (Nördlingen, 1868), and Paulus (Zürich, 1875).

ROMANS, King of the. The coronation of Otho I. of Germany by Pope John XII. at Rome in 962 was considered as having transferred the imperial dignity bestowed by Leo III. on Charlemagne (800) from his Italian to his German successors, the title of emperor depending, however, on the coronation at Rome. Before that coronation the German monarchs, down to the time of Maximilian I., styled themselves kings of Germany (though by historians indiscriminately designated as emperors), and improperly also kings of the Romans. In a stricter sense the latter title belonged to the princes elected in the lifetime of crowned emperors to succeed them; Henry VI. was thus elected king of the Romans, or future emperor, in the lifetime of his father Frederick Barbarossa (1169). Maximilian I. and his successors assumed the imperial title, and were crowned as emperors in Germany without being crowned in Rome, Charles V. alone being crowned by the pope. Their successors elect continued to be called kings of the Romans down to Joseph II., who was elected in the lifetime of his father Francis I. (1764), and the empire continued to be called the holy Roman empire down to its dissolution in 1806.

ROMANSH, or Rومانsh, also called Romanese and Rhaeto-Romanic, a language spoken in the Grisons, Switzerland, and the bordering districts of Tyrol, comprising a portion of ancient Rhaetia. Though it is commonly grouped with the Romance languages, its peculiar construction and the great degree in which it has been subjected to foreign influences, as well as the arbitrariness with which it has always been written, have so obscured its original character as to render it very doubtful whether it has ever been a direct sister of Provençal, French, or Italian. The Germans call the language Churwälsch after the name Churewala anciently given to its territory. The term Rhaeto-Romanic is a modern invention, never used by the people speaking the language. The natives call it *rumonsch*, the Provençals *romans*. It has been maintained that the Rhaetians were of the same origin with the Etruscans, but this view cannot be said to be established. (See ETRURIA.) In the time of Augustus Rhaetia was conquered by the Romans, and the original language was in a measure displaced by Latin. Several centuries later the western portion was occupied by Alemanni and the eastern by Boioarians, which brought about a greater confusion in the Latin elements, and produced a preponderance of Germanic forms. Two main dialects are now distinguished, Romansh proper and Latin, each of which has several varia-

tions. There are about 70,000 persons who still speak it, about 15,000 of them living in Tyrol. The earliest monument of the language is a version of the New Testament, published in 1560; and the various poetical and theological works, all of a minor character, since produced, number about 180 volumes by 150 authors. The language is now gradually succumbing to German.—See Andeer, *Ueber Ursprung und Geschichte der rhaeto-romanischen Sprache* (Coire, 1862), and Rausch, *Geschichte der Literatur des rhaeto-romanischen Volkes* (Berlin, 1870).

ROME, a city and one of the county seats of Oneida co., New York, on the W. bank of the Mohawk river (which here changes from a S. to a S. E. course), at the junction of the Erie and Black River canals, and at the intersection of the New York Central, the Rome, Watertown, and Ogdensburg, and the Rome and Clinton railroads, 15 m. W. N. W. of Utica and 110 m. by rail W. N. W. of Albany; pop. in 1870, 11,000; in 1875, 12,511. It is laid out with wide streets, well shaded with maples and elms. Public and private parks and fountains add to its beauty, and pure water is obtained from the Mohawk. The city contains 200 wholesale and retail stores, three banks, two savings institutions, two rolling and puddling mills, a knitting mill, sash, blind, and planing mills, locomotive and car works, and minor manufacturing establishments. There are ten schools, a free academy, and an institution for the education of deaf mutes, two weekly newspapers, and 15 churches.—Fort Stanwix, of revolutionary fame, was in what is now the heart of Rome, and the battle of Oriskany was fought just outside of its limits. The fort was besieged by the British in July and August, 1777. Rome was incorporated as a village in 1819, and as a city in 1870.

ROME, a city and the county seat of Floyd co., Georgia, at the confluence of the Etowah and Oostenaulla rivers, which here form the Coosa, 60 m. N. W. of Atlanta; pop. in 1870, 2,748, of whom 1,005 were colored; in 1875, including the suburban villages of South Rome, Forrestville, and De Soto, about 6,000. The Selma, Rome, and Dalton railroad passes through it, and it is connected by the Rome railroad (20 m. long) with the Western and Atlantic railroad at Kingston. The Oostenaulla is navigable by steamers 70 m. above this point, and the Coosa 180 m. below, to Greenport, Ala. Rome is situated on several picturesque hills, which command an extensive view of mountain scenery. It has the finest water works in the south. It is in the centre of the rich iron ore deposits of N. W. Georgia, and is the nearest town to six blast furnaces now in operation. It contains a rolling mill, a nail factory, and two iron foundries and machine shops. There are three private banks, two female colleges, two male high schools, seven primary schools, two newspapers (one daily and weekly and one tri-weekly

and weekly), and eight churches.—Rome was incorporated in 1847. It was occupied by the forces of Gen. Sherman, May 19, 1864, during the advance on Atlanta.

ROME (Lat. and It. *Roma*), the chief city of ancient Italy, ultimately the capital of the Roman empire, and now the capital of the kingdom of Italy. Its origin is lost in the mists of antiquity, for modern criticism has dispelled nearly all belief in the legends which for many centuries passed as historic testimony respecting the primitive city. There are grounds for the supposition that small fortified towns or villages stood on each of the seven hills now comprised within the walls of Rome. On the Palatine hill there were probably two such fortresses in prehistoric times, one Etruscan, the other either Pelasgic or Sabine. The more fully developed city and state seems to have risen from a union of the inhabitants on the Palatine with the Etruscans, Sabines, and Pelasgians, and perhaps also with other peoples,

What is known as the fall of the Tarquins was probably the overthrow of the Etruscan power. The population of Rome then consisted of the patricians and their clients, and of plebeians. The patricians were the original Roman people, and were divided into three tribes, the Ramnenses, the Titienses, and the Luceres, who represented the Latin, the Sabine, and the Etruscan elements of that population. The clients were the dependants of the patricians. The plebeians, or commons, were freemen, but had originally no political rights. They owed their existence to conquest and other causes, and they were mostly of Latin origin. By the Servian constitution they were incorporated into the state. This change was long regarded as the subversion of a popular constitution, by the substitution of an aristocratical polity; but Servius, or whoever it was by whom the change was made, did really, by establishing the constitution of the centuries, and constituting the order of equites, a distinct political body, of mixed patrician and plebeian elements, break up the patrician monopoly of power, and prepare the way for those further political reforms by the success of which Rome became mistress of the ancient world. The change was liberal, and opposition to its facts and its principles was never permanently successful. That regal Rome was powerful, and possessed an extensive territory and a large population, is established by the greatness of its public works, some of which endure to this day; and also by the terms of the treaty between Rome and Carthage, which, made in the first year of the republic, shows that the whole Latin coast was subject to Rome. The republican polity is supposed to have been established about the year 510 B. C. The most ancient history of Rome of which we have any knowledge was written in Greek by Fabius Pictor, a Roman citizen who served in the Gallic war, 225 B. C. No fragment of it remains. We know only by vague report of a similar work in Greek by Timæus, a Sicilian, who brought his history down to about 261. The earliest history of Rome in Latin is by Cato the Censor, who died in 149. The Servian constitution, as a whole, was lost as one of the effects of the overthrow of the monarchy; but it was gradually restored in part, its principles characterizing all the subsequent struggles of the plebeians to obtain power in the republic. Early republican Rome was a weak state, and for a century and a half it exercised little influence at home, and none abroad. Not only the kings fell, but the country fell with them. Rome is believed by modern historians to have been conquered by Porsena, and when she recovered her freedom, she was no longer the head of Latium; and during the next 150 years she was employed in recovering the ground she had lost. This slow advance was owing to internal convulsions. The political contests between the patricians and the plebeians were bitter, and

Plan of the Roman Hills.

long previously settled on the adjacent hills. (See *ITALIC RACES AND LANGUAGES*.) This union seems to have reached a state of political and constitutional perfection about 51½ centuries B. C., in the reign of that monarch who is known as Servius Tullius, and toward the close of the regal period. During that period a Roman state had grown up (according to the legends, ruled successively by Romulus, the reputed founder about 753 B. C., Numa Pompilius, Tullus Hostilius, Ancus Martius, Tarquin the Elder, Servius Tullius, and Tarquin the Proud), which seems to have been a powerful monarchy, and which may have been, as Müller thinks it was, in the times of the Tarquins and Servius, ruled by an Etruscan dynasty, by whom Etruscan usages were introduced into Rome. Its mythology resembled that of the Greeks. (See *MYTHOLOGY*, vol. xii., p. 118.) This monarchy embraced a portion of southern Etruria and the whole of Latium.

Rome and its Vicinity, Ancient and Modern.

more than once they threatened the utter destruction of the state. The plebeians seceded from Rome about 494, with the intent to found a new city; but a compromise was effected, and plebeian tribunes were created, for the purpose of protecting members of their order against the cruel and unjust action of patrician magistrates; during their year of office, the persons of these tribunes were to be sacred and inviolable. The number of tribunes was increased, until they became ten; and they possessed the veto power, which enabled them to stop any law, or to annul any decree of the senate, without assigning any cause for their action. They were the representatives and protectors of the plebeians, and none but plebeians could be made tribunes. The plebeians were at the same time allowed to elect two ædiles. By the Publilian law it was provided that these tribunes and ædiles should be chosen by the tribes in the forum, and not

at the assembly of the centuries in the Campus Martius. The first free election was held about 470. Spurius Cassius, who was finally put to death by the patricians because he had successfully advocated a popular agrarian law, formed leagues with the Latins and Hernici, by which the Volsci and Æqui were prevented from conquering Rome and Latium. The legends of the elder Brutus, Lucretia, Valerius Publicola, Horatius Cocles, Mucius Scaevola, Menenius Agrippa, Coriolanus, the dictator Cincinnatus, and the Fabii belong to this first period of the republic. Historically, Cincinnatus appears as a stern oligarch. The decemvirate was established in 451 (according to the commonly adopted chronology), and lasted but two years, the period of its existence being a patrician despotism, to which belongs the legend of Virginia. The consuls elected in 449 (according to some the first, the supreme magistrates of the republic having previously been

called *prætors*) were L. Valerius Potitus and M. Horatius Barbatus. Several popular laws were passed under their lead, by which an appeal to the people was secured to every citizen, the people including the plebeians, and the assembly of the tribes was endowed with full legislative power. The Canuleian law provided that patricians and plebeians might intermarry. A proposition to throw the consulship open to the plebeians led to the establishment of military tribunes, to which offices plebeians were eligible. The censors were now first appointed. The *quæstorship* was thrown open to the commons in 421, and this opened the senate to them. Veii was conquered in the beginning of the 4th century B. C. by Camillus. About 390 Rome was taken by the Gauls under Brennus, after a battle on the banks of the Allia, and destroyed, with the exception of the citadel on the Capitoline hill, which was bravely defended through a siege of seven months. According to one account, the dictator Furius Camillus defeated Brennus and totally destroyed his army; but the better sustained tradition is that the Gaul quitted Rome as a conqueror, after receiving 1,000 lbs. of gold as a ransom for the defenders of the fortress. The people then wished to settle at Veii, but their design was prevented through the influence of Camillus. They were reduced to great misery, and to this time belongs the story of Manlius Capitolinus, who, like earlier popular leaders, was charged by the patricians with aspiring to kingly power and put to death. The Licinian rogations were brought forward in 376, by the tribunes C. Licinius Stolo and L. Sextius; they provided that debtors should be relieved, that the occupation and use of the public domain should be limited, and that one of the consuls should be a plebeian. After a contest of about ten years, these rogations became law; and during the contest a law was passed committing the charge of the sibylline books equally to plebeians with patricians, an invasion of the monopoly of the religious ministry of the state which the latter had long held. L. Sextius was the first plebeian consul, chosen at the election next following the triumph of the measures of himself and his colleague. At this time the judicial power was taken from the consuls, and placed in the hands of the *prætor urbanus*, a newly created patrician magistrate. The *curule ædileship* was created, to which members of both orders were eligible. These changes were the most important events of Roman history. Not only did they go far to unite the two orders, and so put an end to those civil contests which had prevented the military advance of the Romans, but by enlarging the sphere and elevating the spirit of citizenship, they created the citizen legions by whom the conquest of Italy was effected. But for this, the Samnites would probably have become masters of the Italian peninsula. The patricians did not immediately submit to the Licinian laws, both con-

sulships being at times held by members of their order down to 343; but after that time they were divided regularly. In 172 both consulships were opened to the plebeians. The first plebeian dictator was C. Marcius Rutilus (356), who was chosen censor five years afterward. For many years after the restoration of Rome under Camillus, the wars waged by the Romans were carried on against Volscians, Æquians, Etruscans, and Gauls, and were successful contests, the victors behaving with much liberality to those of the vanquished whom they incorporated into the state, making them citizens, and increasing the number of the tribes. Fears of the Gauls led to the renewal of the Latin league in 358. The first Samnite war began in 343, and the immediate occasion of it was the demand for assistance by the Capuans against the Samnites, they surrendering their city to Rome. It lasted little more than a year, when peace was made in consequence of the renewal of internal troubles; and the settlement of those troubles was followed by the Latin war, which ended (339) in the complete triumph of the Romans. The second Samnite war was begun in 326, and lasted about 22 years. Its fortunes were various, including the disaster of the Caudine forks, but the Romans were finally victorious. The Etruscans made war upon Rome, but were defeated. The third Samnite war opened in 298, and Samnium submitted to Rome in 290. The Gauls and Etruscans were also defeated in the same war. During the time of these wars several political measures were carried at Rome which tended to establish equality between the plebeians and patricians; and by the Ogulnian law the pontificate and the augurate were opened to the plebeians. The passage of this law, in 300, is considered as the establishment of the Roman constitution. "What is called the constitution of Rome," says Arnold, "as far as regards the relations of patricians and plebeians to each other, was in fact perfected by the Ogulnian law, and remained for centuries without undergoing any material change. By that law the commons were placed on a level with the patricians, and the contests between these two orders were brought to an end for ever. The *comitia* too had assumed that form, whatever it was, which they retained to the end of the commonwealth; the powers of the magistrate as affecting the liberty of the citizen underwent but little subsequent alteration." The subsequent civil troubles were social, or were brought about by the ambition of able men who sought to make use of "the forum populace," a class entirely distinct from the plebeians, with whom they are often confounded; or they were caused by attempts to effect great reforms, like those of the Gracchi, which sought the restoration of the old constitution after its provisions had long been neglected or violated by the ruling classes. The last secession of the plebeians took place in 286, and

was appeased by the enactment of the Hortensian laws, which reduced debt, divided lands among the needy, and provided that all the resolutions of the tribes should be law for the entire people. This last measure clothed the people with supreme legislative power, and took from the senate its veto on their action. The dictator Hortensius put an end to that dispute in which the people had been supported by Curius Dentatus, one of the most popular Roman characters, both with his contemporaries and in history. He had previously conquered the Sabines of the mountains. The extension of their dominion to the south now brought the Romans into collision with the Italian Greeks, at the same time that they were defeating the Gauls in northern Italy. They aided the Thurians, who were of Greek origin, against the Lucanians and others, who were believed to be incited by the people of Tarentum, one of the most opulent and powerful of the Hellenic communities. A Roman army was marched to Tarentum, and the Tarentines called Pyrrhus, king of Epirus, to their aid. This was at the close of the year 281. Pyrrhus landed in Italy with more than 20,000 men, and defeated the Romans at Heraclea, and afterward at Asculum. He was not well supported by the Italians; and in consequence of an alliance between Rome and Carthage, he made peace with the Romans, who had an excellent consul in Fabricius, and went to Sicily, where he pursued a brilliant but unsuccessful career till 276, when he returned to Italy, where he was defeated in the following year by Curius Dentatus, near Beneventum. The Romans now pursued their course of Italian conquest, and about 264 they had become masters of all ancient Italy. In that year the first Punic war broke out. The Romans resolved to assist a body of mercenaries, called Mamertines, who had possession of Messana in Sicily, against Hiero, king of Syracuse. Hiero was defeated and retired, but the victors then attacked a Carthaginian force, which also had been sent to the assistance of the Mamertines, and defeated it. War was then declared against Carthage. It lasted 23 years, with various fortune. Though ignorant of naval matters, the Romans soon learned to defeat the Carthaginians at sea, after rapidly effecting the conquest of nearly all Sicily, making peace with Hiero, and leaving him in possession of his small but rich kingdom. Their first naval victory was won by C. Duilius in 260. It was followed by other successes, and Sardinia and Corsica were invaded. The Carthaginians were reduced to the defensive in Sicily, holding there only a few strong places. In 256 M. Regulus and his colleague Manlius defeated the Carthaginians in the greatest sea fight of those days, and then landed in Africa, which was incapable of making any resistance. Regulus was left to continue the work of conquest, with only 15,000 men; he was at length defeated, and his army destroyed and

himself taken captive, by an army commanded by the Greek Xanthippus. The Romans also lost two fleets by storms. They were more fortunate in Sicily, capturing Panormus, and totally routing the Carthaginian army that sought to recover the town. The Romans began the siege of Lilybæum in 250, building a third fleet to blockade it, but this was destroyed by the Carthaginians. Another fleet was lost at sea. Hamilcar now took command of the Carthaginians, and though but feebly supported he carried on the war with considerable success, the Romans still maintaining the siege of Lilybæum. A fourth Roman fleet was prepared, which destroyed that of Carthage. Peace was then made, on harsh terms to Carthage, and Sicily became the first Roman province. Taking advantage of the war that Carthage was compelled to wage with her mercenary soldiers, Rome demanded of her the cession of Sardinia and Corsica, and the sum of 1,200 talents, to which no resistance could be made. For some years there were but few campaigns, and in 235 the temple of Janus was closed. Colonies had been founded during the war with Carthage, and the number of tribes was increased to 35. The Romans first crossed the Adriatic in 229, when they conquered the Illyrians, and sent envoys to Greek states to explain their proceedings, who were well received. They were threatened with a Gallic war, which was to them always the source of peculiar terror, and it was ascertained that the whole number of available men was 750,000. The war began in 225 and lasted four years, the Gauls being beaten, and the Roman arms carried far toward the Alps. At this time were to be seen the beginnings of that popular party which was in later times to have so important a place in the republic, but the growth and action of which were stayed for a century by the operation of external events. A new war with Carthage was impending. The conquests of Hamilcar and Hasdrubal in Spain alarmed the Romans; and in 228 they concluded a treaty with Hasdrubal, by which it was arranged that the Carthaginians should not go beyond the Ebro. Hasdrubal was killed seven years later, and was succeeded by his brother-in-law Hannibal, who completed the Carthaginian empire in Spain to the south of the Ebro and the Douro. He besieged and took Saguntum, a Greek city in alliance with Rome. The Carthaginian government having refused to deliver up Hannibal for this action, Rome declared war in 219. The next year Hannibal marched to Italy, through Spain and Gaul, and reached that country in about seven months, with 26,000 men, having lost or dismissed nearly three fourths of his army, but many Gauls soon joined him. He defeated the consul Scipio on the Ticinus, his colleague Sempronius on the Trebia, and in 217 Flaminius at Lake Trasymenus. He made captives of the Romans who were taken, but dismissed the Italian allies, his

war being directed against Rome only. The Romans made Q. Fabius Maximus prodicator, and Hannibal, who marched south, was baffled by his strict defensive; but in 216 the consuls, Varro and L. Æmilius Paulus, gave battle at Cannæ, and were routed with immense slaughter. The Romans showed much firmness, and took their measures with such promptitude and vigor that immediate danger was soon removed; but they never thereafter dared to meet Hannibal in a pitched battle while he remained in Italy. Most of southern Italy now declared for Hannibal. The great city of Capua, which was almost capable of being the rival of Rome, opened her gates to him, and welcomed him as a deliverer. Had he been reinforced from home his purpose might have been accomplished; but at first it was impossible to send him assistance, and when it was sent the time for success had passed away. The Romans gradually recovered ground. They retook Capua after a long siege, which Hannibal could not raise, though he marched to Rome for that purpose, and threatened the city. Marcellus reconquered Sicily. In Spain, which they had invaded, they were less fortunate, the brothers Scipio being there defeated and slain. Wherever Hannibal was present he was almost invariably successful. In 207 his brother Hasdrubal, following his route from Spain, entered Italy, but he was defeated and killed on the Metaurus. Hannibal was forced to remain in Bruttium. In Spain the war was renewed with great vigor and complete success by P. Cornelius Scipio, then a young man. He was elected consul, with Sicily for his province, and had permission to carry the war into Africa, in accordance with the policy which he supported, but which was opposed by the old Roman leaders. Nothing happened in his consulship, but at its close he was appointed proconsul, and it was resolved that he should retain his command until the end of the war. In 204 he invaded Africa, and his successes were so decisive that Hannibal was recalled, and the war was ended by the victory of the Romans at Zama in 202. Peace was then made, Carthage accepting humiliating terms (201).—Rome had now become a conquering nation, and in 200 she made war on Macedonia, the king of which country had endeavored to assail her while she was engaged in the contest with Hannibal. She was victorious, Flamininus routing the army of Philip at Cynoscephalæ; she granted the vanquished moderate terms of peace, and nominally restored the Greeks to freedom, but really established her influence over Greece. A Syrian war was begun in 191, and ended with the defeat of Antiochus the Great at Magnesia, the Romans having entered Asia in 190. The Ætolians were reduced to submission, and the Galatians conquered without a declaration of war. The Italian Ligurians were also subdued, and the province of Cisalpine Gaul was created. In Spain the Roman dominion was great-

ly extended, so that nearly the whole peninsula acknowledged it for many years. Istria was reduced in 177. The last Macedonian war began in 171, and was closed in three years, by the victory of L. Æmilius Paulus over Perseus at Pydna. Rome was now virtual mistress of the East and the West, and protected Egypt against Syria, and ruled Greece through the tyrants that were established in her states. The legions crossed the Maritime Alps in 166, and took the first step toward the conquest of Gaul 12 years later. The Dalmatians were subdued in 155. A Macedonian rebellion was promptly quelled. The Achæan league was conquered in 146, and Corinth taken and destroyed; and Greece became a Roman province, called Achaia. The third Punic war, long urged by the elder Cato, was begun in 149 and ended in 146, when Carthage was taken and destroyed by the second Scipio Africanus. The wars in Spain, renewed in 149, were brought to a close at the end of 16 years, by the siege and destruction of Numantia, the work of Scipio. Lusitania, too, was annexed after the assassination of its gallant defender Viriathus in 140. The servile wars of Sicily broke out in 134, and the first continued two years. In Asia the Romans gained the kingdom of Pergamus, by will of its last monarch Attalus III. The tribune Tiberius Gracchus entered upon his course of agrarian legislation in 133. His object was to create a new body of Roman commons, by reviving the Licinian laws, with some modification. Though this was in fact a war against property holders, it was not a war against property, as the rich had obtained a monopoly of the public lands in defiance of law. Some of the best of the Roman statesmen supported Gracchus, but the evil he wished to cure was too deep-seated to be removed by legal means. Nothing less than a revolution could have effected the proposed change. During the long time that had elapsed since the passage of the Hortensian laws, there had grown up in Rome the party of the *optimates*, which was an exclusive aristocratical party, composed of both patricians and plebeians, and which enjoyed all the power of the state. The success of Gracchus would have been the destruction of this party; and its leaders opposed him until he was driven to the adoption of unconstitutional means of resistance, when he was slain by some of their number, in an outbreak which they had caused. The contest between the aristocracy and the people had now begun. The younger Scipio for a time acted as a moderator between parties, but he was assassinated; and Caius Gracchus resumed the projects of his brother, with additions, such as his law to distribute corn to the people, and another to transfer the judicial power from the senate to the equestrian order. He also purposed extending the Roman franchise. But he too failed, and was murdered in 121, while his adherents were put to death with every circumstance of illegality and cruel-

ty. From this time reform became impossible, and revolution, through the aid of the legions, was inevitable. The few years that followed the triumph of the *optimates* form the most corrupt period of Roman history. The effect of this corruption of the aristocracy was seen on the breaking out of the Jugurthine war in 111. The Roman armies were baffled through the arts of Jugurtha, who found their commanders accessible to his bribes, until first Metellus, and then Caius Marius, were appointed to conduct the war against him. The election of Marius to the consulship was a triumph of the people over the *optimates*, and he opened the legions to a lower class of men, which was an important step toward that change which made them the instruments of successful leaders. Numidia was conquered in 107, and Jugurtha was starved to death (104). The invasion of the Cimbrians and Teutons led to the repeated reelection of Marius; and he justified his countrymen's confidence by exterminating those barbarians (102, 101), after they had destroyed many Roman armies. The second servile war in Sicily, after lasting three years, was brought to an end in 99. The political contests of Rome now assumed a decisive character, and the failure of the Italians to obtain enfranchisement led to the social or Marsic war (90-88), in which the Romans were victorious, but voluntarily granted the franchise to the Italians. The appointment of Sulla to the command in the war against Mithridates, king of Pontus, caused the rivalry between that chief and Marius to assume the form of a bloody civil war, the result of which was to throw the whole power of the republic into the hands of Sulla, who was appointed perpetual dictator, which office he resigned after reconstructing the constitution according to aristocratic ideas. Sertorius, a partisan of Marius, having fled to Spain, for years braved there the best Roman generals, until removed by assassination (72). Sulla died in 78, and the changes that he had made lost their vitality with their creator. In the mean time the conquests of the Romans had been carried on in the East by Sulla, and subsequently by Lucullus and Pompey, who overthrew Mithridates, and defeated the king of Armenia. Pompey converted Syria into a Roman province, and made Judea virtually dependent upon the republic. The great servile war, in which the Thracian gladiator Spartacus headed the slaves, began in 73, and lasted nearly three years, much of Italy being in the hands of the slaves; and it was not until several powerful armies had been beaten, and forces of the greatest magnitude had been employed, that the insurgents were overthrown. Before his expedition to the East, Pompey subdued the Mediterranean pirates. The greatest man in Rome, Pompey had soon to encounter the rivalry of Julius Cæsar, while Cicero's services in baffling the conspiracy of Catiline (63) gave him a high degree of consideration, and the

wealth and civil and military talent of Crassus enabled him to control a powerful party. Through a coalition known as the first triumvirate, Cæsar, Crassus, and Pompey became virtual masters of their country (60); but the defeat and death of Crassus, in an expedition against Parthia, left supreme power to be struggled for by his associates. Cæsar had been appointed to the command in Gaul, the conquest of which country he completed, while he also invaded Germany and Britain. Nominally as the champion of the senate, Pompey broke with Cæsar, who in 49 advanced upon Rome at the head of some of his legions, and compelled his enemies to fly. In the contest that followed Cæsar was victorious, defeating his enemies, including Pompey, Ptolemy of Egypt, Pharnaces of the Bosphorus, Juba of Mauritania, the younger Cato, M. Scipio, and the sons of Pompey, in Italy, Spain, Greece, Egypt, Asia, and the province of Africa. He had concentrated all power in his person when he was assassinated in 44. His power passed into the hands of his nephew Octavius, who, with the aid of Lepidus and Antony, triumphed over the republican party, whose chief leaders were Brutus and Cassius. Octavius soon mastered his associates, and became lord of the Roman world, the most important addition to which made by himself was the kingdom of Egypt. Drusus and Tiberius, his stepsons, conquered in Germany, but Varus perished there with his legions. Octavius (or Octavianus) is generally considered the first of the emperors, and his undivided rule dates from 30 B. C. He assumed the title of Augustus, by which he has ever since been known. All the powers of the state were vested in him. His reign, which embraced a part of the golden age of Roman literature (see LATIN LANGUAGE AND LITERATURE), lasted until A. D. 14, and he was succeeded by Tiberius, his adopted son, who was of the Claudian gens, and in whose reign disappeared the last remnants of the old Roman constitution. Tiberius was succeeded in 37 by his grandnephew Caius, known as Caligula. After him reigned Claudius, and then Nero (54-68), the last of the emperors who could make any claim to connection, either by blood or by adoption, with the founder of the Julian imperial line. Tyranny and shameless corruption had reached their height. In the reign of Claudius Britain was conquered. The emperors Galba, Otho, and Vitellius followed each other in rapid succession, until the throne was occupied by the Flavian family in the person of Vespasian (69), who was succeeded by his son Titus (79-81), the conqueror of Jerusalem, whose successor was his brother Domitian. On this tyrant's assassination (96), the humane Nerva was made emperor. His successor was Trajan (98), who added Dacia to the empire, and who carried the Roman arms to the Persian gulf, conquering many countries of the East; but these conquests were abandoned by the next emperor, Hadrian (117-138),

who restored the Euphrates as the eastern boundary of the empire. Hadrian was succeeded by Antoninus Pius, whose heir was Marcus Aurelius Antoninus (161-180). The 84 years of the reigns of Nerva, Trajan, Hadrian, and the two Antonines are considered the happiest period of the Roman empire; and from the year of the accession of Commodus, son of Marcus Aurelius, A. D. 180, Gibbon dates the commencement of that empire's decline. At that time the empire consisted of Italy, Spain, Gaul, Britain, Rætia, Noricum and Pannonia, Dalmatia, Mœsia and Dacia, Thrace, Macedonia, and Greece; Asia Minor, Syria, Phœnicia, and Palestine; Egypt and all the north of Africa, and the Mediterranean with its islands. The population is estimated at 120,000,000. The emperor Commodus became one of the worst of the imperial tyrants, and was assassinated (192). His successor, Pertinax, was murdered by the prætorians, who sold the empire to Didius Julianus, to whom succeeded Septimius Severus (193). Severus's son Caracalla, and the successor of the latter, Elagabalus, rivalled Caligula and Nero in infamy. Most of the emperors who subsequently reigned were men of little ability down to Diocletian, including Maximin, the three Gordians, Philip, Balbinus, Valerian, Gallienus, Claudius II., Tacitus, Probus, Carus, Carinus, Numerian, and others, and their conduct accelerated the decline of the empire. Alexander Severus (222-35), Decius, and Aurelian are the principal exceptions, the last named conquering Zenobia and destroying Palmyra (273). Under the rule of Diocletian (284-305) the empire was so strengthened that its power enjoyed a certain revival; but its constitution was essentially changed by that sovereign. The principles of a despotism yet unknown were adopted and carried into effect by him, together with the usages and pomps of oriental courts, totally foreign to the ancient simplicity with which all but the more lascivious and vicious emperors had contented themselves. Diocletian associated with himself a colleague on the throne, Maximianus; and subsequently two others with the subordinate rank of Cæsar, each of the supreme rulers being henceforth styled Augustus. Rome then ceased to be the seat of government, Diocletian residing principally at Nicomedia in Bithynia, and Maximianus at Milan. The senate sunk into total insignificance, and from this period the emperors rarely appeared in the ancient capital, except on occasions of grand festivals or triumphs. Constantine the Great, the son of Constantius Chlorus, the first of the Christian emperors, after the death of the associate or rival rulers Maxentius, Galerius, Maximinus, and Licinius, formally transferred the capital to Byzantium, thenceforth called Constantinople, though its founder meant that it should be called New Rome. From that time, A. D. 330, should be dated the cessation of the Roman ascendancy, though the remains of the

empire continued to influence the world down to the middle of the 15th century, when Constantinople fell into the hands of the Turks. The Roman element was little known in the empire after the abandonment of the city on the Tiber, and that abandonment was the consequence of the change that had come over the world since the fall of the republic. Constantine only did that which other rulers had contemplated, in transferring the seat of empire permanently to some other place than Rome, that transference simply rounding and completing the imperial policy which had been inaugurated by the first of the Cæsars. He divided the empire on his death between his three sons. Constantine II. inherited Gaul, and attempted to seize Italy, which had fallen to the share of his youngest brother Constans, but was slain in the attempt, and Constans, master now of both Italy and Gaul, was subsequently assassinated by his general Magnentius. The whole empire finally came into the possession of the second brother, Constantius (351), who on his father's death had been assigned the provinces of the East. The northern barbarians, having penetrated into northern and eastern Gaul, were driven out by Julian, who succeeded to the purple in 361, restored paganism, and fell in 363 in an expedition into Persia. Paganism fell with him. The army conferred the crown upon Jovian, who bought a disgraceful peace and died before he reached Constantinople, leaving the selection of an emperor again to the soldiers. The choice fell upon Valentinian I., who appointed his brother Valens his colleague, and left to him the government of the East, with a part of Illyricum. The weak and unfortunate reign of Valens (364-378) was signalized by the overthrow of the Goths by the Huns, and the establishment of the defeated tribe within the limits of the empire. Revolting in consequence of their ill treatment by the Romans, they were attacked by Valens in person, defeated him at Adrianople, and forced him to take refuge in a hut, where he perished by fire. More than 60,000 Roman soldiers fell in this battle, and the Goths ravaged the whole country from the scene of the conflict to the walls of Constantinople. In this moment of danger the hopes of the East were turned on the court of Treves, where Gratian, the son of Valentinian I., ruled over the western division of the empire, while his younger brother, Valentinian II., governed Italy and Africa. Gratian chose as his colleague Theodosius, and caused him to be proclaimed emperor of the East (379). He himself, after a not inglorious reign (367-'83), was assassinated in a military insurrection, and succeeded by Maximus, who soon turned his arms against Valentinian II. and drove him out of Italy. Theodosius in the mean time had restored peace to the East, and was now enabled to attack the usurper, defeated him on the banks of the Save (388), and caused him to be put to death. Valentinian perished soon after by

the hand of a Frankish assassin, and Theodosius, who merited from posterity the surname of Great, was acknowledged in 394 without a rival or colleague throughout the whole Roman empire. His death the following year plunged everything again into confusion. The sovereignty was divided between his sons Arcadius and Honorius, and thenceforth there were two distinct empires, the further history of which will be found in the articles BYZANTINE EMPIRE and WESTERN EMPIRE. (For Roman antiquities, see the general or special articles on the various subjects, such as AQUEDUCT, ARMY, AUGURS, BATH, CALENDAR, CIRCUS, CIVIL LAW, COMITIA, CONSUL, FORUM, &c.)—*Description of Ancient Rome.* The ancient city of Rome was situated principally on the left bank of the Tiber, about 16 m. from the sea, and just on the N. border of Latium. From the Palatine hill, where it was originally founded, it spread over several adjacent eminences and the valleys between them, and became known as *urbs septicollis*, the "city of seven hills;" these were Mons Palatinus, Capitolinus, Esquilinus, Cælius, Aventinus, Quirinalis, and Viminalis. The Quirinal, Viminal, and Capitoline hills were occupied by the Sabines, and the Cælian, together with Mons Cispus and Mons Oppius, which are parts of the Esquiline, by the Etruscans. The Aventine hill was for a time not included within the *pomerium* (limits which could not be built upon, extending along the walls both on the outer and the inner sides, and in which auguries were taken). Ancus Martius is said to have built the first fortress on the Janiculum hill, on the right bank of the Tiber, beyond the limits of the ancient city. The walls ascribed to Servius Tullius enclosed all the seven hills, and were about seven miles in circumference. These fortifications had, as generally reported, 17 gates, though ancient writers are not all agreed concerning the number. In some places the steep sides of the hills were a sufficient protection without artificial fortification; in others the wall is known to have been over 60 ft. high and 50 ft. wide, faced exteriorly with flag stones and bordered by a ditch, and traces of it are still visible. The city was divided by Servius Tullius into four *regiones*, corresponding to the four tribes in which the citizens were classed; they were named Suburana, Esquilina, Collina, and Palatina. The Capitoline, as the seat of the gods, was not included in them. Augustus increased the number of *regiones* to 14, comprehending besides the city of Servius Tullius the suburbs which had since grown up. Each *regio* was subdivided into *vici*. At what time the Mons Janiculus, on the right bank of the Tiber, was encompassed by walls seems doubtful; it was fortified and connected with the left bank by a bridge as early as the time of Ancus Martius. The emperor Aurelian (270–275) began the new walls, which were completed under Probus, in 276. These fortifications, restored and perhaps amplified in circuit by

Honorius in 402, formed the actual defences of the city, not however including the Transtiberian quarter, on the right bank, which was first enclosed with walls by Pope Urban VIII. (1623–44). The region called Borgo, on the same side, which contains St. Peter's church and the Vatican, was protected by other walls built long anterior by Pope Leo IV. (847–55); and this quarter, like a separate city, was called after him *Civitas Leonina*, or the Leonine City. The walls of Aurelian and Honorius, as they now exist, are between 11 and 12 m. in circuit, and have 16 gates, three of which are now walled up as useless, and one, the Porta Septimiana, on the Transtiberian side, is surrounded by streets. Within this fortified circuit are five bridges spanning the Tiber (besides the ruins of two others), three of which are ancient: the Ælian, now the Ponte Sant' Angelo; the Fabrician, now the Ponte Quattro Capi; and the Cestian, now the Ponte San Bartolommeo. The last two connect the small island in the Tiber, now called Isola di San Bartolommeo, with the opposite banks. The number of streets is said to have been 215, the principal avenues being called *via* and *vici*, and the narrow ways *angustulus*. The main thoroughfare was the Via Sacra, which began in the valley between the Cælian and Esquiline mounts, and wound in a rather devious course westward, past the Flavian amphitheatre and under the arch of Titus, through the centre of the city to the capitol. The Via Lata and its continuation the Via Flaminia extended from the N. side of the capitol to the Porta Flaminia near the N. W. angle of the city. The Vicus Tuscus, running out of the Forum Romanum, contained many of the shops, and was celebrated by Horace for the rascally character of its inhabitants. The Vicus Sandalarius was the place where shoemakers congregated, and also the quarter of some of the booksellers. The whole valley between the Esquiline, Viminal, and Quirinal hills, a little N. E. of the centre of the city, was called the Subura, and through it ran a street of the same name. This was the scene of most of the bustle and wickedness of the city, and the seat of the principal shops and brothels. The Carinæ, a district just without the limits of this noisy region, was the residence of Pompey, Cicero, and many other distinguished persons. Here and there were open places called *fora* and *campi*, the former being intended for the transaction of business, and the latter for pleasure grounds. The *fora* were level oblong spaces, paved, and surrounded with buildings of various kinds, and were either *fora civilia*, where justice was administered and other public matters were attended to, or *fora venalia*, which answered very nearly to modern market places. The Forum Romanum, sometimes called simply the forum, or *forum magnum* or *vetus*, occupied a space between the Capitoline and Palatine hills, and was the most important of

the 19 Roman fora. (See FORUM.) Among the others were the Forum Julium or Cæsar's, close behind the former; the Forum Augusti; the Forum Nervæ or *transitorium*, intended merely as a passageway from the two preceding to the temple of Peace; and the Forum Trajani. But little of the splendid forum of Trajan is now visible, except the celebrated column. Most of the magnificent buildings founded by that emperor within the limits of his forum were left for ages in ruin and buried under earthworks. Excavations begun by the French early in the present century, and continued by the pontifical government after the restoration of Pius VII., resulted in the discovery of some remains of the Ulpian basilica, so called from the family name of the founder (Ulpian Trajanus), and other fragments of antique structures, strewn over an area not more than one twelfth of the space occupied by Trajan's buildings. In this narrow place, below the level of the surrounding piazza Traiana, is all that now remains visible of the ruins of those magnificent structures. The Campus Martius, at the N. W. side of the ancient city, was almost entirely occupied by public buildings, temples (among which was the Pantheon), the mausoleum of Augustus, and pleasure grounds. This region is now covered by the modern city, and contains those streets and piazzas where the population is most dense. (See CAMPUS.) The Campus Sceleratus was the spot where vestals who had violated their vows were buried alive, and the Campus Esquilinus was originally used for the execution of criminals and the burial of the poor, though the greater part of it was afterward converted into pleasure grounds. Besides these places of public resort, there were beautiful private parks and gardens on the hills around the city.—The houses of Rome were divided into two classes, the *domus*, or residences of the nobles, corresponding to the modern *palazzi*, and the *insulæ* or dwellings of the middle and lower classes, which were often let out by floors or apartments after the modern fashion. These *insulæ* were sometimes carried up so many stories that a law was passed forbidding any house to be built more than 70 ft. high—a regulation all the more necessary as every house was surrounded by an open space of at least 5 ft. The *domus* had porticoes in front and inner courts called *atria*. The *insulæ* perhaps had smaller courts within, and in place of the porticoes they had open spaces which served for shops and workshops. The common building material was brick, at least before the time of Augustus; the upper story of the *domus* was generally of wood. Under the emperors more costly materials, such as marble and other stone, came into frequent use; and when Nero rebuilt the city after the great fire, he employed a kind of volcanic rock now called *peperino*, formed by the cementing together of sand and cinders. He also dispensed with the wooden upper story, and took pains to

make the streets wide and straight. Most of the *domus* were situated at the E. end of the city on the Quirinal, Viminal, and Esquiline hills; they did not form streets, but were built in the midst of large gardens and fields. The city is supposed to have reached its greatest size in the time of Vespasian, when it was 13 m. in circuit, and embraced a population probably not much under 2,000,000, of whom about half were slaves. The public edifices during the palmiest days of the empire were of almost unparalleled magnificence. The high grounds of the Quirinal, Viminal, Esquiline, and Aventine hills were mostly occupied by the populous quarters of the ancient city, but were covered in some parts by private gardens, as those of Mæcenas on the Esquiline. The Capitoline hill was almost entirely covered by public edifices, with the *arx* (citadel) on its highest point, the Tarpeian rock. The most splendid of the many temples on this hill was that of Jupiter Capitolinus, the exact site of which is still in dispute among antiquaries. (See CAPITOL.) Latin writers, when using the name "Capitolium," usually imply this great temple, the most important and magnificent in Rome. The residence on the Palatine hill, which finally became developed into the vast palace of the Cæsars, was originally the private house of the orator Hortensius, which was inhabited by Augustus and rebuilt for his use at the public expense. New buildings were raised for themselves by successive emperors, till the greater part of the hill was covered by their splendid structures. Nero built more than any other emperor, and after his first great palace had been destroyed by the most disastrous conflagration that ever visited Rome (A. D. 64), he began another, the edifices, gardens, and pleasure grounds of which extended over the Palatine, Esquiline, and Cælian hills, and the intervening valleys. This immense palace, the Domus Aurea of Nero, was almost totally demolished by Vespasian. There were several *curiæ*, or senate houses, and the senators sometimes assembled in temples, especially in that of Concord, on the southern slope of the Capitoline hill. The Curia Hostilia, the most ancient senate house, said to have been founded by Tullus Hostilius, was burned down during the tumultuous funeral of the tribune Clodius in 52 B. C., and was first restored by Faustus, the son of Sulla. This later building having been taken down, a new curia was begun, or at least projected, by Julius Cæsar, and after his death completed, if not actually founded, by Augustus, who dedicated it, in his great uncle's name, as the Curia Julia. Its exact site cannot be determined, but Roman antiquaries recognize it in the ruins of a large structure, built in brickwork like that of the Augustan age, below the N. E. declivity of the Palatine, and therefore in the immediate vicinity of the forum at its S. W. limit. The Curia Pompeiana, which was abandoned after it had been stained by the blood of Cæsar, who was there

assassinated, was one among many superb edifices raised by Pompey the Great. This, together with a theatre, a temple of Venus, and a portico with 500 columns, stood between the western side of the Campus Martius and the Tiber. A few remains of this temple and theatre were visible, till concealed by recent buildings, in the cellars of a modern palace. The basilicas were chief courts of justice presided over by the urban prefects, in which the emperors themselves often heard causes and administered justice. Among these, the most splendid one founded under the republic was the Basilica Æmilia, so called after its founder Æmilius Paulus, 179 B. C. It is supposed that a remnant of it is preserved in the outer walls of Sant' Adriano, a church on the N. E. side of the forum. Three other basilicas founded under the republic (in the 2d century B. C.), the Porcian, the Sempronian, and the Opimian, have totally disappeared. The Julian, founded by Augustus and dedicated to Julius Cæsar, still exists in extensive but low and roofless ruins on the W. side of the principal forum. These ruins were brought to light through works undertaken by the pontifical and recently finished under the royal government. Among favorite places of resort for business or recreation were the porticoes, several of which, with far-extending colonnades, ornamented ancient Rome. One, built by Agrippa in the Campus Martius, was called Porticus Argonautarum, from a picture or series of pictures on its walls illustrating the Argonautic expedition. The only one of these porticoes the ruins of which are still considerable is that built by Augustus and named after his sister Octavia. Within the quadrangle of colonnades forming this portico stood temples of Jupiter and Juno, both wholly destroyed. We find mention of only two prisons in ancient Rome, the oldest being that founded by Ancus Martius and said to have been enlarged by Servius Tullius. Two dark subterranean chambers of these ancient prisons, known as the Mamertine, and entered below a church on the principal forum, were long ago consecrated and are still used as chapels, because supposed to have been the place where St. Peter and St. Paul were confined, and from which they were led to death. Five other vaulted chambers, mostly built of similar stonework, have recently been cleared out (one of them had long been used as a safe for butcher's meat), and are now recognized as pertaining to the same prisons, and ascribable therefore to the time of the kings. Another ancient prison was destroyed and a temple of Piety raised on its site, in commemoration of the act of the Roman daughter who saved the life of a parent condemned to die in that dungeon; a well known story narrated by Pliny the Elder and by Valerius Maximus. The military were quartered in two great camps, walled around and defended like fortresses, beyond the limits of the primitive city, the *castra prætorialia*

at the N. E. extremity of the city, beyond the walls of Servius Tullius, and the *castra peregrina*, on the Cælian hill. The former, built by Tiberius, was occupied by the prætorian guards, and the latter by foreign legions. The aqueducts, the most stupendous works of their kind in the world, and the sewers, the chief of which, called *cloaca maxima*, is still in excellent preservation, are described elsewhere. (See *AQUEDUCT*, and *CLOACÆ*.) Scarcely surpassed by any of the public edifices were the *thermæ* or baths, whose name conveys but a very imperfect idea of the various uses to which they were devoted. Besides the apartments for bathing (see *BATH*), they contained places for athletic exercises, public halls, vestibules and porticoes for lounging and conversation, shaded walks and gardens, fountains, libraries, and collections of paintings and sculptures. The *thermæ* of Antoninus, built principally by Caracalla and completed by Alexander Severus, had accommodations for 2,300 bathers at the same time, and the *thermæ* of Diocletian for 3,000. The latter was the most extensive building of the kind in Rome. Those of Agrippa or Alexander Severus, Nero, Titus, Trajan, Commodus, and Constantine were also celebrated; and there were several smaller ones, besides a great number of *balneæ* or common baths. There were only three theatres proper, those of Pompey, Cornelius Balbus, and Marcellus. The first was in the Campus Martius, and had seats for 40,000 spectators; the second, near the Tiber, where the Cenci palace now stands, could contain 11,600 people; and the third, in the S. part of the Campus Martius, between the Capitoline and the river, could hold 20,000. The first theatres were mere temporary structures of wood, though even these were sometimes of extravagant splendor, like that upon which M. Æmilius Scaurus wasted an enormous fortune, and which was large enough to seat 80,000 spectators. The stage was decorated with 360 columns, arranged in three stories, the lowest of white marble, the middle of glass, and the uppermost of gilt wood. The *odeum* in the Campus Martius was a sort of music hall, and was capable of accommodating 11,000 persons. The circus dates its introduction into Rome long prior to the erection of permanent theatres. (See *CIRCUS*.) Amphitheatres, for gladiatorial combats and shows of wild beasts, were at first built of wood and taken to pieces after the performances were over (see *AMPHITHEATRE*); the first stone edifice of the kind was erected by Statilius Taurus in 80 B. C. Another was begun by Caligula, but never finished. The great Flavian amphitheatre, founded by the emperor Vespasian (of the Flavian family) about A. D. 72, dedicated by his son Titus in 80, and called the Colosseum from its vast size, is still in its ruinous state among the most imposing of Roman antiquities. Excavations carried on in its interior by the government since 1873 have brought

to light many complicated structures, elliptic arcades, chambers, and long vaulted corridors, about 22 ft. lower than the level formerly supposed to be that of the ancient arena. (See *COLOSSEUM*.) Among the numerous temples of the city, the two most magnificent were those of Jupiter Capitolinus and of Venus and Rome; the former, on the Capitoline hill, founded by Tarquinius Priscus, and several times rebuilt, the last time by Domitian, being undoubtedly the larger; the latter, founded by Hadrian, probably the richest in decoration. The temples still conspicuous in ruin in the forum and on the slope of the Capitoline hill are those of Castor and Pollux, of Saturn, and of Vespasian and Titus. That dedicated by Antoninus Pius to his deceased wife Faustina still partially exists in a magnificent peristyle with monolithic columns, and the massive stone walls of the cella, or sanctuary, near the S. E. angle of the forum. The circular temple with a graceful marble colonnade of the Corinthian order, close to the Tiber, which was long misnamed the temple of Vesta, is now generally assigned to Hercules, to whom many temples in Rome were dedicated. The real temple of Venus, said to have been founded by Numa, is now recognized in the low, massively constructed remnant of a circular building at the S. W. extremity of the forum, brought to light by excavations made in 1873. Most interesting is another discovery, in the same vicinity, of an edifice so ruinous that even the style of its architecture is not distinguishable, but which may be recognized beyond doubt as the *Ædes Cæsaris*, a temple raised by Augustus on the spot where the body of Julius Cæsar was consumed in the flames after his funeral. In front of this building is still seen the *Rostra Julii*, a semicircular platform of stone which Augustus erected before the threshold. The temple of Pallas, in the forum of Nerva, existed, still beautiful in ruins, till 1612, when it was taken down in order to use its columns and marbles for the construction of a large fountain erected by Pope Paul V. on the Janiculan hill. The Pantheon was dedicated, according to common belief, to all the gods, though Dion Cassius says it was sacred to Mars and Venus. (See *PANTHEON*.) Prominent among the

other remarkable features of the city were the triumphal arches thrown across the principal streets in commemoration of victories; 21 are

mentioned, of which the most important are the arch of Titus, on the Via Sacra, of Pentelic marble, built to celebrate the capture

Arch of Titus.

of Jerusalem, and still standing; the arch of Septimius Severus, of the same material, at the entrance of the Via Sacra into the forum;

Arch of Constantine.

the arch of Constantine, at the mouth of the valley between the Palatine and Cælian hills, with three archways, adorned with beautiful

columns, bass reliefs, and statues, erected to commemorate the victory over Maxentius; and the arches of Dolabella, Gallienus, and Drusus. The most interesting of the columns erected in various parts of the city is that of Trajan, in the forum of Trajan, which was dedicated to that emperor by the senate and Roman people in commemoration of his victory over the Dacians. It is composed of 34 pieces of white marble, 9 of which form the base, 23 the shaft, and 2 the torus and capital. The height of the entire column, exclusive of the statue on its summit, is $127\frac{1}{2}$ ft., and of the shaft alone, $97\frac{1}{4}$ ft. The base and capital are of the Tuscan order, the shaft Doric, and the mouldings of the pedestal Corinthian. A series of bass reliefs form a spiral around the

Forum and Column of Trajan.

shaft from the base to the summit, representing the military achievements of the emperor. There are 2,500 human figures in the sculptures, and many horses, military engines, and weapons. The column was formerly surmounted by a statue of Trajan, but its place is now occupied by one of St. Peter, which was erected by Sixtus V. In the interior of the column is a spiral staircase of 184 steps. The column of Marcus Aurelius Antoninus, in the piazza Colonna, erected A. D. 174, is similar to that of Trajan, but inferior in design and execution. Its height is 122 ft. 8 in., the shaft being $97\frac{1}{4}$ ft. On the summit is a statue of St. Paul, placed there by Sixtus V. Of the many obelisks in Rome, the highest is that of the

Lateran, the shaft of which is 105 ft. 7 in. It was brought from Heliopolis to Alexandria by Constantine the Great, and removed by his son Constantius to Rome. The obelisk of the Vatican was brought from Heliopolis by Caligula. The obelisk of Santa Maria Maggiore is one of the two which formerly stood at the entrance of the mausoleum of Augustus; they are supposed to have been brought from Egypt by Claudius. The obelisk of the piazza del Popolo once stood before the temple of the sun at Heliopolis, whence it was removed to Rome by Augustus. Another obelisk, that of Monte Citorio, was also brought to Rome from Heliopolis by Augustus. The mausoleum of Augustus, in the Campus Martius, surrounded by a large park, was built by that emperor as the burial place of the imperial family, and was one of the most magnificent edifices of his reign. The mausoleum of Hadrian is now the castle Sant' Angelo. The tomb of the Scipios was discovered in 1780; and among the other most imposing sepulchral monuments were the tombs of Cæcilia Metella, Cestius, and Septimius Severus.—*Modern Rome.* The modern city occupies very nearly the same space as the ancient; lat. of the observatory of the collegio Romano, $41^{\circ} 53' 52''$ N., lon: $12^{\circ} 28' 40''$ E.; pop. in 1846, 180,000; in 1852, 175,838; in 1858, 180,359; in 1872, 244,484. Since the change of government in 1870, the population has rapidly increased, but many new streets opened since then are yet scarcely inhabited. The Tiber has a course within the walls of about 3 m., and is crossed by five bridges, viz.: the Ponte Sant' Angelo, the ancient Pons Ælius, opposite the castle of Sant' Angelo at the N. W. end of the city; the Ponte Sisto, built by Sixtus IV. in 1474 on the ruins of the Pons Janiculensis, connecting the city proper with the quarter of Trastevere; the Ponte di Quattro Capi (so called from a four-headed statue of Janus), the ancient Pons Fabricius, and the Ponte San Bartolommeo, the ancient Pons Cestius, connecting the Isola di San Bartolommeo, the former with the city, and the latter with the Trastevere; and the Ponte Rotto, on the site of the ancient Pons Æmilius; this last was partly washed away in 1598, and a suspension bridge now extends from the remaining portion to the shore. The ruins of the old Pons Triumphalis and Pons Subicius are visible when the water is low. The walls are nearly 13 m. in circuit, those on the left bank of the river following the line of the wall of Aurelian; they have been so often repaired that it is difficult to assign a date to any portion of them. On the outside they are 50 ft. high, on the inside generally less than 30. They have no ditch, but are crested with about 300 towers and pierced by 13 gates still in use. The general level of the city has been considerably raised by the rubbish accruing from long habitation and from the ruins of ancient edifices, so that the lower parts are estimated to be at least 15 ft. higher than they were in

the days of the Cæsars. The modern city is chiefly on the low land, the hills being mostly covered with vineyards, cornfields, and villas. The closely built part is about 2 m. in length,

these divisions are on the left bank and 2 on the right bank of the river. 1. The rione de' Monti is the largest quarter, containing, among other public buildings and monuments, the

column of Trajan; the church of St. John Lateran, the chief church of the city in point of antiquity and ecclesiastical dignity (see LATERAN); the church of Sta. Bibiana, which covers the relics of 5,260 martyrs; the splendid church of Sta. Maria Maggiore, with the Sistine and Borghese chapels; the villas Albani and Borghese, and the ruins of the baths of Titus and Diocletian. 2. The rione di Trevi contains the Corso; the piazza di Monte Cavallo, in which stand two colossal antique statues of horses; the Quirinal, formerly the pope's ordinary residence, now the royal palace; the palazzo della Consul-

Babbuino.

Corso.

Ripetta.

Piazza del Popolo.

with a breadth of from 1 to $1\frac{1}{2}$ m. Many of the streets are long, but they are mostly narrow and crooked. They have seldom any foot pavement, and are often filthy, and present in their architecture a mixture of magnificence and meanness, stately palaces and churches alternating with miserable huts. The three finest streets diverge from a square called the piazza del Popolo near the N. gate. These are: 1, the Corso, which extends to the foot of the capitol and is a mile long, perfectly straight, 50 ft. wide, with foot pavements on each side; it is the great public walk of the city; 2, the strada del Babbuino, which runs to the piazza di Spagna; 3, the strada di Ripetta, which leads to the Tiber. The houses of Rome are generally lofty, and are mostly built of brick and tufa, marble being less commonly used than

in the cities of northern Italy. The city is divided into 14 *rioni* or quarters, corresponding to the 14 regions of Augustus, but not resembling them in size or situation; 12 of

ta; and the magnificent Barberini palace, rich in treasures of art and literature. 3. In the rione di Colonna stand the column of Antoninus, the Pantheon, the palace of the propaganda, and the piazza di Spagna, one of the finest squares of the city. 4. The rione di

Farnese Palace.

in the cities of northern Italy. The city is divided into 14 *rioni* or quarters, corresponding to the 14 regions of Augustus, but not resembling them in size or situation; 12 of

Campo Marzo comprises most of the area of the ancient Campus Martius, the porta del Popolo (the chief entrance to the city on the N. side), the mausoleum of Augustus, the Pincian

hill with the public gardens on its terraced summit, and about one third of the Corso. 5. The rione di Ponte contains one of the finest streets in Rome, the strada Giulia. 6. The rione di Parione contains the Orsini and Pamphili palaces, and the place Pasquino, where formerly stood the statue of Pasquin. 7. The rione della Regola contains the churches of San Girolamo della Carità and San Tommaso, the English college, and the celebrated Farnese palace. 8. The rione di Sant' Eustachio contains the church of that saint and the university. 9. The rione della Pigna contains the beautiful Dominican convent and church of La Minerva. 10. The rione Campitelli contains the forum, the Colosseum, the basilica of Maxentius, and the Capitoline hill, on which stand the three modern palaces appropriated for the assemblies of the magistrates, the observatory, and the fine art collections. The gallery of sculpture in one of these *palazzi* contains many of the

most precious antiques, among which are the so-called "Dying Gladiator," now recognized as a Gallic chief dying in battle, the statues of Marcellus and Agrippina, the Venus of the capitol, and the complete series of busts of the Roman emperors. 11. The rione Sant' Angelo contains the beautiful ruins of the portico of Octavia, and the Ghetto, or the quarter in which the Jewish inhabitants were confined under the papal government, though allowed to have shops elsewhere. 12. The rione Ripa contains the immense *thermæ* of Antoninus (Caracalla), the temple of Fortuna Virilis, the temple of Hercules, long miscalled that of Vesta, the Tiber island, on which are some remains of the temple of Æsculapius, the Monte Testaccio, the pyramid of Cestius, and the burial place of Protestants. 13. The rione Trastevere, the ancient Janiculum, on the W. side of the Tiber, contains the great fountain of Aqua Paola, a botanical garden, the villa Corsini, and the

Bridge and Castle of Sant' Angelo, with St. Peter's in the distance.

church of San Pietro in Montorio. 14. The rione di Borgo contains the castle of Sant' Angelo, the citadel, the centre or nucleus of which was the mausoleum of Hadrian. This castle is now of little importance as a fortress, and is chiefly used as a state prison. It communicates by a long covered gallery with the palace of the Vatican, an immense edifice, almost unrivalled for its internal splendor and magnificence. Among its treasures of literature and art are the great library, chiefly rich in rare manuscripts; the tapestry chambers, hung with tapestry copied from the cartoons of Raphael; picture and sculpture galleries filled with masterpieces of the highest order; the *camere* and *loggie*, painted in fresco by Raphael and his pupils; and the Sistine and Pauline chapels, painted in fresco by Michel Angelo. (See VATICAN.) Celebrated statues and pictures also adorn other palaces and churches of the city; and besides the great collection of the Vatican there are 10 or 11 public libraries,

two of which, the Angelica and the Casanatense, have more than 100,000 volumes each and many valuable manuscripts. There are in the city about 360 churches and 180 conventual edifices; but many of the convents and monasteries have been suppressed since the occupation of the city by the Italian government, and the buildings converted to public uses. Preëminent among the Christian temples of the world is St. Peter's church, the work of many popes and architects, finally consecrated by Urban VIII. in 1626, which Gibbon calls "the most glorious structure that has ever been applied to the use of religion." (See CATHEDRAL.) Externally the work, though magnificent in materials and dimensions, is disfigured by the prominence of the front added by Maderno, which almost hides from the near spectator the principal feature, the vast and towering dome; while, had the original plan of Bramante and Michel Angelo been followed, the whole dome would have been

St. Peter's Church and the Vatican Palace.

visible from the square before the church. But the dome itself and the interior of the edifice are held to be unrivalled in magnitude, proportion, and decoration. The church of St. Paul "outside the walls," destroyed by fire in 1823 and rebuilt and dedicated in 1854, is also a masterpiece of magnificence in architecture and decoration. Like the ancient St. Peter's, it was originally founded by the emperor Constantine. The first English Protestant church ever erected within the walls of Rome was opened Oct. 26, 1874. It is a handsome edifice, built of *pietra serena* on the basilica plan, but without aisles, and is situated on the piazza San Silvestro, E. of the Corso. The former English church, outside the porta del Popolo, still continues its services. The palaces of the Roman nobles are numerous and large, but are generally more remarkable for internal than for external splendor. Their walls are usually of brick stuccoed, and their chief external ornament is a rich cornice. The principal of these mansions are the palazzi Doria, Ruspoli, Corsini, Orsini, Giustiniani, Altieri, Ciciaporci, Farnese, Barberini, and Colonna. There are several palaces which, from being surrounded by extensive gardens, are called villas. Of these the principal is the villa Borghese, whose gardens, nearly 3 m. in circuit, are open to the public, and form the most fashionable promenade in Rome.—There are many squares in the city, consisting of small paved areas, generally adorned with fountains

and monuments. The large oval area in front of St. Peter's is surrounded by a superb colonnade, and in the middle between two fountains is an Egyptian obelisk 78 ft. in height. The square next in size is the piazza Navona, which is about 840 ft. in length, and has in the centre an elegant fountain, the finest in Rome. Fountains are numerous throughout the city, and form one of its most striking and attractive features. They are copiously supplied with water by three aqueducts which still remain in operation, of the many that poured their streams into the ancient city. Among the most curious remains of ancient Rome are the catacombs. (See CATACOMBS.)—The manufactures of Rome are various, though not extensive. The principal are of woollens, silks, velvets, hats, gloves, stockings, leather, glue, glass bottles, liqueurs, pomade, artificial flowers, mosaics, jewelry, and articles connected with the fine arts. The city is a great resort for foreigners, of whom the English, French, and Americans are the most numerous, and is a favorite place of residence and study for foreign artists. The climate is mild, but relaxing and oppressive in summer. Rains are frequent and heavy in November and December, and there is usually a little snow in the winter, which seldom remains more than a few hours. The *tramontana*, a disagreeable cold north wind, sometimes blows for several days at a time. The malaria fever, so much dreaded, may be avoided by proper

precautions, and may be expected ultimately to disappear, through the cultivation of the Campagna, improved drainage, and increase of population both within the walls and over the surrounding districts, hitherto left uncultivated and uninhabited. (See CAMPAGNA DI ROMA, LATIUM, and PONTINE MARSHES.) A new city is now springing up on the higher grounds on the Esquiline and Viminal hills. The official report for 1873 shows that the sanitary condition of Rome is better than is generally supposed, the average death rate being about 34 in 1,000. The people of Rome, at least the middle and working classes, are stout and well formed, the women being remarkable for beauty and a certain majesty of air and mien. The public amusements are theatrical performances, concerts, and religious celebrations. The most noted festival is the carnival, which immediately precedes the season of Lent. The chief educational institution is the university, which has professors in theology, law, medicine, philosophy, the fine arts, and the Greek, Hebrew, Syriac, and Arabic languages. It had 470 students in 1875. The college *de propaganda fide* has a rich library and a printing office which contain works in 30 languages. There are several other colleges and many learned societies, the principal of which are the academies of Roman history, of geography, of ecclesiastical history, of antiquities, and of the Arcadians. Much has been done for public education by the new government. At the close of 1873 there were 14,389 pupils in the new elementary schools. A female seminary was opened in 1874.—During the turbulent and ignorant ages which succeeded the downfall of the western empire (see ITALY), the city of Rome slowly sank to a state of degradation and decay, which reached its greatest depth about the end of the 8th century, when little more remained than is now visible, while the modern city had not yet begun to be constructed. The population at this period is supposed to have dwindled to about 13,000. The popes, however, soon began to assert their supremacy over the potentates around them, and exerted themselves to restore and enlarge their capital. (See PAPAL STATES, and POPE.) Leo IV. made a large accession to the city about 850, and under the influence of peace and stable government the population rapidly increased. In the 11th century the city suffered severely from the attacks of the emperor Henry IV. in his wars with Gregory VII.; still at the end of this century its population had grown to 35,000. In the 14th century the prosperity of the city was checked by the removal of the papal see to Avignon, and was not materially promoted by the brief splendor of the rule of Rienzi. After the return of the popes in 1377, a long period of turbulence and civil strife succeeded, in which the Colonna and Orsini families were the principal actors; but at length, about 1417, the authority of the

popes prevailed, and during the 15th and 16th centuries the city was enlarged to nearly its present dimensions and adorned with its principal churches and palaces. By the middle of the 17th century it had attained its highest state of population and magnificence in modern times. The only great calamity which befell it during these last three centuries was the storming and pillaging by the army of the constable de Bourbon in 1528. In 1798 Rome was occupied by the French, who sent the pope to France, and proclaimed a republic, which was suppressed by the allies in 1799 and the pope restored. In 1808 the city was again occupied by the troops of Napoleon, and in the following year annexed to his empire. The pope was restored on the downfall of Napoleon in 1814, and the city remained in peace till in 1848 revolutionary movements began, which resulted in the expulsion of the pope and the establishment of a republic in February, 1849, at the head of which were Mazzini, Armellini, and Saffi. The new republic, though bravely defended by Garibaldi, was speedily suppressed by the French army, which, after a siege of two months, compelled it to surrender on July 1. The French occupation lasted till the close of 1866, when the troops were almost entirely withdrawn from the Papal States by Napoleon III. In 1867 the occupation was resumed in consequence of an invasion of the papal territory (reduced since 1860 to little more than one third of its previous extent) by an army of Italian volunteers led by Garibaldi. The siege and capture of Monte Rotondo, a small town 14 m. from Rome, by Garibaldi, was soon followed by the defeat of the volunteers at Mentana, Nov. 3, 1867, through French intervention, which secured victory for the pontifical cause, and for the time rescued that government from its opponents. After these events a French force continued to occupy Civit  Vecchia, but not the city of Rome, until 1870, when the troops were again withdrawn on account of the Franco-German war. Soon after the deposition of Napoleon III., Rome was occupied (Sept. 20, 1870) by an Italian army, after a very brief resistance. A plebiscitum held in the following October declared, by an immense majority, the will of the citizens to submit to the constitutional government of the king of Italy. The temporal sovereignty of the pope was in consequence abolished. (See PIUS IX.) Rome was declared the capital of the Italian kingdom, and became thenceforth the seat of the new government, where the royal court has its residence, and the Italian parliament holds its sessions. The first session of parliament was opened on Nov. 27, 1871. On Sept. 20, 1874, a stone in commemoration of the occupation of the city by the Italian troops was erected near the porta Pia. It contains the names of 33 soldiers who fell in the conflict with the papal forces.—Among the principal modern books on ancient Roman history

are Niebuhr's *Römische Geschichte* (3 vols., Berlin, 1811-'32; 2d ed., 1827-'42); Arnold's "History of Rome" (3 vols., London, 1838-'42); Gibbon's "Decline and Fall of the Roman Empire," edited by Milman (12 vols., 1838-'9; 2d ed., 1845); Merivale's "Fall of the Roman Republic" (1853) and "History of the Romans under the Empire" (7 vols., 1850-'62); Mommsen's *Römische Geschichte* (3 vols., Berlin, 1854-'6; translated into English, 1862-'3); and Ihne's *Römische Geschichte* (Leipsic, 1868 *et seq.*). For fuller descriptions of the city of Rome see Franz Reber, *Die Ruinen Roms und der Campagna* (Leipsic, 1863); Robert Burn, "Rome and the Campagna, an Historical and Topographical Description of the Site, Buildings, and Neighborhood of Ancient Rome" (Cambridge and London, 1871); Augustus J. C. Hare, "Walks in Rome" (London, 1871); Francis Wey, "Rome" (1872); and Charles Isidore Hemans, "Historic and Monumental Rome" (1874). See also Gregorovius, *Geschichte der Stadt Rom in Mittelalter* (8 vols., Stuttgart, 1859-'72; 3d ed., 1874).

ROMILLY, I. Sir Samuel, an English jurist, born in London, March 1, 1757, died there by his own hand, Nov. 2, 1818. He was descended from French Protestant refugees, was distinguished as a chancery lawyer, and in 1806 was appointed solicitor general. He was elected to the house of commons, and for many years strenuously advocated parliamentary reform, the abolition of the slave trade, the emancipation of the Roman Catholics, and the mitigation of the criminal code. Down to 1818 he had represented "pocket boroughs." In that year he was returned for Westminster without solicitation, but the death of his wife and other sorrows deranged his mind, and led him to commit suicide. His autobiography was published in 1840, in 3 vols. **II.** John, baron, an English jurist, son of the preceding, born in London in 1802, died there, Dec. 23, 1874. He graduated at Trinity college, Cambridge, in 1826, and was called to the bar at Gray's Inn in 1824. He was a member of parliament for Bridport, as a supporter of Lord Grey's administration, from 1832 to 1835, and for a short time in 1846-'7, and for Devonport in 1847-'52. He was solicitor general from 1848 to 1850, when he was knighted, attorney general in 1850-'51, and master of the rolls from 1851 to 1872. He was raised to the peerage in 1866 as Baron Romilly of Barry, in the county of Glamorgan.

ROMNEY, George, an English painter, born at Furness, Lancashire, Dec. 15, 1734, died at Kendal, Nov. 15, 1802. At the age of 23 he began painting at York, in 1762 established himself in London, and in 1763 obtained the second premium of 50 guineas, offered by the society of artists, by a picture of the "Death of Gen. Wolfe." In 1773 he went to Italy, and studied the works of Michel Angelo and Raphael. After his return in 1775 he was a popular painter of portraits. He did not be-

long to the royal academy, and sent no pictures to its exhibitions; moreover there was an ill feeling and rivalry between himself and its president, Sir Joshua Reynolds. In 1756 he had contracted marriage with a young woman at Kendal, but on going to London he left her with two children, and during his prosperity never called her to share his fortune, and even concealed the fact of his marriage. But when his health declined in 1799 he went to live with her, becoming imbecile a year later.

ROMULUS, the legendary founder of Rome. Amulius, the younger son of Procas, king of Alba Longa, after the death of his father seized on the throne rightfully belonging to his brother Numitor, and made the daughter of the latter, Rhea Silvia, a vestal virgin. By the god Mars she had two children, who as soon as they were born were ordered by Amulius to be thrown into the Tiber. The river had overflowed, and the basket in which the boys Romulus and Remus were placed was carried to the foot of the Palatine hill, and left on dry land. A she wolf carried them to her cave, and suckled them; and they were found by Faustulus, the king's herdsman, who took them home, and brought them up with his own sons. When they had grown up, the herdsmen of the Palatine hill had a quarrel with the herdsmen of Numitor, in which Remus was taken prisoner, and the expedition of Romulus to deliver his brother resulted in the discovery of their birth, the killing of Amulius, and the elevation of Numitor to his rightful authority. The two brothers determined to build a city on the Palatine, and to decide which one should give it his name they resorted to augury. First six vultures appeared to Remus, and then twelve to Romulus. A dispute arising, Romulus came off victor, and began building the city (about 753 B. C.). Remus leaped over the rampart, saying, "Shall such defences as these keep your city?" and was instantly slain by his brother. Romulus opened a place of refuge, and thither many fled from the countries round about; but the neighboring people would not give them their daughters in marriage. Hereupon Romulus announced the celebration of games in honor of Neptune, which were largely attended by the men of the neighboring cities with their families, especially Sabines; while they were looking upon the sports, the Roman youth rushed out and carried off the women to be their wives. In consequence a war arose, first with the people of Cænina, then with the people of Crustumium and Antemnæ, in both of which the Romans were successful; and lastly with the Sabines, who came with a great army under their king Titus Tatius. Through the treason of Tarpeia, the Sabines got possession of the fortress on the hill Saturnius, and a battle ensued in the valley at the foot of the hill. While it was raging fiercely, the women who had been carried off ran down from the Palatine, threw themselves between their husbands and their fathers and

brothers, and prayed them to lay aside their quarrel. A peace was therefore made, and the two peoples became one, the Sabines living on the Saturnius or Capitoline and the Quirinal hills, and the Romans on the Palatine; and the two kings and their counsellors met in the valley between the Palatine and Capitoline hills, which was therefore called *comitium*, "the place of meeting." Tatius not long afterward was slain by the inhabitants of Laurentum, and Romulus reigned over the whole people. These were divided into three tribes: the Ramnenses, from his own name; the Titienses, from that of the Sabine king; and the Luceres, according to some from Lucumo, an Etruscan chief who had aided him in previous wars. Romulus had numerous wars, in which he was very successful. After he had reigned a long time he one day called the people together in the field of Mars. When they had assembled, a terrible storm arose, and in the midst of it Romulus disappeared. That night he showed himself to one Proculus Julius coming from Alba to Rome, and said to him: "Go and tell my people that they weep not for me any more; but bid them to be brave and warlike, and so shall they make my city the greatest on earth." From that the people judged that Romulus had become a god, and a temple was built to him, and he was worshipped under the name of Quirinus. He was succeeded by Numa Pompilius (about 716).

ROMULUS AUGUSTULUS. See WESTERN EMPIRE.

RONCESVALLES, or **Roncesvaux**, a small hamlet in the valley of Valcarlos in Navarre, between Pamplona and St. Jean Pied de Port in France. It commands the entrance to one of the passes of the Pyrenees. Charlemagne, returning from an invasion of Spain, was here attacked by the Basque mountaineers and lost his whole rear guard, A. D. 778. The numerous local ballads and romances of the middle ages, in which are related on one side the exploits of the legendary Spanish hero, Bernardo del Carpio, and on the other those of Roland, Oliver, and the other "peers and paladins" of Charlemagne's court who fell in the encounter, have given a character to the place which history cannot easily remove. (See **ROLAND**.) Through this pass the Black Prince led his army into Spain in 1367; and in July, 1813, Soult was forced from a strong position he had taken here by Wellington. Here Don Carlos was proclaimed king in 1833.

RONDA (anc. *Arunda*), a city of Andalusia, Spain, in the province of Malaga, 86 m. W. S. W. of Granada; pop. about 19,300. It is built upon a high rock, nearly surrounded by the river Guadiaro, which separates the town by a deep chasm, crossed by two bridges, into two parts. Cotton and woollen cloth, cutlery, and other articles are manufactured, and there is an active trade in horses, mules, and especially in crucifixes, which are exported from here to all parts of Spain. The annual fair in May is one of the most animated in Spain. Ronda

is of great antiquity. Under the Moors it was the principal fortress of Granada, and it is still protected by a Moorish castle. In 1485 it was conquered by Spain.

RONDO (It.), in music, a composition consisting of three strains, the first of which, forming the burden, closes in the original key, while the others lead the ear easily and naturally back to it. The piece derives its name from the melody going round through the second and third strains to the first.

RONDOUT. See KINGSTON, N. Y.

RONGE, Johannes, a German priest, born at Bischofswalde, Prussian Silesia, Oct. 16, 1813. He completed his studies at Breslau, and was chaplain at Grottkau from 1840 to 1843; but for refusing to submit to the discipline of the church he was suspended and afterward excommunicated. In 1844 he addressed a letter to Bishop Arnoldi denouncing the exhibition of the holy coat at Treves as idolatrous, and next he called upon the German Catholics to secede from Rome. His agitation led to the formation of the German Catholic denomination, but most of its members in 1862 joined the national Protestant church. (See **GERMAN CATHOLICS**.) In 1847-'9 Ronge was a prominent democrat, and subsequently he was an exile in London till 1861, when he returned to Germany, where for some time he continued active for reform.

RONSARD, Pierre de, a French poet, born near Vendôme, Sept. 11, 1524, died near Tours, Dec. 27, 1585. At the age of ten he entered the service of the duke of Orleans, son of Francis I.; and resuming it after some years' connection with the court of James V. in Scotland, he was employed by the duke in several confidential missions when still a boy. He was subsequently secretary of the French ambassador at the diet of Spire, and of Captain Langey du Bellay in Piedmont. But an illness resulting in deafness detained him in Paris about 1541, and he remained for several years at the college of Coqueret engaged in studies for improving the French language and literature after classical models. His disciple Joachim du Bellay published in 1549 *L'Illustration de la langue françoise*, an exposition of Ronsard's projected improvements. The works of the Pleiad (the name which Ronsard and his six friends, Du Bellay, Baif, Jamin, Belleau, Jodelle, and Pontus de Thiard, gave to their literary association) appeared in rapid succession, and were very popular, excepting with the adherents of the old school. The poems of Ronsard were hailed with enthusiasm, and the title of "the French poet" was bestowed on him. He became the poet laureate, and Charles IX. desired his company in all his travels, bestowing upon him pensions and gratuities. Many complete editions of his works were published from 1567 to 1630. Sainte-Beuve published in 1828 a select edition, with a biographical sketch and comments.—See *Vie de Ronsard*, appended to his *Œuvres inédites*,

by Guillaume Colletet (Paris, 1854), and *Essai sur Mansard et sa réforme littéraire*, by G. Scheffler, Dresden, 1874).

ROOF, the covering of a building. Roofs are very various in form, material, and construction. The rude dwellings of barbarous tribes are usually covered with the branches of trees. In tropical climates, the long and broad leaves of palms serve well for this purpose. In Europe the huts and cottages of the poorer classes are frequently covered with a thick layer of skilfully arranged straw, called thatch, supported by a simple framework. The flat roofs of the dwellings in Palestine and other eastern countries are often made of strong timber and covered with earth; temples and palaces are built of stone and roofed with slabs of marble. Tiles (sheets of earthenware) have been used for coverings of roofs from very early times, and are still extensively employed in Europe. Slate, cut into rectangular shape and nailed upon the boarding which covers the framing of the roof, is much used on the larger classes of dwellings and on public buildings. When the inclination of the roof is sufficient, shingles—flat rectangular pieces of wood, either pine or cedar, varying in thickness from three eighths of an inch at one end to an eighth or less at the other—are generally used on the roofs of wooden buildings throughout the United States. Roofs of slight inclination are frequently covered with sheet tin or sheet zinc. A layer of heavy paper, covered with pitch or with mineral or vegetable tar, is becoming common as a roofing material; this is often protected from the sun and from wear by a coating of gravel. Many other forms of mineral roofing, as asbestos and various complex preparations, have been introduced, and some of them appear to find favor with architects and builders, as being very cheap, readily applied, and moderately durable substitutes for the better known materials. In some cases public buildings, railway stations, and similar edifices, are covered with glass; this was done on the most extensive scale in the so-called "crystal palaces" in which international exhibitions were held in London in 1851, and in New York in 1853.—The inclination of roofs varies from 60 degrees in examples of Gothic architecture, and 25 or 30 degrees in the steeper roofs adopted in climates where snow falls heavily, to 10 degrees in warm climates where exposed to heavy rain, and to a perfectly horizontal position in dry countries. In carpentry, the framing which supports the outside covering is called the roof; this framing is generally of timber, but iron roofs are becoming common, and are now almost universally adopted for buildings of great width, when no support can be conveniently obtained between the side walls. This roof often serves not only to support the exterior covering, but to bind the walls together and sustain the upper floors. The design and construction of such roofs, when of great span,

demands the highest skill of the architect and the builder. When a roof consists of two inclined planes meeting along a line extending over the middle of the building, this junction is called the "ridge," and the end is said to be "gabled." When several inclined planes of roofing meet, forming a pyramid or a frustum of a pyramid, the roof is called a "hip roof." When the roof rises steeply from each side wall, meeting other portions extending with less inclination to the middle line of the building, there forming a ridge, the roof is called a "curb roof," or "gambrel roof." The Mansard consists of a nearly flat roof, extending back from the front of the building, and a second part at the front rising from the wall nearly vertically, permitting the construction of windows, as in the walls of the building. This system of roof construction, introduced by the celebrated architect Mansard, has the advantage also of permitting the upper rooms to be made with vertical side walls, and of giving thus greater capacity, better shape, and superior convenience, while giving at the same time a fine architectural effect which cannot be secured with the ordinary forms of roof. When the Mansard roof is built in wood, it is a source of danger to otherwise comparatively fire-proof buildings. If built, as is now common, in iron, this serious demerit is avoided. The strength of roof framing is determined by the character of the covering, the weight of snow to be expected, the pressure of the wind, and by its own location and inclination. Tin roofing weighs $\frac{3}{4}$ to $1\frac{1}{4}$ lb. per square foot, including the boarding; zinc weighs from $1\frac{1}{4}$ to 2 lbs.; slate from 5 to 10 lbs.; tiles from 6 to 7 lbs. as a minimum, though more usually 10 to 15 lbs.; while exceptionally heavy roofs, covered with flagging, weigh 25 lbs. or more. Snow, when freshly fallen, weighs from 5 to 12 lbs. per cubic foot; if wet, much more. Flat roofs laden with snow, in the United States, are sometimes subjected to a pressure of 50 lbs. per square foot. In Europe an allowance of 6 lbs. is usually made for snow; in the United States 15 or 20 lbs. is thought a better allowance. The pressure of the wind against a flat vertical surface is equal to about 55 lbs. as a maximum per square foot; in a tornado, the velocity being known, the formula for its pressure is very nearly $P = .005V^2$, or $\frac{1}{200}$ of the square of the velocity. P is the pressure in pounds on the square foot. The pressure on a cylindrical tower is half that on a turret of square section, having a thickness equal to the diameter of the tower. On any inclined surface the pressure may be estimated as, according to Hutton, $P = P \sin a^{1.64} \cos a - 1$, where a is the angle made by the surface with the direction of the wind. As it frequently acts wholly on one side of the structure, this is often a serious addition to the load borne. The location of the structure with reference to surrounding objects will modify the allowance to be taken for the pressure of the wind. When building

in exposed situations, as in constructing light-houses, or tall chimneys, or houses in unprotected locations, a large allowance should be made; in the midst of cities, in sheltered valleys, and localities in which heavy gales are unknown, comparatively little attention is given by builders to this force. A usual allowance is 40 lbs. per square foot of vertical surface.—In roof framing, the simplest form

FIG. 1.—King-post Truss.

of truss is that known as the “king-post truss,” consisting of a triangular frame (fig. 1), in which the middle portion of the triangular piece, or tie beam, *a a*, is secured to the junction of the inclined timbers, or main rafters, *b b*, by a vertical post called the “king post,” *c*. Several of these frames are placed parallel with each other to support the roof covering, and are connected by longitudinal pieces called “purlins,” *e e*. Over the latter, and parallel with the main rafters, are the common and lighter rafters, *f f*, distributed at short intervals; upon these the boarding is laid, and over all the slate, tin, or other covering. The

FIG. 2.—Queen-post Truss.

“queen-post truss” (fig. 2) consists of a horizontal tie beam, *D*, and main rafters, *e e*; the latter do not meet, but abut against a horizontal “straining beam,” *H*, which is also held at each end, and at the proper height above the tie beam, by queen posts, *B B*. In Gothic architecture the members of the roof trusses are usually exposed to view from below, and are

FIG. 3.—Complete Roof.

frequently carved and ornamented. The complete roof is shown in fig. 3, in which *a* is the tie beam, *b b* are the main rafters, *c* is one of two short rafters abutting against the straining beam *d*; *e* and *f* are king and queen posts in

pairs; *g g* are purlins supporting the common rafters, *h*. The tie beam is sometimes omitted, and the thrust of the rafters is received by the side walls, which are often buttressed to enable them to sustain this thrust safely. Roof trusses are often given peculiar forms to suit special designs. The large spans which are sometimes built in wood are often constructed of built arched beams. One of the largest ever designed, but which was never constructed, was planned for the great imperial riding house at Moscow in 1790; this was to have been a single built beam, in the form of an arch of 285 ft. span, with a tie beam and intermediate trusses. A somewhat similar structure has been used in the United States, first by Wernwag and Burr, and in Germany, by Wiebeking, for spans of 200 ft. and upward. In France, Philibert de Lorme first used, and Col. Erny of the army engineers afterward constructed, roof trusses in which planks are bent and built into an arched beam; trusses of this form have been designed for roofs up to 328 ft. span. Built arches of polygonal form are frequently used; where the struts and ties of the trusses, and the points of support for the superstructure, or incumbent load, are properly placed at the angles of the polygon, this is a stronger form than the arched. The roof of Westminster hall, London, somewhat resembles Erny's construction. Domed roofs have been frequently built with similar framing; that of the *halle au blé* at Paris, by De Lorme, was 129 ft. in diameter, and the arched beams were a foot thick. All roofs of large span are now built with iron trusses. One of the earliest iron roofs was that of the British house of parliament; one of its trusses,

FIG. 4.—Roof of Parliament House.

composed of wrought and cast iron, is shown in fig. 4. The struts, *a a*, are of cast iron; the ties or suspension rods, *b b*, are of wrought iron; *m* and *n* are the chords or tie rods; *e e* and *f f* are stay rods. The roof of the St. Pancras station, of the Midland railway in London, is 690 ft. long, 240 ft. wide, and contains 1,100

tons of iron. The roof of the Grand Central station in New York is 652 ft. long and 200 ft. wide, and consists of 32 wrought-iron trusses, rising in semicircular arches 94 ft. above the rails; the covering is of iron and glass; the trusses weigh 40 tons each; the roof contains 80,000 sq. ft. of glass, and covers nearly three acres.—See Rondelet, *L'Art de bâtir* (Paris, 1812-'17); Ardant, *Etudes sur les charpentes à grande portée* (Paris, 1837); Erny, *Traité de la charpenterie* (Paris, 1840); Ritter, *Dach- und Brückenconstruction* (Hanover, 1869); Unwin, "Iron Bridges and Roofs" (London, 1869); Tredgold, "Carpentry" (3d ed., London, 1870); Matheson, "Bridges and Roof Structures" (London, 1871); Bow, "Economics of Construction in relation to Framed Structures" (London, 1873); Stoney, "Theory of Strains in Girders" (revised ed., London, 1873); D. H. Mahan, "Civil Engineering" (revised ed., New York, 1873); and De Volson Wood, "Bridges and Roofs" (New York, 1873), and "Resistance of Materials" (revised ed., New York, 1875).

ROOK (*corvus frugilegus*, Linn.), a bird of the crow family, about the size, form, and color of the common crow, from which it differs principally in having the base of the bill covered with a rough scabrous skin, whitish in old birds. It is about 20 in. long and 40 in. in alar extent, the bill $2\frac{1}{2}$ in.; the female is a little smaller; the color is black, with purple, greenish, and bluish reflections, the feathers of the neck blended, and on the fore part of the head abraded; the head is entirely feathered in the young; albinos sometimes occur, and the bill is often variously distorted. It is found over most of Europe, and abundantly in many parts of Great Britain. Rooks live in society all the year round, building their nests, seeking food, and roosting in flocks; their resorts, called rookeries, are often very extensive, one near

They are very early risers, going in search of worms in the fields or of garbage in the streets; they sometimes visit the beaches and flats in search of shellfish and crustaceans; they eat also grain, seeds, insects, nuts, and lizards, but rarely if ever carrion; they plunder the grain fields only when forced by hunger; they feed with birds of various families without quarrelling. They prefer open fields, placing a sentinel, and flying off at his alarm note with great noise; the flight is generally by slow and regular flappings, without undulations; they often go many miles in search of food, and if they return in the forenoon or early afternoon, a storm within 24 hours may be confidently expected. They begin to repair their nests early in spring, and lay four or five eggs, light greenish blue, spotted and clouded with grayish brown and light purplish gray; the young are hatched about the middle of April, and leave the nest by May 20; great numbers of the newly fledged birds are annually shot to be eaten. The rook has been taught to imitate the sounds of animals, but is less intelligent and docile than the raven, crow, and jackdaw.

ROOKE, Sir George, an English admiral, born at the family seat near Canterbury in 1650, died there, Jan. 24, 1709. He entered the navy as a volunteer, and was made rear admiral of the red by William III. In the battle off Cape La Hogue, May 19, 1692, between the combined English and Dutch fleets and the French fleet, he led a night attack in the boats of the squadron, and burned six French three-deckers and seven other ships of the line, with a loss of only 10 men. He received a pension of £1,000, and was knighted. He was twice elected to parliament, and on the accession of Queen Anne in 1702 he was constituted "vice admiral and lieutenant of the admiralty of England, as also lieutenant of the fleets and seas." The war of the Spanish succession having begun, he was sent with a fleet against Cadiz, an attack upon which place was made, but abandoned; but receiving intelligence that the Plate fleet, under convoy of a French squadron, had taken shelter in the port of Vigo, in concert with the duke of Ormond he stormed the town, and destroyed 17 ships, capturing specie and goods amounting in value to £1,000,000. In August, 1704, he was conspicuous in the capture of Gibraltar. After a whole day's battle with a large French fleet off Malaga, Aug. 24, which got away in the night, he returned to England and retired from service.

ROOKS, a N. W. county of Kansas, intersected by the S. fork of Solomon river; area, 900 sq. m. It is not included in the census of 1870. The surface is gently rolling, and consists chiefly of prairies.

ROON, Albrecht Theodor von. See supplement.

ROOT, in botany. See PLANT, vol. xiii., p. 576.

ROOT, in mathematics, a term used in two different though related senses. I. In arithmetic a root is the inverse of a power; thus 16 is the fourth power of 2, and 2 is the fourth

Rook (*Corvus frugilegus*).

Edinburgh in 1847 containing 2,660 nests and about 30,000 inhabitants of all ages. The nests are made on tall trees, often in the midst of populous towns, and the same are used year after year; they are fond of the groves of old family mansions, where they are protected.

root of 16; 9 is the second power, or, as it is usually called, the square of 3, and 3 is the second or square root of 9. It will thus be seen that a root of a given number is a number which being taken a certain number of times as a factor will produce the given number. An arithmetical root of a number is indicated by the sign $\sqrt{}$ with the number placed after it, and the number indicating the degree of the root placed above and before it; thus $\sqrt[4]{16}$ is read "the fourth root of 16." The sign is a modification of the letter r , which was formerly used for this purpose. The second or square root is indicated by the sign alone, the figure 2 being omitted; thus $\sqrt{9}$ means the same as $\sqrt[2]{9}$. The first root of a number is the number itself, and therefore needs no sign. In the best modern works on algebra the sign $\sqrt{}$ is strictly limited to the designation of the arithmetical root of a quantity. II. In algebra the term root is used to denote any value of the unknown quantity in an equation, which being substituted for that quantity will satisfy the equation; thus the equation $x^4 - 7x^3 + 27x^2 - 47x + 26 = 0$ can be satisfied by substituting for x any one of four different values, two of which are real, viz., 1 and 2, and two are imaginary, viz. $(2 + 3\sqrt{-1})$ and $(2 - 3\sqrt{-1})$. Any given number has only one arithmetical root of a given degree, but it has as many algebraical roots as there are units in the number denoting the degree of the root; thus 3 is the only arithmetical square root of 9, but algebraically 9 has two square roots, $+3$ and -3 , because either of these will satisfy the equation $x^2 = 9$. The arithmetical root is at the same time one of the algebraical roots. Algebraical roots are designated by means of fractional exponents (see EXPONENT); thus $9^{\frac{1}{2}}$ may be considered as representing either $+3$ or -3 , and $1^{\frac{1}{2}}$ means either 1 (its arithmetical value) or -1 or $\sqrt{-1}$ or $-\sqrt{-1}$, either of which will satisfy the equation $x^4 = 1$. When the numerator of the fractional exponent is some number other than 1, it indicates that the root expressed by the denominator is to be raised to the power expressed by the numerator; thus $a^{\frac{2}{3}}$ means the third power of any one of the five fifth roots of a .

ROPE, a large cord, formed by twisting together a collection of vegetable or animal fibres or metallic wires. The smaller cords are called twines and lines, and all are included under the general name of cordage. The invention of ropes or cordage dates from the earliest times. The first ropes were probably made of the fibres of the inner bark of some kinds of trees or of grasses, and of thongs from the hides of animals. There are sculptures among the relics of the ancient Egyptians illustrating the manner of making ropes more than 4,000 years ago, and their most ancient records contain representations of well made ropes capable of transmitting the enormous power required in transporting their

colossal statues and huge blocks of stone. It appears that they made use of flax, and also of the fibres of the date tree. The most celebrated ropes known to history are the cables used in the construction of the bridges of boats on which the army of Xerxes crossed the Hellespont (Herodotus, vii. 36). There were two bridges, and six cables were assigned to each bridge. Two of the cables were of white flax, while four were of papyrus. Both sets of cables were of the same size and quality, but the flaxen were the heavier, weighing not less than a talent the cubit. If we assume the talent to be equal to about 56 lbs. and the cubit to be 22 in., the cables must have measured about 28 in. in circumference. The largest hemp cables ever made in the United States were 24 in. in circumference. The ancient Peruvians twisted together the strong fibres of the magney plant, forming them into cables as large as a man's body, used in the construction of the suspension bridges by which their paved highways were carried over ravines and rivers. Many rude savages, especially among the islands of the Pacific and Indian oceans, are celebrated for making beautiful cordage. In modern times, among civilized nations, the principal materials for ropes are hemp, flax, manila hemp, plantain leaf, jute, and metallic wire. Rope making was regarded as a matter of great importance to the early American colonists, and efforts were made to introduce it with other branches of manufacture in Virginia, where the climate and soil were found to be favorable to the cultivation of hemp and flax; but the culture was neglected for that of tobacco. In New England it was regarded with more interest; crops were raised from seeds of the plant received in Salem in 1629, and in 1641 the general court of Massachusetts directed attention to the wild hemp which grew in the province, and was used by the Indians for making nets, mats, and lines. In the same year the manufacture of cordage was begun in Boston by John Harrison, and in 1662 in Charlestown by John Heyman. In Connecticut the government at Hartford in 1642 gave direction for the sowing of hemp and "for the better furnishing of the river with cordage toward the rigging of ships." In the "History of Pennsylvania and West New Jersey," by Gabriel Thomas (London, 1698), there is a notice of large ropewalks in Philadelphia, several of which were owned by Joseph Wilcox.—*Rope Making*. In the United States there are four principal kinds of rope in common use: hemp rope, made of the fibres of the *cannabis sativa* or hemp plant; manila rope, made of the fibres obtained from the leaves of the *musa textilis*, or wild plantain; hide rope, made of long strips of green ox-hide; and wire rope. The best hemp for rope making comes from Russia, the Riga Rein being the brand preferred. One reason assigned for the superior quality of Russian hemp is the

practice of water-rotting it. American hemp is dew-rotted. Manila hemp comes chiefly from the Philippine islands, taking its name from Manila, the principal town. The best brand is the Cebu, named from the island on which it is grown; Quilot is another good brand; the Leyte is of inferior quality, while Lupis is very fine, white and silky, and of too high a grade for rope making. Hemp purchased for government use is first tested by inspection. It should present a fair appearance to the eye, be clear, dry, and free from a musty smell. If the appearance is satisfactory, a sample is selected at random from the cargo or lot and sent to the ropewalk to be more thoroughly examined. A lot containing about 140 lbs. is given to the hackler, and divided into two parts of 70 lbs. each. One part is hackled sufficiently fine for the smallest yarn or that used for bolt rope; the other part for larger yarn or the size used for cables. After hackling the hemp is again weighed to ascertain the quantity of dressed hemp produced and the percentage of tow and waste taken from it; this should not exceed 20 per cent. The dressed hemp is then passed through the spreaders and drawing machine and taken to the spinners, where it is spun into yarns of 20 s. and 40 s. The yarns are then weighed to ascertain the waste in spinning and the quantity of yarn produced. Half of the yarn is taken to the "laying" ground, where it is laid up into rope $1\frac{1}{2}$ in. in circumference. The other half is first tarred and then laid up into ropes of each sized yarn, making in all four ropes: tarred and untarred of 20 s., tarred and untarred of 40 s. The ropes are then carefully weighed to ascertain the weight per fathom and the percentage of tar absorbed. The strength of the rope is then found by securing short pieces, cut in lengths of 6 ft. for convenience, in a testing machine. The dry or white rope should sustain a strain of 4,200 lbs.; the tarred, 3,200 lbs. The weight should be from .5 to .6 of a pound per fathom for the dry, and from .6 to .7 for the tarred. The hemp having passed the required inspection, the first step in the process of preparing it for the manufacture of rope is to hackle or hatchel it. The hackle or hatchel consists of a strong board in which are inserted long steel prongs sharply pointed and polished. The hackler, taking a wisp of hemp in his hand by one end, throws the other over the prongs and combs it out, cleaning it of dirt and tow and straightening out the fibres. Having combed it out to where it was held, he reverses the wisp and combs out the other end. Much of the tow that is thus combed out is again hackled and spun into yarn for inferior kinds of rope. After hackling, the hemp is passed through the spreading and drawing machines, care being taken to regulate the supply so that the "sliver" or "roping" for the spinning machines shall be of suitable size; if too small, the yarn is liable to break in spinning; if too large, the spinning machine will clog up. The first

of the "preparation machines" is the "spreader," which is in fact a finer method of hackling. Its office is to comb out and straighten the fibres. The largest one now in use at the government ropewalk is intended especially for the very long manila fibres, being 17 ft. long by 6 ft. wide. It will run off a bale of 270 lbs. of manila in nine minutes, or 60 bales in 10 working hours, taking it direct from the bale, or rather with the intermediate step of oiling. From this machine the manila passes to a smaller and finer one, where the fibres in the sliver are still further straightened, and the sliver itself evened and drawn down. Thence it passes to a third, called the drawing frame, a machine built on precisely the same principle, but with one chain instead of two and with finer teeth, through which it is usual to pass it twice, the sliver at each successive step being reduced in volume, straightened and evened more thoroughly, to prepare it for the spinners. The course of preparation for the hemp is the same, though if the machines are properly geared and the draught correct, it will be found sufficient to run the hemp through the spreader only once, and through the drawing frame twice. From the preparation machines the hemp passes to the spinner, where it is spun into yarn and at the same time wound on a bobbin containing about 300 fathoms. In making rope, a three-inch rope is the key to the sizing of the yarn. Yarns of 20 s. are of such a size as to require 20 to make one strand for a three-inch rope, or to fill a tube half an inch in diameter; yarns of 26 s. require 26 threads to fill the same sized tube, and so on. If manila or white rope is to be made, the bobbins pass from the spinning room to the laying ground; if tarred rope, the next step is tarring. The bobbins containing the yarn are taken from the spinners to the tar house, where they are placed on horizontal rods contained in a framework conveniently arranged with reference to the tar box; 160 bobbins is about the capacity of the frame. The end of each yarn is passed through a board or gauge perforated with holes sufficiently large to allow the yarns to run freely, thence through three or more similar gauges so arranged over the tar box that when all is ready they can be lowered to the bottom. The tar box should be about 30 ft. long, 2 ft. wide, and 3 ft. deep. Steam, admitted to copper steam pipes at the bottom, keeps the tar at the desired temperature. A thermometer is so arranged that the bulb is always immersed in the tar, which, after the evaporation of the watery parts, should be maintained at 220° F., and should never be allowed to get below 212° while tarring. The machinery is so regulated that the yarn is drawn through the tar at the rate of about 15 ft. a minute. After leaving the tar the yarn passes between two metal rollers attached to the further end of the box, the upper one carrying a heavy weight to press out the superfluous tar. Thence the yarn passes

over a drum to cool it, when each separate yarn is led to, and evenly wound upon, its appropriate bobbin. After tarring, the yarn should before use be allowed a few hours to harden, and attach more closely to the fibre. Should it be made into rope immediately after tarring, the tar would press through to the surface, giving it an unsightly appearance, and decay would soon set in at the centre of the rope. The passing of the yarn through the boiling hot tar at a certain rate is necessary to enable it to take up a sufficient quantity of tar, the rollers pressing out and returning to the trough the superfluity. Enough of the tar is retained in the yarn to coat over the fibre and preserve it from decay. Tarring protects cordage from injury by exposure to rain and immersion in water; but it makes its fibre rigid and impairs its strength. This fact has long been known, and many efforts have been made, hitherto unsuccessful, to improve the tar or find a substitute for it. It has been shown by experiment: 1, that white cordage in continual service is one third more durable than tarred; 2, that it retains its strength much longer when kept in store; 3, that it resists the ordinary injuries of the weather one fourth longer. Manila is judged by inspection, and is not tested by strain. It is neither hackled nor tarred, with the single exception of the case of outside yarns of large hawsers, which are tarred. Having a harsher fibre, it is oiled before running through the preparation machines, the oil softening the fibre and relieving the machinery of much of the work it would otherwise have to perform. Care must be exercised, however, not to use too much oil, lest the manila turn yellow and the yarn become gummy. It should be well prepared before being taken to the spinners, as all the work required of them should be to put the twist into the yarn and wind it on the bobbin. The yarn having been spun of the size desired and wound up on bobbins, it is taken to the laying ground, where each bobbin is placed on an iron rod in frames convenient for reeling off in the process of forming the strands. The frames hold from 200 to 300 bobbins, one, two, or three frames being used, according to the size of the rope to be made. The number of yarns required for a strand are passed each through its proper hole in a metallic plate, brought together through a closely fitting iron tube in the tube board, and attached to the proper hook in the "former," a machine so called because it forms and equalizes the twist of the strand. The holes in the plate are made on concentric circles. The tube inserted in the tube board opposite the centre of the plate is so made as to compress the yarns of each strand into a solid mass as they are drawn through and twisted into a strand. Each strand has a separate plate and tube. The "former" is drawn down the ropewalk by steam power, and is so constructed with "whelps" on drums, and gears, that at whatever rate it may travel the

proper rotary motion is always given to the spindle to twist the yarns into strands. Power is applied to the former by means of an endless rope passing from one end of the walk to the other. The tube board is heated during cold weather by steam pipes, thus warming the tubes and keeping the tarred yarns soft and pliable. The next step is to put the strands into a rope, termed "closing." Two machines are used for this purpose, one at each end of the walk. The one at the lower end is termed a layer, as it lays up or closes the rope. The upper machine is stationary, and is used to keep the proper twist in the strand while laying. The strands are attached to the hooks of the machines separately. The machines being put in motion, the strands are brought to a proper degree of tension by means of a press attached to the lower or laying machine. As the turn or twist is put into the strands they shorten in length; this is termed "hardening." After the strands become hard, they are placed on one hook of the laying machine, but kept separate in front by the insertion of the "top," a wooden cone with grooves cut in its surface of a size to admit the strands. The top has attached to it "rope tails," which are applied to the rope during the process of closing for the purpose of creating friction. The more turns taken with the tails, the more twist is given the rope, and consequently the harder it becomes. The machines are so geared that the lower one makes two revolutions to one of the upper; that is to say, it requires two revolutions of the rope to one of the strands, the additional revolution being requisite to overcome the friction caused by the top, tails, and stake heads, which are placed at every five fathoms to support the strands and the rope. To obviate the necessity for long ropewalks, a machine has been devised for reeling up the rope as it is made. In private establishments rope is made on these layers as large as 10-inch. They are known as "Woodworth's laying machines." The government ropewalk, in Boston, Mass., is 1,360 ft. long. Rope can be made there, without resorting to unusual means, 170 fathoms (1,020 ft.) in length.—*The Quality of Rope.* The strength of rope depends mainly upon the quality of the material of which it is made. Hemp fibres vary from 3 to 3½ ft. in length; the manila averages over 6 ft., and is often found as long as 12 ft. To make rope, these fibres must be overlapped among themselves, and compressed so as not to be drawn apart. This compression is obtained by twisting, the fibres being continuously drawn out from a bundle in quantities sufficient to produce the thread or yarn, as already described. It is customary to spin the yarn right-handed. Yarns are then combined by twisting, and form a strand which becomes left-handed, the twist being reversed at each successive step. Three or more strands are then combined by twisting, forming a rope, which in its turn becomes right-handed; and

three or more ropes twisted together form a left-handed cable of nine strands. The proper twist to give the yarn averages about one turn and a half to the inch. The degree of twist to the rope may be determined by constructing a right-angled triangle, the base of which is the circumference and the height the length of one turn of the strand measured parallel to the axis. The difference between this height and the hypotenuse is the quantity by which the rope is twisted. The rope maker's rule for a three-strand rope is to have one turn to as many inches as are contained in the circumference of the rope. A three-inch rope, for example, should have one turn in three inches, measured on a line parallel to its axis. Three-stranded right-hand rope is commonly called plain laid. Four-stranded rope is made with a smaller rope in its centre, called a heart. If in making a rope the twist of the strands, instead of being reversed, is made the same as the yarn, right-handed, then the rope itself becomes left-handed, commonly called back-handed rope. It is more pliable but not as strong as the plain laid. The continual twisting necessary to bind the fibres into a permanent bundle "shortens in" its length. Plain-laid rope takes up 46 fathoms of the original yarn for every 100 fathoms of rope. It requires 2,488·8 lbs. of hemp to produce one ton of rope of 20-thread yarn, or about 11 per cent. more hemp than yarn. The size of rope is designated by its circumference; thus a six-inch rope measures six inches in circumference.—*The Strength of Rope.* The utmost strength of good hemp rope was formerly supposed to be about 6,400 lbs. to the square inch; but 9,200 lbs. is nearer the average strength. Tarred hemp ropes of $3\frac{1}{2}$ and 3 in., made at the government ropewalk, on a trial, required respectively a strain of 14,622 and 10,725 lbs. to break them, and therefore their utmost strength per square inch was 15,000 and 14,975 lbs., considerably more than double the strength ordinarily assigned to good hemp rope. These ropes were not made expressly for the trial. Rope stretches from one seventh to one fifth, and its diameter is diminished from one seventh to one fourth before breaking. A rough but safe rule for finding the breaking strain in tons of plain-laid rope is to square half the circumference. Thus, in a six-inch rope, the square of three is equal to nine tons, the table giving ten. A fore-handed rope is 25 per cent. stronger than one laid back-handed. A plain-laid rope is stronger than a cable-laid by about one sixth, owing to its having less twist. Four-stranded rope is weaker than three, about one thirteenth of its yarns going into heart. The heart forms the centre round which the strands circle. On applying a breaking strain, the heart breaks first, when an unequal strain is brought on the strands, and they part in detail. The strength of manila rope is about one third less than that made of hemp. Repeated experiments show that there is a great varia-

tion in the strength of rope cut from the same coil, amounting sometimes in large ropes to several hundred pounds.—*Hide Rope* is made of strips of green oxhide. The hide is stretched on frames, and when partially dry is placed on a revolving table, the ragged edges stripped off, and the entire hide cut into one yarn or strip by a knife placed for the purpose, the table and knife being worked by machinery. Two or more strips are united by a rope yarn. These strips are then reeled upon bobbins placed in the frames on the laying ground, and without giving any twist to the hide yarn they are laid up into strands, &c., just as in making hemp rope.—*Wire Rope.* The best charcoal iron wire or steel is used. The first step in the process of manufacture is to wind the wires on bobbins, the ends of separate pieces of wire being joined by brazing or twisting. Having seven bobbins filled, six are put in a small machine, and one in a reel stand conveniently situated for leading the wire down through a fair leader and thence up through the vertical shaft; this single wire is for the heart, around which are wrapped the six wires placed on the horizontal disk. As the disk revolves the six bobbins turn on their own centres in an opposite direction, so as to avoid twisting the wires. The proper tension on the wire is maintained by friction bands attached to the bobbins. The six wires with the single wire in the centre are for the heart of the strands. Having formed the heart (which is wound up on a bobbin as it is made), it is placed in a reel stand as before. On the machine to form the strand are twelve bobbins filled with wire; the machinery is put in motion, the seven-wire heart drawn up the vertical shaft, and the twelve wires wrapped about it. As the strand is formed it is wound up on a bobbin, which at each successive step increases in size. When the required length of strand is on the bobbin, known by a register fitted for the purpose, the machinery is stopped, the strand cut, the full bobbin removed, and an empty one put in its place. When seven bobbins are filled with strands, six are placed on another machine, a bobbin containing the heart being placed in the rear; the machinery is put in motion, the heart drawn through, and the six strands wrapped about it. The six strands of 19 wires each contain 114 wires, to which the 19 wires in the heart must be added, giving 133 wires to a rope. There are six wire-rope machines, made by Jackson and Watkins, London, and now in operation in the government ropewalk, known as A, the largest, B, C, D, E, and F, the smallest. A and B

Wire Rope with Hemp Heart.

machines are for forming the rope, and are placed in a horizontal position; the others are for making strands and hearts, and are vertical. Wire hearts are used for bridge cables, &c. Hemp hearts are used instead of wire for standing rigging, as it makes the rope more pliable. The amount of twist to give to the strand and to the rope itself varies with the size, and requires much care and judgment on the part of the manufacturer. The numbers assigned to the various sizes of wires run from No. 22, the smallest, to No. 0, the largest. The heart of the strand must be of the same size as the single wire, and the heart of the rope the size of a strand. The softer hemp permits the inside wires to become imbedded, as in the preceding figure. The foregoing description of wire-rope making applies to the fine wire of 133 to a rope. A stiffer kind of rope is made of coarser wire having seven to a strand and 49 to the rope. The sizing of the wire will be understood from the annexed diagram. Wire rope is applicable to all the general purposes of ordinary rope, except running rigging on board ship, and has many advantages over that

a distance in place of belting, and for all other purposes of this kind, where safety, durability, and economy are necessary, wire rope is far superior. Wire rope must not be coiled or uncoiled like hemp rope. When mounted on a reel, the latter should be turned on a spindle to pay off the rope. When in a coil without reel, roll it over the ground like a wheel, and run off the rope in that way. All untwisting or kinking must be avoided. To preserve wire rope, apply raw linseed oil with a piece of sheepskin, wool inside, or mix the oil with equal parts of Spanish brown or lampblack. To preserve wire rope under water or under ground, take mineral or vegetable tar, add a bushel of fresh slacked lime to a barrel of tar (to neutralize the acid), and boil it well, then saturate the rope with the boiling tar. The grooves of cast-iron pulleys and sheaves should be filled with well seasoned blocks of hard wood, set on end, to be renewed when worn out; this end wood will save the rope and increase adhesion. The small pulleys or rollers which support the ropes on inclined planes should be constructed on the same plan. Steel wire is to a certain extent taking the place of iron wire in ropes, where it is a special object to combine lightness and strength.

ROQUEPLAN, Joseph Étienne Camille, a French painter, born at Mallemort, near Arles, in 1803, died in Paris, Sept. 29, 1855. He became known in 1827 by his illustrations of Sir Walter Scott's romances. In 1853 his "Amateur Antiquary," painted in 1834, brought 30,000 francs. His latest and best painting was "The Well near the tall Fig Tree" (1852).

RORIC FIGURES (Lat. *ros*, dew), a name applied to certain curious images rendered manifest upon breathing on polished solid surfaces, when these have been previously exposed to contact with or close proximity of the objects thus represented, and usually at the same time acted upon by light, heat, or electricity. The singularity of these phenomena is, that they consist usually in the production at the first of a sort of latent or invisible image, which may afterward be developed somewhat in the manner of photography. Dr. J. W. Draper, in the "Philosophical Magazine" for September, 1840, mentioned certain facts going to show that an insensible molecular change may be made to take place in the surface of bodies; and among them he named the following instance, as long known: "That if a piece of very cold clear glass, or, what is better, a cold polished metallic reflector, has a little object, such as a piece of metal, laid on it, and the surface be breathed over once, the object being then carefully removed, as often as you breathe on it again, a spectral image of it [the object] may be seen; and this phenomenon may be exhibited for many days after the first trial is made." Möser of Königsberg first distinctly called attention to these figures; his statement through M. Regnault to the French academy in July, 1842, being to the effect that generally,

Wire Rope with Wire Heart.

made of hemp or hide. Its first cost is less than that of hemp rope of equal strength, the only correct mode of comparison; and, as a general rule, it will last three times longer than hemp rope. Its utility and economy have been fully demonstrated on inclined planes and slopes, to which purposes its application has become very general, and for hoisting, in warehouses, machine shops, foundries, mines, &c. It has also been substituted with perfect success for staying or guying derricks, suspension bridges, cranes, shears, masts, chimneys, &c., and for these purposes, not being affected by the weather, it never requires resetting, saving thereby a large amount of labor. For ferries, tow lines, tiller ropes, suspending gasometers, lightning conductors on vessels or houses, hauling logs in saw mills, for transmitting power to

when two bodies are sufficiently near, they impress their images upon each other; or, as he elsewhere says, if a surface has been touched in any parts by any body, it acquires the property of precipitating all vapors, these adhering to or combining with it on those spots differently from what they do on others. Möser inferred from the facts that there is a latent light, as well as latent heat; and that bodies radiate such a light, even in complete darkness. Write with a dry, blunt wooden point, a coil of paper, a brush, or any solid that does not scratch or color, on a clean surface of glass, or on any polished solid; no visible trace may appear; but breathe on the surface, and the parts that were touched will alone condense the breath, or they will condense it much more completely than, or differently from, other parts, and the characters traced become visible in lines of moisture. Or, breathe upon a surface, trace upon, and then dry it; breathing upon it again, the figures will reappear. To these appearances the name of Möser's images has been given; while some German writers term them *Hauchfiguren*, breath figures; and Mr. Grove has designated them as "molecular impressions," a name truly expressing the nature of only a limited proportion of the cases. Place a coin on a clean looking-glass, and leave both for some time in the sun; removing, and breathing gently on the glass, a quite distinct image of the coin will appear. Mr. R. Hunt produces similar effects by heat; and he ascribes the phenomena directly to thermic agency, though he seems to claim also (what more recent investigators deny the necessity of) a galvanic influence, his results being best when the metals used were electrical opposites, and as the impressing object was larger. He placed on a well polished copper plate, too hot to be handled, coins and medals of gold, silver, bronze, and copper, and allowed the whole to cool; removing the objects, exposing the plate to the vapor of mercury, and wiping off any non-adherent mercury, he found that the coins had made impressions on the surface that were distinct in the order above given, those of the gold and silver most so; and these were permanent. Whatever in cases of this kind the change may be, the parts of any device affect the surface to which they are near according to the relative proximity of the projecting and depressed portions. By exposure over night he obtained a very distinct image of the grain of wood placed at more than half an inch distance from the receiving plate; and so, images are readily obtained with objects an eighth of an inch from the surface; a very good plan is, with the object on or hung near the plate, to place both on the mantelpiece over a fire, the ascending heat radiations being thrown back from the object, and affecting the polished body. (See the chapter on "Thermography" in R. Hunt's "Photography," republished in New York, 1852.) Karsten placed a medal on a glass plate, resting on one of metal (a coin on a look-

ing-glass coated with amalgam may be used), and allowed a few sparks from an electrical machine to fall on the medal; the image on the glass is brought out by vapor of mercury, iodine, or the breath. Some years before, Riess discharged electric sparks on glass and mica plates, and, breathing on these, brought out figures of the traces of the spark. But if he first cleaned the glass by boiling in nitric acid and washing in ammonia, or employed platinum foil clean enough to fire gases, or fresh mica surfaces obtained by splitting for the occasion, no figures appeared after applying the electric spark. Karsten concludes that surfaces show figures after the electric discharges only when they have previously become "weathered" over with minute depositions of fatty and other organic matters; the spark burning these off along certain lines, which then behave differently from the other parts to moisture and to light. This doubtless explains some of the figures due to electricity, as does the supposition of Fizeau some of those occasioned by heat. The latter considers that most surfaces are slightly coated with fatty or organic matters, and that during proximity these are transferred in minute quantity to the receiving surfaces. It is known that mercurial vapor condenses in a manner visibly different on a surface already soiled or exposed to vapor, however slightly. But there are instances that appear to be covered by neither of these suppositions, and which can only be explained by some actual change in the molecular constitution of bodies, affecting their subsequent behavior toward the physical forces. If we modify Karsten's experiment by placing eight or ten plates beneath the coin, and afterward mercurialize the upper surfaces of all the plates, the figures appear upon them all, but more faintly as the surfaces were further removed. Electrical discharges render evident impressions long apparently obliterated by polishing, thus showing that these could not have been superficial merely. The surfaces may be impressed in the dark, and without known change of temperature. Near a polished silver plate fix one of glass, painted black, with characters scratched through this coating, and expose to the sun for some days; or place a lattice-work before polished granite in the sun for half an hour; in either case the images can be afterward developed. The electric images are not easily obliterated by ordinary means of washing and rubbing. Mr. Hunt, observing that black substances in case of heat leave the strongest impressions, applied this fact, in an art which he named thermography, to the copying of prints, cuts, writing, &c., the impression obtained on amalgamated copper being treated with mercury to develop the light, and with iodine for the dark spaces. The art in this form has not been practically introduced. Breguet, the celebrated Parisian watchmaker, found inscriptions on the inner case of a watch reproduced on the

inner surface of the outer case; and engineers observe examples in which the near surfaces of parts of machines become visibly impressed the one on the other. Without doubt these are instances of mere transfer of material; and a sort of printing, due to such transfer during long contact, is obviously the explanation of such cases as those of the images which picture framers find impressed on glass or paper with which a print has been long in contiguity. Photographic negatives or positives sometimes produce latent impressions on paper, or through it on sensitive surfaces with which they are laid away; and a sensitized plate from which one picture had been apparently discharged, receiving a second, has had the two pictures then developed on the same field. These and similar phenomena must be explained on simply chemical principles. Mr. C. A. Seely of New York has observed that a sheet of sensitive paper, having been enclosed between several folds of a printed circular, and left within a book, of course in the dark, for about a week, impressions became visible on both sides of the sheet, and the printing on both sides of two or more folds of the circular became superposed on the sensitive paper, that of more distant folds being sometimes the more distinct, and usually not on their own, but on the opposite side of the sensitive sheet. Mr. Grove observed peculiar spots on some trout, and placing freshly caught fish with a serrated leaf on each side in the sun, found that, after a while, that on the sunned side had impressed its image on the skin of the fish, while that in the dark had not. Grove experimented also by placing paper with letters cut in it between glass plates, making these with sheets of tin foil into a Leyden apparatus, and electrifying for a few seconds with a Ruhmkorff coil; he then breathed on the inner surfaces of the glass, and images of the letters appeared; or by exposure to hydrofluoric acid, these were permanently etched. Pouring over a plate holding this latent image a film of iodized collodion, treating as for a photograph, and exposing to diffused daylight, another image, also insensible, was by the consequent action on light induced in the collodion film; and this being dried, removed, and submitted to developing agents, the insensible molecular change by which characters were impressed on the glass by electricity was finally rendered manifest by visibility of the image in the film. The number and variety of the ways known in which the luminous, actinic, and thermal rays, as well as electric perturbation and discharge, are capable of modifying the condition, and doubtless the molecular constitution of bodies, have been since the time of the announcements by Draper and Möser continually on the increase; until we are at length led to admit that many or all of these agents must modify molecularly all bodies subjected to their influence, and in turn their subsequent behavior to many of the physical forces. (See

FLUORESCENCE, PHOSPHORESCENCE, and PHOTOGRAPHY.) Finally, it appears no longer necessary, with Möser, to ascribe these actions to latent light; nor with Herschel, to claim a peculiar heat or set of "parathermic rays."

RORQUAL, the largest of the whale family, distinguished from the Greenland or right whale (*Balæna mysticetus*, Linn.) by the presence of a dorsal fin, and by nearly parallel longitudinal folds extending between the arches of the lower jaw, from the under lip along the chest and abdomen. The name rorqual is of Norwegian origin, meaning "whale with folds;" the genus was named *balænoptera* by Lacépède in 1804; the whalers give to it the names of razorback and finback. There are no teeth, and the baleen or whalebone is very short. The largest species is the great northern rorqual (*B. [physalus] boöps*, Flem.), probably the most bulky and powerful of living animals. The head is about one fourth the length of the body, which is longer, more slender, and less cylindrical than in the right whale; the blubber is much thinner, rarely exceeding 6 in., and usually yields less than

Great Northern Rorqual (*Balænoptera boöps*).

10 barrels of oil, on which account, and also because the baleen is of comparatively little value, whalers do not often attack this bold, restless, and powerful inhabitant of the ocean. The head is so flat that the longest baleen plates seldom measure 4 ft.; there are many hundred plates, becoming toward the sides mere bristles; the posterior arch of the palate is large enough to admit a man, though the opening of the œsophagus would not allow anything larger than a cod to pass; the sieve is coarser and the swallow larger than in the right whale, indicating a totally different kind of food, the rorqual devouring not only medusæ and crustaceans, but immense numbers of herring, pilchards, salmon, haddock, and cod; Desmoulins says that 600 good-sized cod, and a great quantity of pilchards, have been found in the stomach of a single individual. The longitudinal folds of the under surface

vary in width from $\frac{1}{2}$ in. to 3 in., and allow of the distention necessary to hold the water containing its prey, which is strained through the baleen during the shutting of the mouth; the tongue is free at the apex. The rorqual attains a length of 100 to 110 ft.; the body is compressed on the sides and angular on the back; the head comparatively small, and the tail narrower than in the right whale; the lower jaw is longer and much wider than the upper; there is a small dorsal opposite the vent; the pectorals are distant from the angle of the mouth, slender, straight, and pointed. The color is dark bluish gray, lighter below, the lower lip and the folds rosy white. They blow so violently as to be heard a great distance in calm weather; when seen, they are almost always in motion, and when about to descend do not throw the tail high in the air. They are abundant in the arctic seas, especially on the coast of Spitzbergen, as far as lat. 80° N. in open summer weather; they generally avoid much ice, and are shunned by the right whale, and their appearance is consequently unfavorable to the whalers' success. The usual rate of swimming is about 12 m. an hour; they are bold, but not revengeful or mischievous, though like other whales they will often attack and destroy a boat when their mates or young are wounded. The Greenlanders sometimes take small specimens by following in their canoes, and throwing so many lances that the animal dies from loss of blood; they are also occasionally stranded in their pursuit of herring and other fish into shallow water on a retreating tide. In a skeleton 78 ft. long, the head was 21 ft., and the vertebral column 57 ft.; there were 7 cervicals and 13 dorsals, the longest rib (the 6th) 11 ft. long; the bodies of the larger vertebræ were 14 in. in diameter, and 6 to 7 ft. from tip to tip of the transverse processes; the skull in some parts had a vertical thickness of more than 3 ft. In a female 95 ft. long, the head was 22 ft. and the lower jaw 25 ft. long, and the weight of the skeleton 35 tons. This, with the Mediterranean rorqual (mentioned below) and other species, Gray places in a distinct genus *physalus*, though without very satisfactory generic characters. The lesser rorqual, considered by Bell as the young of the greater, was made into a separate species by Dr. Knox with the specific name of *minor*, and is the *B. rostrata* (Gray). It attains a length of 25 ft., and has 15 fewer vertebræ than the preceding species; the baleen is short and white, the folds of the throat rosy, and the upper part of the base of the pectoral is marked with a white spot. It frequents the rocky bays of Greenland and the coasts of Norway and Iceland, sometimes descending to lower latitudes; it feeds on the arctic salmon and other fish; it is very active and rarely attacked, though its flesh is highly estimated in northern climates; the oil is also very delicate, and forms an important article of Icelandic materia medica.—

The rorqual of the southern seas, or black whale of the South Pacific (*B. australis*, Cuv.), has a long dorsal immediately over the pectorals; it is black above, white beneath, and the folds roseous; the vertebræ are 52 in all. It rarely approaches the cape coasts, and from its strength, velocity, and small yield of oil is not considered worth pursuing; it attains a length of 40 ft.; it can leap entirely out of water, and is fond of floating perpendicularly, with only the head above the surface. The rorqual of the Mediterranean (*B. antiquorum*, Fisch.) is probably the one called *mysticetus* by Aristotle, and *musculus* by Pliny. Some of this species have been stranded on the southern coasts of France, 60 to 80 ft. in length; the color is grayish black above, lower jaw and folds rosy, rest of lower parts white. Two specimens of rorqual have been obtained within a few years on the New England coasts, and the skeleton of one 50 ft. long is in the collection of the Boston society of natural history. Other species are described. Some small species have been found fossil in the pliocene of Piedmont, far from and high above the present level of the sea. M. Cortesi discovered two species, named by Desmoulins *B. Cuvieri* and *B. Cortesii*, respectively 21 and 12 ft. long.

ROSA, *Euphrosyne Parepa*, an English soprano singer, born in Edinburgh in 1836, died in London, Jan. 21, 1874. Her father was Georgiades de Boyescu, a Wallachian nobleman; her mother was Elizabeth Seguin. The latter, left a widow at the age of 21, adopted music as a profession, and trained her daughter for it. She studied under Crescentini, Panseron, and Bordogni, and made her début at Malta in 1855 as Amina in *La sonnambula*, adopting the stage name of Parepa. After singing in many cities of southern Europe, in 1857 she went to London, where she made her first appearance in *I Puritani*. In 1863 she withdrew from the stage and married Capt. Carvell, a retired officer of the East India service, who died in 1865. Having lost all her property by an unfortunate investment, she returned to the profession, and joined a concert company which Mr. H. L. Bateman was organizing for the United States. Her first appearance in this country at Irving hall, New York, in September, 1865, was exceedingly successful. She returned with the same manager in 1866-7, and in the course of the season married the violinist Carl Rosa. In New York, Boston, and other American cities she sang frequently in oratorio, winning probably in this class of music her most enduring fame. She appeared also from time to time in Italian opera. In 1869 she and her husband organized an English opera company, with which during three winters they made tours of the principal American cities, producing for the first time in America Weber's "Oberon," and reviving Mozart's "Marriage of Figaro." During the winter of 1872-3 she was a member of the Italian opera company at the khedive's

theatre in Cairo. The next season M. and Mme. Rosa formed an English opera company, with which after a tour in England they proposed returning to America. Mme. Rosa was large in person, with a handsome countenance, and a physique of remarkable endurance.

ROSA, Francisco Martinez de la. See MARTINEZ DE LA ROSA.

ROSA, Monte, a mountain group at the eastern extremity of the Pennine Alps, on the frontier line between the Swiss canton of Valais and the kingdom of Italy, in lat. 45° 55' N., lon. 7° 52' E. It is, after Mont Blanc, the loftiest mountain of the Alps, the highest peak being 15,150 ft. above the sea. The main ridge stretches S. from the peak known as Nordende to the Parrot-Spitze, where it connects with the Lyskamm range. Between these points two principal branches radiate, one westward, with the highest summit or Höchste Spitze at its junction with the main ridge, and the other eastward from the Signal-Kuppe, somewhat to the south of the middlemost point. Four angles are thus formed; those on the west contain the Monte Rosa and Lys glaciers, and give rise to the great Gorner ice stream, and those on the east enclose the Macugnaga and Sesia glaciers. Monte Rosa thus forms a part of the watershed between the basins of the Rhône and the Po. The mountain walls are most precipitous in the N. E. angle above the Macugnaga glacier. Along the crest, especially in the neighborhood of the Höchste Spitze, the edge is sometimes so sharp as to allow the climber to bestride it. All the summits of Monte Rosa are composed of gneiss and white mica slate, and all have of late years been ascended.

ROSA, Saint, commonly called St. Rose of Lima, the only canonized saint of American birth, born in Lima in 1586, died there, Aug. 24, 1617. Her parents were wealthy Spaniards, and gave her in baptism the name of Isabel; but, it is said, her extreme beauty in childhood made them call her Rosa. Their fortune having been swept away, Rosa was taken into the household of the treasurer Goncalvo, where she supported her parents by her labor, while following her bent for asceticism. She refused every matrimonial offer, assumed the habit of the third order of St. Dominic, and lived a recluse in the garden of her protectors. She was canonized by Pope Clement X. in 1671, and her feast was fixed on Aug. 30.

ROSA, Salvator, an Italian painter, born at Aranella, near Naples, June 20, 1615, died in Rome, March 15, 1673. In early life he explored the wildest regions of Calabria, associating with banditti, in the interest of his art. After his father's death he supported the family by making drawings on primed paper, which brought his talent into notice; and he afterward studied under Spagnoletto and Aniello Falcone. He then visited Rome, where he became celebrated not only as a painter, but also as a poet, musician, and actor. In 1647 he took part in the insurrection at Naples un-

der Masaniello, after whose overthrow he fled to Rome. Incurring there the displeasure of the authorities by satirical pictures, he escaped to Florence, where he was employed in the Pitti palace; but after some time he returned to Rome. Among his most celebrated works are the "Catiline Conspiracy," "Saul and the Witch of Endor," "Attilus Regulus," and altarpieces. He is best known as a landscape painter, having been one of the first in Italy to practise that branch with success. He delighted in gloomy effects, powerful contrasts of light and shade, and romantic forms. He also excelled in portraits and as an engraver. See "The Life and Times of Salvator Rosa," by Lady Morgan (2 vols., London, 1824), and *Salvatore Rosa*, by Cantù (Milan, 1844).

ROSAMOND, a Lombard queen. See ALBOIN.

ROSAMOND, commonly called "Fair Rosamond," a favorite of King Henry II. of England, the daughter of Walter, Lord Clifford, died in 1177. She was first brought to the king's notice through the collusion of her brothers, who desired to advance their own fortunes by means of their sister's beauty. She lived at Woodstock, where Henry frequently visited her, and bore to him William Longsword, earl of Salisbury, and Geoffrey, who was nominated bishop of Lincoln. She was buried in the church of Goodstone, opposite the high altar, but in 1191 Hugh, bishop of Lincoln, caused her bones to be removed with disgrace. The story of her concealment in a labyrinth and being poisoned by Queen Eleanor lacks historic basis.

ROSARIO, a city of the Argentine Republic, in the province of Santa Fé, on the right bank of the Paraná, 170 m. N. W. of Buenos Ayres; pop. about 40,000, including many foreigners. In 1854, when it contained only 4,000 inhabitants dwelling in wooden sheds and mud huts, it was created a port of entry, and it is now the second commercial city of the republic. The climate is temperate and healthful, the thermometer averaging 78° F., and rarely rising to 100°. The city is well laid out; the streets are paved, lighted with gas, and traversed by cars. There are several handsome churches, theatres, banks, hotels, a custom house, exchange, &c., and docks and wharves are in course of construction. The river here is a mile wide, and vessels of any size may lie alongside of the steep bluff, 50 to 60 ft. high, on which the city stands. Rosario is the natural receiving and distributing centre of a vast region. It is the starting point of the railway system of the interior, designed to consist of two main stems extending to the Pacific coast, with branches to every part of the republic; one line is completed (1875) for nearly 400 m., and another to the Rio Cuarto. In 1874 the official value of merchandise imported direct was \$7,046,400; of the exports, \$2,101,100, of which \$1,073,540 consisted of wool, hides, hair, goat skins, &c., sent to the United States. The movement of shipping to

and from foreign ports was 230,209 tons, 69 per cent. of which was steam.

ROSARY (Lat. *rosarium*), the name given by Roman Catholics to a certain form of prayers recited on a string of beads, and to the beads themselves. This form of prayer was instituted in the 13th century by St. Dominic, as a popular way of meditating on the chief mysteries of Christ's life. It consists of 15 times 10 small beads, every 10 small ones being preceded by one larger one. At each large bead the Lord's prayer is recited, and at each of the smaller ones the "Hail Mary," the 10th "Hail Mary" being followed by the doxology: "Glory be to the Father, and to the Son, and to the Holy Ghost," &c. In each "Hail Mary," after the word "Jesus," which concludes the first half of it, a few words commemorative of a mystery in the life of Christ are inserted. The rosary was intended to be for the laity what the breviary is for the priests; and as the number of "Hail Marys" in the rosary is equal to the number of psalms in the breviary, it is often called *psalterium Marianum*. The name *rosarium* (in mediæval Latin) is probably derived from the appellation *rosa mystica*, by which the Virgin Mary is frequently designated in the prayers of the church. On account of the length of the original rosary, it soon became and still is customary to take for common use only one third of it, which is also called "the small rosary," and popularly the crown (*corona*) or chaplet of the Blessed Virgin.—The Buddhists and Mohammedans likewise use beads for counting their prayers, those of the latter being commonly formed of sacred clay of Mecca or Medina. (See **BEAD**.)

ROSAS, Juan Manuel de. See **ARGENTINE REPUBLIC**, vol. i., p. 693.

ROSCHER, Wilhelm, a German economist, born in Hanover, Oct. 21, 1817. He graduated at Berlin in 1840, and was professor there from 1843 to 1846, and afterward at Leipsic. His principal works are: *System der Volkswirtschaft* (vol. i., *Die Grundlagen der Nationalökonomie*, Stuttgart, 1854; 9th ed., 1871; vol. ii., *Nationalökonomie des Ackerbaues*, 1859; 6th ed., 1870); and *Geschichte der Nationalökonomie in Deutschland* (Munich, 1874).

ROSCIUS, Quintus, a Roman comic actor, born at Solonium, near Lanuvium, died in 62 B. C. Sulla gave him a gold ring, the symbol of equestrian rank. He is frequently spoken of in terms of the highest praise and affection by Cicero, who in his youth received instruction from him, and afterward defended him in a lawsuit. Roscius wrote a treatise in which he compared eloquence and acting. According to Macrobius he received 1,000 denarii (about \$150) every day, and Pliny says that he yearly gained 50,000,000 sesterces.

ROSCOE. I. William, an English historian, born near Liverpool, March 8, 1753, died in Liverpool, June 27, 1831. In 1774 he was admitted an attorney of the court of king's

bench, and commenced practice in Liverpool. He took an active part in the agitation for the abolition of the slave trade, and published "A General View of the African Slave Trade" (1787); "A Scriptural Refutation of a Pamphlet lately published by the Rev. Raymond Harris, entitled 'Scriptural Researches on the Licitness of the Slave Trade,' in four Letters from the Author to a Clergyman" (1788); and "An Inquiry into the Causes of the Insurrection of the Negroes in the Island of St. Domingo" (1792). In 1796 he published "The Life of Lorenzo de' Medici, called the Magnificent" (2 vols. 4to), which was translated into French, German, and Italian; and in 1805 "The History of the Life and Pontificate of Leo X." In a supplementary volume, "Illustrations, Historical and Critical, of the Life of Lorenzo de' Medici" (1822), he replied to various criticisms. In 1806 he was elected a member of parliament from Liverpool in the whig interest, and after the dissolution of that parliament in 1807 he published "Occasional Tracts relative to the War." He was also the author of other works of minor importance, and edited Pope's works (10 vols. 8vo, 1824).—Three of his sons became well known in literature. **ROBERT** (1790–1850) wrote poems, and completed in return for a legacy his friend Mr. Fitchett's posthumous epic "Alfred" (6 vols., London, 1844). **THOMAS** (1791–1871) was distinguished especially as a translator and editor of Italian works. His more important publications are: a translation of the "Memoirs of Benvenuto Cellini" (2 vols., 1822); a translation of Sismondi's "History of the Literature of the South of Europe" (4 vols. 8vo, London, 1823); specimens from Italian novelists (4 vols., 1825), from German novelists (4 vols., 1826), and from Spanish novelists (3 vols., 1832); a translation of the "Memoirs of Scipio de Ricci" (2 vols., 1828); a translation of Lanzi's "History of Painting in Italy" (6 vols., 1828); and a "Life of William the Conqueror" (1846). **HENRY** (1799–1836), barrister at law, published a life of his father (2 vols. 8vo, 1833), and wrote also "Lives of Eminent Lawyers" for "Lardner's Cyclopædia," besides various legal works. **II. Henry Enfield**, an English chemist, son of Henry, born in London, Jan. 7, 1833. He was educated at the Liverpool high school, University college, London, and Heidelberg university. While at Heidelberg (1853–'7) he published in conjunction with Bunsen a series of memoirs on the measurement of the chemical action of light, and other original investigations. In 1857 he was appointed professor of chemistry in Owens college, Manchester, in 1863 became a fellow of the royal society, and in 1873 received the royal medal of that society. He has published "Elementary Lessons in Chemistry" (1866), translated into several languages, and "Lectures on Spectrum Analysis" (1869), giving the first connected account of the discoveries in that branch of science.

ROSCOMMON, an unorganized county of N. Michigan, drained by the south branch of the Au Sable and some of the head waters of the Muskegon and Titibawasee rivers; area, 625 sq. m.; returned as having no population in 1870. It contains several lakes, the largest of which are Higgins's and Houghton's. The surface is rolling, and the soil poor.

ROSCOMMON, a central county of Ireland, in Connaught, bordering on Sligo, Leitrim, Longford, Westmeath, King's, Galway, and Mayo; area, 915 sq. m.; pop. in 1871, 141,246. The Curlew and Brailieve mountains, which attain a height of from 1,000 to 1,200 ft., lie in the north of the county. The Shannon and its tributary the Suck flow on about two thirds of the whole boundary line, the former expanding in several lakes, of which the largest is Lough Ree. The Shannon has been made navigable by means of short canals, and the Suck can be ascended by flat-bottomed boats about 10 m. above its junction with the former. Grazing and agriculture are the chief occupations. Coarse woollen goods are made, and there are manufactories of tobacco pipes and earthenware. The principal towns are Roscommon, the capital, Boyle, and Elphin.

ROSCOMMON, *Wentworth Dillon*, earl of, an English poet, born in Ireland about 1634, died Jan. 17, 1684. He was the nephew of the earl of Strafford, after whose impeachment he went to the continent. After the restoration he held various offices about the court. An edition of his poems was published in 1717, and in the same year his "Essay on Translated Verse." He is reputed to be the only popular poet of the reign of Charles II. whose writings are not immoral.

ROSE, the common name for plants of the genus *rosa*, the ancient Latin name, which has been adopted into most European languages. The genus gives its name to the family *rosaceæ*, which includes most of the cultivated fruits and many of the ornamental plants of northern climates, among which are herbs, shrubs, and trees, with simple or compound, usually alternate and stipulate leaves; flowers usually regular; the sepals mostly united, and often adherent to the ovary; petals four or five, inserted on the calyx, as are the usually numerous, distinct stamens; one to many pistils, distinct or (in the pear tribe) united with the calyx tube; seeds without albumen. About 70 genera are included in this family, which are grouped in several tribes; the characters of the important tribes are given in describing the plants belonging to them; the peach, cherry, and plum represent the tribe *prunææ*; the almond represents the *amygdalææ*; *spirææ* stands for another subtribe; the *rubeææ* are described under RASPBERRY; the strawberry represents another tribe; while the apple, pear, quince, and thorn are familiar representatives of the most important tribe, *pomeææ*. In the tribe *rosææ* the only genus is *rosa*, which, while widely differing in appearance from the genera

just referred to, has all the essential characters of the family in common with them. The species of rose are all shrubs, sometimes climbing, and generally prickly; they have alternate, odd-pinnate, and generally serrate leaves, with stipules united with the base of the petiole; flowers solitary, or in clusters at the ends of the branches; calyx with an urn-shaped tube, contracted at the mouth, and five spreading, often leafy lobes; petals five, spreading, and with the numerous stamens inserted on the edge of the hollow, thin disk that lines the calyx tube; pistils numerous, concealed in and attached to the lower part of the disk, their hairy ovaries becoming bony akenes in fruit; in ripening, the enlarged calyx becomes fleshy, often colored, and forms a fruit popularly known as hip or hep. The foliage, stems, and calyx in some species bear aromatic glands. There are few genera in which so much confusion exists in regard to species as in the rose, the plants being very variable even in the wild state; about 180 species have been described, and many more enumerated, but the best authorities admit only about 30; in the limited area of Great Britain some botanists find 20 species, while others reduce these all to five. Probably the next revision of the genus will reduce the North American species to six or eight, though several more have been described; of these, three are frequent in the northern states. Our most common wild rose on dry soils is the dwarf rose (*rosa lucida*); it is from 1 to 3 ft. high, the stems with bristly prickles, the depressed-globular hip smooth when ripe; this varies greatly in wet soil, and forms of it have been described as distinct species; it blooms from May to July, while the swamp rose (*R. carolina*) blooms from June to September; this has stems 4 to 7 ft. high, armed with stout hooked prickles, and the fruit is somewhat bristly; it is found in low moist grounds as well as in swamps. These two are the common wild roses in the eastern states, and extend as far south as Florida. The early wild rose (*R. blanda*), 1 to 3 ft. high, is nearly unarmed, or has a few straight deciduous prickles; the flower stalks and calyx, which are glandular bristly in both the preceding, are in this smooth and glaucous; this is a northern species found as far as Hudson bay; it extends from Vermont along the northern border to California, and has been described under several names. The prairie, Michigan, or climbing rose (*R. setigera*), our only scandent species, makes shoots 15 to 20 ft. long in a season; it has stout, nearly straight prickles; leaves with only three to five leaflets; the abundant flowers, produced in July, are deep rose-colored, changing to white; unlike any other native species, this has its styles united in a column and projecting beyond the calyx tube; common in rich soil from western New York, westward and southward, and sometimes cultivated, though not so often as the double varieties derived from it.—A few ex-

otic species are more or less naturalized; the best known is the sweetbrier (*R. rubiginosa*), which is here used to illustrate the structure of the genus. It is about 6 ft. high, but may be trained much higher; its stems have strong, hooked prickles, with some smaller awl-shaped

Sweetbrier Rose (Section of Flower and the Fruit).

ones; the doubly serrate leaflets have the under surface downy and clothed with russet glands, which, especially when bruised, give off a characteristic and pleasant fragrance; the small pink flowers are mostly solitary, with a pear-shaped hip. This is sometimes called eglantine, a name which was formerly applied to roses in general. The dog rose (*R. canina*) of Europe, which occurs in some parts of Pennsylvania, is the common briar of England, and is found throughout Europe and Russian Asia; it is close to the sweetbrier, but has no aromatic glands; in England this is largely used as a stock upon which to bud the finer kinds of roses. The most important introduced species is the Cherokee rose, which Michaux, regarding it as indigenous, described as *R. lavigata*, but it is now certain that it is a Chinese species (*R. Sinica*), introduced into Georgia and South Carolina before the revolution; it has every appearance of a foreign species, and is found in China, where it is the common wild rose; it is a vigorous climber, reaching the tops of tall trees, and hanging in shoots and festoons 20 to 40 ft. long; the otherwise smooth stems have strong, sharp, curved prickles, and its leaves, usually of only three leaflets, glossy and evergreen; the flowers, which appear in the greatest profusion in early spring, are large, single, and of a peculiarly clear and pure white. This has proved to be one of the most valuable of all hedge plants for the southern states; hedges made over 50 years ago are still in full vigor. Cuttings are set in the hedge row, 3 ft. apart; the growth of the first year is the next winter cut back to within a foot of the ground; after this the long and vigorous shoots are allowed to grow and are directed on the line of the

hedge, where they pile up and interlace to form an impenetrable barrier. Cultivators near Boston have found the Cherokee rose admirable for the greenhouse, the great abundance of the flowers and their purity compensating for their singleness. Another Chinese rose used in the southern states for hedges, and somewhat naturalized, is the Macartney rose (*R. bracteata*), introduced into England by Lord Macartney in 1795; it is barely hardy in England, but in the southernmost states is evergreen, and differs from the foregoing in having the stems downy as well as prickly, and its calyx covered by leafy bracts; in low rich soils it is preferred as a hedge plant to the Cherokee.—The foregoing wild or naturalized roses are botanical species in their normal form, with single flowers; the roses of our gardens and greenhouses are for the most part varieties obtained by selection and by hybridizing and crossing, and this has been continued so long that often all traces of their original parentage are concealed. Bud variation is remarkably frequent in the rose; a bud will often produce a shoot upon which the flowers, and even the leaves, are in form and color unlike those upon the rest of the plant; these bud variations may be propagated by cuttings or by budding, and several of our well known kinds were thus obtained. The most prized garden roses are double; *i. e.*, instead of the five petals of the wild flower, these are multiplied indefinitely; some roses are so double that no stamens can be seen, while others are only partly double; the doubling is due (in good part, at least) to the conversion of stamens into petals (see PLANT); any partly double rose will show the gradual metamorphosis from the proper stamen through intermediate states to the fully developed petal, as indicated

Transformation of Stamens into Petals.

in the accompanying diagram.—In the enumeration of cultivated roses, a garden rather than a strictly botanical classification is most convenient. 1. *Climbing Roses*. The prairie rose (*R. setigera*) has been mentioned as a native species; from this Samuel Feast of Baltimore and others have obtained our most valuable climbers, hardy from Canada to the gulf, and producing a great profusion of showy though scentless flowers; they are evidently crossed with foreign kinds; the Queen of the Prairies is the best known of these, and will grow in any soil; another is the Baltimore Belle; and there are several others of the prairie group with flowers from white to deep rose. The evergreen rose (*R. sempervirens*) has given

rise to another race of climbers; it is the wild rose of Italy, where, as in other warm climates, it is evergreen, but not so in the north, where some of its varieties are hardy and others tender; it has very bright green leaves, and in its wild state produces an abundance of single white flowers; its best double variety is *félicité perpétuelle*. The Ayrshire roses, of which there are pink sorts, are varieties of this; they grow with great vigor, producing shoots 20 to 30 ft. long, and are useful for covering walls, banks, and other objects. The musk rose (*R. moschata*) is a native of Asia, where it grows to a great size; its cultivated varieties are treated as climbers by training up their shoots; the flowers, later than those of any other, are in large clusters, white or yellowish white, and very fragrant, especially in the evening; the "white musk cluster" is the best known variety. The many-flowered rose (*R. multiflora*), from Japan and China, has furnished a race of climbers, most of which are not hardy north of the middle states; it has large clusters of small, scentless, white and pale purple flowers; the Seven Sisters, or *Grevillei*, is one of the best varieties. The Boursalt roses are supposed to be from this, crossed with some hardier species; they are hardy, rampant growers, with long red stems, and produce a profusion of blush or crimson-purplish flowers, which are odorless. The Banksia or Lady Banks's rose (*R. Banksiae*), from China, is (at the north, at least), only a greenhouse climber; it has very glossy foliage, and umbels of double small roses, not larger than the flower of a double cherry, white or buff, and with a violet fragrance. 2. *Garden Roses*. Under this not very definite title are included those non-climbing kinds which, without regard to their origin, bloom but once in the season; some of these are but little removed from their normal form, such as the Scotch roses, which originated from the Burnet rose (*R. pimpinellifolia*) of temperate Europe and Asia; they grow from 1 to 2 ft. high, and are exceedingly prickly; their leaflets are small, roundish, and smooth, and their small flowers, abundantly produced all along the stem, are about two weeks earlier than other garden roses. The first double variety was found near Perth, Scotland, and has been reproduced abundantly by seed, giving white, pink, and yellow sorts; there are between 200 and 300 named varieties; among the most distinct are Countess of Glasgow, pink, William IV., pure white, and Yellow Scotch. The yellow brier (*R. eglanteria*), closely related to the sweetbrier, produces double yellow, buff, and orange varieties, among which are Harrison's yellow, the best known yellow rose, but inferior to the Persian yellow. The yellow rose (*R. sulphurea*) of Persia and the far East, also known as the yellow Provence, produces large full double flowers, of a fine transparent yellow; it is rarely seen in our gardens, it being of doubtful hardiness, and very difficult to cultivate, the buds spoiling be-

fore opening. The cinnamon rose (*R. cinnamomea*), from Europe, is rarely met with except in old country gardens, from which it has in some places escaped and become partially naturalized; it has brownish red bark, a few prickles, and small double but badly shaped flowers with a cinnamon-like fragrance; it is closely related to the wild *R. blanda*. The white rose (*R. alba*), from central Europe, is very near the dog rose, and has given several white and blush varieties. The common summer or June roses are from the French or Provence (*R. Gallica*), the hundred-leaved or cabbage (*R. centifolia*), and the damask rose (*R. Damascena*); while these are distinct in their typical forms, they are much confused in the garden varieties, and the most skilled rosarians are unable to trace them to their original species. While these old-fashioned roses have been largely displaced by more recent kinds, none exceed them in beauty and fragrance, or in the abundance of flowers during their short season.—The pomponé or button roses are dwarf, small-flowered forms of the hundred-leaved. The most striking varieties are those known as moss roses, in which the glands and bristles upon the flower stalk, and especially upon the calyx, are developed as a substance resembling moss; this was supposed to be due to injury by insects, until it was found that the peculiarity was reproduced by seeds. The first moss rose was introduced into England from Holland in 1596, and until early in the present century it was the only variety known; and although more than 100 others have since been introduced, the old or common moss is not exceeded by any in the abundance and beauty of its mossiness. Celina and Lane's are good varieties, and some of the newer kinds have good flowers when full-blown. A favorite sort, the crested moss (*eristata* of the catalogues), unlike the others, is said to be a variety of the Provence; its calyx lobes are fringed by a broad and much cut crest, rather than the fine mossiness of the other kinds. 3. *Roses blooming more than once in the season*. The most popular garden roses are the remontants, more generally known as hybrid perpetuals, an incorrect name, as they are not perpetual bloomers, but produce abundantly in June, and after a season of rest bloom again in autumn; they have also been called autumnal roses, but the varieties differ greatly in their ability to flower a second time, and the French term *remontant* (growing again) is adopted by the best rosarians. This class of roses is the result of various crossings of other classes derived from the China or India rose (*R. Indica*), and includes also a strain of the damask rose; they have great size, the most brilliant colors, and exquisite fragrance, with perfect hardiness; the great show roses and those of the rose fanciers are found here, and are the kinds referred to as having so generally superseded the old June roses; it being a mixed race, varieties quite unlike in appearance are com-

prised in it, and they differ according to the preponderance of one or another parent. They are numbered by hundreds, and the list receives annual additions through the labors especially of the French, and to some extent of the English growers; Baron Provost, General Jacqueminot, Giant of Battles, Jules Margottin, and La Reine are well known and fine examples of this class. There are a few moss roses which, having a tendency to bloom a second time, are classed as remontant moss.—The Bourbon rose, first obtained on the isle of Bourbon by a cross between the China and a damask variety, is a race including some magnificent kinds, but they are not so generally hardy as the preceding; they are abundant bloomers, and are useful for forcing; the Souvenir de Malmaison, everywhere a standard of perfection, belongs here, as does Hermosa, so much valued for forcing. 4. *Roses which bloom continuously all the year.* The Bourbons are classed among the ever-blooming roses, but they are less constant than the China roses, which are varieties of *R. Indica* and prized for the abundance and brilliancy of their flowers; they are too tender for northern winters, but are easily protected by bending down the stems and covering them with sods, or by placing them in a frame and covering with leaves; the readiness with which they may be multiplied makes them the cheapest of all roses, and they are much used for bedding out in summer, where they flower in the hot months; they are well adapted to greenhouse culture, and are the easiest of all to grow in the window garden; they are popularly known as monthly roses, and are given in some catalogues as Bengal roses. Agrippina, Daily Blush, Daily White, and Mrs. Bosanquet are among the best of this class.—The Noisette roses originated with M. Noisette, a florist at Charleston, S. C., who in 1817 crossed a musk rose (*R. moschata*) with the pollen of a tea rose; they are for the most part climbers, and have the habit of blooming in clusters of the musk; these have been again crossed with the tea, and varieties produced which are exceedingly difficult to classify. Some of the Noisettes are nearly hardy at the north, while others are very tender; Lamarque is the best known, being everywhere popular as a greenhouse climber; its sulphur-yellow flowers are produced in great abundance; Chromatella and Solfaterra are choice varieties, both darker yellow than Lamarque, which is their parent.—The tea or tea-scented roses are from a variety of the China rose (*R. Indica*, var. *odorata*); they have long buds, semi-double flowers, and a fragrance resembling that of green tea. A blush and a yellow tea rose were brought from China early in the present century, and from these have proceeded a large and increasing class, all of great delicacy of color; some make long branches and are adapted for pillars or rafters; they are more tender than any others, and require the same pro-

tection as the China roses. Buds of tea roses are in great request for winter decorations, and near the principal cities large houses are devoted to rose forcing; the colors are white, buff, salmon, and various shades of yellow and rose, with combinations of these in the same

Double Rose (Noisette).

flower. Among the most popular of the tea roses are Bon Silene, Gloire de Dijon, Isabella Sprunt, Pactole, Safrano, and White Tea; the grand yellow rose, Maréchal Niel, is by some classed as a tea, and by others as a Noisette; it is a rampant grower, and produces freely enormous flowers of a fine golden color, which deepens to the centre.—*Propagation and Cultivation.* New varieties of roses are sometimes obtained from the seed of flowers which have been cross-fertilized, but cultivators, knowing the tendency of flowers so far removed from their normal state to vary, sow seeds from any good variety. Though in very double flowers the stamens may be quite obliterated, the pistils usually remain serviceable, and such may be fertilized with other pollen. The seed should be sown as soon as ripe and exposed to changes of weather, and the plants which appear will in some cases flower the same year, in others not until the next. Established varieties are multiplied by cuttings, by layering, by suckers, and by budding or grafting. Plants which have been potted for the purpose are forced into growth by the florists in early spring, and cuttings are taken of the young and slightly hardened wood; another set of cuttings may be made from the tender shoots formed by roses in the open ground in August, and still another from the ripened wood in October, setting them in a cold frame, and when freezing weather comes on covering them with leaves; the majority of such cuttings will be well rooted in early spring. Layering is a ready method of multiplying hardy roses. (See LAYERING.) In

Europe, where the climate allows rose culture to reach a greater perfection than with us, it has been found that the finest flowers are obtained when the rose is budded on some stock with vigorous roots; the common brier or dog rose, and the Manetti rose, so called from the Italian who raised it from seed, are the usual stocks; the bud is inserted in the ordinary manner (see **BUDDING**), near the ground, unless standard or tree roses are wanted, when the stocks are budded at 4 or 5 ft. high. Budded roses are in little favor in this country, as in our severe winters the plant may be killed quite to its insertion in the stock, and our hot summers induce the stocks to throw up abundant suckers, which weaken the growth of the budded rose and are a constant source of annoyance. Our rose growers prefer roses on their own roots, except for the few varieties which will only bloom freely on other stocks. The tree or standard roses are imported in large numbers every year, but seldom survive the first winter. Roses may be grafted, but this is rarely done.—The soil for roses can hardly be too rich; the hardy kinds may be planted in autumn or in spring; the tender kinds may be set out as soon as frosts are over; in planting, all weak growth should be cut out, and the strong stems shortened to a few buds. Each spring the hardy sorts should have their stems pruned according to their vigor, the weakest being cut out altogether, and the others shortened from one third to one half. Climbing roses need only to have the old wood thinned out.—Few flowering plants have so many enemies as the rose. Aphides or plant lice may be killed by tobacco water; the rose slug, the larva of *selandria rosea*, must be treated to frequent syringing of whale-oil soapsuds, or infusion of white hellebore; the rose bug (*macrodactylus subspinosus*), which eats the buds, can only be conquered by hand picking.—The China, Noisette, tea, and other tender roses are grown in greenhouses and window gardens; for greenhouse management reference must be made to works on floriculture. Roses for house blooming should be potted by September, all the flower buds being removed and the pots kept in a cool place until well established; only the China and tea varieties are likely to give good results, and these will need constant care, as they are very apt to be infested by plant lice and the red spider; tobacco smoke or tobacco water is the remedy for the one, and frequent showering of the leaves with water on both sides for the other.—**Uses.** Roses have long been used in medicine, and two kinds of rose leaves or petals are official in the pharmacopœias of the present day. Red rose leaves are the unexpanded flowers of the Provence rose (*R. Gallica*) collected and dried; they are mildly astringent; their infusion by the addition of a small portion of sulphuric acid turns a brilliant crimson, and is used as a medium for soluble medi-

cines. The confection or conserve of roses, formerly prepared by beating one part of the fresh petals with three parts of sugar, is now made from the powdered dried petals, with honey and rose water; it is used as the base of blue pill, and as a vehicle for other medicines. The hundred-leaved rose (*R. centifolia*) is sometimes used for the preparation of rose water, 8 lbs. of the petals and two gallons of water being placed in a still, and one gallon of rose water distilled off. The petals are sometimes preserved by heating them with twice their weight of salt, to be distilled when required. Most of the rose water now in use is prepared from the oil of roses. In Europe the ripe hips of the dog rose (*R. canina*) are used to prepare a confection; the hairy akenes being separated, the pulpy portion, beaten up with about twice its weight of sugar, forms the confection of dog rose, used for the same purposes as the conserve of roses. Oil, attar, or otto of roses is by far the most important commercial product of the rose. (See **ATTAR OF ROSES**).—The works on general floriculture treat of the rose; the leading special works are: "The Book of Roses," by Francis Parkman (Boston, 1866); "Propagation, Cultivation, and History of the Rose," by Samuel B. Parsons (New York, 1869); "A Book about Roses," by S. Reynolds Hole (London, 1870); and "The Amateur's Rose Book," by Shirley Hibberd (London, 1874).

ROSE. I. Heinrich, a German chemist, born in Berlin in 1795, died there, Jan. 29, 1864. His grandfather, Valentin Rose the elder, and his father, Valentin Rose the younger, were distinguished chemists. He first devoted himself to pharmacy, studied in Berlin, in Stockholm in 1819 under Berzelius, and at Kiel, where he took his degree. In 1823 he became extraordinary and in 1835 ordinary professor of chemistry at Berlin. His *Handbuch der analytischen Chemie* (Berlin, 1829) has obtained wide celebrity. In 1845 he discovered a new metal in the tantalites of Bavaria, which he called niobium. (See **COLUMBIUM**.) **II. Gustav**, a German mineralogist, brother of the preceding, born in Berlin, March 28, 1798, died there, July 15, 1873. In 1820 he took his degree in Berlin, in 1821 studied under Berzelius at Stockholm, in 1822 became keeper of the mineralogical collection in the university of Berlin, and in 1826 was made extraordinary and in 1839 ordinary professor of mineralogy there. He wrote *Elemente der Krystallographie* (2d ed., Berlin, 1838); *Ueber das Krystallisationssystem des Quarzes* (1846); *Ueber die Krystallform der rhomboëdrischen Metalle* (1850); and *Das krystallochemische Mineralsystem* (Leipsic, 1852). With Humboldt and Ehrenberg he travelled through northern Asia in 1829, and published *Reise nach dem Ural, dem Altai und dem Kaspischen Meer* (2 vols., Berlin, 1837-'42).

ROSE. I. Hugh James, an English author, born at Little Horsted, Surrey, in 1795, died

in Florence, Italy, Dec. 22, 1838. He graduated at Trinity college, Cambridge, in 1817, was ordained there in 1818, and in 1825 was chosen select preacher of the university; and at the time of his death he was rector of St. Thomas's, Southwark. In 1832 he founded and edited the "British Magazine," and in 1836 became principal of King's college, London. Among his works are: *Inscriptiones Græcæ Vetustissimæ* (8vo, 1825); "Christianity always Progressive" (1829); "Farmers and Clergy" (1831); "Answer to the Case of the Dissenters" (1834); and *Concio ad Clerum* (1835). He was editor of the "Encyclopædia Metropolitana," and projected the "New General Biographical Dictionary," published after his death. **II. Henry John**, an English author, brother of the preceding, born in 1801, died in Bedford, Jan. 31, 1873. He graduated at St. John's college, Cambridge, in 1821, became fellow of his college in 1824, Hulsean lecturer in 1833, rector of Houghton Conquest, Bedfordshire, in 1837, and archdeacon of Bedford in 1866. He edited the "Encyclopædia Metropolitana" from 1839, and also the first volume of "Rose's Biographical Dictionary;" translated Neander's "History of the Christian Religion and Church during the first three centuries" (2 vols., 1831; 2d ed., 1842); contributed one of the essays in "Replies to Essays and Reviews" (1861); edited in conjunction with the Rev. J. W. Burgon, Schnorr's "Bible Prints," with accompanying letterpress (1864); and was one of the authors of "The Speaker's Commentary." He also published "The Law of Moses viewed in Connection with the History and Character of the Jews" (Hulsean lectures, 1834), and reprinted from the "Encyclopædia Metropolitana" his "History of the Christian Church from 1700 to 1858" (1858).

ROSE BAY. See RHODODENDRON.

ROSE BUG, a diurnal beetle of the melolonthian group, the *melolontha subspinosus* (Fab.) or *macrodactylus subspinosus* (Lat.). It is about $\frac{3}{5}$ of an inch long, buff yellow above and white below, with a slender body tapering before and behind, entirely covered with very short ashy yellow down; thorax angularly widened in the middle of each side, which suggested the specific name; the legs slender, yellow or pale red, with the joints of the feet very long and tipped with black. This insect, one of the greatest pests in gardens and nurseries, was unknown in northern New England until within 50 years; its annual appearance coincides with the blossoming of the rose, whence the common name; it attacks also grape vines, young apples and other fruits, garden vegetables, corn, forest trees, and even grass, devouring flowers, leaves, and fruit. They arrive in swarms unexpectedly, and disappear as suddenly; they emerge from the ground about the second week in June, and remain 30 or 40 days, when the males die, and

Rose Bug.

the females enter the earth, lay their eggs, and return to the surface to perish; the eggs are about 30, nearly globular, whitish, $\frac{1}{16}$ of an inch in diameter, placed from 1 to 4 in. below the surface, and hatched in 20 days. The larvæ begin at once to feed on tender roots, and by the autumn are nearly three fourths of an inch long and one eighth of an inch in diameter; they are yellowish white, bluish toward the posterior end, with a few short hairs; there are six short legs, a pair to each of the first three rings behind the head, the last part covered with a horny shell of a pale rust color; in October they descend below the reach of frost, and pass the winter in a torpid state; in the spring they come toward the surface and form little shells of earth, within which they are transformed during May into pupæ; these are yellowish white, with stump-like wings, legs, and antennæ folded on the breast, and the whole enclosed in a filmy skin which is rent in June, and the perfect beetle digs its way to the surface. As they are beyond reach during the egg, larva, and pupa states, they can only be exterminated as perfect insects; they are destroyed by crushing, scalding, and burning, after being shaken daily from the infested plants. They are occasionally found in immense numbers on the flowers of the worthless whiteweed (*chrysanthemum leucanthemum*); in this case it is expedient to mow it, and consume it with them on the spot. It is said that they never infest the cinnamon rose. This is one of the most destructive of insects, in some places in the west having consumed year after year the crop of young apples; choice fruits in such cases can only be preserved by covering them with netting. Insectivorous birds devour these beetles; moles and various predaceous animals and insects also eat them; young chickens are said sometimes to be killed by the irritation produced by the prickly feet and sharp claws of these insects which they have swallowed.—The European rose chafer is another allied lamellicorn beetle, the *cetonia aurata* (Fab.).

ROSECRANS, William Starke, an American soldier, born at Kingston, Ohio, Sept. 6, 1819. He graduated at West Point, and served for a year as assistant engineer in the construction of fortifications at Hampton Roads, Va. From 1844 to 1847 he was assistant professor of engineering and natural philosophy at West Point. He resigned his commission in 1854, and became a civil engineer and architect at Cincinnati, was superintendent of a coal company, and also engaged in the manufacture of kerosene oil. At the commencement of the civil war he became voluntary aide-de-camp to Gen. McClellan, who commanded the department of the Ohio, and was soon made brigadier general of the regular army. He took a prominent part in the operations in Western Virginia, and was put in command of that department when McClellan was placed at the head of the army. In March, 1862, he was made

major general of volunteers, and was placed in command of the army of the Mississippi, and fought the battles of Iuka (Sept. 19) and Corinth (Oct. 3, 4), in both of which he was victorious. In October he was made commander of the army of the Cumberland, and fought against Gen. Bragg the battle of Murfreesborough or Stone river, Dec. 26, 1862, to Jan. 2, 1863. Crossing the Cumberland mountains and the Tennessee river, he was defeated by Bragg at the battle of Chickamauga, Sept. 19, 20, and was relieved from the command and succeeded by Gen. Thomas. In January, 1864, he was placed in command of the department of the Missouri. He was mustered out of the volunteer service in 1866, and resigned his commission in the United States army in 1867. In 1868-'9 he was for a few months minister to Mexico.

ROSELLINI, Ippolito, an Italian Egyptologist, born in Pisa, Aug. 13, 1800, died in Florence, June 4, 1843. In 1824 he was appointed professor of oriental languages in the university of Pisa. He became a disciple of Champollion in the study of Egyptian hieroglyphics, and when in 1824-'6 that scholar examined the Egyptian monuments in the capitals of Italy, Rosellini attended him, and returned with him to Paris. In 1827 the grand duke of Tuscany, Leopold II., sent him and six companions to explore the monuments of Egypt; and he joined Champollion's party sent out at the same time by the government of France on a similar expedition. The results of both expeditions were to appear conjointly; but on the death of Champollion in 1832, Rosellini took sole charge of the publication, the last volumes of which were completed after his death by friends. After his return to Pisa he was appointed librarian of the university, and in 1839 he began a series of archæological lectures; but in 1841 he gave up all other labor to devote himself to Egyptology. His great work is entitled *I monumenti dell' Egitto e della Nubia* (9 vols. 8vo with 3 vols. fol. of plates, Pisa, 1832-'43).

ROSEMARY (Lat. *rosmarinus*, dew of the sea, the plant growing wild upon the Mediterranean coast), a genus of the labiate family, consisting of a single species, *rosmarinus officinalis*. Rosemary is a shrub 4 or 5 ft. high, with opposite, sessile, entire, linear leaves, about an inch long, which are rather thick, and revolute on the margins, the upper surface smooth and green, the under side white-hoary, with stellate hairs; the pale blue flowers appear in the axils of the upper leaves, and have the structure common to the *monardia* tribe of labiates to which the genus belongs. All parts of the plant have an aromatic odor and taste due to an essential oil. Its aromatic qualities were known to the ancients, who ascribed numerous virtues to it; in Europe it was formerly used in funeral as well as marriage garlands, it being regarded as the herb of remembrance and fidelity, and there were vari-

ous superstitions connected with it. The Germans appear to value it at present, and the florists near large cities send to market numerous pots of rosemary each spring to supply the demand. It is not hardy north of Virginia. The properties of rosemary are similar to those of other aromatics; it has long had a reputation as a useful stimulant for the hair, and the oil is still employed to perfume hair washes. Dried rosemary tops are sometimes kept in the shops, but it is principally used in the form of oil, which is made in considerable quantities on the southern coast of France and that of Italy, and largely by persons who travel from place to place with a rude still, which they set up in localities where the plant is abundant. The oil of commerce is much adulterated; when pure it has an agreeable odor, and is used in some kinds of perfumery, and as an external stimulant in liniments.—Marsh rosemary is the common name for *statice limonium*, a perennial herb of the *plumbaginaceæ*, the large and intensely astringent root of which is often used in domestic practice.

ROSEN, Friedrich August, a German orientalist, born in Hanover, Sept. 2, 1805, died in London, Sept. 12, 1837. After attending the gymnasium in Göttingen, he studied in Leipsic, and subsequently in Berlin, where he was a pupil of Bopp. In 1826 he published his *Corporis Radicum Sanscritarum Prolusio*, subsequently enlarged under the title of *Radices Sanscritæ* (1827). In 1829 he became professor of oriental languages in the university of London, which post he exchanged for the professorship of Sanskrit. He was also secretary to the oriental translation committee, and honorary foreign secretary to the royal Asiatic society. He published in 1831 an Arabic treatise on mathematics by Mohammed ben Musa, and wrote the oriental articles for the "Penny Cyclopædia." At the time of his death he was at work on an edition of the Rig-Veda, and the Asiatic society published in the following year the portion completed by him. He revised the Bengalee, Sanskrit, and English dictionary of Sir Graves Haughton.

ROSENKRANZ, Johann Karl Friedrich, a German philosopher, born in Magdeburg, April 23, 1805. He graduated at Halle in 1828, and was professor there from 1831 to 1833, and subsequently at Königsberg. He has extended the system of Hegel, applying it to all spheres of thought and life. His best known works are: *Psychologie* (Königsberg, 1837; 3d ed., 1863); *Geschichte der Kant'schen Philosophie*,

Rosemary (*Rosmarinus officinalis*).

forming the 12th and last volume of his and F. W. Schubert's complete edition of Hegel's works (1838-'40); *Studien* (5 vols., 1839-'47); *Die Pädagogik als System* (1848; English translation by Anna C. Brackett, St. Louis, 1873); *Die Wissenschaft der logischen Idee* (2 vols., 1858-'9); *Diderot's Leben und Werke* (2 vols., 1866); *Hegel's Naturphilosophie* (1868); *Hegel als Nationalphilosoph* (1870; English translation by G. S. Hall, London, 1874); *Von Magdeburg und Königsberg* (1873); and *Neue Studien* (1874-'5).

ROSENMÜLLER. I. Johann Georg, a German theologian, born at Ummerstädt, near Hildburghausen, Dec. 18, 1736, died in Leipsic, March 14, 1815. He became professor of theology at Erlangen in 1775, at Giessen in 1783, and at Leipsic in 1785, and also superintendent of the Lutheran church. He wrote *Religionsgeschichte für Kinder* (1771; 10th ed., 1827); *Christlicher Unterricht für die Jugend* (1773; 14th ed., 1822); *Historia Interpretationis Librorum Sanctorum in Ecclesia Christiana, ab Apostolorum Ætate ad Literarum Instauracionem* (5 parts, 8vo, 1795-1814); and *Scholia in Novum Testamentum* (6th ed., 6 vols., 1815-'31).

II. Ernst Friedrich Karl, son of the preceding, born Dec. 10, 1768, died in Leipsic, Sept. 17, 1835. He was professor of oriental languages at Leipsic, and published *Scholia in Vetus Testamentum* (23 vols. 8vo, Leipsic, 1788-1835). A "Compendium of the Scholia," containing the Pentateuch, the Psalms, Job, and the prophets, was executed by Dr. J. C. Lechner, with the cooperation of the author, in 5 vols. (1828-'33). He also wrote a *Handbuch der biblischen Alterthumskunde* (4 vols. 8vo, 1823-'31).

ROSE OF JERICHO, a trivial name for an oriental plant of the *cruciferae* or mustard fam-

which is found in northern Africa, Syria, and Arabia. It is an annual, and grows in sandy wastes; its main stem is very short, and its branches, which are a few inches long, spread in all directions; it has obovate leaves, and small, sessile, white flowers, succeeded by globose pods, each of which has two rounded earlike projections. The plant in flower during the growing season presents no unusual appearance, but as the pods begin to ripen on the approach of dry weather, the branches, which were heretofore succulent and spreading, drop their leaves, and become hard and woody; at the same time each branch curls inward from the tip, and when completely ripe the whole plant appears like a ball of curious wickerwork at the top of a short stem; most of the root dies away, and the fierce autumn wind readily uproots the dead plants, which are rolled along before it to a great distance. Should the plant, as it often does, reach the sea or other body of water, or should it be lodged somewhere on dry land until a rain falls, then the curled and dried branches, under the influence of moisture, unbend and resume their proper position; the pods open and discharge their seeds, it may be at a great distance from the locality where the plant made its growth, illustrating one of the many methods by which the distribution of plants is effected. In its native country the plant is surrounded by various superstitions. Besides rose of Jericho, it was called by the monks *rosa Mariae*, and in Palestine it is known as *raf Maryam*, Mary's flower, it being asserted that the flower, as it is called, expands each year on the day and hour of Christ's birth. The phenomenon of the so-called blooming, which is simply a hygrometric change of form, may be repeated as often as the plant becomes dry and curls into a ball. It is said that women in the countries where it is found place the plant in water at the commencement of labor, hoping that the expansion may be the signal of their deliverance. Other plants have similar hygrometric properties; this is sometimes called "resurrection plant," a name also given to a still more striking club moss of the Pacific coast. (See LYCOPIDIUM.)

ROSE OF SHARON. See HIBISCUS.

ROSETTA (Arabic, *Rashid*), a town and seaport of Lower Egypt, on the westerly or Rosetta branch of the Nile, 36 m. E. N. E. of Alexandria, and 6 m. from the Mediterranean by way of the river; pop. in 1872, 15,002. It is about 1½ m. N. of what is supposed to be the site of the ancient Bolbitine. Rosetta is regarded as one of the most attractive towns in Lower Egypt. It contains many beautiful gardens, and the houses are well built, although numbers of them have been allowed to fall into ruin. The port is secure, but is difficult of entrance, owing to a shifting sand bar. The trilingual inscription known as the "Rosetta stone," the key to the discoveries of Young and Champollion, was found here. (See EGYPT, LANGUAGE AND LITERATURE OF.)

Rose of Jericho (*Anastatica hierochuntina*). The Dead Plant and a Leafy Branch.

ily, *anastatica hierochuntina* (Gr. *ἀνάστασις*, resurrection), the only species of the genus,

ROSEWOOD, the name under which several costly kinds of ornamental wood are found in commerce, coming from different countries and afforded by various known and unknown trees of different species and families. Usually they are of a deep rose color, veined and clouded with dark purple, which on exposure becomes nearly black, and have the odor of roses, which is especially manifested when the wood is worked. The best known rosewoods are from Brazil and other parts of South America, and are from different species of *Dalbergia* and *machærium*, of the order *leguminosæ*; they are imported in semi-cylindrical slabs, about 12 ft. long and from 12 to 22 in. in diameter; the bark is removed, and the trunk split through the centre in order that the quality of the wood in the interior may be inspected, as it varies greatly in the fineness of grain; varieties which come in short cylindrical pieces, known as violet wood and king wood, are supposed to be from related trees. African and Burmese rosewoods are from species of *pterocarpus*, of the same family. Other countries have rosewoods produced by trees of other families, among which are those of Jamaica afforded by species of *amyris*, of the *burseraceæ*, and *Linociera*, of the olive family. Rosewood is used for the finer kinds of furniture and cabinet work, but it has less strength than some less expensive woods.—Under the name of oil of rosewood or oil of rhodium there is found in commerce a thick yellowish oil, used in perfumery, especially to adulterate oil of roses, and by fur trappers to scent the bait of their traps; this has been erroneously supposed to be from the ordinary rosewoods, but it is obtained from what is known in French commerce as *bois de Rhodes*, or *lignum rhodium*; it is in sticks of 3 or 4 in. diameter, with a strong odor of rose. It is the stems and roots of two species of *rhodoriza*, of the convolvulus family, a genus confined to the Canary islands.

ROSICRUCIANS, the name of a secret society first known in the 17th century. In *Chymische Hochzeit Christiani Rosenkreuz* (1816), ascribed to J. V. Andrea, there is a story of a certain Christian Rosenkreuz, a German noble of the 14th century, who had spent a large portion of his life in the East in the pursuit of wisdom. After returning to Germany he established a secret society, consisting of but few members, which met in a building erected by himself and called *Domus Sancti Spiritus*, where he died at the age of 106, after ordering the following words to be inscribed upon one of the doors of the edifice: *Post CXX annos patebo*. The spot where he was buried was kept secret, and new members were silently admitted from time to time to keep up the numbers of the society. In the "Revelation of the Fraternity of the Holy Cross to the Learned of Europe," a declaration was made that the order had no intention of interfering with the religious or political action of states,

but only desired the improvement of mankind by the discovery of the true philosophy; and that meetings were held once a year to admit new members, and to deliberate upon secret matters. Whether such a fraternity ever existed, except in the brain of the author of the above mentioned works, is an open question; but the impression that it existed gave rise to fraternities that spread over Europe, and the term Rosicrucian came to be applied to all kinds of occult skill. The fraternity had not been heard of for a long period, when in the latter half of the 18th century interest in them was revived, especially by Cagliostro, who pretended that he was a Rosicrucian.—See J. G. Buhle's *Ueber den Ursprung und die vornehmsten Schicksale der Orden der Rosenkreuzer und Freimaurer* (Göttingen, 1804).

ROSIN, the residue after the distillation of the volatile oil from the turpentine of different species of pines. It is rather an incidental product of the preparation of the oil of turpentine, which, though amounting to only 10 to 25 per cent. of the turpentine (and the rosin constituting the large remainder), is by far the most valuable product. (See **TURPENTINE**.) The rosin while still liquid is drawn off into metallic receivers coated with whiting to prevent adhesion, and from these it is transferred to the casks for shipment. When the distillation is stopped at the proper point, the product is the yellow rosin, which contains a little water; or this may be expelled, and the product is then transparent rosin. By continuing the heat the residue in the stills is made brown or black, a variety which in Europe is sometimes known as colophony. Rosin melts at 276° F., and becomes completely liquid at 306°; at 316° it emits bubbles of gas, and at a red heat it is entirely decomposed. Its specific gravity varies from 1.07 to 1.08. It is insoluble in water, but dissolves easily in alcohol, ether, wood spirit, and both fixed and volatile oils. Strong acids dissolve and decompose it. Chemically it is for the most part a mixture of several resinous acids, viz.: picric, which forms the principal part, sylvic, and colophonic; sometimes also pimaric acid. These acids are isomeric, having a common formula, $C_{20}H_{30}O_2$. They are perhaps formed by oxidation of oil of turpentine. When quickly heated in a retort, it distils partly undecomposed, and partly resolved into gases and volatile oils, leaving a small residue of carbonaceous matter. When the distillation is performed on a larger scale, the gases evolved are air, carbonic acid, carbonic oxide, and carbides of hydrogen; at a higher temperature the oxygen disappears. The first portion of the liquid distillate is yellow and mobile; later a viscid, fluorescent oil passes over, called rosin oil. At a red heat rosin yields a mixture of gases, burning with a very luminous flame, which are largely used in villages and isolated buildings instead of coal gas.—Many attempts have been made to bleach the common sorts of rosin, which would

add materially to their value. By the process of Messrs. Hunt and Pochin, the rosin is distilled at a temperature below that by which it would be decomposed, the process being conducted with steam under a pressure of ten atmospheres. The maximum temperature allowed is about 600°. The rosin and steam are collected and condensed in a suitable receiver kept as cold as possible by the application of water, and free from the moisture of the condensed steam. Instead of steam, carbonic acid, or a mixture of carbonic acid and nitrogen, or hydrogen gas, &c., is introduced to decolor the rosin. The product is white and almost transparent, and is greatly preferred to the crude article by soap and varnish makers.—Rosin is employed for a variety of useful purposes. It is an ingredient in varnishes, and is united with tallow in the preparation of cheap candles. It answers to some extent as a substitute for fixed oil or fat in the manufacture of yellow soap; but, without glycerine in its composition, it possesses no true saponifying properties. (See SOAP.) Rosin is also used in perfumery, and in various pharmaceutical preparations, as plasters and ointments. In caulking the seams of ships it is used in a melted state to fill them, and by oakum makers it is intermixed in a pulverized state with the oakum to increase its weight. It enters into the composition of some fireworks, and is used as a reducing agent in soldering. Another well known use of it is for covering the bows of violins, to prevent them from slipping over the strings without producing vibration. In France rosin oil is largely used as an ingredient in printers' ink, and elsewhere in the composition of coarse lubricating oils. Nearly all the rosin of commerce is furnished by North America.

ROSINI, Giovanni, an Italian author, born at Lucignano, Tuscany, June 24, 1776, died in Pisa, May 16, 1855. He became in 1803 professor of Italian literature at the university of Pisa. He prepared new editions of Guicciardini's *Storia d'Italia* (10 vols., 1819-'20), and of Tasso's works (33 vols., 1821-'32). He wrote the novels *La monaca di Monza* (3 vols., 1829) and *Luisa Strozzi* (4 vols., 1833), *Storia della pittura italiana* (2d ed., 7 vols., 1848-'52), and other works.

ROSIN WEED. See SILPHIUM.

RÖSKILDE, a town of Denmark, in the island of Seeland, on a branch of the Issefiord, 20 m. W. by S. of Copenhagen; pop. about 5,000. It was the ancient capital of the kingdom, but ceased to be a royal residence in 1443. The cathedral, dating from 1084, is the largest and finest in Denmark, and contains more than 70 tombs of Danish kings and members of the royal family. Outside of the town is the large lunatic asylum, called Bidstrup, belonging to the city of Copenhagen. Charles X. (Gustavus) of Sweden, after several victories over Frederick III. of Denmark, concluded a treaty here in March, 1658.

ROSMINI SERBATI, Antonio, an Italian philosopher, born in Roveredo, March 24, 1797, died at Stresa, July 1, 1855. He took priest's orders at the age of 24, and in 1827 published his *Introduzione alla filosofia*, followed in 1829 by *Il nuovo saggio sull' origine delle idee*. In 1828 he founded "the brethren of charity," a religious order, which was confirmed by the pope in 1839. In 1836 he became abbot of San Michele della Chiusa, where he founded "the sisters of Providence." In 1848 Pius IX. nominated him to the cardinalate; but on account of his work on church government and reform, *Cinque piaghe della santa chiesa* ("Five Wounds of the Church"), and one of his political tracts, *La costituzione secondo la giustizia sociale*, he was not confirmed, and the books were put upon the catalogue of the *Index Expurgatorius*. His published works amounted to 35 volumes, 14 being posthumous. Father Lockhart published a memoir of Rosmini in 1856, and Vincenzo Garelli another in 1861. (See PHILOSOPHY, vol. xiii., p. 440.)

ROSSNY, Léon de, a French orientalist, born at Loos, department of Le Nord, Aug. 5, 1837. He studied in Paris, and was appointed in 1863 interpreter of the Japanese ambassadors to the European courts. In 1868 he was appointed to the chair of Japanese at the special school of oriental languages in Paris. He is perpetual secretary of the Asiatic society, and is the founder of the society of American and oriental ethnography. He has published treatises on the Semitic languages and their history, figurative and hieroglyphical writing, the Korean language, text books for learning Japanese, *Dictionnaire des signes idéographiques de la Chine* (5 parts, 1864-'7), *Études asiatiques de géographie et d'histoire* (1864), &c.

ROSS, a S. county of Ohio, intersected by Scioto river and drained by Paint creek; area, about 650 sq. m.; pop. in 1870, 37,097. It has a diversified surface, and the soil, especially in the valley of the Scioto, is very fertile. It is intersected by the Marietta and Cincinnati railroad, and by the Ohio and Erie canal. The chief productions in 1870 were 327,858 bushels of wheat, 2,313,529 of Indian corn, 99,983 of oats, 98,134 of potatoes, 9,368 tons of hay, 4,048 lbs. of tobacco, 85,402 of wool, 334,391 of butter, and 24,191 gallons of sorghum molasses. There were 8,035 horses, 5,532 milch cows, 14,258 other cattle, 24,411 sheep, and 53,926 swine; 23 manufactories of carriages and wagons, 1 of railroad cars, 2 of iron castings, 18 of leather, 3 of liquors, 10 of lumber, 1 of engines and boilers, 2 of paper, 15 of saddlery and harness, 10 flour mills, and 5 woollen mills. Capital, Chillicothe.

ROSS, a county of Scotland. See ROSS AND CROMARTY.

ROSS, Alexander Milton, a Canadian naturalist, born at Belleville, Ontario, Dec. 13, 1832. He was educated as a physician, and has collected a male and a female specimen of every bird, native or migratory, in the Dominion, num-

bering 323 distinct species; his collection in entomology numbers more than 10,000 species; and his botanical collection comprises 620 varieties of flowering plants native to Canada. He has published "Birds of Canada" (1871), and "Butterflies and Moths of Canada" (1872).

ROSS, George, a signer of the Declaration of Independence, born in New Castle, Del., in 1730, died in Lancaster, Pa., in July, 1779. He commenced the practice of law at Lancaster in 1751, and was a member of the colonial assembly of Pennsylvania from 1768 to 1776; and after the substitution for the legislature of the general convention, he was elected to that body also. In 1774 he was one of the committee of seven who represented Pennsylvania in the continental congress, and he remained a member of congress till January, 1777. In April, 1779, he was appointed judge of the court of admiralty.

ROSS. I. Sir John, a British navigator, born at Balarroch, Scotland, June 24, 1777, died in London, Aug. 30, 1856. He served as a volunteer in the British navy from 1786 to 1791, after which for several years he was in the merchant service. In 1799 he became a midshipman, and in 1805 a lieutenant. The next year he received severe wounds in a desperate engagement, for which two years later he was pensioned. He was appointed to the command of the *Briseis* in 1812, and subsequently to that of other vessels. On April 25, 1818, he set sail from the Thames in the *Isabella*, the larger of two vessels sent out to settle the question of a northwest passage, accompanied by Lieut. Parry in the *Alexander*. (See *ARCTIC DISCOVERY*.) He was promoted to the rank of post captain on his return, and published an account of his voyage. In 1829 he made a second voyage to the arctic regions, in a badly constructed steamship called the *Victory*, equipped at the expense of Mr. (afterward Sir Felix) Booth, a distiller of London, and accompanied by a small tender of 16 tons, called the *Krusenstern*. He was frozen up in the ice for four years, and was finally rescued with his crew by the *Isabella*, then on a whaling voyage, in August, 1833, after abandoning his ship in April, 1832. In 1834 he was knighted. From 1839 to 1845 he was consul at Stockholm. In 1850 he went in search of Sir John Franklin in a vessel of 90 tons, and remained one winter in the ice. He attained the rank of rear admiral July 8, 1851. He published "A Voyage of Discovery" (2 vols. 8vo, London, 1819), "A Narrative of a Second Voyage" (2 vols. 4to, 1835-'6), and "A Treatise on Navigation by Steam" (4to, 1828). **II. Sir James Clark**, a British navigator, nephew of the preceding, born in London, April 15, 1800, died at Aylesbury, Buckinghamshire, April 3, 1862. At the age of 12 he entered the navy as a volunteer on board the *Briseis*, then commanded by his uncle. He accompanied Capt. Ross in 1818 as midshipman on his first arctic voyage, was an officer under Parry in his four voyages

between 1819 and 1827, and was promoted while absent on the second voyage to the rank of lieutenant. In 1827, on his return from the fourth voyage, he received a commission as commander. He accompanied his uncle's second expedition, 1829-'33, and in 1834 was made post captain. In 1835 he again visited Baffin bay to search for some missing whale ships, and after his return was employed for several years in a magnetic survey of Great Britain and Ireland. In 1839 he commanded the *Erebus*, to which, with the *Terror*, Commander Crozier, was assigned the duty of exploring the Antarctic ocean. In this voyage, which occupied four years, he made many valuable discoveries. He made an independent discovery of the antarctic continent, which Commander Wilkes, U. S. N., had a few months before discovered and traced at a different point, and gave it the name of Victoria Land; a volcano, 12,000 ft. high, was named Mt. Erebus from his vessel. He returned in 1843, and in 1844 was knighted. In 1848 he was appointed to the *Enterprise*, and made a voyage as far as Barrow strait in search of Sir John Franklin. His only published work is "A Voyage of Discovery and Research in the Southern and Antarctic Regions" (2 vols. 8vo, London, 1847).

ROSS, John, or **Kooweskoowe**, a chief of the Cherokee Indians, born in the Cherokee country, Georgia, about 1790, died in Washington, D. C., Aug. 1, 1866. He was a half-breed, and at an early age had acquired a good English education. He became principal chief of the Cherokees in 1828. In 1835 a treaty was concluded between the United States and Major Ridge, his son John Ridge, Elias Boudinot, and about 600 other Cherokee Indians, by which they agreed to surrender their lands and remove west within two years. Against this treaty Ross and over 15,000 of his tribe protested in an appeal written by Ross and addressed to the president of the United States. But the government sent a force to compel the fulfilment of the treaty, and the Cherokees removed to their new home. Ross continued to be the principal chief, and in 1861 entered into a treaty with the seceding states.

ROSS, Sir William Charles, an English painter, born in London, June 3, 1794, died there, Jan. 20, 1860. In 1837 he was appointed miniature painter to Queen Victoria, and in 1842 he was knighted. He early abandoned historical for miniature painting, but he prepared in 1842 a fine cartoon for the new houses of parliament. Among his original paintings is "The Judgment of Solomon."

ROSS AND CROMARTY, two N. counties of Scotland, which, being politically connected, are generally treated under one head. They border on Sutherland, Inverness, the North sea, and the Atlantic; area, including the N. portion of the island of Lewis, one of the Hebrides, which belongs to Ross, 3,151 sq. m.; pop. in 1871, 80,909. Both coasts are

indented with numerous bays and excellent harbors. There are several lakes, of which the largest is Loch Maree, 12 m. long. The general surface is mountainous, some peaks reaching a height of 3,500 ft. and upward. The scenery is remarkably wild and romantic. The fisheries employ upward of 20,000 hands. Improved breeds of cattle and sheep are extensively reared. Numerous plantations of trees have been formed within the present century, and parts formerly bare are now covered with extensive forests. These counties contain many remains of antiquity. The principal towns are Tain, Dingwall, and Cromarty.

ROSSANO (anc. *Roscianum*), a town of S. Italy, about 3 m. from the gulf of Taranto, in the province and 28 m. N. E. of the city of Cosenza; pop. about 12,000. It is built upon a rocky hill at the foot of the Apennines, and surrounded by deep precipices. It is the seat of an archbishop, and has a fine cathedral, a castle, and a trade in oil, capers, and saffron. During the Gothic wars the ancient Roscianum was one of the strongest places in Bruttium.

ROSSEBACH, a village of Prussian Saxony, 17 m. S. by W. of Halle, celebrated as the scene of the victory of Frederick the Great over the combined French and imperial army, commanded by the prince de Soubise, Nov. 5, 1757. The army of Frederick numbered only half of that of his opponents, the French being officered by noblemen who regarded the expedition as a pleasure excursion. Emboldened by his having retired from before the duke de Broglie's camp at Mülhausen, the French and imperial army left a strong position to attack Frederick without having made a reconnaissance; but they were themselves attacked by surprise, and, though but one wing of the Prussians was engaged, soon broke and fled, leaving their whole artillery and baggage and 7,000 prisoners in the hands of the victor.

ROSS-CHURCH, Florence M. See supplement.

ROSSE, William Parsons, earl of, a British astronomer, born in York, June 17, 1800, died at Parsonstown, Ireland, Oct. 31, 1867. He graduated at Magdalen college, Oxford, in 1822. From 1821 to 1834, under the title of Lord Oxmantown, he represented King's county, Ireland, in parliament. At the death of his father in 1841 he succeeded to the peerage, and in 1845 was elected one of the representative peers for Ireland. He voted with the liberal party. In 1826 he erected upon the grounds of his residence, Birr castle, near Parsonstown, an observatory for which instruments were made under his special direction. The most important was the enormous reflecting telescope, finished about 1844 at a cost of about \$60,000; it has an aperture of 6 ft. and a focus of 53 ft., and is now the most powerful reflector in the world as far as great space-penetrating capacity is concerned. It has been of especial use in resolving nebulae, for which it was in great measure designed. In 1843 Lord Rosse was made president of

the British association. He was elected to the astronomical society in 1824, and to the royal society in 1831. From 1849 to 1854 he was president of the royal society. During the last six years of his life he was chancellor of Trinity college, Dublin.

ROSSEL, Louis Nathaniel, a French soldier, born in St. Brieuc, department of Côtes-du-Nord, in 1844, shot at Satory, near Versailles, Nov. 28, 1871. He graduated at the school of engineers in Paris, and became first lieutenant in 1860. In 1870, while on the staff of the commander of the city of Metz, he conspired against Bazaine, who had him arrested. He fell into the hands of the Germans, but escaped and was made colonel by Gambetta, took part in the campaign of the Loire, and next organized the camp of Nevers. He resigned to join the commune, and was made chief engineer of a legion, but was arrested after the disastrous operations of April 2-3. He was released at the instance of Cluseret, who placed him at the head of his staff, and whom he succeeded on May 1 as delegate for war; but in less than ten days he tendered his resignation in a letter in which he severely criticised the commune. He was again arrested, and escaped only to be captured by the Versailles troops. After several trials he was executed despite the general sympathy that was expressed for him at home and abroad. A select edition of his writings (*Papiers posthumes*) was edited by Jules Amigues (Paris, 1871; English translation, London, 1872). His biography has been written by M. E. Gerspach (Paris, 1873).

ROSSETTI, I. Gabriele, an Italian poet, born in the Abruzzi, March 1, 1783, died in London, April 26, 1854. He was director of the museum of Naples from 1814 to 1821, when he was exiled, and in 1824 he settled in England. He was professor of Italian literature at King's college, London, from 1831 to 1845, when he became blind and resigned his chair. He published *Commento analitico sulla Divina Commedia* (1826-'7); *Sullo spirito antipapale* (1832); *Il mistero dell'amor platonico svelato* (1840); and *La Beatrice del Dante*. According to his theory, Dante and his contemporaries adopted a peculiar idiom to veil their aversion for the papacy, and introduced a woman as the special object of their adoration to symbolize true Christianity. Rossetti's poetical works include *Dio e l'uomo* (1840), *Il veggente in solitudine* (1843), *Poesie* (1847), and *L'Arpa evangelica* (1852). **II. Dante Gabriel**, an English artist, son of the preceding, born in London in 1828. He studied at King's college, London, and contributed designs to an illustrated edition of Tennyson's poems. In 1849 he exhibited "The Girlhood of the Virgin," a picture in the pre-Raphaelite style, of which he was one of the earliest promoters, and in 1858 at the Liverpool academy three water-color paintings entitled "A Christmas Carol," "The Wedding of St. George," and

"Dante's Dream on the Day of the Death of Beatrice." His "Fair Rosamond" was exhibited at the Scottish academy in 1860. He has published "The Early Italian Poets," translations from Dante and his predecessors (London, 1861; revised ed., "Dante and his Circle," 1874), and "Poems" (1870). **III. Christina Gabriella**, an English poetess, sister of the preceding, born in London in December, 1830. Her publications are: "Goblin Market, and other Poems" (1862); "The Prince's Progress, and other Poems" (1866); "Commonplace, and other short Stories in Prose" (1870); "Sing-Song, a Nursery Rhyme Book" (1872); and "Speaking Likenesses" and "Annus Domini" (1874). **IV. William M.** See supplement.

ROSSI, Giovanni Battista de', an Italian archæologist, born in Rome, Feb. 23, 1822. He became celebrated by his discoveries in the catacombs, an account of which he is publishing in two works. The first is to be a complete collection of all the Christian inscriptions, amounting to more than 11,000, of which a folio volume, containing 1,374, appeared in 1861, entitled *Inscriptiones Christianæ Urbis Romæ septimo sæculo antiquiores*; the other is a general work called *Roma sotterranea cristiana*, of which vol. i. appeared in 1866. He is also editor of the *Bollettino di Archeologia*.

ROSSI, Pellegrino, count, an Italian statesman, born in Carrara, July 13, 1787, assassinated in Rome, Nov. 15, 1848. Until the overthrow of the French rule in Italy he taught law at Bologna. Removing to Geneva in 1814, he became professor of law there, and a member of the council and of the diet, where he advocated centralization. While on a mission in Paris he found a patron in Guizot, and in 1834 received the chair of political economy in the collège de France and of public law in the faculty of law. Louis Philippe made him a peer in 1839, and in 1845 sent him as ambassador to Rome. He first favored and then, by order of Louis Philippe, endeavored to check the reformatory policy of Pius IX. During the revolution of 1848 the pope appointed him prime minister (Sept. 16), and he aimed to establish a confederation of Italian states. While going to attend the opening of parliament, he was surrounded by a crowd, and killed with a stiletto. His principal work is a *Traité du droit pénal* (3 vols., Paris, 1829).

ROSSINI, Gioacchino, an Italian composer, born in Pesaro, Feb. 29, 1792, died in Paris, Nov. 13, 1868. His parents were members of a strolling operatic company, and at 10 years of age he played the second horn in the orchestra, his father playing the first. Soon afterward he was placed with Angelo Tesei, a music teacher in Bologna, under whose instructions he developed a soprano voice of great purity and compass; and at 14 he was able to sing at sight any piece of music placed before him. After being for several years a chorister in the Bolognese churches, and occasionally chorus master in provincial theatres, he was induced in

1807 by the breaking of his voice to enter the lyceum of Bologna, where he was instructed in counterpoint by the abbate Mattei. Hearing his master say that simple counterpoint would suffice for ordinary stage composition, he left the school, studied the works of the principal opera writers, giving especial attention to Mozart, and at 18 years of age, having tried his hand at some minor pieces, produced his first dramatic work, *La cambiale di matrimonio*, an operetta performed with moderate success at the theatre San Mosè in Venice. His *Demetrio e Polibio*, produced in Rome in 1811, is said to have been written two years earlier. In 1812 he composed five operas, all of which, with the exception of *L'Inganno felice*, speedily sank into oblivion. In the succeeding year he appeared before the Venetians with three operas, one of which, *Tancredi*, excited an enthusiasm almost without a parallel in the history of music, and within three years found its way into every musical theatre of Europe and America. Of the remaining operas composed in 1813, *L'Italiana in Algeri* was almost equally successful, and with *Tancredi* still holds possession of the stage. In the following year he produced at Milan *Aureliano in Palmira* and *Il Turco in Italia*, the latter of which is still frequently performed; and in 1815 *Elisabetta regina d'Inghilterra* for the San Carlo theatre of Naples, where he also accepted an engagement as musical director. In 1816 his *Barbiere di Siviglia*, probably the most admirable specimen of the Italian *opera buffa* in existence, was performed in Rome during the carnival with a success which, after the lapse of more than half a century, has suffered no diminution. According to Manuel Garcia, for whom the *Barbiere* was written, the greater part of it was composed in eight days. In 1816-17 he composed for the San Carlo and other theatres seven or more operas, three of which, *Otello*, *La Cenerentola*, and *La gazza ladra*, are yet standard favorites—the first a striking example of his forcible style, and the second of his skill in producing florid embellishments. His *Mosè in Egitto* (1818) ranks among the author's finest serious compositions. Within the next few years were produced *La donna del lago*, *Maometto Secondo*, *Zelmira*, and a number of minor works, showing a gradual increase of power in harmony and instrumental effects, with no loss of melodic beauty. In 1821 he married Mlle. Colbran, prima donna at the San Carlo, for whom many of his parts were written. With her he went the same year to Vienna to direct the production of his *Zelmira*, in which his wife took part. Returning to Venice in 1823, he took leave of the Italian stage with the opera *Semiramide*, the most elaborate of his works up to that period. In 1824 he visited London with his wife under an engagement to compose an opera for the king's theatre. An indolent carelessness now took the place of his former activity, he neglected his duties, failed to produce his

promised opera, and made the season ruinous to the lessees of the theatre. But his visit was profitable to himself, and he left England with £10,000, derived principally from concerts arranged for him by the leaders of fashionable society at enormous prices of admission. Going to Paris, he accepted the post of director of the Italian opera, an office which he held till 1830, with little increase of professional celebrity, but with considerable profit. For three years he composed nothing new except a slight piece called *Il viaggio a Rheims*, a portion of which was reproduced in a graceful French opera entitled *Le comte Ory*; but several of his former works were brought out with success, including his *Maometto* under the title of *Le siège de Corinthe*. In 1829 he produced *Guillaume Tell*, generally considered his masterpiece in serious composition, a work abounding in beautiful melodies and in rich and varied instrumentation, but so different in style from any of his previous operas that it seems the creation of another mind. With this work, at the age of 37 and in the prime of his powers, he voluntarily closed his career as a dramatic composer; and for many years he wrote nothing with the exception of his *Stabat Mater*, a pleasing composition, but rather operatic than ecclesiastical. During his residence in Paris he was appointed by Charles X. inspector general of singing, with a liberal salary, from the enjoyment of which he was cut off by the revolution of 1830. He still remained several years in Paris, claiming compensation for losses he had sustained, and in 1836 retired to an elegant villa near Bologna, where for nearly 20 years he principally resided, refusing the most tempting offers to write for the stage, on the ground that he was unwilling to endanger his reputation by the production of inferior works. Disturbed by the revolutionary excitements of 1848, he retired to Florence, but in 1855 returned to Paris, where he chiefly resided till his death. During this interval he composed but one work of importance, his *Messe solennelle*, which he wrote in 1863 and scored for orchestra in 1865. It was first performed at the Théâtre Italien in Paris, Feb. 28, 1869. He was buried in Père Lachaise. He left a widow, his second wife. His operas number about 40. He also wrote cantatas, hymns, and miscellaneous vocal and instrumental pieces. A number of his posthumous pianoforte compositions were sold in 1873 by his widow to Baron Grant, who proposes to publish them in England and to devote the proceeds to the establishment of a prize at the musical academy in London. His larger dramatic compositions, on which his fame chiefly rests, illustrate the richness and variety of his melodic invention, his consummate skill in writing for the voice, and the intimate and natural association of florid ornament with the body of the music, which constitutes his peculiar style.—Many biographies of Rossini have been written, among them the following: *Ros-*

sini e la sua musica, by Bettoni (Milan, 1824); *Vie de Rossini*, by Beyle, under the *nom de plume* of Stendhal (Paris, 1823-'4); *Rossini, sa vie et ses œuvres*, by Azevedo (Paris, 1865); "Life of Rossini," by Edwards (London, 1869); *Della vita e delle opere di Gioacchino Rossini*, by Silvestri (Milan, 1875); and a life by A. Ganolini (Bologna, 1875).

ROSTAN, Louis Léon, a French surgeon, born at St. Maximin, department of Var, March 16, 1790, died Oct. 4, 1866. He graduated in medicine at Paris in 1812, and was from 1833 professor in the faculty of medicine, with a chair of clinical medicine at the Hôtel-Dieu. His principal works are: *Recherches sur le ramollissement du cerveau* (1819; 2d ed., 1823); *Traité élémentaire de diagnostic* (3 vols. 8vo, 1826-'7; 2d ed., 1829); *Cours élémentaire d'hygiène* (2 vols., 1828; 2d ed., 1838); and *Exposition des principes de l'organicisme* (1846; 3d ed., 1864). He also published important papers on rupture of the heart, the distinction of aneurisms, transposition of the viscera, spontaneous fracture of the femur, &c.

ROSTOCK, a fortified town of Mecklenburg-Schwerin, on the left bank of the Warnow, about 9 m. above its mouth in the Baltic sea, and 95 m. N. E. of Hamburg; pop. in 1871, 30,980. It has a university founded in 1419, which in 1874 had 34 professors and teachers and 135 students, with a library of 80,000 volumes. There are also a school of navigation, a gymnasium, a botanic garden, and various literary and charitable institutions. Rostock is a place of great antiquity; in the middle ages it was a member of the Hanseatic league, and its commerce is still very extensive.

ROSTOPTCHIN, Fedor, count, a Russian soldier, born in the government of Orel about 1765, died in Moscow in January or February, 1826. He became a page of Catharine II. and a favorite of Paul I., under whom he was minister of foreign affairs, and received the title of count. Opposed to an alliance with France, and frequently subjected to the caprices of Paul, he was absent from St. Petersburg at the time of his violent death (1801). In 1810 Alexander I. made him grand chamberlain, and in 1812 military governor of Moscow. He displayed much activity in organizing volunteer corps; and when against his opinion the evacuation of Moscow was decided upon after the battle of Borodino, he withdrew with the whole army and the population, leaving for the French a deserted city. He set fire to his own suburban palace, but in his *La vérité sur l'incendie de Moscou* (Paris, 1823), he denies having burned the city, though he is generally regarded as the author of the conflagration. Despite his great services, he was removed in 1814 from the governorship of Moscow, and resided till 1823 in Paris, where his daughter married the count Eugène de Ségur. An incomplete edition of his works appeared in Paris in 1853. One of his sons published a universal history in French.—See *Rostoptchine*

et Koutousof, ou la Russie en 1812, by Schnitzler (Paris, 1863).

ROTH, Rudolf, a German orientalist, born in Stuttgart, April 3, 1821. He studied in Tübingen, Berlin, Paris, and London, and became in 1856 professor of oriental languages at Tübingen. He has published *Zur Literatur und Geschichte des Veda* (1846); an edition of Yaska's *Nirukta* (1852); the *Atharva Veda*, in conjunction with Prof. W. D. Whitney (1856-'7); *Ueber den Mythos von den fünf Menschengeschlechtern* (1860); and *Ueber die Vorstellung vom Schicksal in der indischen Sprachweisheit* (1866). His principal work is a large Sanskrit dictionary, prepared in conjunction with Böhtlingk, and published by the St. Petersburg academy of sciences (1853-'75).

ROTHE, Richard, a German theologian, born in Posen, Jan. 28, 1799, died in Heidelberg, Aug. 20, 1867. He studied theology in Heidelberg, Berlin, and Wittenberg, was chaplain of the Prussian embassy in Rome for five years, became a professor in the Wittenberg theological seminary and its director, conducted a theological seminary at Heidelberg for twelve years, and was a professor of theology in Bonn and Heidelberg. His religious views are tinged with the philosophy of Schleiermacher and Hegel. He published *Die Anfänge der christlichen Kirche und ihre Verfassung* (1837); *Zur Dogmatik* (1863); and *Theologische Ethik* (3 vols., 1845-'8). A revised edition of the *Ethik* by Holtzmann (5 vols., 1867-'71) contains the author's posthumous notes. His university lectures on dogmatics (*Dogmatik*, 1870), a collection of essays (*Stille Stunden*, 1872), and his lectures on church history, edited by Weingarten (1875), have appeared since his death. The best account of his life is Nippold's *Richard Rothe, ein christliches Leben auf Grund der Briefe Rothe's* (Wittenberg, 1873).

ROTHERMEL, Peter F., an American painter, born in Luzerne co., Pa., July 8, 1817. He was educated as a land surveyor, studied painting, and about 1840 commenced practice as a portrait painter. In 1856-'7 he visited France, Germany, and Italy, and painted his "St. Agnes," now in St. Petersburg, and "The Foscari." Some of his best known paintings are "De Soto discovering the Mississippi," "Columbus before Isabella the Catholic," the "Noche Triste," from Prescott's "Conquest of Mexico," "Patrick Henry before the Virginia House of Burgesses," "Christian Martyns in the Colosseum," and "The Battle of Gettysburg," in the state capital at Harrisburg.

ROTHERSAY, a town of Scotland, capital of Buteshire, at the head of Rothersay bay on the E. side of the island of Bute, 30 m. W. of Glasgow; pop. in 1871, 7,800. It has a good harbor. The houses are built of greenstone, and in the suburbs are numerous villas and gardens. There are ship-building yards, tanneries, a distillery, and a cotton mill, and many of the inhabitants are employed in fishing and

coasting. It has lately become a watering place and a resort for consumptive patients. The ancient castle of Rothersay, now in ruins (having been burnt by the duke of Argyle in 1685), was given by Robert III., who died in it, to his son David, with the title of duke of Rothersay, which the prince of Wales still holds.

ROTHSCHILD, Mayer Anselm, a German banker, born in Frankfort in 1743, died there in September, 1812. He belonged to a poor Jewish family, and was a clerk in Hanover before establishing himself at Frankfort, where his integrity and ability brought him into relations with German governments, and particularly with that of Hesse-Cassel. The elector William, on his flight in 1806 after the invasion of his states by the French, deposited about \$5,000,000 for safe keeping with Rothschild for eight years without interest, and subsequently received from his heirs an annual interest of 2 per cent., the capital being repaid to the elector's son and successor in 1823. The judicious investment of this capital was the source of the colossal fortune of the Rothschilds. Mayer Anselm's five sons, Anselm, Solomon, Nathan, Charles, and James, respectively became chiefs of houses at Frankfort, Vienna, London, Naples, and Paris, and all were made barons by the emperor Francis; and they acquired world-wide celebrity by making loans to governments and by other financial and mercantile operations. The firm is continued by members of the family at all these places excepting Naples, the London and Paris houses being the most important; and special agents of the firm are established in all parts of the world. The eldest son of the London Rothschild, Lionel Nathan, the present head of the firm (1875), was elected to parliament from the city of London in 1847. He declined to take the customary oath "on the true faith of a Christian," and did not take his seat, although regularly reelected, until the removal of the disabilities of the Jews in 1858. He was the first Jew that ever sat in the house of commons.

ROTIFERA. See ANIMALCULES, vol. i., p. 517.

ROTTECK, Karl von, a German historian, born in Freiburg, Baden, July 18, 1775, died there, Nov. 26, 1840. He was professor of history at Freiburg from 1798 to 1818, and subsequently of political science, and long represented the university in the first constitutional assembly of Baden, where he advocated the liberty of the press. This displeased the authorities, who stopped the journal *Der Freisinnige*, of which he was an editor, and in 1832 removed him from his professorship. He was repeatedly elected burgomaster, but did not serve. His monument at Freiburg, erected in 1848, was removed in 1849 and reerected in 1862. His principal work is *Allgemeine Geschichte* (9 vols., Freiburg, 1813-'27), continued by Steger and Hermes to 11 vols. (25th ed., Brunswick, 1866 *et seq.*). Several translations of this work and of an abridgment (4 vols.,

Stuttgart, 1830-'34; 7th ed., 6 vols., 1860-'61) have appeared, including one of the latter by T. Jones (4 vols., Philadelphia, 1840, reprinted in London). Conjointly with Welcker, Rotteck began to publish the *Staatslexikon* (12 vols., Altona, 1834-'44; 3d ed., 14 vols., Leipzig, 1856-'66).

ROTTERDAM, a city of the Netherlands, in the province of South Holland, on the Maas, 18 m. from the sea and 36 m. S. W. of Amsterdam; pop. in 1870, 116,232; in 1873 (estimated), 125,893. It is remarkable for its canals, the most recent being the Nieuwe Singel. The finest quay (Boompjes) is lined with trees and many new buildings and piers. On the Groote Markt (great square) is a bronze statue of Erasmus. There are about 15 places of worship, the largest being the *groote kerk* or great church of St. Lawrence. Rotterdam has a famous Latin school, a school of navigation, an industrial school, and a number of other literary and charitable institutions. The most notable public buildings are the exchange, the museum, and the zoological garden, one of the best in Europe. The finest promenade is the New park. The annual fair begins on the second Monday in August and lasts a week, during which the city presents a scene of uproar and revelry. Rotterdam was formerly a favorite resort of English tourists and adventurers. The improved navigation of the Rhine and traffic by railway and steamers have greatly increased its trade, and there are new docks and other improvements, including new water works completed in 1872. A ship canal has recently been constructed from Rotterdam to Maassluis, through which nearly 900 vessels passed between March and December, 1872. The Moerdijk railway bridge, finished in 1871, one of the longest in Europe, carries the railway to Fyen-oord, opposite Rotterdam, where are extensive ship yards and new docks and warehouses. The total number of vessels entering the port in 1872 was 3,710, tonnage 1,433,895, including 2,406 steamers, tonnage 1,105,427. The exports from Rotterdam to the United States in that year were valued at \$1,104,033. Large quantities of refined petroleum are imported, and the imports of cotton in 1871 amounted to 115,595 bales. A direct steamship line from Rotterdam to New York was established in October, 1872. There are cotton factories, sugar refineries, brandy distilleries, and other manufactures.—Rotterdam received a town charter in 1272. A great fire occurred in 1563, and the town suffered considerably during the struggle with the Spaniards. In 1580 it had a vote in the states of Holland, and its progress has been remarkable ever since, especially within the past 15 years.

ROUARIE, Armand Taffin, marquis de la, a French soldier, born near Rennes in 1756, died near Lamballe, Jan. 30, 1793. He entered the army young, was dismissed from the king's guard in consequence of a duel, came to America, and received from congress a com-

mission as colonel under the name of Charles Armand. He served under Gen. Gates against Cornwallis, having before done various sorts of duty in New Jersey, New York, and Connecticut. In 1781 he visited France on business for the army, but returned in time to take part in the operations before Yorktown in October. In 1783 he received the rank of brigadier general, and in 1784 returned to France. In 1788 he was one of twelve deputies sent to Paris by Brittany to demand the preservation of the privileges of that province, and was imprisoned in the Bastille. With the approval of the king's brothers, he became in 1791 the head of a secret organization spread over Brittany, Anjou, and Poitou, to act in conjunction with the army of the allies. The design was betrayed, and Rouarie became a fugitive; and for several months before his death he directed from his various retreats the preparations for revolt.

ROUBAIX, a town of France, in the department of Le Nord, 6 m. N. E. of Lille; pop. in 1872, 75,987. The population in 1800 was only 8,700, and in 1834 18,187, the rapid increase being due to that of the manufactures of woollen, silk, and cotton goods, known as "Roubaix articles." Linen yarns, shawls, cloth, carpets, and other goods are also made, the annual value of all the manufactures exceeding 150,000,000 francs. The Roubaix or La Marcq canal, 15 m. long, commences near Marquette and joins the Scheldt in Belgium.

ROUBILIAC, Louis François, a French sculptor, born in Lyons about 1695, died in London, Jan. 11, 1762. After completing his studies at the academy in Paris, he settled in England, where he was patronized by the Walpole family. His works include monuments of the duke of Argyll and Handel in Westminster abbey, a statue of Shakespeare for Garrick, who bequeathed it to the British museum, and one of Newton at Trinity college, Cambridge.

ROUEN (anc. *Rotomagus*), a city of France, capital of the department of Seine-Inférieure, on the right bank of the Seine, 67 m. N. W. of Paris; pop. in 1872, 102,470. It stands on a gentle acclivity sloping toward the south, and is connected with its suburb St. Sever, on the opposite side of the river, by three bridges. Ramparts formerly extended round Rouen on the land side, and their site is now occupied by boulevards bordered with shade trees. The Place Royale is the principal square; the others are all small; that of La Pucelle contains a statue of the maid of Orleans. The cathedral of Notre Dame, constructed chiefly in the 13th and 16th centuries, is 484 ft. long and 103 ft. broad, with transepts 174 ft. in length, and the nave is 89 ft. high. The front is richly ornamented, and has three fine portals flanked by lofty towers. The central tower at the intersection of the nave and transept is surmounted by an iron spire nearly 470 ft. high. The decorations are very elaborate and profuse. The interior is lighted by 130 windows. It contains

many tombs, including that of Richard Cœur de Lion. Near the cathedral is the abbey church of St. Ouen, supposed to be one of the most perfect Gothic edifices in the world. It has a tower 260 ft. high, composed of open arches and tracery and terminating in a crown of *fleurs de lis*. Rouen is the seat of an archbishop, and of a Protestant and an Israelite consistory, and has a faculty of Catholic theology and a large theological seminary, a museum rich in masterpieces of painting, a library of 120,000 volumes, an academy of science and arts, and several special schools. Among the public monuments is that of Corneille, who was born here. Rouen is the chief seat of French cotton manufacture. Ship building is carried on.—Under the Romans Rotomagus was the capital of Gallia Lugdunensis Secunda. In the 3d century it was made the see of a bishop, and afterward was successively the capital of Neustria and of the duchy of Normandy. In 1204 Philip Augustus of France took it from John of England, but it was retaken by Henry V. in 1419, and retained by the English till 1449, when it was finally annexed to France. The maid of Orleans was burned here in 1431. Several engagements took place here at the end of 1870, and the Germans occupied the city from Dec. 5, 1870, till July 22, 1871.

ROUGE. I. A pink cosmetic for the cheeks. Varieties are prepared from carmine and from the dried leaves of the safflower or carthamus. The latter furnish the delicate sort known as vegetable rouge. The leaves, thoroughly washed, are dried, and then pulverized and digested in a weak solution of carbonate of soda. Into this is placed some finely carded cotton, and the alkaline mixture is neutralized with lemon juice or vinegar. The red coloring matter collects on the cotton, and this being washed with water to remove the yellow matter, the rouge is again dissolved, and some finely pulverized talc is introduced into the solution before it is again precipitated with the acid. Upon this the red color is received, and when separated from the liquid the two are thoroughly mixed by trituration, a little olive oil being rubbed in to add to the smoothness. Sometimes woollen threads are placed in the second solution to receive the rouge when it is precipitated, and these, called *crepons*, are used to rub the color upon the cheeks. For further accounts of this coloring material, see **CARMINE**, **COCHINEal**, and **SAFFLOWER**. II. In the arts, a pigment known as English red, also used as a polishing powder, made with peroxide of iron. As the perfection of the specula of telescopes depends upon the fineness and efficiency of the rouge used for polishing them, the preparation of this article has received much attention from scientific men, and various processes are employed to insure its greatest purity. Lord Rosse gives the following as his method. The peroxide of iron is precipitated by ammonia from a pure dilute solution of sulphate of iron, and the

precipitate after being washed is compressed under a screw press until nearly dry, and then exposed to a heat which in the dark appears only of a dull low red. The color thus obtained should be a bright crimson inclining to yellow. If potash or soda is used instead of ammonia to precipitate the oxide of iron, a trace of the alkali always remains, injuring the polishing property of the rouge.

ROUGE, Olivier Charles Camille Emmanuel de, viscount, a French Egyptologist, born in Paris, April 11, 1811, died there in December, 1872, or January, 1873. He was professor of archæology in the collège de France, and one of the editors of the *Revue archéologique*. He published *L'Examen de l'ouvrage de M. Bunsen* (1846); *Sur les éléments de l'écriture démotique* (1848); *Mémoire sur l'inscription du tombeau d'Ahmès* (1849); *Notice sommaire des monuments égyptiens exposés dans les galeries du musée du Louvre* (1849); *Mémoire sur la statuette naophore du Vatican* (1851); *Explication d'une inscription égyptienne, prouvant que les anciens égyptiens ont connu la génération éternelle du Fils de Dieu* (1851); *Notes sur les noms égyptiens des planètes* (1856); *Le poème de Pen-ta-Our* (1856); *Le roman des deux frères* (1856); *Étude sur une stèle égyptienne* (1858); *Étude sur le rituel funéraire* (1860); *Monuments du règne de Toutmès III.* (1861); an edition of the Egyptian "Book of the Dead" (1861-'3); *Inscription historique du roi Pianchi-Mériamoun* (1863); *Recherches sur les monuments qu'on peut attribuer aux six premières dynasties de Manéthon* (1866); *Chrestomathie égyptienne* (1867-'8); and *Moïse et les Hébreux d'après les monuments égyptiens* (1869).

ROUGET, Georges, a French painter, born in Paris in 1781, died in 1869. He assisted David in many of his celebrated works, and copied his "Coronation of Napoleon" so faithfully that his picture has been sold as the original. Among his best known works are "The Death of St. Louis," "Francis I. pardoning the Insurgents of La Rochelle," "Henry IV. at the Siege of Paris," "The Abjuration of Henry IV.," "The Marriage of Napoleon and Maria Louisa," and "The Death of Napoleon."

ROUGE ET NOIR (Fr., red and black), *Trente et un* (thirty-one), or *Trente et Quarante* (thirty and forty), a game of chance played with cards upon a table marked with two large spots of red and black (whence the name), of a diamond shape, placed opposite to each other. The banker, or *tailleur* (dealer), who represents him, having shuffled six packs of cards together, draws as many cards as will, counted by their points (the ace counting 1, the court cards 10 each, and the others according to their number of spots), amount to at least 31; so that if he should happen to count only 30, he must still draw another card. The whole number of cards drawn must be more than 30 and not more than 40. These he places in one row or parcel, and designates as *noir*; and he

immediately afterward draws in the same manner another parcel of cards for the *rouge*. The players, who play against the *tailleur*, and whose number may be unlimited, have previously placed their stakes on the red or black spots upon the table, and as the *rouge* or the *noir* parcel of cards amounts to 31 or approaches nearest to it, they win or lose; *i. e.*, if the *rouge* counts for example 32 and the *noir* 33 or more, the money placed upon the red wins. When the *tailleur* deals to the second or *rouge* parcel of cards the same number he has turned up in the *noir*, it is called a *refait*, and another deal must be had. There are two other chances, called *couleur* and *inverse*, which are determined by the color of the first card turned up and the success of *rouge* or *noir*; those playing on the *couleur* winning if the first card dealt is of the successful color, and those on the *inverse* if the contrary. This game, with roulette, was forbidden by law in France in 1838.

ROUHER, Eugène, a French politician, born in Riom, Nov. 30, 1814. He became an advocate, and was returned in 1848 to the constituent, and in 1849 to the legislative assembly. He was minister of justice under Louis Napoleon as president from Oct. 31 of the same year to January, 1851, again from April till October, and from Dec. 2 till the confiscation of the Orleans estates (Jan. 22, 1852), which he assigned as a motive for his resignation; but a few days afterward he returned to office as vice president of the council of state. In February, 1855, he became minister of agriculture, commerce, and public works; in June, 1856, he was made a senator; and he was president of the council of state from Oct. 18, 1863, till Jan. 19, 1867, when he resigned in consequence of the emperor's announcement of a more liberal policy; but he was at once reinstated as the head of the cabinet with the additional portfolio of the finances, and remained in office till July 13, 1869, a few days after which date he was appointed president of the senate. He was identified with all the foreign and internal affairs which proved fatal to the second empire, and after its downfall (Sept. 4, 1870) he fled. When he ventured to return to France he was a short time under arrest; yet he was elected to the assembly at Versailles in February, 1872, and continued to be a member of it in 1875 as a champion of Napoleon IV.

ROULETTE (Fr., a little wheel), a game of chance, which from the end of the 18th century till 1838, when it was forbidden by law, was the principal gambling game in Paris. It was the leading game in the German spas till public gambling was abolished in 1873, is still popular in Italy, and is played to some extent in Great Britain and the United States. It is played on a cloth-covered oblong table, in the centre of which is a round cavity having several copper bands around its sides at equal distances from each other. The sides are fixed, but the bottom is movable round an

axis in the centre of the cavity, and around its circumference are 38 holes painted black and red alternately, and numbered from 1 to 36, with two zeros marked 0 and 00. These numbers and zeros are painted on the green cloth, and on the margin of the table are the words *impair*, *manque*, *rouge*, *pair*, *passee*, and *noir*. The manager turns the wheel, at the same time throwing into the cavity in an opposite direction to the movement given to the movable bottom an ivory ball, which when the revolution ceases falls into one of the numbered cells. The player stakes his money upon one or more numbers, and if the ball falls into the corresponding number or zero, he receives for one number his stake and 35 times more, for two numbers 18 times more, for three numbers 12 times more, and so on, the gain being less as the risk is reduced. If the player stakes upon a column, or 12 numbers, and the ball enters a cell corresponding to one of them, he wins three times the amount of his risk. Or he may stake upon an even number (*pair*), an odd number (*impair*), from 1 to 18 inclusive (*manque*), from 19 to 36 inclusive (*passee*), or upon the colors *rouge* and *noir*. If he ventures upon these six chances and the ball falls into either of the zeros, the stakes may be divided between the banker and the player, or may be "put into prison" for another trial to determine to whom they belong. Some tables have but a single zero, and with 37 cells the amount returned to the winners is but 35 to 1, the bank gaining the difference; with two zeros, the advantage of the bank is proportionately greater; and with the divided chances on *pair*, *impair*, &c., the steady gain of the bank is almost certain, and is estimated at 4 per cent. on all the money staked. In American roulette a 28 instead of 36 table is often used, the banker paying the winner but 27 for 1, thus giving a greater percentage against the player.

ROUM. See SELJUKS.

ROUMANIA, a state of S. E. Europe, tributary to Turkey, consisting of the united Danubian principalities Wallachia and Moldavia (including that portion of Bessarabia which was annexed from Russia in 1856), situated between lat. 43° 38' and 48° 16' N., and lon. 22° 20' and 30° 15' E. It is bounded by Hungary, Transylvania, Bukovina, the Russian province of Bessarabia, the Black sea, Bulgaria, and Servia; area, 46,708 sq. m.; pop. about 4,500,000, mainly Roumans, but including many eastern and European nationalities, besides about 150,000 Jews and 200,000 gypsies; capital, Bucharest. (For a description of the physical geography, see MOLDAVIA, and WALLACHIA; see also WALLACHIAN LANGUAGE AND LITERATURE.) About two thirds of the population depend on agriculture and cattle breeding. The soil is very fertile, and yields rich harvests, but of the total area only 68·7 per cent. is productive, comprising 20·4 per cent. in farm, garden, and wine land, 7·6 per

cent. meadows, 16.6 per cent. forests, and 24.1 per cent. pastures. The chief agricultural products are corn, average yield about 122,000,000 bushels; flax and hemp, 480,000 cwt.; tobacco, 10,000 cwt.; and wine, 39,000,000 gallons. The number of cattle in 1873 was 3,600,000, of horses 600,000, of hogs 1,200,000, and of sheep 5,000,000. Rock salt, a monopoly of the state, abounds in the Carpathian mountains; the annual yield is about 1,370,000 cwt. Much petroleum is also produced. In 1872 the imports amounted to \$16,400,000, and the exports, chiefly grain and flour, to \$30,700,000. The principal ports are Galatz and Braila. The aggregate movement of shipping at all the Roumanian ports in 1873 was 13,003 arrivals, tonnage 1,818,371, and 12,772 departures, tonnage 1,764,377. The aggregate length of railways in 1874 was 600 m.—The constitution of Roumania is a limited monarchy, the head of which bears the title of prince, with male succession. The legislative body consists of a senate and a chamber of deputies. The senate consists of the heir to the throne, the metropolitans and eparchial bishops, representatives of the universities of Bucharest and Jassy, deputies of the large holders of real estate, and 33 chosen by the towns paying the highest amount of taxes. The chamber of deputies consists of 157 members, 82 for Wallachia and 75 for Moldavia. The deputies are chosen for four years, the senators for eight years; the former must have completed their 25th, the latter their 40th year. Every tax payer has the right to vote; but the electors are divided into several groups, one of which, containing the lowest tax payers, chooses its deputies by indirect election (through electors), while the others vote directly. Each of the two chambers elects its own president; the sessions are public. In 1874 the ministry consisted of the departments of the interior, finances, war, foreign affairs, justice, agriculture, commerce and public works, and public instruction and worship. The minister of the interior was president of the council. For administration purposes the country is divided into 33 districts, each of which has a prefect and an elective district council; the districts are divided into 162 sub-districts, at the head of which are subprefects. Every commune has an elective communal council; the heads of communes are elected in the rural communities by the people, and in the cities are appointed by the prince. The judiciary, as reorganized in 1865, includes the court of cassation in Bucharest, the courts of appeal in Bucharest, Jassy, Krayova, and Fokshani, the courts of assizes for criminal affairs, 32 tribunals of justice, and local courts. The finances are in an unsettled condition, and the annual deficits are much larger than is apparent from the official records. The budget for 1875 estimated the expenditures at \$18,700,000, and the revenue at only \$17,600,000. An increased revenue is expected from the tobacco monopoly, which was established in

1872. The public debt in 1874 amounted to \$37,000,000, exclusive of \$3,000,000 in government bank notes. The military forces, reorganized in 1869 and somewhat modified in 1872, consist of four large divisions: 1, the standing army and its reserve; 2, the territorial army and reserve; 3, the militia; 4, the civic guard of the towns and the *gloata* (general levy) of the rural communities. The territorial army comprises those from 21 to 29 years of age who are not drafted for the annual contingent. The militia comprises all from 21 to 37 years who have not been called to either the standing or the territorial army, or have completed their service in either. The fourth division, comprising men from 37 to 46 (in the cities, from 36 to 45), is only called out for the defence of the country. The standing and territorial armies in time of peace number about 60,000; on the war footing, 95,000. The total active national force, including the militia, is 150,000, without the fourth division, which is not yet fully completed. A cadet force was organized in 1874 in all the public schools.—About 90 per cent. of the people belong to the Greek church, at the head of which are the metropolitan and primate of Roumania at Bucharest, the metropolitan of Moldavia at Jassy, and six bishops. The number of priests is about 9,700; the number of monks and nuns has greatly decreased in consequence of the secularization in 1864 of all monastic property. The Roman Catholics, represented by two vicars, are estimated at from 50,000 to upward of 100,000, and the Protestants from 25,000 to 50,000; there are but few Mohammedans. There are two universities, at Bucharest and Jassy, each with faculties of philosophy and literature, law, medicine, and mathematical and natural sciences. There are eight Greek theological seminaries and one Catholic. The number of town schools in 1873 was 2,616, and of rural schools 1,975.—For the history of the country previous to the union in 1859 of the two principalities under the name of Roumania, see MOLDAVIA, and WALLACHIA. Alexander John I., of the house of Cuza, elected prince of Moldavia on Jan. 17, 1859, and of Wallachia on Feb. 5, obtained the recognition of the sultan in 1860, and on Dec. 23, 1861, formally proclaimed the permanent union of the two principalities. He was forced to abdicate on Feb. 23, 1866 (see ALEXANDER JOHN I.), and was succeeded by a provisional government. Prince Charles I. of Hohenzollern was elected prince by the people on April 14, and confirmed by the legislature on May 12, and in July took the oath of fidelity to the constitution. His reign has been disturbed by partisan animosities and by financial troubles arising from the failure of the Prussian railway contractor Strousberg to fulfil his obligations in the construction of railways for which the government had given heavy guarantees. In 1871 the Germans at Bucharest celebrated the restoration of peace,

on which occasion there were disturbances. The prime minister, Prince Ghika, was obliged to resign for not preventing them, and Prince Charles himself would have resigned if the people had not urged him to remain. Persecutions of the Jews, who are obnoxious to the poorer classes on account of their great success in trade, led to remonstrances from abroad, and in 1874 municipal rights were granted them, on condition of having attained the grade of under officer in the army, or of producing a diploma of a Roumanian or foreign university, or of owning a manufactory employing not fewer than 50 persons; but as hardly any of the Jews can comply with these conditions, the rights conferred are purely nominal. Roumania pays an annual tribute to Turkey, which in 1874-'75 amounted to \$181,825, of which \$113,650 was for Wallachia, and the rest for Moldavia; but in most other respects the country is virtually independent. Yet in 1875 the sultan and his allies contested with Prince Charles the right of concluding commercial treaties, and Roumania, though diplomatic and consular agents are accredited at Bucharest, is not permitted to appoint ministers at foreign courts. The relations with the Porte are extremely delicate. The relationship of Prince Charles with the emperor of Germany imposes a certain restraint upon the sultan; and while the latter is jealous of maintaining his suzerainty, the Roumanians avail themselves of every opportunity to claim and to exercise sovereign power.

ROUMELIA, *Rumelia*, or *Romania* (Turk. *Rumili*, Roman land), the name formerly applied by the Turks to the largest of their European provinces, comprising their most important possessions in Greece and N. of it as far as the northern ridges of the Balkan, and subsequently applied by them to a territory comprising portions of Albania and Macedonia (capital, Monastir or Bitolia), now embraced in the vilayets of Prisrend and Salonica. By occidental writers the name is generally used to designate the provinces known to the ancients as Macedonia and Thrace, and in a more limited sense to Thrace alone. In this limited sense Roumelia is bounded N. by the Balkan, E. by the Black sea, S. E. and S. by the Bosphorus, the sea of Marmora, and the Grecian archipelago, and W. by the range of the Despoto Dag; it is watered by the Maritza and its affluents the Tundja and Erkeneh, and contains among others the cities of Constantinople, Adrianople, Philippopoli, Rodosto, Gallipoli, and Enos. This country, corresponding to the modern vilayet of Adrianople or Edirneh, which, however, does not embrace Constantinople and the adjoining territory, is the most important portion of the Turkish empire in Europe, although it is principally occupied by Bulgarians and Greeks, and the number of Ottomans is comparatively small. (See THRACE.)

ROUND WORMS. See ENTOZOA, vol. vi., p. 668.

ROUSE'S POINT, a village in the town of Champlain, Clinton co., New York, on the W. shore of Lake Champlain, at the head of the Richelieu river, $\frac{1}{2}$ m. S. of the Canada line, and 21 m. N. by E. of Plattsburgh; pop. in 1870, 1,266. It is at the terminus of a branch of the Grand Trunk railway, and the Central Vermont railroad here crosses the lake on a bridge 1 m. long. There are about 2,000 arrivals and departures of vessels annually. About seven eighths of the revenues of the district of Champlain are collected here, the receipts amounting to \$500,000 a year. Fort Montgomery, guarding the outlet of the lake, is a mile distant. The village contains an extensive publishing house.

ROUSSEAU, Jean Baptiste, a French poet, born in Paris, April 6, 1670, died in Brussels, March 17, 1741. His first play was performed in 1694 with little success, and his last, *Le capricieux*, in 1700, was still less successful. Ascribing his failure to jealous authors, he satirized them with great virulence, and made many enemies; while his contempt for his father because he was a shoemaker gave rise to the poem *Le mérite personnel*, by La Motte, the son of a hatter, who was elected to the academy instead of Rousseau. In 1712 he was sentenced for licentious and slanderous writing, though perhaps unjustly, to perpetual banishment, and went to Switzerland, and subsequently settled in Brussels. He made a fortune by publishing his works in England, but lost it, and was supported by the duke of Arenenberg, who gave him a pension and rooms in his palace. His complete works were published by Amar-Durivier (5 vols., Paris, 1820). The most recent edition of his *Œuvres lyriques* is by Manuel (1852).

ROUSSEAU, Jean Jacques, a French author, born in Geneva, June 28, 1712, died at Ermenonville, near Paris, July 2, 1778. He was descended from a family of Paris booksellers and Protestant refugees. His mother, the daughter of a clergyman, died when he was born, and he afterward mourned her death as the first of his woes. From his father, a watchmaker, he inherited a visionary, restless disposition, and a great fondness for works of fiction. Before he was nine years old he had spent whole nights with him in reading novels and Plutarch's "Lives." He was a sickly boy, and his life was saved only through the care of an aunt. After his father's departure from Geneva he was sent to school in the neighboring village of Boissy; and he afterward lived for several years in the house of his uncle, an engineer in Geneva, and acquired some knowledge of drawing and mathematics. After serving in the office of a lawyer, who dismissed him, he was apprenticed to an engraver, from whom he ran away in 1728. While wandering about penniless, he was relieved from starvation by the proselytizing priest Pontverre of Conignon in Savoy, who presented him to Mme. de Warens at Annecy, a recent convert to

Catholicism. She sent him to the school of catechumens at Turin for his definitive conversion, and he lost no time in nominally going through the ceremony, in order to escape from that institution. But his destitution obliged him to become a lacquey of the countess de Vercellia, and after her death of the count de Gouvion at Turin, who taught him Latin, and with whom his prospects were improving when an old comrade tempted him to lead a roving life, which in the autumn of 1729 ended in his seeking shelter under the roof of Mme. de Warens. She now sent him to a theological seminary at Annecy, from which he was dismissed as unfitted for the priesthood. Finally he took up his abode in her house at Chambéry, and after a severe illness he passed several years with her as her lover in the neighboring farmhouse Les Charmettes. He left her in 1740 in a fit of jealousy, and was a tutor in the family of M. de Mably at Lyons till the autumn of 1741, when he went to Paris. He was absorbed at that time in the study of music, after attempting to teach the art, and he had invented a new system of musical notation, which he submitted in 1742 to the academy of sciences in Paris, under the auspices of Réaumur, but without success. At a later period he published a *Dictionnaire de musique*. He then composed *Les muses galantes*, an opera which was never performed. After recovering from a new attack of illness he was secretary to M. de Montaigu, French ambassador at Venice, for about 18 months, but in 1745 he returned to Paris disgusted with his chief. Here he became acquainted with Mme. d'Épinay, Diderot, Grimm, and D'Holbach. He now lived with Thérèse Le Vasseur, whom he had first met at a squalid hotel where she was a cook. She was coarse but faithful, and bore him five children, who were successively sent to the foundling hospital. Toward the close of his life he took her as his wife, in presence of two witnesses. He struggled with adversity for several years, receiving little or nothing for his musical and literary labors, and only a small income as secretary to Mme. Dupin, and next as cashier, which latter employment filled him with anxiety and nearly ruined his health. In 1750 he received the prize offered by the academy of Dijon for the best disquisition on the question whether the progress of science and the arts has contributed to corrupt or improve the morals of mankind. In his essay he declared war against all civilization, and henceforward he set himself up as a censor and reformer of society, disdaining all the elegancies of life, and attracting attention by his oddities. In 1752 he produced *Le devin du village*, an opera, the artless melody of which won general admiration, and *Lettre sur la musique française*, in favor of Italian music, which exposed him to the animosity of the national school. He caused a still greater sensation by writing in 1753 another essay for the academy of Dijon on

"The Origin of Inequality among Men," in which he attacked the existing social order. He now revisited Geneva, where he was cordially received and regained his citizenship by returning to Calvinism, and would have remained there but for his jealousy of Voltaire, who resided in the vicinity. In 1756 he took up his residence at the Hermitage, a charming retreat which Mme. d'Épinay had fitted up for him and his family in the valley of Montmorency; and here he wrote most of *Julie, ou la Nouvelle Héloïse* (6 vols., 1760), in which he idealized Mme. d'Houdetot, and his *Lettre sur les spectacles*, addressed to D'Alembert. But his love for Mme. d'Houdetot gave umbrage to Mme. d'Épinay, and he in his turn became jealous of the relations of the latter to Grimm, Diderot, and D'Holbach. His domestic life was at the same time made intolerable by the mother of Thérèse, and after many tribulations he was obliged to leave the Hermitage, and retired to Montmorency, where he found friends in the duke and duchess de Luxembourg, who prevailed upon him in May, 1759, to inhabit one of their châteaux. Here he met the prince de Conti, the marchioness de Boufflers, and Malesherbes, the censor of the press. At Montmorency he wrote *Émile* and the *Contrat social*, and collected materials for his *Confessions*. His *Émile, ou de l'éducation*, a visionary work which has been called by Goethe "nature's gospel on education," was printed in Amsterdam at the duke's expense (4 vols., 1762); and being also published in Paris against Rousseau's wishes, it was condemned by the parliament, and he escaped arrest by going to Geneva and thence to the canton of Bern. Expelled everywhere, he finally took refuge in the then Prussian principality of Neuchâtel, where he was befriended by Lord Keith, the governor. His *Contrat social*, in which he proclaimed the principles of universal suffrage and popular sovereignty, appeared in the same year, and made him still more obnoxious to the adversaries of progress. He effectively replied to the fulminations of the archbishop of Paris against *Émile*, and in his *Lettres de la montagne* (1764) to those of the Genevan authorities; but as the departure of Lord Keith from Neuchâtel left him unprotected against the fanaticism of the priests and the populace at Motiers, to which place he had retired, he fled at the end of 1765, intending to visit Berlin, but lingered at Strasburg and other places, where he was well received. Arriving in Paris, he was treated with much distinction, but was not permitted to remain. Early in 1766 he accompanied David Hume to England at his urgent invitation, but soon fell out with him. The correspondence relating to this quarrel was deposited in the British museum in 1874, together with Rousseau's autograph will. He returned to France in May, 1767, and resided in various places till 1770, when he settled in Paris. His health was utterly broken by his imaginary and real fears of his enemies; and

the police having interdicted the readings of his *Confessions* at the house of Mme. d'Épinay, at that lady's own request, he became still more despondent. Early in 1778 he was invited by M. de Girardin to his country seat at Ermenonville, where he ended his life so suddenly that rumors of suicide were circulated, but without sufficient evidence; he probably died from apoplexy. In 1794 his remains were removed to the Pantheon, where a statue of him had been erected; and in 1815 the allied sovereigns honored his memory by exempting Ermenonville from all war taxes.—No writer has been more bitterly denounced than Rousseau, on account of his subversive theories and the errors of his life. But despite his sickly sentimentality, the subtle eloquence of his style is unrivalled in French literature, and his social and political theories, crude and erratic as they were, are redeemed by an all-pervading desire to increase the happiness of the laboring masses, and they paved the way for mighty reforms and revolutions. The most celebrated of his posthumous works is *Les confessions* (4 vols., Geneva, 1782), which like his other writings has been translated into most civilized languages. One of the best complete editions of his works is by Musset-Pathay (23 vols., Paris, 1823-'6); and there are many earlier and later complete and select editions, besides *Œuvres et correspondances inédites*, by G. Streckeisen-Moulton (Paris, 1861). The biography of Rousseau by Musset-Pathay (2 vols., 1821), though superior to preceding ones, has been eclipsed by John Morley's "Rousseau" (2 vols., London, 1873). See also *Rousseau, ses amis et ses ennemis*, by Streckeisen-Moulton (2 vols., Neufchâtel, 1865); *Voltaire et Jean Jacques Rousseau*, by G. Desnoiresterres (Paris, 1875); and *Jean Jacques Rousseau, sa vie et ses ouvrages*, by Saint-Marc Girardin (2 vols., Paris, 1875).

ROUSSEAU, Philippe, a French painter, born in Paris about 1808. He first exhibited landscapes, and subsequently pictures of still life and animals. Among the most remarkable is "The Photographic Ape," with flowers (1866).

With Corot, Daubigny, Dupré and Diaz, he founded the modern French school of landscape painting, of which he is one of the chief glories. Few, if any, have surpassed him in the rendering of atmospheric effects, in the ability to diffuse light and air throughout a landscape, and in the power of communicating to others the deep feelings excited by nature in a highly sensitive organization like his own. The Forest of Fontainebleau, where he spent many years of his life, supplied him with an inexhaustible mine of subjects, which he rendered with rare felicity. Four etchings only by Rousseau are known, and proofs of any of them are very rare.

son administration politique et militaire (4 vols., 1861-'3), and *Correspondance de Louis XV. et du maréchal de Noailles* (2 vols., 1865).

ROUSSILLON, an ancient province of S. France, now forming the greater part of the department of Pyrénées-Orientales. It took its name from the town of Ruscino, afterward called Roscilion, and now Tour de Roussillon. It was taken from the Saracens by Pepin the Short in 759, and was governed by Frankish counts till 1172, when the last of them bequeathed it to Alfonso II. of Aragon. John II. of Aragon ceded it in 1462 to Louis XI. of France as security for borrowed money. Charles VIII. restored it to Ferdinand of Aragon in 1493. Louis XIII. conquered it in 1642, and by the treaty of the Pyrenees in 1659 it was annexed to France.

ROUSSY, Girodet de. See GIRODET-TRIOSON.

ROUVILLE, a S. W. county of Quebec, Canada, bounded N. W. by the Richelieu river; area, 244 sq. m.; pop. in 1871, 17,634, of whom 16,954 were of French origin or descent. It is intersected by the Yamaska river, and by the Stanstead, Shefford, and Chambly, and the Montreal, Chambly, and Sorel railways. Capital, Ste. Marie de Monnoir.

ROVIGO. **I.** A N. E. province of Italy, in Venetia, bordering on Verona, Padua, Venice, the Adriatic, Ferrara, and Mantua; area, 651 sq. m.; pop. in 1872, 200,835. The Po and the Adige are the principal rivers, and there are three other navigable streams and two canals. The chief products are wheat, maize, and other grains, hemp, flax, wines, and wool. Silk culture is increasing. The province is divided into the districts of Adria, Ariano, Badia, Lendinara, Massa, Occhiobello, Polesella, and Rovigo. **II.** A town, capital of the province, on the Adigetto, 35 m. S. W. of Venice; pop. about 10,000. It is surrounded by old walls flanked with towers, and possesses a dilapidated castle. The river, spanned by four bridges, divides the town into two parts, the lower being called San Stefano and the upper San Giustino. In the principal square is a column on which once stood the lion of St. Mark. Besides the fine cathedral, there are 26 churches, but none of them remarkable. It contains also a seminary, a gymnasium, an academy of sciences with a large library, and two theatres. The bishop of Adria usually resides here. The annual fair lasts eight days. Leather and saltpetre are the chief manufactures. The wine of the neighborhood has lost its ancient reputation.

ROVIGO, Duke of. See SAVARY.

ROWAN. **I.** A W. county of North Carolina, bordered partly on the E. by the Yadkin, and N. E. by the South Yadkin; area, about 600 sq. m.; pop. in 1870, 16,810, of whom 5,307 were colored. It has an uneven surface and a generally fertile soil. It is intersected by the Richmond and Danville and the Western North Carolina railroads. The chief productions in 1870 were 126,753 bushels of wheat, 289,400 of Indian corn, 119,132 of oats, 4,142 tons of hay, 520 bales of cotton, 54,810 lbs. of tobacco, 9,699 of wool, 70,104 of butter, and 9,658 gal-

lons of sorghum molasses. There were 2,654 horses, 899 mules and asses, 3,529 milch cows, 4,294 other cattle, 7,669 sheep, and 18,023 swine; 5 manufactories of carriages and wagons, 1 of freight and passenger cars, 1 of chewing tobacco, and 3 wool-carding establishments. Capital, Salisbury. II. A N. E. county of Kentucky, bounded W. by Licking river, and drained by several tributaries of that stream; area, about 500 sq. m.; pop. in 1870, 2,991, of whom 32 were colored. The surface is uneven and hilly, and a large portion of it is covered with forests. The chief productions in 1870 were 2,786 bushels of wheat, 112,040 of Indian corn, 15,950 of oats, 56,275 lbs. of butter, 7,072 of wool, 11,295 of tobacco, and 552 tons of hay. There were 721 horses, 720 milch cows, 1,125 other cattle, 3,521 sheep, and 2,900 swine. Capital, Morehead.

ROWE, Elizabeth, an English authoress, born in Ilchester, Sept. 11, 1674, died at Frome, near Bristol, Feb. 20, 1737. She was the daughter of a dissenting minister named Singer. She published "Poems on Several Occasions, by Philomela" (1696); "Friendship in Death, or Twenty Letters from the Dead to the Living" (1728); "Letters, Moral and Entertaining, in Prose and Verse" (1729-'33); "Joseph, a Poem" (1736); and "Devout Exercises of the Heart," published after her death by Dr. Isaac Watts. Her "Miscellaneous Works, in Prose and Verse," were published in 1739 (2 vols. 8vo).

ROWE, Nicholas, an English dramatist, born at Little Barford, Bedfordshire, about 1673, died Dec. 6, 1718. He was educated at Westminster, and studied law. When 25 years old he composed a successful tragedy called "The Ambitious Stepmother." In 1702 appeared his tragedy of "Tamerlane." In 1703 he brought out "The Fair Penitent," founded upon "The Fatal Dowry" of Massinger, and in 1706 the comedy of "The Biter," which failed. Afterward he produced the tragedies "Ulysses," "The Royal Convert," "Jane Shore," and "Lady Jane Grey," and translated the *Pharsalia* of Lucan. In 1709 he published an edition of Shakespeare (7 vols. 8vo), with the first biography of the poet. In the reign of Queen Anne Rowe was under secretary of state for a short time. On the accession of George I. he was created laureate. He was buried in Westminster abbey.

ROWING, the art of propelling a boat by means of oars. In the Greek and Roman galleys the oars were arranged in banks, of which different galleys had from 2 to 12, and more. (See *GALLEY*.) In all civilized countries for a long period boating was merely a means of living to those who rowed people for pleasure, ferried them across rivers, or transported goods. It was not till the 18th century that boat racing became popular, especially on the Thames, the watermen testing their superiority in rowing in the clumsy boats then built. In 1715 Thomas Doggett,

the comedian, offered the prize still known as "Doggett's coat and badge" to the waterman's apprentice between Gravesend and Oxford who was the fastest sculler of the year, and this prize is still annually conferred. In England 50 years ago the racing boat was 35 ft. long and 6 ft. beam, weighed 700 lbs., and carried two oarsmen of 200 lbs. weight each, with two spare men to act as ballast and assist at the oars. Now four men weighing 150 to 160 lbs. each propel a shell of 17 in. beam and 41 ft. length, weighing but 94 lbs., over a six-mile course, at the rate of 9 m. an hour. The first notable improvement in racing boats was removing the oar from the rowlock on the gunwales to the outriggers. In a match race on the Tyne between the Fly of Scotswood and the Diamond of Ouseborn, Anthony Brown narrowed the Diamond, and by placing various pieces of wood on either side, now known as false outriggers, secured an easy triumph. Harry Clasper of Newcastle substituted for this rude device, not the light and graceful outrigger of to-day, with its rowlocks tightly blocked and wired, but something much nearer it than the original. It was not till 1844, when he won the £50 prize of the Thames national regatta in a four-oared outriggered gig of his own building, that the merits of the outrigger were generally acknowledged. He also remodelled the racing oar. Forty years ago it was an unwieldy stick "of prodigious size and loaded with lead at the loom end," while the blades were flat and straight, like those of the ash oars of to-day, and very wide. A London crew on the Tyne, with scoop or spoon oars, had beaten Clasper's crew, and Clasper did not rest until he had improved the spoon oar. "The progress and success of Tyne boating now became universal; crew after crew sprang up; boats underwent still further alterations; light men were substituted for the rollicking, over-fed, fourteen-stone keelmen; and the Clasper crew gained a notoriety which has long since been developed." The Thames Subscription club threw open yearly races, and the "Sons of the Thames crew," "Pride of the Tyne crew," and "Pride of the Thames crew" soon came to be familiar names. While the professional rowers were thus advancing, the amateurs were in no way behind. For some time prior to 1825 eight-oared rowing had been in vogue at Oxford, while the first eight-oared boat at Cambridge belonged to St. John's college, and was built in 1826 at Eton, which organized its boat club in 1825. On June 10, 1829, the chosen eights of Oxford and Cambridge first met on the course, 2½ m. long, from Hambledon lock to Henley bridge on the Thames, and Oxford won easily by 60 yards. The two universities next met in 1836, and rowed from Westminster bridge to Putney bridge, Cambridge now being the winner. They next met in 1839, and since then have nearly every year kept up the now famous rivalry. In 1874 Cambridge had won 15 times

and Oxford 16, but in 1875 the latter made her number 17. At Oxford there are 18 distinct college rowing clubs, and one university club. Yet one of the two large boat-building establishments of Oxford keeps 350 boats for hire, among which are 40 eight-oared outriggers and 40 four-oared outriggers, and in addition builds an average of three boats a week. At Cambridge there are 19 rowing clubs and one university club. In 1864, when the college crews were in training with a view to select from the best eight-oared crews the university crew with which to meet Oxford at Putney, a writer says that "the college eights were formed for practice in three divisions of 20 boats each, thus making 60 eight-oared outrigger cutters, or nearly 500 oarsmen in practice on the Cam at the same time, day by day." The Henley-on-Thames royal regatta, rowed late in June each year and open to all amateur clubs of a year's standing, has flourished since 1839; and among the competitors for its grand challenge cup and ladies' challenge plate for eights, its steward's, visitors', and Wyfold challenge cups for fours, silver wherries and goblets for pair-oars, and diamond skulls for scullers, it has for many years brought out the best amateur material in England. The record of matches in Great Britain for 1865, as far as known, footed up 365. There are also many clubs formed merely for exercise and pleasure, which do not race, making the total number of boating clubs in the United Kingdom more than 450.—In 1850 there was no boat club in the United States of more than a local reputation, and there had been no racing of importance. The boats of that day were half as wide and not much longer than the English wherry, though not so heavy. There was no distinctive class of watermen, and little rowing except in the harbors of the seaboard places, where only heavy boats could be used; and among the stevedores, longshoremen, and others plying these, racing was not popular. Apart from the credit due to a few professionals and to local amateur clubs, the most interesting if not most important racing records belong to the northern and eastern colleges. Rowing as a pastime began at Yale in 1843, and at Harvard in 1844. The first intercollegiate race took place on Aug. 3, 1852, at Centre Harbor, Lake Winnepiseogee. It was for eight-oared barges carrying coxswains, over a two-mile course. Harvard in the Oneida defeated the Halycon and Undine of Yale, leading at the finish by two lengths. The boats averaged about 37 ft. in length and 3 ft. in breadth. In 1855 Yale again challenged Harvard, and on July 21, on the Connecticut near Springfield, over a three-mile tideway course, the six-oared Nereid and Nautilus of Yale, each carrying a coxswain, were beaten by the Harvard four-oared Y. Y. with no coxswain, and the eight-oared Iris with a coxswain. The Iris took 23 m.; the Y. Y., after deducting an allowance of

11 s. an oar, 22 m. 3 s.; the Nereid, 23 m. 38 s.; and the Nautilus, 24 m. 38 s. In 1858 Harvard proposed to the undergraduates of the principal New England colleges and those of New York city to establish an annual intercollegiate regatta. Delegates from Harvard, Yale, Brown, and Trinity met at New Haven, May 26. The course was fixed at three miles. An allowance of 12 s. an oar was to be given to smaller boats, and the prizes were to be flags, not to exceed \$25 in value, and to be paid for by the entrance fees of the boats. But a week before the time appointed for the race the Yale boat was overturned by a collision, and her stroke drowned. This broke up the race. The next contest was at Lake Quinsigamond, near Worcester, Mass., July 26, 1859. All the boats were six-oared, Brown sending the lapstreak Atalanta, Yale the shell Yale, and Harvard the lapstreak Avon and the shell Harvard. The Yale and Brown boats carried coxswains. The boats were several feet longer than in former years, had narrowed to about 2 ft. in beam, and had been materially lightened. Harvard won easily in 19 m. 18 s., Yale being 60 s. later, and the others far behind. But next day, in a regatta thrown open by the citizens of Worcester, Harvard was beaten by Yale by 2 s. There was no rudder to the Harvard boat, while Yale had a coxswain; and the next year Harvard introduced a device which by dispensing with coxswains practically revolutionized American rowing. The bow oarsman, by touching with his foot a strip of wood or iron, moving horizontally on a pivot, worked wires running to a parallel strip on top of the rudder, and so steered the boat. This contrivance probably won Harvard the race in 1860 by 12½ s., while Yale carried a coxswain weighing 112 lbs. The war stopped these races till 1864, when Yale won, and again on July 28 and 29, 1865. Harvard took the flags for the following five years. The boats were still lengthening and narrowing, the climax being reached in 1866, when the Harvard craft was 57 ft. long and but 19 in. wide, while each rower, instead of sitting close up to the side of the boat furthest from his oar blade, sat in the middle, rendering her much steadier. In 1868 Harvard rowed the three miles on Lake Quinsigamond in 17 m. 48½ s. In 1869 Harvard challenged both the Oxford and Cambridge crews to a friendly race over their own course on the Thames, from Putney to Mortlake. Cambridge declined the challenge, but Oxford accepted, each crew to consist of four rowers and a coxswain. When the day, Aug. 27, came, Harvard was obliged to supply the places of two of her best oarsmen with comparatively new men. She was also overmatched by Oxford 44 lbs. in the total weight of crew. Yet in a course of 4 m. 3 fur. Harvard led for more than 2 m., Oxford finally winning by 1½ length in 22 m. 20.6 s. of time. In 1870, owing to some dissatisfaction with regard to the decision of the umpire, Yale

and Harvard resolved to row no more races on Lake Quinsigamond, and the 12th college regatta took place, July 21, 1871, on the Connecticut river, 6 m. above Springfield, when Harvard and Brown were beaten by the Amherst agricultural crew, which made the three-mile course in 16 m. 47 s. In 1872 the number of college crews increased to 6, in 1873 to 11; in 1874, when Columbia won in 16 m. 32½ s. on Saratoga lake, it fell back to 9, and in 1875 increased to 14. In the intercollegiate race on Saratoga lake, July 14, 1875, 12 colleges competed over a three-mile course, Cornell winning in 16 m. 53¼ s., Columbia coming in second in 17 m. 4¼ s., and only a half length in advance of Harvard. The college races have improved every year. Besides lengthening and narrowing the boats, improving the oars, and introducing foot rudders, the number of strokes per minute has been increased, with more uniformity and precision. The more powerful men are placed in the waist of the boat, the lighter ones at the ends, and for stroke oar a medium weight, tough, wiry man, who will maintain the required quickness through the race and force the heavy men behind to do the same. Instead of turning a stake boat, the races are now on a straight course from start to finish. This obviates the danger of collisions at the turning, and permits the introduction of more boats.—While the college races have been mainly instrumental in improving and making popular rowing in the United States, other amateur clubs and professionals have not been idle. For many years past, on July 4, Boston has held a rowing regatta, with prizes sufficient to encourage good local ability, bring out fast work, and stimulate rowing in New England generally. Occasionally crews from St. John, Portland, and Pittsburgh, and often the Wards, the Biglins, and Harvard men, have competed in these races. Fast single scullers sprang up from time to time, the names of R. F. Clark, M. Smith, John Tyler, jr., Fay, Appleton, and Walter Brown becoming well known, and these men materially reduced the time formerly needed to cover two miles. The Atlanta boat club of New York was organized in 1848, and in 1874 it was the oldest of 91 clubs in the state. Philadelphia has nearly a score of clubs, some of them 20 years old, while Pittsburgh has half as many; and of late years the interest has been spreading throughout the west and south, till Georgia has 12, Michigan and California each 20; and in 1874 there were 364 known rowing clubs in the United States, owning real and personal property to the aggregate value of more than \$500,000. It was not till 1859 that there was any formal contest between professionals for the championship at single sculling. Stephen Roberts, now (1875) a boat builder in New York, had for many years beaten nearly all contestants; but in a five-mile race off Staten island, Oct. 11, 1869, Joshua Ward of Cornwall on the Hudson won

the championship, beating three good men. On Aug. 14, 1862, James Hamill of Pittsburgh wrested it from him on the Schuylkill near Philadelphia, but in less than a year Ward won it back at Poughkeepsie; 13 months later, at the same place, it went again to Hamill; and less than a year afterward at Pittsburgh he once more defeated Ward. Walter Brown of Portland took it away from him at Pittsburgh, and lost it to him again at Newburgh a few months later, in a race for \$4,000. In 1866 Hamill went to the Tyne to contest with Harry Kelly, the English champion, and was twice badly beaten. Apart from these contests between single scullers, another class of professionals were competing. In 1860, at Lake Quinsigamond, "Josh" Ward with five others from the Hudson, though carrying a boy as coxswain weighing 40 lbs., rowed 3 m. in the Gersh Banker in 18 m. 37 s., the fastest time then on record. Many times during the next 12 years the Biglin brothers of New York proved their claim to the championship. Hamill at Pittsburgh, Stevens at Poughkeepsie, and Coulter at Pittsburgh, each succeeded in getting together a fair crew. But not till Josh Ward, with four of his brothers and J. L. Raymond, in July, 1868, at Worcester, beat the Harvard crew in 17 m. 40½ s., the fastest time ever made in America over a three-mile turning course, was the champion crew of America generally rated very fast. In 1867, at Springfield on the Connecticut, the Wards had easily beaten a picked crew from St. John, N. B., in a contest for \$1,000 and the American championship, course three miles to stake boat and return, the Wards winning in 39 m. 28 s. In October, 1868, St. John sent to the same course its "Paris crew," which in the exposition races of 1867 had beaten the picked crews of England and France, and now won \$3,000 and the championship, covering the six miles in 39 m. 28¾ s., the Wards coming in 60 s. behind. In 1870 the champion English four, with Renforth at stroke, met these St. John men at Lachine, Canada, and in a six-mile race beat them by half a minute. In 1871 the Tyne crew, including Renforth and Henry Kelly, again tried the St. John Paris crew on the Kennebecasis river, N. B., but hardly a mile and a quarter was rowed when Renforth, dropping his oar, fell backward into the boat, and shortly afterward died. Congestion of the lungs, caused by over exertion, was the coroner's verdict. A few days later, at Halifax, his crew, with John Bright as the new man, was beaten by the Biglins of New York, who were third, the other English crew being first and a Halifax boat second. But on Sept. 11, at Saratoga lake, came the greatest international race of all, the course being two miles to line of flag boats and return; the prizes were \$2,000, \$1,250, and \$750. The contestants were the Ward brothers, the Tyne crew, the Biglins, another Tyne crew, the Stevens four from Poughkeepsie, and a crew from

Pittsburgh. The Wards won, making time to the turn in 11 m. 20 s., and the four miles in 24 m. 40 s.—St. Petersburg, Paris, Vienna, Pesth, Marseilles, Antwerp, Amsterdam, Rotterdam, Hamburg, and many other European cities have their regularly organized rowing clubs. Indeed, as a popular amusement, rowing is now nearly universal.—In the matter of training, the course in later years has been uniformly one of improvement. Instead of unnatural sweating, physicking, and living on half-cooked meat and scarcely any vegetables or liquid, the preparation for the race is now much more rational. A generous supply of vegetables, a fair allowance of liquid, and abundance of fresh meats have been found to work so beneficially, notwithstanding the free perspiration which this diet occasions, that it is surprising that stinting is still so common. The first work is easy, and the approach to the severe is careful and gradual. A bath and a short walk (no running) before breakfast, short, slow pulls before dinner, in which great attention is paid to improving and perfecting the style, and a long, careful row in the afternoon, followed by a vigorous rub-down, soon begin both to toughen the men and bring uniformity in their rowing. Then the fast row over a part, and finally over the whole of the distance, takes the place of the long row, and for

the last two weeks before the race these fast rows are taken daily. There have been many variations from this régime.—To row as the term is now understood, one must sit facing opposite the way he wishes to go, and, bracing his feet against the footboard, and grasping his oar or oars firmly, must reach well out, promptly dip his blade in the water, and then vigorously throw the whole weight of his back and all the pushing power of his legs into the stroke, pulling until his hands actually touch his body. No one rows well who does not do substantially all these. The number of strokes per minute will vary in different crews from 39 to 45, and some crews have “spurred” to 47. Dr. J. E. Morgan, after a painstaking and exhaustive inquiry among all the Oxford and Cambridge oarsmen now living, and among the friends of those deceased, reaches a conclusion most favorable to this exercise, the only serious danger being to him who, with abounding pluck and spirit, has not yet sufficient growth or strength to take part in such a race at all.—The lightest forms of modern outrigger racing boats in the United States, built with a single streak or smooth skin, are called “shells.” Those for one oarsman are single shells, for two men each using a pair of sculls double sculls or shells, and for four and six men respectively, four- and six-oared shells.

FIG. 1.—Six-oared Rowing Shell: Elevation.

The covering of the wooden frame, technically known as the skin, is made of pine, cedar, or mahogany, of uniform thickness, from $\frac{1}{16}$ to $\frac{3}{16}$ in. according to the size of the shell; or the skin may be of layers or even a single sheet of the requisite thickness of manila paper,

stretched on a pine model, which is taken out when the paper skin is thoroughly dry. The skin is then made water-proof, is finished with hard varnishes, and must have a frame to support and keep it in shape. Other component parts of the shell are the washboards, decks

FIG. 2.—Six-oared Rowing Shell, showing Seats and Outriggers.

or “canvas” of thin wood, oiled linen, or silk, the thwarts or seats for oarsmen, stretchers or footboards against which the rowers press their feet, the rudder connecting with the “traveler,” which the bow oarsman operates with his feet, and the outrigger. The dimensions are: single shells, $9\frac{1}{2}$ to $15\frac{1}{2}$ in. beam, 28 to 31 ft. length; double shells, 14 to 30 in. beam, 32 to 34 ft. length; four-oared shells, $17\frac{1}{2}$ to 30 in. beam, 40 to 42 ft. length; six-oared shells, 19 to 21 in. beam, 48 or 49 ft. length. For the

lightest single sculls the draught is from 3 to $3\frac{1}{2}$ in., weight of boat 30 lbs., oars 6 lbs., rower 125 to 158 lbs.; total weight and displacement, 162 to 194 lbs. For larger single sculls the total weight may be 168 to 242 lbs., including boat 38 to 40 lbs., and rower 130 to 200 lbs. For double shells, draught $3\frac{1}{2}$ to $4\frac{1}{2}$ in., boat 50 to 90 lbs., oars 12 to 14 lbs., crew 262 to 458 lbs.; total weight, 324 to 562 lbs. For four-oared shell, draught $4\frac{1}{2}$ to $5\frac{1}{2}$ in., boat 94 to 180 lbs., oars 26 to 28 lbs., crew 552 to 800 lbs.;

total weight and displacement, 672 to 959 lbs. For six-oared shells, draught 5 to 5½ in., boat 120 to 150 lbs., oars 36 lbs., crew 760 to 880 lbs.; total weight and displacement, 916 to 1,098 lbs. These displacements are in fresh water; in salt water they are reckoned a few pounds more. Eight-oared shells are not yet common in the United States. The cost of the boats, without oars, is: for single shells, \$90 to \$100; double, \$135 to \$190; four-oared, \$210 to \$260; six-oared, \$300.—Among the many works on the construction of boats, records of races, training, and modern method of rowing, the following are prominent: "The Principles of Rowing, by an Oarsman" (London, 1846); "Manual of British Rural Sports, by Stonehenge" (London, 1863); "Modern System of Naval Architecture," by John Scott Russell (3 vols., London, 1865); "Book of American Pastimes," by Charles A. Peverelly (New York, 1866); "Training in Theory and Practice," by Archibald Maclaren (London, 1866); "The Arts of Rowing and Training, by Argonaut" (London, 1866); "The Boat, and How to Manage it, by Salacia" (London, 1868); "How to Row," by T. J. Derington (Oxford, 1870); "The Oxford and Cambridge Boat Races," by W. F. Macmichael (Cambridge, 1870); "Yale and Harvard Boat Racing" (New Haven, 1871); "Four Years at Yale, by a Graduate of 1869" (New Haven, 1871); "The Illustrated Oarsman's Manual" (Troy, N. Y., 1872); "University Oars: A Critical Inquiry into After-health," by Dr. J. E. Morgan (London, 1873); and the "Rowing Almanac and Oarsman's Companion" (London, annually since 1861).

ROWLEY, William, an English dramatist of the age of Elizabeth, who lived through the reign of James I., and died in that of Charles I. He was educated at Cambridge, belonged to the royal company of players, excelled in comedy, and was intimate with all the poets and wits of his time, many of whom he assisted in the preparation of plays, and some of whom assisted him. Thus, "A Fair Quarrel" is by T. Middleton and W. Rowley; "The Witch of Edmonton" is by Rowley, Decker, and Ford; "The Old Law" is by Massinger, Middleton, and Rowley; "Fortune by Land and Sea" is by Heywood and Rowley; and it is said that in "The Birth of Merlin" Rowley received some assistance from Shakespeare. The Percy society in 1840 republished his tract, "A Search for Money, or the Lamentable Complaint for the Losse of the Wandring Knight, Monsieur l'Argent."

ROXBURGHSHIRE, a S. E. county of Scotland, bordering on Cumberland and Northumberland, England; area, 670 sq. m.; pop. in 1871, 53,965. Jedburgh, Kelso, Hawick, and Melrose are the chief towns. The principal rivers are the Tweed and Teviot. The Cheviot hills extend from the E. to the S. W. extremity of the county, and afford excellent pasturage. Many sheep are raised. Wool is manufac-

tured. Roxburghshire is very rich in remains of monastic magnificence. Scott has made many of its traditions familiar to the world.

ROXBURY, formerly a city of Norfolk co., Massachusetts, but since 1867 forming the 13th, 14th, and 15th wards of Boston; pop. in 1860, 25,137; in 1870, 34,772. It is connected with Boston proper by Boston neck. It was settled in 1630, and incorporated as a city in 1846. Roxbury was for many years the scene of the labors of John Eliot, the apostle to the Indians, whose remains are in the "ministers' tomb" in the old burial ground.

ROXOLANI. See *SARMATIA*.

ROY, William, a British surveyor, born near Lanark, Scotland, May 4, 1726, died in London, July 1, 1790. From 1746 to 1755, being a colonel in the army, he was employed in mapping the Scottish highlands for the establishment of military posts. He became a general, and between 1783 and 1788 made a trigonometrical survey from Greenwich to Dover (the first in Great Britain), to aid in determining the difference of latitude and longitude between the Greenwich and Paris observatories. At his death he was surveyor general of the coast. The society of antiquaries published his work on "The Military Antiquities of the Romans in North Britain" (fol., with 51 plates and 3 maps, 1793).

ROYAL FERN. See *OSMUNDA*.

ROYER-COLLARD, Pierre Paul, a French statesman and philosopher, born at Sompuis, Champagne, June 21, 1763, died at Châteauneuf, Loir-et-Cher, Sept. 4, 1845. He was an advocate, held office in Paris after the commencement of the revolution, and after Aug. 10, 1792, was proscribed as a moderate. In 1797 he was elected to the council of 500 by the department of Marne, which he afterward represented in the chamber of deputies under the restoration and Louis Philippe. He was a liberal royalist, and the founder of the party of *doctrinaires*. The most eloquent of his discourses was delivered in 1825 against the proposed law of sacrilege, which would have required of every citizen a profession of the Roman Catholic faith. From 1811 till March, 1814, he was professor of the history of philosophy in the Sorbonne. In 1827 he succeeded Laplace as a member of the French academy. The master of Cousin and Jouffroy in speculative philosophy, and of Guizot and De Tocqueville in political science, he has left no permanent record of himself at all corresponding to his personal reputation and authority. His philosophical writings, chiefly fragmentary, are published with Jouffroy's translation of the works of Reid.—See *Vie politique de M. Royer-Collard, ses discours et ses écrits*, by Barante (2 vols., Paris, 1861), and *Vie de Royer-Collard*, by M. de Lacombe (1863).

RUBEN, Christoph, a German painter, born in Treves in 1805, died July 8, 1875. He studied at Düsseldorf and Munich, was connected with the academy of Prague, and in 1852 be-

came director of that of Vienna. He executed many cartoons for churches and for the palace of Hohenschwangau. His most celebrated oil painting is "Columbus at the Moment of Discovering Land," now in Prague.

RUBENS, Peter Paul, a Flemish painter, born at Siegen, Germany, June 29, 1577, died in Antwerp, May 30, 1640. His father, John Rubens, was the secretary of William the Silent, who on discovering his intimacy with his wife imprisoned him in a citadel, and next banished him to Siegen, whence he was permitted to remove in 1578 to Cologne, where he died in 1587. In 1588 Rubens went with his mother (Maria Pypelinckx) to Antwerp, where he became page of Marguerite de Ligne, countess de Lalaing, but soon left her to study art, chiefly under A. van Noort and O. van Veen or Venius, by whose advice he went in 1600 to Italy, furnished with letters of recommendation from the archduke Albert, then viceroy of the Netherlands, and his consort, the infanta Isabella. He was generally accomplished, handsome, and dignified. Making Venice his first halting place, "he compounded," says Fuseli, "from the splendor of Paul Veronese and the glow of Tintoretto that florid system of mannered magnificence which is the element of his art and the principle of his school." Vincenzo di Gonzaga, the duke of Mantua, attached him to his court, sent him on a diplomatic mission to Spain, and enabled him to reside in Rome. Subsequently he visited Milan and Genoa, where he made a collection of drawings of the chief edifices (published in 2 vols. fol. in 1622). The serious illness of his mother in 1608 hurried him back to Antwerp, and there he was appointed court painter by the archduke. In 1609 he married Isabella Brandt, a sister-in-law of his brother Philip, and for many years was prosperously engaged in his profession. His pictures painted at this period are considered, both in composition and finish, his most pleasing productions; and notwithstanding the rapidly increasing demand for them, it is probable that the greater part were executed wholly by himself. In his later works he was aided by pupils. He lived in an elegant mansion built by himself and stored with works of art, and his prestige as courtier and artist drew around him pupils from all parts of Europe. In 1620 he was commissioned by Maria de' Medici to decorate the gallery of the Luxembourg palace with allegorical compositions illustrating the principal events in her career. The pictures, 21 in number, were in great part executed by his most eminent pupils from sketches prepared by him, which are now in the Pinakothek in Munich. While in Paris, superintending the details of this commission, Rubens made the acquaintance of the duke of Buckingham, who bought his entire collection of works of art for 100,000 florins. In 1626 he was for a time rendered inconsolable by the death of his wife, whose portrait he frequently introduced into his works.

In the following year he was sent by the infanta Isabella to the Hague to negotiate with Sir Balthasar Gerbier, the agent of Charles I. of England; and in the autumn of 1628 he revisited Spain. Philip IV. appointed him secretary to the privy council, an office subsequently granted in reversion to his eldest son, Albert. Scarcely had he returned to Flanders in the spring of 1629, when he was sent as envoy to England. During his residence there, which terminated in February, 1630, he painted his allegory of "Peace and War," now in the British national gallery, with other works, and was knighted. Returning to Antwerp, he married in December, 1630, Helena Forman or Fourment, a girl of 16. So numerous at this time were his commissions from crowned heads alone, that he had time for little more than designing and applying the finishing touches to the pictures which pass under his name, leaving the body of the work to be done by assistants. In this manner were executed the series of pictures representing the apotheosis of James I. for the ceiling of the banqueting house of Whitehall, which he completed in 1635, receiving for them £3,000. In 1633 he was sent on another embassy to Holland, which was interrupted by the death of the infanta. This was his last public service, and a few years later he became in a great measure incapacitated for work by the gout, which finally caused his death. His posthumous collection of works of art, including 319 pictures, is said to have produced £25,000. The pictures ascribed in whole or in part to Rubens amount, according to Smith's *catalogue raisonné*, to 1,800, or, estimating the number of years he was actually engaged in the practice of his art, to nearly one a week. They comprise history, portraits, landscapes, animals, and fruit and flower pieces, and are widely dispersed over Europe, the collection in the Louvre being particularly rich. The finest are still in Antwerp, in the cathedral of which city are his well known "Descent from the Cross" and "Elevation of the Cross," the former being generally considered his masterpiece. In the academy at Antwerp are many of the pictures executed by Rubens in his earliest and best period, but some of those formerly in the churches have been removed to other collections. The Belvedere in Vienna contains a noble altarpiece, with wings, representing the "Virgin presenting a splendid Robe to St. Ildefonso;" "St. Ambrose refusing to admit the Emperor Theodosius into the Church;" and two altarpieces representing the miracles performed by St. Ignatius Loyola and St. Francis Xavier. In the Pinakothek at Munich, which contains nearly 100 of his works, are two which especially illustrate the surprising energy which he infused into his delineations of human actions, the "Battle of the Amazons" and the small picture of the "Fall of the Damned." Scarcely less powerful, though in a different degree, is the

"Village Fête" in the Louvre. The British national gallery possesses the "Rape of the Sabines," which has been called "a perfect nosegay of color," the "Judgment of Paris," and several other works. Animal vigor, in the representation of which Rubens excelled, is seen nowhere with more effect than in his bacchanal feasts and mythological subjects of the coarser kind, of which "Castor and Pollux carrying off the Daughters of Leucippus," wonderful for its flesh coloring, and "Sleeping Wood Nymphs surprised by Satyrs," in the Pinakothek, are excellent examples. In his representations of the human figure he seldom attempted to idealize, and his Madonnas, Magdalens, and female saints are literally imitated from Flemish types of womanhood. As an animal painter he showed great excellence, and Sir Joshua Reynolds particularly commends his lions and horses, which, he observes, "perhaps never were properly represented but by him." His portraits are by some considered superior in their combinations of vigorous life with careful handling to any other of his productions, especially his "Straw Hat," and his numerous portraits of himself and his wives; while in his landscapes he exhibited, says Kugler, "the same juiciness and freshness, the same full luxuriant life, the same vigor and enthusiasm as in his historical pictures."—Among the numerous biographers of Rubens are Waagen, in Raumer's *Historisches Taschenbuch* (Leipsic, 1833; English translation by R. R. Noel, edited by Mrs. Jameson, London, 1840); A. van Hasselt (1840); A. Michiels, *Rubens et l'école d'Anvers* (Paris, 1854); Gustave Planche (1854); and Sainsbury (London, 1859). See also Waagen's "Treasures of Art in Great Britain" (4 vols., London, 1854-'7).—His son ALBERT RUBENS (1614-'57) published several archæological works.

RUBICON, or *Rubico*, a small river of Italy, flowing into the Adriatic a little N. of Rimini (Ariminum), celebrated for its passage by Cæsar in his march toward Rome, 49 B. C. This act was equivalent to a declaration of war against the republic, as the Rubicon was the dividing line between Italy and his province of Cisalpine Gaul. On reaching its brink he is said to have hesitated a moment and then plunged in, exclaiming: *Jacta est alea* ("The die is cast"). In 1756 a papal bull declared the Lusa, the larger and more southern of two neighboring streams, to be the Rubicon; but modern geographers generally prefer the Fiumicino, formed by the Pisatello and Rugone.

RUBIDIUM (Lat. *rubidus*, dark red), a metal of the alkalis, discovered by Bunsen and Kirchhoff in 1860 by means of the spectroscope. The lines characteristic of the new metal are two remarkable bands of dark red lying beyond Fraunhofer's A, and consequently in a part of the spectrum visible only by unusual methods. Two blue and some yellow and green lines on the spectrum have since been observed. Rubidium occurs in a

considerable variety of potash minerals, among which may be mentioned the deposits of the Stassfurt salt mines; lepidolite from Rozna in Moravia, and from Goshen and Paris, Me.; orthoclase, triphylline, carnallite, and saltpetre; in mineral waters; in beet root, tobacco, ashes of tea and coffee, crude tartar, ashes of oak and of a great variety of plants, being very widely though sparingly distributed. The metal was extracted by Bunsen from the acid tartrate, 1,100 grains of which when distilled furnished about 80 grains of a brilliant metallic mass. It is silver white, with a slightly yellow lustre, oxidizes rapidly in the air, and takes fire spontaneously. It is soft like wax at 14° F., melts at 101°, and at red heat furnishes a blue vapor. It is more electro-positive than potassium, and when thrown upon water takes fire and burns with a violet flame resembling that of potassium. It burns readily in chlorine, bromine, iodine, sulphur, and arsenic vapors. Its symbol is Rb; specific gravity, 1.52; atomic weight given by Bunsen at 85.36, by Piccard at 85.41. The salts of rubidium are with difficulty distinguished from those of potassium, and the only certain test is the appearance of the flame in the spectroscope. The sparing solubility of the chloride of rubidium and platinum in boiling water is employed as one of the means of obtaining pure salts of rubidium.

RUBINI, Giovanni Battista, an Italian singer, born at Romano, near Bergamo, in 1795, died there, March 2, 1854. In his boyhood his teacher reported that he had no talent for singing; but he persevered in his studies, and after an obscure career of several years in Lombardy made his début at Brescia in 1815 with great success. He first appeared at Paris in 1825 as Ramiro in Rossini's *Cenerentola*, and speedily rose to the first place in his profession as a tenor singer. From 1831 to 1846 he sang principally in London, Paris, and St. Petersburg, and in the latter year retired with a large fortune to a villa near Bergamo, where he passed the remainder of his life. His voice, a tenor of remarkable sweetness, extended from E to F above the staff, a compass of two octaves and one note, and has been known to reach as high as G above the staff. He excelled in the music of Bellini, and was almost unrivalled in the expression of sorrow and tenderness. He was an indifferent actor.

RUBINSTEIN, Anton, a Russian musician, born in a frontier village of Bessarabia, Nov. 30, 1830. He is of Jewish descent, but was brought up by his father in the Greek faith. His mother was an excellent pianist, and instructed him and his brother Nicholas, since director of the conservatory at Moscow, in the elements of music. The family removed to Moscow while he was still a child, and there at the age of six he began the systematic study of music. At the age of nine he gave his first public concert in that city. The result was so encouraging that he was sent in

August, 1840, with his teacher Villoing, to Paris, where Liszt heard him and prophesied for him a great career. Here he studied diligently for a year and a half, and then undertook his first artistic tour in England, Holland, Sweden, Denmark, and Germany. After the close of this prosperous tour Rubinstein remained at home in Russia for a year, and then by the advice of Meyerbeer was placed under the instruction of the famous contrapuntist Dehn at Berlin. In 1846, left to his own resources, he went to Vienna, giving there for a year lessons upon the piano, at the close of which time he undertook a concert tour in Hungary with the flutist Heindl, and then went to Berlin, but on the breaking out of the revolutionary troubles of 1848 retired to St. Petersburg. In 1849 he wrote his first opera, *Dmitri Donski*, which was brought out in 1852. The grand duchess Helen now patronized the young composer, and at her instigation he wrote three one-act operas, "The Circassian," "The Siberian Hunters," and "Tom the Fool." Rubinstein founded and for nine years superintended the conservatory at St. Petersburg, and between 1850 and 1860 composed more than 50 works in various forms, many of them of the largest dimensions. Among these were his "Ocean Symphony" and three other symphonies, six string quartets, his trios in G minor and B flat major, his oratorio "Paradise Lost," and a great variety of pianoforte compositions, including his two concertos in F and G for piano and orchestra, and many songs. He found time also to give concerts in Germany, Paris, and London, everywhere exciting the liveliest interest by his astonishing qualities as a pianist. In February, 1861, his German opera *Die Kinder der Haide* ("The Children of the Steppe") was produced under his supervision at Vienna. Later he composed another German opera entitled *Feramors*. He made his first appearance in America at New York on Sept. 23, 1872. During the succeeding winter and spring he gave concerts in all the larger cities of the United States as far west as the Mississippi, meeting everywhere with the same success that attended his concert tours in Europe. Returning to Russia in 1873, he devoted himself anew to composition, producing on Jan. 25, 1875, at St. Petersburg, his fantastic opera "The Demon," founded on a legend by Lermontoff, and at Berlin, in April of the same year, another opera, *Die Moccabäer*. Since Liszt ceased to play in public, Rubinstein has had no superior as a pianist.

RUBLE, a Russian silver coin and unit of account. About the beginning of the 14th century the Russians began to use silver in bars for purposes of trade. The act of cutting off from a bar sufficient weight for a payment was called *rubit*, whence the name ruble. The ruble is divided in account into 100 copecks. The value has greatly varied at different times. By the circular of the secretary of the trea-

sury of the United States dated Jan 1, 1875, the rating of foreign silver coins has been considerably reduced owing to the depreciation of the value of silver as compared with gold. In the article *Corns* the value of the silver ruble in 1872 is given at 79.4 cents; by the above named circular it is now fixed at 73.4 cents. Gold is coined in pieces of five rubles; fractions of the ruble are in silver. For the paper ruble see *ASSIGNATIONS*.

RUBY. See *SAPPHIRE*.

RÜCKERT, Friedrich, a German poet, born in Schweinfurt, May 16, 1788, died near Coburg, Jan. 31, 1866. He completed his studies at Jena, was a journalist at Stuttgart from 1815 to 1817, and was professor of oriental languages for 15 years at Erlangen, and for 8 years at Berlin. His works embrace various collections of lyrical, epic, and other poems; *Die Weisheit der Brahmanen*, a didactic poem (6 vols., 1836-'9; 7th ed., 1870); and admirable translations from the Arabic and other oriental tongues, including *Die Verwandlungen des Abu Seid von Sarug, oder die Makamen des Hariri* (2 vols., 1826; 5th ed., 1875). Among his posthumous works is one on the Coptic language (1875). His life has been written by Fortlage (1867) and Beyer (1868).—His son **HEINRICH**, an eminent historian, born in Coburg, Jan. 14, 1823, died in Breslau, Sept. 11, 1875.

RUDDER FISH, one of the mackerel family, constituting the only described species of the genus *pallinurus* (De Kay). It belongs to the division of the scomberoids in which the first dorsal is composed of isolated spines connected by a low membrane; the gill covers are serrated and spiny; there are one or more spines in front of the anal fin, which seems to remove it from the scomberoids with which in other respects it agrees; the body is elevated, compressed, and oblong, and the tail without lateral keel; the profile is vertical; the teeth are small, pointed, and nearly equal. The *P. perciformis* (De Kay), the black pilot, or the rud-

Rudder Fish (*Pallinurus perciformis*).

der fish of the fishermen of Martha's Vineyard, attains a length of from 9 to 12 in.; it is occasionally seen on the coasts of Massachusetts and New York. The color is bluish white on the sides, with minute black dots, the lower parts lighter; top of head and back with black blotches; in the young the color is a bright bronzed black, with obscure reddish hues; there are eight short spines in front of the fleshy rays of the dorsal; a bony ridge is observed over the eyes, and there is a depression between them.

RUDOLPH I. of Hapsburg, emperor of Germany, founder of the imperial house of Austria, son of Count Albert IV. of Hapsburg, born in the Breisgau, May 1, 1218, died in Gernersheim, July 15, 1291. He was brought up at the court of his uncle the emperor Frederick II., under whom he served in the wars in Italy. On the death of his father in 1240, he succeeded to the landgraviate of Upper Alsace, the burgraviate of Rheinfelden, and with his brother to the county of Hapsburg. He wrested additional territory from his relatives and others, and in 1245 married a daughter of Burchard, count of Hohenberg, who brought him valuable possessions. He distinguished himself in several wars, and acquired so high a reputation for justice and prowess that he was chosen by many cities as their protector and the leader of their armies. In 1264 he became chief magistrate of Zürich, and was involved in several conflicts, which generally terminated in his favor. The most bitter of these was with the bishop of Basel, and Rudolph was besieging that city in 1273 when he was unanimously chosen to the throne of Germany in preference to Alfonso of Castile and Ottocar of Bohemia. Basel immediately opened its gates, in spite of the angry remonstrances of the bishop. Rudolph strengthened himself after his coronation at Aix-la-Chapelle (Oct. 28) by the marriage of his two daughters, Matilda and Agnes, to Louis, duke of Bavaria, and Albert, duke of Saxony, and by a concordat with Pope Gregory X., who persuaded Alfonso of Castile to recognize Rudolph, while Duke Henry of Bavaria and King Ottocar of Bohemia were speedily overcome by him. Ottocar, after violating a truce, fell in battle on the Marchfeld, Aug. 26, 1278. Rudolph restored Bohemia and Moravia to Wenceslas, son of Ottocar, but retained Austria, Styria, and Carniola for his own sons. He now established order and tranquillity in his dominions, put an end to the depredations of the feudal barons by sentencing many of them to death and demolishing their strongholds, and passed so many new decrees that he was called *lex animata*, "the living law." Under him German was substituted for Latin in official documents. Rudolph also engaged in a successful war with the count of Savoy, but was unsuccessful in 1288 against the city of Bern. He restored order in Bohemia, delivering the young king Wenceslas II. from his captivity, and marrying him to one of his daughters. He was greatly mortified at the refusal of the diet of Frankfort in 1291 to choose his son Albert as his successor. He set out for Spire, but died on the way, and was succeeded on the imperial throne by Adolphus of Nassau.—See *Geschichte Rudolfs von Habsburg*, by Schönhuth (2 vols., Leipsic, 1843-'4).

RUDOLPH II., emperor of Germany, born in Vienna, July 18, 1552, died Jan. 20, 1612. He was the son of Maximilian II. and Maria, daughter of Charles V., a bigoted princess, un-

der whose charge he passed his early years. In 1564 he was sent to the court of Spain, where Philip II., who had then no male issue, designed him to be his successor, and here the Jesuits continued his education. In 1572 he was crowned king of Hungary and in 1575 of Bohemia, was in the latter year elected and crowned king of the Romans, and on Oct. 12, 1576, succeeded Maximilian in all his dominions. Under the tolerant rule of his father the Protestants had gained vastly in strength, especially in the Austrian states. Rudolph, led by the Spanish court and the Jesuits, proceeded at once to restore the Catholic party to its former position. The religious dissensions broke out in all their former bitterness, and Aix-la-Chapelle, the electorate of Cologne (where the dispute arose out of the ecclesiastical reservation), and the see of Strasburg became the theatre of war. Failing to obtain redress from Rudolph, a number of the Protestant states formed in 1608 a confederacy known as "the Union," and in the following year the Catholic states established a counter confederacy styled "the League." While Germany was thus brought to the brink of a general struggle, the incapacity and intolerance of Rudolph, who had been involved in war with the Turks and Transylvania, had alienated his family, and provoked an insurrection in Hungary under Bocskay (1604) which threatened to overturn his throne. In 1608 he was forced to cede Hungary, Austria, and Moravia to his brother Matthias, who had gained the malcontents by promises of religious liberty (see MATTHIAS); and in July, 1609, the Protestants of Bohemia extorted from the distressed emperor a letter patent (*Majestätsbrief*) guaranteeing the exercise of their religion. A new war was kindled in Germany by the disputed succession to the dominions of the duke of Jülich. In 1611 an attempt against the liberties of Bohemia, whose capital Prague was his favorite residence, cost Rudolph the crown of that kingdom, which was transferred to Matthias. Rudolph died soon after, stripped of all but his imperial dignities. His temper had become extremely gloomy and mistrustful, and from superstitious fear he had never married and sought to keep his brothers from doing so. He was fond of science and the mechanical arts, in which last he personally excelled, but he was greatly addicted to alchemy as well as to astrology, which at his court found votaries in Tycho Brahe and Kepler. He encouraged letters, his reign being the most brilliant period of Bohemian literature. He was succeeded by Matthias.

RUDOLSTADT. See SCHWARZBURG-RUDOLSTADT.

RUE, from *ruta*, the ancient Latin and present botanical name of a genus of plants, one species of which, the common rue (*R. graveolens*), has long been cultivated, and is now occasionally seen in old gardens. The genus *ruta* comprises about 40 species, which are natives of the Mediterranean region and west-

ern Asia; it gives its name to the *rutaceæ*, a family of polypetalous exogens which, under the recent revision of Hooker and Bentham, is a large and important one, as they have included in it the orange family and others of less importance, and it now consists of over

Garden Rue (*Ruta graveolens*).

80 genera, numbering some 650 species. The only representatives of this family indigenous to the northern states are prickly ash and hop tree, which are described under their titles. The common rue, from the south of Europe, is hardy in the northern states; it is a half shrubby plant, with alternate, pinnately divided leaves, which are of a bluish green and strongly marked with transparent dots or glands containing an oil of a powerful and unpleasant odor; the greenish yellow flowers are produced all summer in small corymbs, the first flower which opens in each cluster having its parts in fives, and all the others in fours; stamens twice as many as the petals, inserted at the base of a glandular disk which surrounds and elevates the compound pistil; fruit a four- or five-lobed, many-seeded pod. Rue was formerly held in high repute, and was thought by the ancients to prevent contagion; it is still somewhat employed in domestic medicine, though it is too dangerous to be carelessly administered; its properties are due to the oil contained in the leaves, which is so acrid that persons with delicate skin are blistered by handling it, and children in playing with it have suffered from its effects. Rue is at present comparatively little used. It is called antispasmodic, and has been used in hysteria as well as in colic and in dysmenorrhœa. It has also been employed to procure abortion, acting like most drugs of this class with great and even dangerous violence. The fresh plant is eaten in some parts of Europe as a condiment and in salads, it being thought to strengthen the sight. The "vinegar of the four thieves," used by robbers in France to

enable them to carry on their thieving during the plague, contained rue. Like rosemary, rue was formerly employed in religious ceremonies, for which reason Shakespeare speaks of it in two of his plays as "herb of grace." —Meadow rue is a name for several species of *thalictrum*, of the ranunculus family, which have none of the properties of common rue.

RUFF, a wading bird of the subfamily *tringinæ* or sandpipers, and the genus *philomachus* (Möhr.). The bill is as long as the head, straight, rather slender, with sides compressed and grooved, and slightly dilated at tip; wings long and pointed, the first and second quills longest and equal; tail moderate and nearly even; tarsi long and slender, covered in front with transverse scales; toes moderate, the lateral ones unequal, with the outer united to the middle as far as the first joint, and the hind one elevated and short. The ruff (*P. pugnax*, Gray) is about 10 in. long, and the bill $1\frac{1}{4}$ in.; above it is varied with black, rufous, and gray, arranged in oblique bands on the scapulars and tertiaries, and whitish below; primaries dark brown, with green reflections above and with inner webs finely mottled toward the base; the tail, except the three outer feathers, transversely barred; sides of rump white, bill brown, and legs yellow. The males in spring have the feathers of the neck developed into a kind of ruff, whence the common name, and the face is covered with reddish papillæ; they fight during the breeding season, unlike most wading birds; they are also polygamous, and larger than the females, and in these three respects the ruff seems to form one of the links between wading and gallinaceous birds; the females are called reeves. The colors of the ruff vary exceedingly, and

Ruff (*Philomachus pugnax*).

no two are precisely similar. They are natives of northern Europe and Asia, migrating southward during winter; they have been introduced into America, and are sometimes killed on Long Island. They are found chiefly in flocks, in marshy and moist districts; they

feed at night on worms, insects, and larvæ; the nest is made of coarse grass, and is placed in a hollow of the ground; the eggs are four or five, pointed, green with brown specks. Their flesh is esteemed; they are taken alive in nets and fattened for market; great numbers are sent from Holland to London.

RUFFED GROUSE, or **Partridge**. See **GROUSE**.

RUFFINI, **Giovanni**, an Italian novelist, born in Genoa about 1810. He and his brother Jacopo were fellow students of Mazzini at Genoa, and Giovanni coöperated with the latter in organizing at Marseilles the league known as *la giovine Italia*. In 1834, on the failure of the invasion of Savoy planned by Mazzini, Jacopo was executed, while Giovanni escaped, and lived chiefly in England till the amnesty of 1848, when for a short time he was Sardinian minister in Paris. In 1849 he returned to England, where he has since resided. He is married to an English lady, and writes English with remarkable fluency and elegance. He has published "Lorenzo Benoni, or Passages in the Life of an Italian," an autobiographical narrative (London, 1853); "The Paragreens' Visit to the Paris Exhibition" (1855); "Doctor Antonio" (1855); and "Lavinia" (1860).

RUFINUS. See **STILICHO**.

RUGBY, a market town of Warwickshire, England, on the river Avon, 16 m. N. E. of Warwick, and 83 m. N. W. of London; pop. in 1871, 8,385. It is on the line of the London and Northwestern railway, and several other railways meet here. It has important horse, cattle, wool, and cheese fairs. The grammar school, of which Dr. Thomas Arnold was head master from 1828 to 1842, was founded in 1567 by Lawrence Sheriff, a London tradesman born in Rugby. It occupies a quadrangle of buildings in the Elizabethan style, and has 14 teachers and about 500 students, with an income from its endowment of about £5,000, and 20 exhibitions to the universities of £40 to £80 per annum for four years.

RUGE, **Arnold**, a German author, born at Bergen, island of Rügen, Sept. 13, 1803. He was imprisoned for five years as a member of a political students' association, but subsequently graduated and lectured on philosophy at Halle, and joined in the publication of the *Hallische Jahrbücher*, which was ultimately suppressed in Prussia and Saxony. He next edited for about two years the *Deutsch-französische Jahrbücher* in Paris, conjointly with Karl Marx, and afterward connected himself with Julius Froebel's literary bureau at Zürich, which was closed by the authorities, as was also a similar establishment which he founded in 1847 at Leipzig. The city of Breslau elected him in 1848 to the Frankfort parliament. In the same year he established *Die Reform*, a daily journal, at Berlin, which was speedily suppressed, and he was expelled from that city, and in 1849 also from Paris. With Ledru-Rollin and Mazzini he founded in London in the same year the European democratic committee, and he

has since resided at Brighton as a visiting tutor. His collected works (10 vols., Mannheim, 1846-'8) were followed by his *Revolutionsnovellen* (2 vols., Leipsic, 1850) and *Aus früherer Zeit* (4 vols., Berlin, 1862-'7). He has translated into German "The Letters of Junius," Buckle's "History of Civilization" (5th ed., 1874), Henry Lytton Bulwer's "Life of Viscount Palmerston," and other works.

RÜGEN, an island of Prussia, in the province of Pomerania, separated from the mainland by a channel from $\frac{1}{2}$ to 2 m. wide; area, about 400 sq. m.; pop. of the circle of Rügen in 1867, 47,539. Numerous shallow bays and arms of the sea divide it into several peninsulas. The channel separating it from the mainland is gradually narrowing. (See **BALTIC SEA**.) The surface presents great variety, and the scenery is very beautiful. The island is much visited in summer for sea bathing. The Stubbenkammer, a chalk headland in the north, rises about 440 ft. above the sea, its highest point, called the King's Seat, being the summit from which Charles XII. witnessed the sea fight between the Swedes and Danes, Aug. 8, 1715. There are many ancient sepulchral mounds on the island. Capital, Bergen. —Rügen was occupied in the 6th century by the Rugians, a Germanic people, and subsequently by Slavs, and in the early part of the middle ages was governed by princes of its own, but the Danes conquered it in 1168. The Swedes occupied it during the thirty years' war, and it was ceded to them at the peace of Westphalia, but it was allotted to Prussia in 1815. Several engagements took place off the island in 1864 between the Danes and the Prussians.

RUM, a spirituous liquor distilled from fermented molasses, the refuse juice and scum from the sugar manufacture, and the spirit wash or lees (known as *dunder*) of former distillations. A peculiar volatile oil comes over in the first part of the process, which imparts to the rum its flavor. The manufacture of rum has long been carried on extensively in connection with that of sugar and molasses upon the plantations of the West India islands. Jamaica rum ranks first in quality, and that made in Santa Cruz is also favorably known. In the New England states it has been largely distilled from molasses. In Newport, R. I., there were in the last century 80 of these manufactories, and their product was a staple article in the African slave trade. The materials named above are employed in various proportions at different places. In some the proportion of spent wash already used several times over is so great as to seriously impair the flavor. The fermentation is continued upon large quantities of material at a time from 9 to 15 days, according to the strength of the wash and condition of the weather. Rum often has a deep red color, which is acquired from molasses or caramel added for the purpose, and not from the wood of the casks as is commonly supposed. Unlike other spirits, rum

tends to cause perspiration. Rum is greatly improved by age, and when very old is often highly prized. At a sale in Carlisle, England, in 1865, rum known to be 140 years old sold for three guineas a bottle.

RUMELIA. See **ROUMELIA**.

RUMFORD, Benjamin Thompson, count, an American natural philosopher, born in Woburn, Mass., March 26, 1753, died at Auteuil, near Paris, Aug. 21, 1814. He was educated at the common school in his native place, afterward at Medford, and at the age of 13 entered the counting house of a Salem merchant. In 1770 he taught an academy in Rumford (now Concord), N. H., and in 1772 married Mrs. Rolfe of that place, a wealthy widow considerably his senior, and was made major in the militia of New Hampshire by the royal governor. This excited the jealousy of older officers, and he was charged with disaffection to the cause of the colonies, driven from his home, and finally took refuge in Boston, where he became an associate of Gen. Gage and the other British officers. He was subsequently tried at Woburn, and, though not condemned, was refused a full acquittal, and afterward made an unsuccessful effort to obtain a commission in the continental army. When Boston fell into the hands of the patriots he carried to England the despatches announcing that event. There he was employed by Lord George Germain, secretary of state for the department of the colonies, and in 1780 became under secretary of state. After the retirement of Lord Germain in 1781 Mr. Thompson returned to America, and there formed a regiment of dragoons, of which he received the command with the rank of lieutenant colonel. Returning to England at the close of hostilities, he obtained leave of absence to visit the continent of Europe, and by permission of the English government entered the service of the elector of Bavaria, who knighted him. Toward the end of 1784 he settled in Munich with the appointment of aide-de-camp and chamberlain to the elector. Here he reorganized the entire military establishment of Bavaria. In the beginning of 1790 he undertook to suppress beggary in Bavaria, which had become a profession, and inculcated habits of industry and order in the people of the lower class. In this he was successful, and was also wholly or partially so in the establishment of a military school, the improvement of the breed of horses and of horned cattle, and the conversion of an old hunting ground near Munich into a park, where after his departure the inhabitants erected a monument in his honor. He had been successively raised to the rank of a major general in the army, member of the council of state, lieutenant general, commander-in-chief of the general staff, minister of war, and count of the holy Roman empire, on which occasion he chose as a title the name of the place in America in which he had resided. His health failing under his ar-

duous labors, he made a tour in Italy; but not finding himself recovered, he visited England, reaching that country in September, 1795, and on his arrival in London was robbed of a trunk containing all his private papers and original notes and observations on philosophical subjects. Returning to Bavaria when that country was threatened by the war in 1796 between France and Germany, he was appointed head of the council of regency during the absence of the elector, and maintained the neutrality of Munich; for this service many honors were conferred upon him, one of which was an appointment to the superintendency of the general police of the electorate. As the climate did not agree with him, after spending two years in public duties and private studies, he determined to fix his residence in England, and was named minister to the court of St. James; but the English government, acting on the rule of inalienable allegiance, refused to recognize him in this capacity. While in England he was largely concerned in the affairs of the royal institution, of which he was the real founder. After the death of Charles Theodore, elector of Bavaria (1799), Rumford gave up his citizenship in the electorate, and finally settled at Paris. He married in 1804 for his second wife the widow of Lavoisier, and with her retired to the villa of Auteuil, the residence of her former husband, where he spent the remainder of his life. He contributed a large number of papers to various scientific journals. The subject to which he devoted his philosophical investigations more than any other was that of heat, and what has been done to demonstrate experimentally the doctrine of "correlation of forces" was begun by him in a series of experiments suggested by the heat evolved in boring cannon at the arsenal in Munich. (See **CORRELATION OF FORCES**.) For Count Rumford's claim to having very nearly established the "mechanical equivalent of heat," see a paper by Prof. Robert H. Thurston in the "Transactions of the American Society of Civil Engineers," vol. ii., p. 289; also Tyndall's "Heat as a Mode of Motion." Rumford also devoted a good deal of attention to the construction of chimneys, with principal reference to remedies for their smoking, and wrote popular essays on the subject. His investigations into the strength of materials and the force of gunpowder resulted in great improvements in artillery; and on the subjects of light and illumination he also made many experiments and discoveries. Some years before his death he instituted prizes for discoveries in light and heat, to be awarded by the royal society of London and the American academy of sciences, of which he himself received the first on the former subject from the royal society; and he bequeathed to Harvard university the funds by which was founded the Rumford professorship of the physical and mathematical sciences as applied to the useful arts, which was

established in October, 1816.—The results of his investigations were published in pamphlets and essays, in French, English, or German. A complete edition of his writings has been published in 4 vols., with his life by the Rev. G. E. Ellis (Philadelphia, 1871). See also his life by Prof. Renwick, in Sparks's "American Biography," 2d series, vol. v.

RUMIANTZEFF, or **Romantsoff**, **Petr**, count, a Russian general, born in St. Petersburg in 1725, died in Mohilev in December, 1796. During the seven years' war he coöperated with Soltikoff in defeating Frederick the Great at Kunersdorf (1759), and captured the fortress of Colberg (1761). In 1770 he became commander-in-chief against the Turks, and defeated in two battles much superior forces on the Pruth and the Kagul, which gave to Russia the whole left bank of the Danube. In 1774 he compelled the Turks to conclude a peace at Kutchuk-Kainarji; and after being made field marshal, he was presented with a large domain. In 1787, on the renewal of the war with Turkey, he and Potemkin were placed in command; but Rumianteff declined serving with Potemkin and retired.

RUMINANTIA (Lat. *ruminare*, to chew the cud), a group of ungulate even-toed mammals, characterized by the absence of incisors in the upper jaw in almost all cases, their place being supplied by a callous pad; six lower incisors; canines inconstant; molars usually six on each side in each jaw, with flattened crowns and irregularly crescentic folds of enamel; stomach compound, with three or four cavities, in connection with the act of rumination; cæcum large; placenta generally cotyledonous; and feet ungulate and bisulcate. This group is equivalent to the *pecora* of Linnæus, and includes such animals as the camel, deer, giraffe, antelope, gnu, goat, sheep, and ox. Almost all the genera are provided with horns, solid and deciduous as in the deer, or hollow and permanent as in the ox and sheep. They are large or moderate in size, and generally rapid runners; they feed in herds, headed by an old male, and are exclusively herbivorous; the shape in most is light and elegant, and the limbs long and slender; the skin is covered with hair or wool; the eyes are large, full, and often very beautiful; the ears long, erect, very movable, and more or less pointed; the tail varies much in length and covering. They inhabit vast plains, the forests of the north, and the dry deserts of the tropics, their speed taking them in a few hours from an exhausted to a rich feeding ground, and from a sandy waste to a well watered region. They wage no war on each other or on other animals, except during the pairing season; taking to flight at slight causes of alarm, when brought to bay they fight boldly with their horns and antlers, and strike powerful blows with their sharp front hoofs.—The deciduous horns of the ruminants may be rounded as in the stag, roebuck, and Vir-

ginia deer, or palmated as in the moose, reindeer, and fallow deer; they are usually symmetrical as to position and size, but not as to arrangement of the divisions; there is an intimate connection between the horns and the generative system, as their development may be arrested and their periodical shedding prevented by castration. There are seldom more than two; but in the fossil *sivatherium* of the tertiary of the Sivalik hills there are four, also in the four-horned sheep, goats, and antelopes; sometimes there are even five in the domesticated sheep. The solid horns have been described under **BUCK**, and **DEER**; these antlers fall by a process having a close resemblance to that by which in necrosis the dead is separated from the living bone; after the pairing season has passed the circulation stops in the horns, and they become dry and dead, and separate from the frontal bone by absorption carried on by the Haversian canals; these, acting on one plane through the whole thickness of the bone just below the burr, remove the solid materials around them, so that each canal finally unites its cavity with that of an adjoining one; when this has extended entirely across the base the antler falls. Prof. J. Wyman ("Proceedings of the Boston Society of Natural History," vol. vii., p. 168, 1859) regards the antlers as dermal bones rather than parts of the internal skeleton, because they are developed in the integuments by a special centre of ossification, and become attached to the frontal only after ossification has somewhat advanced. In the hollow horns of the ox, sheep, and antelopes, the frontal bony cores are cylindrical shafts, more or less solid, protected by periosteum and an extension of the true skin, of which the epidermic portion is developed into a dense horny sheath; in most the frontal sinuses extend into the cores.—The tongue generally performs the office of prehension as well as deglutition; the anterior part collects and judges by the touch of the nature of the food, the next portion prepares the morsel and thrusts it backward toward the oesophagus, and the basal part regulates the movements of the whole organ from its insertion in the hyoid bone; the papillæ, fungiform and filiform in front, conical and circumvallate behind, are largely developed. The salivary glands are large, with long ducts; tonsils bulky, and oesophagus thick and muscular. The stomach is fourfold, the first three cavities (paunch or *rumen*, honeycomb bag or *reticulum*, and manyplies or *psalterium*) being essentially dilations of the oesophagus for the purpose of rumination, and leading to the fourth or true digestive cavity; in the fourth or *abomasum*, the only one developed in the newly born animal, there is in the calf an organic acid secreted, possessing the power of converting the albumen of milk into curd or whey, in the prepared condition called rennet. Concretions of balls of hair, the result of hairs swallowed when licking their own or others' hides,

felted together by the movements of the stomach, and incrustated with a polished earthy deposit of great hardness, are often found in the stomachs of ruminants, especially of the cow.

Stomach of a Sheep.—*a*. Œsophagus or gullet. *b*. Rumen, paunch, or first stomach. *c*. Reticulum, honeycomb, or second stomach. *d*. Psalterium or manyplies. *e*. Abomasum, fourth or true stomach.

The intestinal canal is very long and simple; compared with the length of the body it is, according to Meckel, as 12 to 1 in the camel and deer, 22 to 1 in the ox, and 28 to 1 in the sheep; the large intestine is often scarcely wider than the small; the cæcum is always large, smooth, and without lateral bulgings. The eyes are wide apart, and so prominent that the range of vision is very extensive; the opening of the pupil is transverse, and the *tapetum* is exceedingly brilliant. The senses of hearing and smell are highly developed, and the cranial sinuses are extensive. The mammae are inguinal, and the teats four, except in sheep and goats, which have only two. The *panniculus carnosus* muscle is remarkably developed, serving as a means of defence by shaking off flies and other stinging insects from the skin. In the camel there is a hump on the back, consisting principally of adipose matter developed in the subcutaneous areolar tissue, probably serving as a storehouse of nutriment to the animal during its long fasts in the desert. The hair is generally coarse, and never what would be called fur; it varies from the harsh and shaggy coat of the camel and the somewhat softer one of the llama to the fine wool of the sheep. Rumination is rendered necessary by the bulky character of the food as compared with its nutrient qualities; the timid animals of this order are naturally forced to take in a large amount of food in a short time, and then to flee from the carnivorous beasts always lying in wait for them to some retired place where they can remasticate it quietly. In camels the bolus is triturated alternately from side to side; in horned ruminants and in the giraffe it is always in one direction, either from right to left or from left to right.—Ruminants embrace the animals most useful to man and the most easily domesticated; whole races of men count their wealth by the numbers they possess of them, whether camels, llamas, goats, sheep, reindeer, or cattle. They are distributed all over the world except in Australia; the reindeer and musk-ox are found in the polar regions of both hemispheres, the llamas and alpacas in South America, the cam-

els in Asia and Africa, the giraffe and most antelopes in Africa, and the deer everywhere in suitable feeding places; in North America there are only two antelopes, only one of the sheep family, and two of the ox family; there are no hollow-horned ruminants in South America as original species, though there are vast herds of wild cattle of foreign introduction. The distribution of fossil ruminants was in some respects different from that of the living species; for instance, the giraffe has been found fossil in France and the Sivalik hills, showing a warmer climate than now prevails in those regions; on the contrary, the reindeer has been found in S. Europe, indicating also a temporary diminution of heat, probably from the extension southward of the ice during the glacial period. There are many interesting coincidences of geographical distribution in geological and the present times, bearing on the point of the origin of existing mammals, and in favor of the theory of such origin from the development of previously existing types, rather than from a distinct creative act after the entire destruction of the preceding fauna. Camels are found fossil in the Sivalik hills of India, llamas in the caverns of Brazil, musk deer in Asia and Africa, &c.; deer (*cervidae*) are numerous in the diluvial formations of Europe, greatly resembling the present species, and, according to Pietet, some may be considered as the stock from which have been derived the present stag, reindeer, fallow deer, and roebuck, these, with also the goat and sheep, having survived the catastrophes of this disturbed period, and preceded the appearance of man in Europe. The fossil deer of Asia and America also very much resemble the existing species of these continents. The urus described by Julius Cæsar (*De Bello Gallico*, vi. 28) among the animals of Germany, and the aurochs even now living in the forests of Lithuania, are interesting in connection with the origin of domestic cattle; these were probably indigenous, as a fossil urus and aurochs have been found in the diluvium of Europe. The fossil musk ox (*ovibos*) has been found in Siberia and North America, like the one now living in the polar regions. The ruminants show more transitions to other orders than would be supposed from the study of their living species, especially in the direction of the odd-toed ungulates; they appeared after the latter, and under forms very nearly resembling existing species; there were none in the eocene tertiary, when almost all herbivorous mammals were of the latter, but appeared first in the miocene, and then became so numerous that in the subsequent epoch (pliocene) and during the diluvium they had entirely displaced the latter, at least in Europe. The *svotherium* of the Sivalik hills resembled proboscideans in its heavy form, short neck, and probable trunk (as indicated by the nasal bones). Among the gigantic animals of this order may be mentioned the great Irish elk, with enormous horns,

found in the diluvium of Europe. The genus *macrauchenia*, as large as a rhinoceros, is peculiar to the southern regions of South America, and forms another remarkable transition form between ruminants and proboscideans. (See *MACRAUCHENIA*.)

RUMSEY, James, an American inventor, born at Bohemia Manor, Cecil co., Md., about 1743, died in London, England, Dec. 23, 1792. In September, 1784, he exhibited on the Potomac, in the presence of Gen. Washington, a boat which worked against the stream by means of mechanism. He subsequently gave his attention to steam as a motive power, and in March, 1786, propelled a boat on the Potomac by a steam engine, which secured motion by the force of a stream of water thrown out by a pump at the stern. In December, 1787, the experiment was successfully repeated on a larger scale. About the same time he became involved in a controversy with John Fitch. (See *FITCH, JOHN*.) In 1788 the "Rumsey society" was formed in Philadelphia; and the inventor going to England, a similar society was formed in London, a boat and machinery were built for him, and he obtained patents for his inventions in Great Britain, France, and Holland. A successful trip was made upon the Thames in December, 1792, and he was preparing for another experiment when he died. He published a "Short Treatise on the Application of Steam" (1788).

RUNES (Old Norse, *rúnir*, secret signs, mysteries), an ancient graphic system employed chiefly by the Teutonic races of northern Europe, though traces of its use are found also in France and Spain. These characters originally served for divination and secret purposes, but it is not known at what time their use began. Specimens of runic writing have been found at Thorsbjerg and Nydarn dating from the 2d or 3d century; and though they were gradually superseded by the Roman alphabet, the runes remained partially in use in out-of-the-way districts of Scandinavia till the close of the last century. There are several varieties of runic writing, classed as the Anglo-Saxon, the German, and the Norse. The last is thought to represent the oldest form, from which the others were developed. It has an alphabet of only 15 or 16 letters, while that of the Anglo-Saxons finally numbered as many as 40. Among the variations, *Æ*, sometimes stands for O,

for N, *for S*, *for T*, *for D*, and *for E*. These variations in the forms of the letters, and the fact that they

are sometimes read from left to right, sometimes from right to left, and sometimes alternately from the right and left, greatly increase the difficulty of deciphering them; but as 61 runic alphabets, or *futhorcs*, as they are called from the first six letters, have been gathered, it is possible to read any well preserved inscription with tolerable certainty. There is no evidence that runes were ever employed in the composition of books, or that they were used as familiarly and generally as other graphic systems. They were confined to inscriptions or carvings on rocks, stones, household utensils, weapons, and ornaments. They were also cut on smooth sticks, called *rún-stafur*, or mysterious staves, generally of beech (Ger. *Buche*, whence *Buchstab*, letter), used for divination. It was even believed that a mysterious power resided in the runes, and some of them were considered as special safeguards of ships, others as capable of healing wounds, &c. The use of the runes, thus associated in popular belief with sorcery, was discouraged by Christian missionaries.—Whatever valuable statements in regard to the nature of runes are to be found in the manuscripts of the middle ages have been gathered in Brynjulfssen's *Periculum Runologicum* (1823). See also Grimm, *Ueber deutsche Runen* (1821) and *Zur Literatur der Runen* (1828); and Stephens, "Old Northern Runic Monuments of Scandinavia and England" (3 vols., London, 1867-'74).

RUNJEET SINGH, a rajah or sovereign of the Sikhs, in the Punjab, born at Gujerawala, N. of Lahore, about 1780, died there, June 27, 1839. He was the son of Maha Singh, sirdar or governor of one of the Sikh states, who when he died (1794) left the government of his province to Runjeet, under the regency of his mother, whom the young sirdar is said to have poisoned when he arrived at the age of 17, in order that he might reign alone. He rapidly and skilfully availed himself of the wealth and influential position to which he had succeeded, and became the recognized leader of the Sikh confederacy W. of the Sutlej. A service to the Afghan monarch obtained for him the title of king of Lahore, by which he was generally known to Europeans. In 1807, having taken from the Afghans several important towns situated on the W. bank of the Indus, and established his position as sovereign of the Sikhs in the Punjab, he endeavored to extend his power over the Sikh territories lying between the Sutlej and the Jumna, and for this purpose advanced into that region. The chiefs of Sirhind demanded protection from the British government, which was granted; but not until an English army advanced to the banks of the Sutlej, in 1809, did Runjeet Singh relinquish his claim of authority. On April 25 of that year he concluded a treaty with the English at Amritsir, making the Sutlej substantially the boundary between his possessions and those of the East India company. He now reorganized his army by the aid of European

officers, and ten years later had not only reduced every sirdar in the Punjab to subjection, but was master of the Afghan city of Peshawer, and had assumed the title of *maharajah* (king of kings). By the employment of two skilful French officers, Allard and Ventura, in 1822, he brought his troops to a still higher degree of efficiency, forming a disciplined army of 80,000 men, with 300 guns. He now crossed the Indus and took the province of Peshawer lying along its W. bank. His conquests in Afghanistan occupied him for several years. In 1838 he entered into negotiations with the British for a closer alliance, but died before they were concluded. He was remarkable for his success in harmonizing the interests of the various Sikh states, no less than for his military achievements; and for fidelity to treaty engagements his name is conspicuous among native princes of India.

RUNNELS, a W. county of Texas, intersected by the N. fork of the Colorado river; area, 750 sq. m.; returned as having no population in 1870. The soil in the valleys of the streams is good. The county is adapted to stock raising, but is subject to Indian incursions.

RUNNERS. See ORTHOPTERA.

RUNNYMEDE, *Runnimeede*, or *Runnemeede*, a narrow slip of meadow land on the right bank of the Thames near Egham, in the N. W. part of the county of Surrey, England, about 20 m. W. S. W. of London, memorable as the place where in 1215 King John was compelled by his barons to sign the Magna Charta. The Egham races now take place upon this meadow.

RUPERT, Prince (Prince Robert of Bavaria), a royalist general of horse during the English civil war, born in Prague, Dec. 17, 1619, died at Spring Gardens, London, Nov. 29, 1682. His mother Elizabeth was the eldest daughter of James I. of England, and the wife of Frederick V., elector palatine, who on the outbreak of the thirty years' war was elected by the insurgents king of Bohemia, and in consequence was deprived of his estates. When only 13 years old Rupert took part in the siege of Rheinberg, and at 18 commanded a regiment of cavalry in active service. At the beginning of the civil war in England he was placed at the head of a regiment of horse. He took Hereford, Lichfield, and Cirencester, and bore a prominent part in the battles of Edgehill and Chalgrove field. His daring and vigor had more than compensated for his want of prudence and military sagacity, and he was created duke of Cumberland. With Prince Maurice he carried Bristol by assault on July 25, 1643. Afterward he scattered the parliamentary forces at Newark, and gained distinction in the north of England, especially by the relief of Latham house, held by the countess of Derby against a detachment of Fairfax's army. The loss of the battle of Marston Moor was due to his rashness and his want of concert with the duke of Newcastle; yet he was promoted from the generalship of

the horse to the command of all the forces, and took the city of Leicester. In the battle of Naseby, June 14, 1645, Prince Rupert commanded the left wing, and pursued the portion of the parliamentary army opposed to him a great distance, returning to find his own side defeated. Subsequently he took command of Bristol. The city was invested by Fairfax and Cromwell on Aug. 22, and was surrendered at the first attack (Sept. 11), the prince marching out with a convoy of two regiments of horse, and proceeding to Oxford. The same day a royal proclamation was issued revoking and annulling all military authority given to "our nephew Prince Rupert;" but in 1648 he obtained the command of that portion of the fleet which adhered to the royal cause, and with it went to the coast of Ireland to assist Lord Ormond. Anchoring in the harbor of Kinsale, he was there blockaded by Blake with the parliamentary fleet until October, 1649, when he forced his way out with the loss of a few ships. Blake pursued him to Malaga, and in January, 1651, attacked his squadron, and destroyed all but two ships, with which the prince escaped to the West Indies. There he remained some time, supporting himself by the piratical capture of Spanish and English merchantmen, and then returned to France, selling his ships to the French government in behalf of Charles II. After the restoration he was made privy councillor. Under the duke of York he held a command in the fleet, and was present at the naval battle of Lowestoft (1655). In 1666, in conjunction with Lord Albemarle, he held command of the fleet which acted against the Dutch with various success. He was a promoter of the Hudson Bay company, and its first governor in 1670. During the latter years of his life he was governor of Windsor castle, and spent a large portion of his time in painting and engraving, and in mechanical and chemical experiments. The invention of the mezzotint has been ascribed to him, but it was made some years earlier. He improved the mechanical mode of the art, and described it in a communication to the royal society in 1662, and some of his engravings are still in existence. He is believed to have been the inventor of pinchbeck or prince's metal, and of the glass bubbles called "Rupert's drops." (See ANNEALING.) He was buried in Henry VII.'s chapel, Westminster.—See *Leben des Prinzen Ruprecht von der Pfalz, Anführer der Cavaliere Karl's I. von England*, by Treskow (2d ed., Berlin, 1857), and *Pfalzgraf Rupert der Cavalier*, by Spruner (Munich, 1854).

RUPHIA, a river of Greece. See ALPHEUS.

RÜPPELL, *Wilhelm Peter Eduard Simon*, a German traveller, born in Frankfurt, Nov. 20, 1796. He early visited Italy and Egypt, and subsequently explored northern Africa, and

especially Abyssinia. He presented his collections to his native town in consideration of an annual pension of 1,000 florins. His works include *Fundgruben des Orients* (5 vols., Vienna, 1818); *Reisen in Nubien, Kordofan und dem peträischen Arabien* (Frankfort, 1829); *Reise in Abessinien* (2 vols., 1838-'40); and *Vögel Nord- und Ostafrikas* (1845).

RURIK, founder of the first Russian dynasty. See RUSSIA.

RUSCHENBERGER, William S. W., an American naturalist, born in Cumberland co., N. J., Sept. 4, 1807. He studied medicine in the university of Pennsylvania, became a surgeon in the United States navy in 1826, and as such circumnavigated the globe. He has published "Three Years in the Pacific" (8vo, Philadelphia, 1834); "A Voyage round the World, including an Embassy to Muscat and Siam" (1838); "Elements of Natural History" (2 vols. 12mo, 1850); "A Lexicon of Terms used in Natural History" (12mo, 1850); and "Notes and Commentaries during a Voyage to Brazil and China in the Year 1848" (8vo, 1854).

RUSH (written by the old authors *rish*, *resh*, and *rashes*, probably from the A. S. *risc*), the common name for species of *juncus*, but used in combination, as bog rush and scouring rush, for plants of other genera. *Juncus* (Lat. *jungere*, to join, the stems having been used for tying) is the typical genus of a small family of endogenous plants, the *juncaceæ*, which, while they have the glumaceous (husk-like) flowers and general appearance of the sedges and grasses, are closely related to the lily family, the structure of the flowers, though greenish and glume-like, being much like that of a minute lily. Dr. George Engelmann, in his monograph of the genus *juncus* (St. Louis academy of sciences, 1868), finds about 50 species in all North America, of which 17 occur also in other parts of the world; four species are found all over the country, and five others everywhere east of the Mississippi; others are very local, especially the maritime and arctic species. The rushes are mostly perennials, growing in water or in wet soil, with pithy or hollow, rarely branching stems, which in some are without leaves, in others with leaves flat and grass-like, while a number have cylindrical leaves, marked by cross partitions. The flowers are in panicles, which are terminal, or in some appear lateral, as the involucre sheath continues beyond the panicle like a prolongation of the stem; the flowers, arranged on the branches of the panicle singly or in little clusters, are from one to three lines long, greenish or brownish, the six-parted perianth with three outer and three inner divisions; stamens six, sometimes reduced to three; pistil with three styles, the many-seeded pod one- or three-celled. Some species are only 1 to 3 in. high, and the larger ones reach as high as 4 ft. Though interesting plants to botanists,

the rushes are of little economical importance. The sea and sharp rush (*J. maritimus* and *J. acutus*) of Europe grow in the maritime sands, and are sometimes planted in order that their roots may retain the earth of embankments in place; the common or soft rush (*J. effusus*) is disposed to spread and be a weed in wet pastures, and is troublesome in southern rice fields; the toad rush (*J. bufonius*), the only annual species in the eastern states, is very common along roadsides and on the edges of footpaths, it seeming to flourish best where it is trodden upon. The most important species is that popularly called black grass, *J. Gerardi* (given in some works as *J. bulbosus*, which is a European species not yet found in this country), abundant in salt marshes the whole length of the Atlantic coast, where it is conspicuous by the dark brown color of its flowers; when cut early it makes a hay that is much relished by animals, and salt-marsh hay is regarded as

Common or Soft Rush (*Juncus effusus*).

valuable in proportion to the amount of this it contains.—Formerly rushes were used as a substitute for carpets; the floors of public buildings and of the houses of the wealthy were strewn with them, a practice which was continued as late as the 16th century. The Japanese use the common rush for making mats, which serve for carpets and for beds; light mats of the same material and covered with transparent paper are used as window curtains. The use of rushes and flags for bottoming chairs was formerly common, and the material serves for weaving small baskets; the street flower venders sometimes offer their wares arranged in neat baskets made from green rushes. The Chinese use the pith of some species for candle wicks, and the rush lights formerly in use by the poor classes in England were made of the pith of the common rush, peeled in such a manner as to leave a narrow strip of the rind on each side as a support.—Bulrush

is one of the sedges (*scirpus lacustris*); scouring rushes are equisetums. (See HORSETAIL.)

RUSH. I. A S. E. county of Indiana, drained by Blue river and Flat Rock creek; area, 410 sq. m.; pop. in 1870, 17,626. The surface is undulating and the soil fertile. It is intersected by the Columbus branch of the Jeffersonville, Madison, and Indianapolis railroad, and by the Cincinnati, Hamilton, and Indianapolis railroad. The chief productions in 1870 were 667,007 bushels of wheat, 1,333,421 of Indian corn, 69,236 of oats, 58,359 of potatoes, 11,038 tons of hay, 63,227 lbs. of wool, 389,552 of butter, 21,576 of maple sugar, and 16,989 gallons of sorghum and 20,359 of maple molasses. There were 7,799 horses, 5,123 milch cows, 10,994 other cattle, 15,921 sheep, and 40,552 swine; 10 manufactories of bricks, 15 of carriages and wagons, 5 of saddlery and harness, 5 flour mills, 15 saw mills, and 3 woollen mills. Capital, Rushville. II. A W. central county of Kansas, intersected by Walnut creek, an affluent of the Arkansas, and watered by other streams; area, 900 sq. m. It is not included in the census of 1870. The surface consists chiefly of undulating prairies, and the soil is productive.

RUSH. I. Benjamin, an American physician, born in Byberry township, near Philadelphia, Dec. 24, 1745, died in Philadelphia, April 19, 1813. He graduated at Princeton college in 1760, studied medicine, chiefly at Edinburgh, and was elected professor of chemistry in the medical college of Philadelphia. In the provincial conference of Pennsylvania he was chairman of the committee which reported that it had become expedient for congress to declare independence. When congress had decided on taking that step, five members from Pennsylvania withdrew, whereupon Rush and four others were elected to fill their places; and he was one of the signers of the Declaration of Independence. The same year (1776) he married Julia, daughter of Richard Stockton of New Jersey, also one of the signers. In April, 1777, he was made surgeon general of the army for the middle department, and in July physician general. He wrote four letters to the people of Pennsylvania on their constitution of 1776, which he censured, and which was soon superseded by a new form of government. In February, 1778, he resigned his post as physician general, on account of the wrongs done to the soldiers in regard to the hospital stores. In the latter part of his life he was a professor in the Philadelphia medical college. In 1793, during the ravages of the yellow fever, he rendered extraordinary services. His bold and original practice, however, made him enemies, and a paper edited by William Cobbett, called "Peter Porcupine's Gazette," was so violent in its attacks that it was prosecuted, and a jury rendered a verdict of \$5,000 damages. From 1799 till his death he was treasurer of the United States mint. He published "Medical Inquiries and Observations"

(5 vols. 8vo, 1789-'98; 3d ed., 4 vols., 1809); "Essays, Literary, Moral, and Philosophical" (1798; 2d ed., 1806); "Sixteen Introductory Lectures," &c. (1811); "Diseases of the Mind" (1812; 5th ed., 1835); and editions of Sydenham's and other medical works. His "Medical Tracts," containing a variety of essays upon health, temperance, exercise, &c., appeared in a separate volume at an early period of his life. In 1791 he wrote an able defence of the use of the Bible as a school book. He was one of the founders of Dickinson college, and was president of the society for the abolition of slavery, and for some time of the Philadelphia medical society, and was vice president of the Philadelphia Bible society, and of the American philosophical society. II. Richard, an American statesman, son of the preceding, born in Philadelphia, Aug. 29, 1780, died there, July 30, 1859. He graduated at Princeton college in 1797, studied law, and was appointed attorney general of Pennsylvania in 1811, and soon after comptroller of the United States treasury. From 1814 to 1817 he was attorney general of the United States. In 1817 he was temporary secretary of state, and was then appointed minister to England, where he remained till 1825, negotiating several important treaties, especially that of 1818 with Lord Castlereagh respecting the fisheries, the N. W. boundary line, conflicting claims beyond the Rocky mountains, and the slaves of American citizens carried off in British ships contrary to the treaty of Ghent. In 1825 President Adams made him secretary of the treasury. In 1828 he was a candidate for the vice presidency on the same ticket with President Adams and received the same number of electoral votes. In 1829 he negotiated in Holland a loan for the corporations of Washington, Georgetown, and Alexandria. In 1836 President Jackson appointed him commissioner to obtain the Smithsonian legacy (see SMITHSON, JAMES), then in the English court of chancery; and in August, 1838, he returned with the entire amount. In 1847 President Polk appointed him minister to France, and in 1848 he was the first of the foreign ministers at the French court to recognize the new republic, in advance of instructions from his government. At the close of President Polk's term he asked to be recalled, and spent the rest of his life in retirement. In 1815 he compiled an edition of the laws of the United States; in 1833 he published "Memoranda of a Residence at the Court of St. James," and in 1845 a second volume of the same work, "comprising Incidents, Official and Personal, from 1819 to 1825; among the former, Negotiations on the Oregon Territory" (3d ed., under the title "The Court of London from 1819 to 1825," with notes by the author's nephew, London and Philadelphia, 1873). In 1857 he published "Washington in Domestic Life." His sons published in 1860 a volume of his "Occasional Productions, Political, Diplomatic, and Miscellaneous, including a Glance

at the Court and Government of Louis Philippe and the French Revolution of 1848."

RUSHWORTH, John, an English compiler, born in Northumberland about 1607, died in London, May 12, 1690. He studied at Oxford and at Lincoln's Inn, and was called to the bar, but never practised. From 1630 he took notes of all important proceedings in the higher courts and in parliament. He was assistant clerk and messenger of the house in the long parliament, from 1645 to 1650 assistant secretary to Lord Fairfax, and afterward for many years a member of parliament. From 1684 till his death he was in prison for debt. The first part (1 vol. fol.) of his "Historical Collection of private Passages of State, weighty Matters in Law, and remarkable Proceedings in Parliament," covering the proceedings from 1618 to 1629, appeared in 1659; the second part, from 1629 to 1640, and the "Trial of the Earl of Strafford," in 1680; and the other parts were ready for the press at his death. The whole work was reprinted in 1721, in 7 vols.

RUSK. I. An E. county of Texas, bordered N. by the Sabine river, and watered in the north by its branches and in the south and west by those of the Angelina; area, 1,025 sq. m.; pop. in 1870, 16,916, of whom 7,715 were colored. Iron ore is abundant, and there are some mineral springs. The chief productions in 1870 were 347,561 bushels of Indian corn, 73,556 of sweet potatoes, 12,752 bales of cotton, 8,718 lbs. of wool, and 108,301 of butter. There were 1,904 horses, 1,337 mules and asses, 11,251 cattle, 3,607 sheep, and 21,785 swine. Capital, Henderson. **II.** A W. central county of Dakota, recently formed and not included in the census of 1870; area, about 1,600 sq. m. It is bounded E. by the Missouri river, and intersected by the Morean. The W. portion is occupied by Elk ridge. The surface is chiefly rolling prairies.

RUSKIN, John, an English author, born in London in February, 1819. He is the son of a London merchant, from whom he inherited a large fortune, and graduated in 1842 at Christ Church college, Oxford, having in 1839 gained the Newdigate prize for English poetry. Immediately afterward he devoted himself to the study of art, and to water-color painting. In 1843 he published "Modern Painters: their Superiority in the Art of Landscape Painting to all the Ancient Masters. By a Graduate of Oxford." It attracted attention from the brilliancy of its style, the eloquence of its descriptive passages, and particularly the summary manner in which the most distinguished landscape painters of the old and new schools were disposed of, and Turner's supremacy advocated. Among critics and connoisseurs its reception was generally hostile, but it gained admirers and disciples, and in 1846 was republished in a greatly enlarged form, accompanied by a second volume treating "Of the Imaginative and Theoretic Faculties," to which, after an interval of ten years, a third and fourth

were added; and in 1860 the work was completed by a fifth volume, the last three volumes containing illustrations by the author. Mr. Ruskin subsequently revised this work, making many alterations (5 vols. 8vo, London, 1860-'67). At the time of its completion in 1860 the original title had become a misnomer, the work being for the most part a philosophical treatise on landscape painting. The collection of materials for this work involved long visits to various parts of continental Europe, and in the cities of Italy, especially in Venice, the contemplation of the more striking mediæval buildings inspired Ruskin with the idea of a reform in domestic architecture. The result was his "Seven Lamps of Architecture" (8vo, 1849), and "The Stones of Venice" (3 vols., 1851-'53), both works illustrated by himself. In 1851 he began a series of "Examples of the Architecture of Venice," from his own designs, of which but three parts appeared. Among his other architectural publications are a pamphlet entitled "The Opening of the Crystal Palace, considered in some of its Relations to the Prospects of Art," mainly devoted to a scheme for the preservation of Gothic buildings and works of art, and "The Study of Architecture in our Schools" (1865). His "Notes on the Construction of Sheepfolds" (1851) is a discussion of church discipline and doctrine rather than of church building. The pre-Raphaelite movement in the British school of painting early enlisted the sympathy of Ruskin, who alleged that the principles on which Hunt, Millais, and their followers proceeded had first been enunciated in his own works; and in his pamphlet "Pre-Raphaelitism" (1851), his "Notes" on the royal academy exhibitions of 1855-'60, and elsewhere, he has recorded his admiration of the productions of the new school. In his "Notes" on Turner's pictures and drawings exhibited in Marlborough house, published in 1857, he astonished the public by severe strictures on that painter. In 1867 he was appointed Rede lecturer at Cambridge, and received from the university the degree of LL. D. In 1869 he was elected professor of fine arts in the university of Oxford. In 1871 he gave £5,000 to endow a master of drawing in the Taylor galleries, Oxford. He has published several courses of lectures to artisans and others, among which are: "Architecture and Painting" (1854); "The Political Economy of Art" (1858); "The Two Paths," being lectures on decoration and manufacture (1859); "Sesame and Lilies," on books and reading (1864); "The Ethics of the Dust," on the elements of crystallization (1865); "The Crown of Wild Olive," on work, traffic, and war (1866); "Lectures on Art," delivered at Oxford (1870); "The Eagle's Nest" and "Aratra Pentelici," on the elements of sculpture (1872); and "Ariadne Florentina," on engraving (1874). He has also published "Elements of Perspective," with 80 diagrams (1839); "The King of the Golden River," a Christ-

mas fairy tale (1851); a notice of "Giotto and his Works" (1855), prepared for a collection of engraved outlines of the frescoes of that master, published by the Arundel society, of which Ruskin was one of the founders; "Elements of Drawing, in three Letters for Beginners" (1857), one of his most practical and useful treatises; "Unto this Last," essays on political economy (1862); "Time and Tide, by Weare and Tyne," letters on the laws of work (1867); and "The Queen of the Air," a study of the Greek myths of cloud and storm (1869). He is the author of the illustrative text in Turner's "Harbors of England," and of many contributions to the "Quarterly Review" and other periodicals, of which some of the more important are the reviews of Lord Lindsay's "Christian Art" and Eastlake's "History of Oil Painting," in the "London Quarterly," and a biographical notice of Samuel Prout in the "Art Journal." In January, 1871, he began a series of monthly letters to working men, under the general title "Fors Clavigera," which are still continued (1875), and have been gathered into volumes. Several volumes of selections from his works have appeared, the best of which are "Art Culture," a treatise ingeniously constructed from selected passages (published only in New York, 1872), and "Frondees Agrestes," readings from "Modern Painters" (1875), with critical notes by himself. A series of articles on the "Poetry of Architecture," which appeared in a London magazine in 1837-'8, under the signature of "Kata Phusin," have been collected and added to his works, as he tacitly admits their authorship. His latest publications are: "Mornings in Florence" (first part), "Proserpina, Studies of Wayside Flowers" (parts i. and ii.), "Love's Meinie," "Notes on some of the Pictures in the Exhibition of the Royal Academy," "Deucalion," and "Val d'Arno" (1875). Besides his numerous writings, he has engaged in or announced various schemes for the benefit of different classes of society.

RUSS, John Denison, an American physician, born at Chebacco (now Essex), Mass., Sept. 1, 1801. He graduated at Yale college in 1823, studied medicine at home and in Europe, and began to practise in New York in 1826. In 1827 he went to Greece with a cargo of supplies from Boston, and remained there three years, superintending for 15 months a hospital which he had established at Poros. After his return to New York he began at his own expense, early in 1832, the instruction of six blind boys, and was appointed the same year superintendent of the New York blind institution. While here he invented a phonetic alphabet for the blind, consisting of 41 characters, sufficiently like the Roman letters to be read by any one, to which he added 22 prefixes, suffixes, &c. He also simplified the mathematical characters for the blind, using four instead of ten, and printed maps for them from raised designs, using wave lines for water, &c., instead of the

plan of marking the boundaries with a cord. The maps, with some slight change, are still in use, but the figures have been superseded by Braille's system. (See **BLIND**.) The phonetic system of writing was never generally introduced. Dr. Russ took part in founding the New York prison association, of which he was successively the secretary and vice president. From 1851 to 1858 he was superintendent of the juvenile asylum. He has also been engaged in other philanthropic enterprises, among them a house of employment for women, especially for those desirous of reforming from a vicious life, which was established in 1850 under the charge of his wife and daughter.

RUSSELL, I. A S. W. county of Virginia, bordered S. E. by the Clinch mountains and intersected by Clinch river; area, about 700 sq. m.; pop. in 1870, 11,103, of whom 1,167 were colored. It has a mountainous surface and some good soil in the valleys, and contains iron ore, coal, and marble. The chief productions in 1870 were 40,985 bushels of wheat, 205,968 of Indian corn, 56,216 of oats, 17,282 lbs. of tobacco, 27,100 of wool, 124,631 of butter, 4,040 of flax, 43,692 of maple sugar, and 13,978 gallons of sorghum molasses. There were 2,251 horses, 2,874 milch cows, 7,448 other cattle, 13,113 sheep, and 7,964 swine. Capital, Lebanon. **II.** An E. county of Alabama, separated from Georgia by the Chattahoochee river, and drained by several tributaries of that stream; area, about 550 sq. m.; pop. in 1870, 21,636, of whom 15,690 were colored. The surface is undulating. The county contains productive tracts, sandy ridges, and barren plains. It is traversed by the Mobile and Girard railroad. The chief productions in 1870 were 272,221 bushels of Indian corn, 26,770 of oats, 52,146 of sweet potatoes, and 20,796 bales of cotton. There were 824 horses, 2,410 mules and asses, 2,672 milch cows, 4,929 other cattle, and 6,540 swine. Capital, Seale's Station. **III.** A S. county of Kentucky, intersected by Cumberland river and drained by its branches; area, about 225 sq. m.; pop. in 1870, 5,809, of whom 293 were colored. It has a hilly surface and a soil fertile near the streams. The chief productions in 1870 were 13,027 bushels of wheat, 224,262 of Indian corn, 43,431 of oats, 89,484 lbs. of tobacco, 15,189 of wool, 66,416 of butter, and 17,446 gallons of sorghum molasses. There were 1,499 horses, 3,709 cattle, 7,171 sheep, and 10,679 swine. Capital, Jamestown. **IV.** A W. central county of Kansas, intersected by the Saline and Smoky Hill rivers; area, 900 sq. m.; pop. in 1870, 156. It is traversed by the Kansas Pacific railroad. The surface is generally level and the soil good. Capital, Russell.

RUSSELL, an E. county of Ontario, Canada, bounded N. by the Ottawa river; area, 686 sq. m.; pop. in 1871, 18,344, of whom 7,745 were of Irish, 5,600 of French, 2,870 of Scotch, and 1,551 of English origin. It is drained by the Petite Nation river. Capital, L'Orignal.

RUSSELL, Benjamin, an American journalist, born in Boston, Mass., Sept. 13, 1761, died there, Jan. 4, 1845. He was apprenticed at 14 years of age to Isaiah Thomas at Worcester, Mass., but before completing his term enlisted in the revolutionary army. He settled in Boston, and in March, 1784, established the "Columbian Centinel," a semi-weekly newspaper, which under his control was for 40 years an influential organ of the federal party.

RUSSELL, Charles William. See supplement.

RUSSELL, John, earl, an English statesman, third son of the sixth duke of Bedford, born in London, Aug. 18, 1792, died May 28, 1878. He was educated at the university of Edinburgh, and travelled in Spain and Portugal in 1809, the English being then shut out from most of the continental countries, and witnessed some of the most important incidents of the peninsular war. In 1813 he was elected to parliament as a whig for the family borough of Tavistock, and the Liverpool-Castlereagh ministry found in him an uncompromising opponent. At the close of 1819 he began his career as a parliamentary reformer, making annual motions on the subject. In 1826, because of his advocacy of Catholic emancipation, he was defeated in the parliamentary election in the county of Huntingdon, but was chosen for Bandon in Ireland. In 1828 he carried the repeal of the test and corporation acts through parliament, and in 1829 voted for the successful Catholic emancipation act. In the Grey ministry, formed in November, 1830, Lord John was paymaster of the forces, and took the lead in the house of commons in support of the reform bill, which he introduced in March, 1831. The bill, with some changes, was carried, and Lord John was chosen member for South Devon in 1832. He went out with the Melbourne ministry in 1834; but in 1835 he returned to office, being then appointed secretary of state for the home department, which place he held till 1839, when he became secretary of state for war and the colonies. During the six years that followed Lord Melbourne's restoration to power, Lord John Russell was really the chief member of the ministry; and he vigorously carried various reform measures, though the whigs had not a constant majority in the commons, and there was a majority against them in the house of peers. He ceased to be minister on Aug. 30, 1841, when the second Peel ministry succeeded to that of Melbourne. For five years he was chief of the opposition, but in 1846, on the breaking up of the tory party, he became prime minister, holding the office of first lord of the treasury. In 1852 he was defeated on the militia question and resigned; but when the Aberdeen ministry was formed, at the close of the year, he became secretary of state for foreign affairs, which office he soon exchanged for that of lord president of the council. He left the Aberdeen ministry in January, 1855, and shortly afterward took

the office of colonial secretary in the Palmerston ministry. He was sent as British plenipotentiary to take part in the Vienna conference, which was intended to put an end to the Crimean war; but his conduct not being approved by the English public, he withdrew from the cabinet, July 16. In 1859 he was appointed secretary of state for foreign affairs. In July, 1861, he was elevated to the house of peers with the title of Earl Russell of Kingston-Russell. The unfriendly tone assumed toward the United States in the Trent affair, the short participation of England in the Mexican expedition, the interference by a note addressed to Russia in favor of Poland in 1863, and a friendly attitude toward Denmark during the Schleswig-Holstein war are among the salient features of his management of foreign affairs during this period. After the death of Lord Palmerston in 1865, Earl Russell for the second time became prime minister, with Mr. Gladstone as chancellor of the exchequer; but differences arising between the leaders of the liberal party on the subject of reform led to a vote in parliament hostile to the ministry, which resigned in June, 1866. From that time Earl Russell was an unofficial supporter of liberal measures in the house of lords. In 1869 he introduced a bill authorizing the conferring of life peerages, and in 1870 moved for a commission on the relation between the mother country and the colonies. He published a "Life of William Lord Russell" (1819); "Don Carlos, a Drama" (1822); "Essay on the History of the English Government and Constitution" (1823; new ed., 1865); "Memoirs of the Affairs of Europe from the Peace of Utrecht" (2 vols. 4to, 1824-'9; vol. i. republished as "History of the principal States of Europe, from the Peace of Utrecht," 2 vols. 8vo, 1826); "Establishment of the Turks in Europe" (1828); "Causes of the French Revolution" (1832); "Correspondence of John, fourth Duke of Bedford, with an Introduction" (3 vols. 8vo, 1842-'6); "Memorials and Correspondence of Charles James Fox" (4 vols., 1853-'7); "Life and Times of Charles James Fox" (3 vols., 1859-'66); "Memoirs, Journal, and Correspondence of Thomas Moore" (8 vols., 1852-'6); "Selections from the Speeches of Earl Russell, 1817 to 1841, and from Despatches, 1859 to 1865, with Introductions" (2 vols., 1870); "Rise and Progress of the Christian Religion in the West of Europe" (1873); and "Recollections and Suggestions, 1813-'73" (1875). He was twice married; in 1835 to Adelaide, widow of Lord Ribblesdale, and in 1841 to Lady Frances Anna Maria, daughter of the earl of Minto.

RUSSELL, John Scott, a British engineer, born in the vale of Clyde, Scotland, in 1808. He graduated at the university of Glasgow in 1824, and was employed as an engineer till 1832, when he became lecturer on natural philosophy at the university of Edinburgh. He claimed to be the discoverer of the "wave

principle" in the construction of ships, and Brunel adopted it in the Great Western and in the monster ship Great Eastern, the latter constructed under Mr. Russell's superintendence; and he read in 1857 a paper before the British association on the "Mechanical Structure of the Great Ship." After being manager of a ship-building yard in Greenock for several years, he settled in London in 1844, where he has been extensively engaged in building large steamers. His principal works include "The Modern System of Naval Architecture for Commerce and War" (London, 1864), and "Systematic and Technical Education for the English People" (1869). He has also been engaged in efforts for the improvement of the working classes.

RUSSELL, William, lord, an English statesman, second son of William, fifth earl of Bedford, born Sept. 29, 1639, beheaded July 21, 1683. He studied at Cambridge, travelled on the continent, and was elected to parliament for Tavistock in 1660, but for the next 12 years was a silent and inactive member. In 1669 he married Lady Vaughan, a widow, and daughter of the earl of Southampton, first lord treasurer to Charles II. In 1673 he ranged himself with the Protestant or "country party," of which he was one of the leaders till his death, coming forward in opposition to the attempts of the king and his partisans to destroy English freedom through the aid of France. On the death of his elder brother, at the beginning of 1678, he became Lord Russell, and heir apparent to the earldom of Bedford. On March 14 of that year he seconded the motion to declare war against France, and spoke in support of it. In November he was chosen to move in the house of commons that the duke of York should be removed from the king's presence and councils. He was one of the chief actors in the impeachment of the lord treasurer Danby, but afterward admitted that he was mistaken in the part he took against that statesman. When the new council proposed by Sir William Temple was formed, Lord Russell was appointed one of the 30 members. He was not at first in favor of excluding the duke of York from the succession, but finally supported the measure. He left the council at the beginning of 1680. On Oct. 26 he spoke in favor of measures against "popery, and to prevent a popish successor" to the crown; and a week later he seconded Col. Titus's motion to disable the duke of York from becoming king of England. His influence in the house of commons was one of the causes of the passage of the exclusion bill through that body; but it was thrown out by the peers. When the reaction against the whigs took place, the government of Charles II. resolved to destroy their leaders, proceeding to do so according to the forms of law. Lord Russell knew that his life was in danger, but he would not fly. He was arrested on the charge of being concerned in the Rye House plot, said to have been

formed by Rumbold and others, for an attack on the king and the duke of York. When he was taken before the council, the king told him that nobody suspected him of any design against his person, but that he had good evidence of his being in designs against his government. After the examination was over, Lord Russell was committed to the tower. From that moment he began to prepare for death, as if he were already under sentence. The trial took place at the Old Bailey, July 13, 1683. The charge was "for conspiring the death of the king, and consulting and agreeing to stir up insurrection; and to that end to seize the guards [appointed] for the preservation of the king's person." The case for the government was conducted by Sir Robert Sawyer, attorney general, Heneage Finch, solicitor general, and Jeffreys. No counsel was then allowed to the accused, except on points of law, but Lady Russell was permitted to assist her husband in writing, "to help his memory." The jury was formed in violation of law, and it is certain that he was not guilty of the crime of which he was accused according to a proper construction of the act of 25 Edward III.; so that the act of 1 William and Mary, reversing his attainder, declared that he "was, by undue and illegal return of jurors, having been refused his lawful challenge to the said jurors for want of freehold, and by partial and unjust constructions of law, wrongfully convicted, attainted, and executed for high treason." The extent of Lord Russell's error was, that he had engaged in "some discourses about making some stirs," such as were common enough with the whigs after it had become evident that the king had resolved to govern contrary to law; this was all that was sworn against him, and this was not treason. Lord Russell made a short but strong speech to the court and jury; but the former charged against him, and the latter found him guilty. When brought up to receive sentence, on July 14, Lord Russell pointed out that judgment ought not to pass upon him for conspiring the death of the king, of which there was no proof by any one witness, all the witnesses having sworn a conspiracy to levy war, but no intention of killing the king. He was answered that it was an exception proper to be made before the verdict, but that the court was now bound by the verdict, as well as the prisoner; and sentence of death was passed upon him. Great efforts were made to save his life, but the king seems to have been impressed with the belief that he could not with safety to his own life spare that of Lord Russell. To please his friends, and because of his wife's distress, Russell petitioned the king and the duke of York to spare him, on condition of his living abroad, and taking no part in English affairs; but he never supposed his petition would be favorably received. He was attended by Burnet and Tillotson, but could not be brought to subscribe to their servile doctrine on the right

of resistance to tyranny. Some of his observations during the few days that passed between his sentence and execution show much pleasant humor, and others great depth of thought and eloquence. He refused to accept of a plan formed for his escape. At the scaffold he gave a paper to the sheriff that embodied his sentiments. His fellow victim, Algernon Sidney, was executed before the close of the year. Russell's attainder was reversed immediately after the revolution, and his father was created duke of Bedford in 1694, the patent stating, among the reasons for conferring the honor, "that this was not the least, that he was the father to Lord Russell, the ornament of his age," &c.—His wife, Lady Rachel Russell, survived him 40 years, dying Sept. 29, 1723, at the age of 87. Her "Letters," edited by Miss Berry, were published in 1819. A more perfect edition, edited by Lord John Russell, appeared in 1854, who has also written "The Life of William Lord Russell, with some Account of the Times in which he lived" (2 vols. 8vo, London, 1819).

RUSSELL, William, a Scottish historian, born in Selkirkshire in 1741, died in Dumfriesshire, Dec. 25, 1793. He was apprenticed for five years to a bookseller and printer of Edinburgh, and on the completion of his term published a "Select Collection of Modern Poems." In 1767 he went to London, where he was employed as corrector of the press for Strachan the publisher. From 1787 he lived on a farm in Dumfriesshire. His principal works are: "History of America" (2 vols. 4to, 1779; new ed., with additions by Charles Coote, 1815); "History of Modern Europe" (4 vols. 8vo, 1779-'84; 5 vols., 1786), continued by Coote and others in various editions to 1856 (4 vols., 1857; and "History of Ancient Europe, with a View of the Revolutions in Asia and Africa" (2 vols. 8vo, 1793; new ed. by Coote, 1815). He left an unfinished "History of England from the beginning of the Reign of George III."

RUSSELL, William Howard, a British journalist, born at Lily Vale, county Dublin, Ireland, March 28, 1821. While a student at Trinity college, Dublin, he was employed to report Irish elections for the London "Times." In 1842 he went to London, and in 1843-'5 was engaged as one of the chief reporters for the "Times." He entered the Middle Temple in 1846, and was called to the bar in 1850, but renewed his connection with the "Times." In 1854-'5 he corresponded with that journal from the Crimea, and witnessed and reported all the important engagements. In 1857-'8 he was in India to report the progress of the mutiny and revolt. He shortly after established the "Army and Navy Gazette," of which he is still (1875) editor and principal proprietor. In 1861-'2 he was in the United States as a war correspondent of the "Times," and travelled in Canada. In 1865 he was in the unsuccessful expedition of the Great Eastern to lay an Atlantic cable. In the Austro-Prussian

war of 1866 he wrote letters to the "Times" from the Austrian headquarters, and during the Franco-German war of 1870-'71 from the headquarters of the crown prince of Prussia. He has published a "History of the Crimean War" (2 vols. 12mo, 1855-'6; enlarged ed., 1857); "Rifle Clubs and Volunteer Corps" (1859); "My Diary in India" (2 vols. 8vo, 1860); "My Diary North and South" (2 vols. 8vo, 1862); "Memorials of the Marriage of the Prince of Wales" (fol., 1864); "Review of Todleben's History of the Defence of Sebastopol" (8vo, 1864); "Canada, its Defences, Condition, and Resources" (1865); "The Great Eastern and the Atlantic Cable" (1865); "Adventures of Dr. Brady," a novel (3 vols., 1868); "Diary in the East: Tour of the Prince and Princess of Wales" (1869); "My Diary during the last Great War" (1873); and some minor works collected from his contributions to periodicals.

RUSSIA (*Russ. Rossiya*), the largest connected empire of the world, extending, in Europe and Asia, from lat. 38° 20' to about 77° 30' N., and from lon. 17° 38' E. to about 170° W. It is bounded N. by the Arctic ocean, E. by the Pacific, S. by the Chinese empire, Independent Turkistan, Persia, Asiatic Turkey, and the Black sea, and S. W. and W. by Roumania, Austria, Prussia, the Baltic sea, and Sweden. Its greatest length from W. to E. is about 6,000 m.; its greatest breadth (exclusive of islands) about 2,300 m. Its total surface is estimated to comprise one twenty-sixth of the entire surface of the globe, and to represent one sixth of its firm land. The natural geographical advantages of Russia are very great. The first trade with England began at the port of Archangel on the White sea. Now the maritime trade of the empire has its chief emporiums on the Baltic, the Black and Caspian seas, and the inlets of the northern Pacific. The N. coast is deeply penetrated by large arms of the Arctic ocean, forming gulfs, of which those of Obi and Kara, on the border of Europe and Asia, and on the N. W. the White sea, are the most important.—The rivers of Russia are numerous and remarkable for their magnitude. Those of European Russia (to which alone we mainly restrict the descriptive portions of this article, referring the reader for Asiatic Russia to the articles CAUCASUS, SIBERIA, and TURKISTAN) belong to the four great basins of the Arctic ocean, the Baltic, the Black sea, and the Caspian sea. The great watershed is formed by a broad central ridge, commencing on the frontiers of Poland, stretching across the empire in an irregular waving line, and terminating on the W. side of the Ural mountains. The waters N. of this shed fall into the Arctic ocean and the Baltic sea, those S. of it into the Black or the Caspian. The Arctic ocean receives directly the Petchora, which rises in the Ural mountains, traverses the most deserted parts of Russia, receives several tributaries, and discharges by a wide estuary, remarkable

for the number of its islands. Through the White sea, the Arctic ocean receives the Mezen, the Dwina, and the Onega. On the declivity of the Baltic are the Tornea and the Kemi, which fall into the gulf of Bothnia; the Neva and the Narva, which fall into the gulf of Finland; the Düna and the Aa, which flow into the gulf of Riga; and the Niemen, which rises in the government of Minsk, and before terminating its course enters Prussia under the name of the Memel. The Vistula, whose source and mouth belong to Austria and Prussia respectively, traverses Poland, and receives several tributaries, among which the Bug, rising in Galicia, Austria, is most important. To the basin of the Black sea belong the Pruth and the Dniester, both rising in Galicia; the Bog, rising in Podolia; the Dnieper, which rises in the government of Smolensk, receives a considerable number of affluents, among them the Beresina, and falls into the Black sea near Kherson; the Don, originating in the government of Tula, intersecting the Cossack country, and discharging into the sea of Azov; and the Kuban, which descends from the Caucasus, forms part of the boundary between Asia and Europe, and near its mouth separates into two branches, one of which falls into the sea of Azov and the other into the Black sea. The basin of the Caspian sea receives the Volga, the largest river of Europe, which rises in the government of Tver and discharges into the Caspian near Astrakhan, and the Ural, which descends from the eastern declivity of the mountains, traces out for some distance the frontier of Europe, and falls into the Caspian near Guriev. Most of the lakes of European Russia belong to the northern basins, as Lake Ladoga, the largest lake of Europe, and Lakes Onega, Peipus, and Ilmen. The government of Olonetz alone contains hundreds of small lakes, and a still larger number is found in Finland.—European Russia in general forms part of an immense plain, beginning in Holland, and extending over the north of Germany and the whole east of Europe. Only occasionally small table lands occur, as the Valdai hills in the governments of Novgorod and Tver, the loftiest summit of which is about 1,150 ft. high. To the northwest some branches of the Scandinavian mountains enter the Russian territory. In the southwest the Carpathian mountains send forth slight ramifications. To the south, in the peninsula of the Crimea, is the insulated chain of the Yaila mountains, which in one place attain an elevation of about 5,000 ft. To the east the Ural mountains, and to the southeast the Caucasus, form in great part the natural frontier between Europe and Asia. The plains are here and there covered with swamps, more frequently with forests; while in the southern parts of the empire they consist of dry and woodless tracts called steppes. The steppe region extends from the river Pruth, across the lower watercourses of the Dniester,

Bog, Dnieper, and Don, as far as the Volga and Caspian sea. It is only in the western and middle parts of this region that rich meadow land is met with; the rest is poorly watered, thinly populated, and, notwithstanding the occasional fertility of the soil, but little favorable to agriculture. What the steppes are to the south and east of Russia, the *tundras* in the governments of Olonetz and Archangel, mostly toward the shores of the Arctic ocean, are to the north. They are treeless wastes, bearing a scanty vegetation of low shrubs on a moss or turf surface.—The geological structure of European Russia is characterized by vastness and simplicity. Single formations are found to extend over entire provinces. In the northern part the granite and the Permian formation, composed of grits, marls, conglomerates, and limestones, prevail; Esthonia and Ingria (government of St. Petersburg) present the Silurian formation, resting on schistose rocks. Along the chain of the Ural mountains, besides the eruptive formations of the most ancient period, the Silurian group prevails. Lithuania and Poland belong almost wholly to the tertiary group; they also contain cretaceous rocks. The southern portion of European Russia belongs to the tertiary and granitic groups. The southern coast of the Crimea is of Jurassic formation. In the Caucasian countries cretaceous and Jurassic rocks prevail, mixed with granite.—The quality of the soil differs very greatly in the different provinces. Some consist mostly of sandy barren plains or vast morasses. The most valuable portion of the empire is that south of the Valdai hills and of Moscow, extending on the east to the Volga, and including the country of the Don almost as far as the sea of Azov, and on the west to the frontier of Galicia. All this region is rich wheat land, exporting wheat to Asia and Europe, through Odessa, Nikolayev, Taganrog, and Kertch.—Almost the whole of European and three fourths of Asiatic Russia lie within the temperate zone. The southern border of the empire approaches to within 15° of the tropic zone, while the northern border extends 11° beyond the arctic circle. In general the climate is severe. The mean temperature of winter passes the freezing point even in the most southern districts. South of lat. 58° the mean temperature is between 40° and 55° F.; the winters are long and severe, and the summers short and hot. With lat. 58° the cold region begins, and with lat. 65° the arctic region. At St. Petersburg, which is within the former space, the thermometer in December and January sinks to 20° or 30° below zero, and exceptionally much lower, while in the summer it rises to 85° or 90°. Among the most common atmospheric phenomena, in the steppes as well as in the northern provinces and in Siberia, is the *buran*, a vehement wind accompanied by heavy falls of snow. The central part is also subject to violent snow

storms, called *viuga*. In general, the climate is healthy.—The official census in Russia is taken once in nine years, and the last was in 1867. More recent estimates of the population of portions of the Russian possessions have been made for 1870, 1871, and 1872, and printed in the St. Petersburg "Calendar" (1875) and other publications. The following tables of areas and population are from Behm and Wagner's *Bevölkerung der Erde*, annexed to Petermann's *Geographische Mittheilungen* for 1875. The areas are Strelbitzki's recent calculations approved by the government and dated 1875. They include the newly acquired Transcaspian province and the Amoo Darya district organized in 1874, with the areas and population of that year. The populations here given in Russia proper, Poland, Siberia, and Central Asia are for 1870; in the Caucasus for 1871; and in Finland for 1872. The Russian empire is divided into governments (and a few divisions differently designated), the area (including inland waters) and population of each of which are estimated as follows:

GOVERNMENTS.	Area in sq. m.	Population.
RUSSIA PROPER.		
1. Archangel.....	881,508	281,112
2. Astrakhan.....	86,668	601,514
3. Bessarabia.....	14,046	1,078,932
4. Courland.....	10,537	619,154

Russia proper is divided by geographers into Great Russia, embracing the central and northern governments (the latter also designated

North Russia) from Kursk and Voronezh to Archangel, and including what was formerly known as Muscovy, from its centre Moscow; Little Russia, or Ukraine (Kiev, Tchernigov, Poltava, and Kharkov); South Russia or New Russia, comprising Bessarabia, Kherson, Taurida, Yekaterinoslav, and the territory of the Don Cossacks; West Russia, comprising Lithuania, Volhynia, Podolia (part of Red Russia, the bulk of which is in Galicia), Vitebsk and Mohilev (White Russia), and Minsk (Black Russia); the Baltic provinces, comprising Courland, Livonia, Esthonia, and St. Petersburg (Ingria); the Volga provinces; and the Ural provinces. The census of Russia for 1722 gave 14,000,000 inhabitants; that of 1815, 45,000,000; that of 1835, 55,000,000; and that of 1851, 65,200,000. But the data of the censuses of former times were very imperfect, and conquests have greatly swollen the total of nearly every census since 1722. For the years 1860 to 1865 the number of births was on an average a little above 3,000,000 a year, the number of deaths about 2,000,000, and the average yearly increase of the population was estimated at $1\frac{1}{2}$ per cent. The number of illegitimate births is given at 90,000 a year, and the excess of females over males in the population is estimated at 750,000. In European Russia the average density is about 35 inhabitants to the square mile; in Asiatic Russia the average does not reach 2 to the square mile. St. Petersburg and Moscow, the present and former capitals of the empire (the latter, however, still ranking as capital for some purposes), have respectively 667,026 (1869) and 611,970 (1871) inhabitants. Only four other cities have more than 100,000, viz.: Warsaw, 279,502 (1873); Odessa, 162,814 (1873); Kishenev, 103,998 (1867); and Riga, 102,043 (1867). Of the other cities and towns, 8 number from 50,000 to 100,000.—Although many portions of the empire in point of productiveness compare favorably with the most fruitful countries in Europe, agriculture is generally still at a low stage; the government and proprietors of large estates, however, have of late done much to improve it, and agricultural machines are largely imported from the United States. The wealth of the landed proprietor formerly consisted less in the extent of his land than in the number of serfs attached to it. The best cultivated land is to be found in the southern portion of the Baltic provinces, in the governments near Moscow, and in Poland; but even in these most favored provinces there are many uncultivated tracts of land. According to Lengenfeldt (*Russland im neunzehnten Jahrhundert*, Berlin, 1875), in European Russia, 20·3 per cent. of the entire surface is arable land, 11·8 meadows, 40·5 forests, and 27·4 pastures and uncultivated land. The arable land amounts to 20·9 per cent. in Russia proper, 50 in Poland, and only 1·2 in Finland. The forests cover 40·3 per cent. in Russia proper, 25·20 in Poland, and 53·3 in Finland. The forests for-

merly constituted an inexhaustible source of riches, but from reckless administration they now produce comparatively little. The old three-field system of husbandry, by which one third of the land is always in fallow, is still in general use; and in Great and Little Russia, owing to the depth of the soil, no manure is necessary. All the cereals are produced in such abundance as to leave a large surplus for export. Maize is chiefly grown in the countries about the Black sea; flax, hemp, and hops are of excellent quality; the potato is grown in all parts of the empire. The cultivation of the beet root has been greatly advanced, and a large number of sugar houses are already supplied by it. The culture of the vine in the Crimea, Bessarabia, and other southern provinces furnishes an average of 54,000,000 gallons, valued at 11,610,000 rubles. Tobacco is grown on the Volga, in Little Russia, and on the Don, and yields annually about 70,000,000 lbs., of which about five sixths belongs to Bessarabia, Poltava, Tchernigov, and Samara. Horticulture, except in the vicinity of the great cities, is neglected. Of late many agricultural societies have been formed, and a number of schools established.—Horses are very numerous in Russia, and highly valued. In the S. W. provinces the breed is particularly fine. In general the horses of Russia are hardy and strong, but not so well taken care of as in other countries. The best studs are in the governments of Tambov, Kharkov, Voronezh, and Kiev. Russia sells a large number of horses annually to Austria and Prussia. The breeding of sheep is very extensive; the wool of the common Russian sheep is hard and coarse, but of late years the breeding of fine-wooled sheep has been steadily on the increase, especially in the Baltic provinces, in Poland, and in the southern governments. Hogs are most abundant in Great Russia, Lithuania, and throughout the western provinces. The number of domestic animals in 1874, according to the reports of the statistical central committee of St. Petersburg, was about 20,000,000 horses, 28,500,000 horned cattle, 64,500,000 sheep, and 11,000,000 swine. Of the sheep about 14,000,000 were of the fine-wooled sort, principally found in the governments of Yekaterinoslav, Kherson, and Bessarabia (about 7,000,000). Bee culture is most extensive in Poland, the Lithuanian governments, and those on the Volga, especially Nizhegorod, Kazan, and Simbirsk; altogether it yields annually about 7,000,000 lbs. of wax and 21,000,000 lbs. of honey, and leaves considerable surplus for exportation. The culture of silkworms was introduced by Peter the Great, and was especially developed in the government of Astrakhan and in the southern part of the Crimea. Since 1864 it has greatly suffered by a disease among the silkworms. The southern provinces yield an annual average of nearly 20,000 lbs.; in Transcaucasia silk to the amount of about 4,000,000

rubles has been produced annually. Reindeer are kept N. of lat. 66°, and camels in the south, many being found near Orenburg. Among the wild animals are the aurochs (in the forest of Bialovitz in Lithuania), elks, deer, bears, wild hogs, gluttons, wolves, foxes, and saiga antelopes. Furs are an important article of export. Fish is very abundant in the Polar sea and in the rivers, and some tribes, especially in the northeast, live entirely by fishing. The most important fisheries are those of the Volga, the Ural, and the sea of Azov.—Nearly all the metals are found in Russia, most of them of excellent quality. The principal mines are in the Ural and Altai mountains, and near Neretchinsk in Siberia. The produce of gold increased from 18,900 lbs. avoirdupois in 1839 to 49,800 in 1845, and 65,700 in 1847, since which it has again decreased, being 61,700 lbs. in 1869. Silver is also found in the Ural and Altai mountains; the produce in 1869 amounted to 39,300 lbs. Platinum is found almost exclusively in the neighborhood of Yekaterinburg. It was first discovered in 1823; in 1861 the produce was 8,060 lbs. Copper is found in the Ural, but much more copiously (though as yet but little worked) in E. Siberia. The produce was 3,555 tons (of 2,240 lbs.) in 1852, 5,441 in 1857, and 4,310 in 1868. The iron mines furnish more than enough for the wants of the empire. The works in the Ural mountains alone are said to employ above 50,000 laborers. The total produce was 167,214 tons in 1852, 205,822 in 1857, and 319,000 in 1868. Rich coal mines have been discovered in nearly all the southern provinces of the empire, and the annual produce is rapidly increasing, amounting in 1868 to 402,300 tons. The country is very rich in salt and brine springs, the most important of which are in the government of Taurida, which alone furnishes annually about 250,000 tons, while the total produce in 1868 was 538,800 tons.—Manufactures are increasing with wonderful rapidity. Their introduction into Russia began in the 15th century, but very little was done until the time of Peter the Great. Catharine II., Alexander I., Nicholas I., and Alexander II. have all distinguished themselves by zeal in encouraging manufactures. At the death of Peter the Great there were 21 large imperial manufactories, and several smaller ones; in 1820 their number had risen to 3,724, in 1837 to 6,450, in 1845 to 7,315, and in 1854 to 18,100. Later statements vary widely. According to Sarauw (*Das Russische Reich in seiner finanziellen und ökonomischen Entwicklung*, &c., Leipsic, 1873) and Lengenfeldt, the total number of factories in 1866, inclusive of distilleries and breweries, large and small, was 84,944, which employed 919,025 workmen, and the value of their products was 650,000,000 rubles. The chief seat of manufactures is Moscow, and next the governments of Vladimir, Nizhegorod, and Saratov, and St. Petersburg and Poland. Among

the most important products are woollen goods, silk, cotton, linen of all kinds, leather, tallow, candles, soap, and metallic wares. Cotton spinning is developing rapidly; in 1870 about 122,000,000 lbs. of raw cotton were imported, while 106 spinning mills yielded about 8,000,000 lbs. of yarn, not sufficient, however, for the domestic looms, which in 1,508 manufactories produced about 220,000,000 rubles worth of cotton goods. The manufacture of woollen goods is likewise rapidly gaining. In 1866, 1,831 manufactories employed 105,135 workmen, and produced goods valued at 63,000,000 rubles. The manufacture of mixed woollen goods began in 1840, and in 1845 Moscow alone had 22 establishments; the number of manufactories in 1870 was 33, and the aggregate value of the goods produced was 1,500,000 rubles. The chief seat of the silk manufacture is the government of Moscow; altogether there are 518 establishments, employing 12,000 workmen. The number of beet-sugar manufactories in 1871 was 325, which employed 70,000 persons; the produce was valued at 30,000,000 rubles.—The seaports are few, being almost confined to Archangel on the White sea, St. Petersburg and Riga on the gulfs of the Baltic, Odessa, Nikolayev, and a few others on the Black sea, Taganrog on the sea of Azov, Astrakhan, Baku, and Kizliar on or near the Caspian, and Nikolayevsk at the mouth of the Amoor. The principal articles of the foreign commerce for 1871-'2 were:

EXPORTS.	Rubles.	IMPORTS.	Rubles.
Cereals.....	184,600,000	Raw cotton....	46,900,000
Flax.....	87,900,000	Hardware.....	20,400,000

Portugal.....	485,000	570,000
United States.....	12,295,000	1,078,000
Other countries.....	12,582,000	1,582,000
Total.....	414,678,000	811,553,000

ASIATIC TRADE.	Imports, rubles.	Exports, rubles.
Turkey	6,275,000	8,552,000
China	8,015,000	2,825,000
Persia	4,925,000	1,693,000
Other countries.....	20,000	1,262,000
Total	19,235,000	9,332,000

The following table gives the value of imports and exports for a series of years:

YEARS.	Imports, rubles.	Exports, rubles.
1880	181,353,251	159,303,405
1885	209,247,777	164,305,010
1893	323,451,000	428,959,000
1870	342,853,000	318,510,000
1871	360,367,284	352,578,686
1872	242,320,000	272,870,000

In 1872 the imports of gold and silver, in coin and bars, amounted to 12,968,000 rubles, and the exports to 5,742,000. The movements of shipping in 1871 and 1872 were as follows:

YEARS.	ENTERED.		CLEARED.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
1871.....	12,256	1,894,830	12,172	1,897,633
1872... ..	10,071	1,577,489	10,044	1,579,204

The Russian commercial fleet in 1874 comprised 2,504 vessels (of which 227 were steamers), of 520,584 tons. The inland trade is carried on in a very great measure by means of annual fairs, of which those at Nizhni Novgorod are the most remarkable.—The first railway in Russia was completed in 1836, and extends from St. Petersburg to Tzarskoye Selo and Pavlovsk, two imperial residences, the latter distant from the capital 17 m. A much more important road, from St. Petersburg to Moscow, was opened in 1851, and is 398 m. long. In 1874 the total length of the Russian railways was 10,725 m., with about 2,400 m. in course of construction. The aggregate capital expended in the construction of railways up to January, 1874, was 1,403,900,000 rubles. The interest guaranteed by the state amounted in 1873 to 51,180,000 rubles, of which 14,590,000 had really to be paid. The entire receipts of the railways in 1873 amounted to 122,880,000 rubles. The first electric telegraph was constructed in 1853, since which time the lines have been rapidly extended throughout the empire, including one across Siberia. The aggregate length of the lines at the close of 1872 was 44,692 m., and of telegraph wires 90,430 m. The number of offices was 1,333, and of telegrams 3,259,552; the revenue, 17,120,000 rubles; expenses, 14,957,000 rubles. The Baltic is connected with the Black sea by the Duna, the Oginski canal, the Beresina, and the Dnieper and Bog systems, and with the Volga and the Caspian sea by the Nizhni Volotchok, Tikhvin, and Maria canals. A canal across N. Finland forms a connection be-

tween the White sea and the Baltic. Many other canals connect two rivers. The Don and the Volga are connected by a horse railroad. The communication with Siberia is greatly facilitated by natural waterways. The Kama and its affluent the Ufa lead close to the mines of the Ural.—The government of the Russian empire is an absolute monarchy. The emperor has the title of *samoderzhets* (autocrat) of all the Russias. At the same time he bears the titles of king of Poland, grand duke of Finland, czar of Kazan, Astrakhan, and Siberia, and several others, including many hereditary German ones which have come to him through the connection of the Romanoff dynasty with German princely houses. According to the law of 1797, the crown was hereditary by right of primogeniture, with a preference for the male descendants; but the emperor Nicholas changed this law, excluding female inheritance altogether so long as there is a male member of the family. All the marriages of the members of the reigning family must have the emperor's sanction, and all the children of a matrimonial alliance not recognized by the sovereign are excluded from the succession. The hereditary grand duke becomes of age at 16; all the other princes at 18. With regard to Finland, the emperor is bound by the act of incorporation of 1809 to observe certain constitutional privileges of the grand duchy; but in reality this is never done, and the kind of diet which Finland possesses is of no value to its people. The highest consultative body of the empire is the state council, which is frequently presided over by the emperor himself. It consists of the ministers and such other dignitaries as he may appoint, and is divided into three departments, legislative, administrative, and financial. The next in importance among the central boards of the empire is the senate, created in 1711 by Peter the Great. It has charge of the promulgation and execution of the law, and forms also the supreme court. The number of its members generally does not exceed 120. The third central body is the holy synod, which has jurisdiction over the affairs of the Russian state church. The synod was established in 1721, and has its seat at St. Petersburg, with a section at Moscow. The state ministry consists of ten ministers, and a department of general financial control. There is also an institution called the committee of ministers, in which all the ministers meet once a week and consult on the affairs of the state, under the presidency of a dignitary specially appointed by the emperor. The ten ministers are those of the imperial house, of foreign affairs, of war, of the navy, of the interior, of finance, of public instruction, of justice, of the imperial domain, and of public works. Poland and Finland are represented at St. Petersburg by special secretaries of state, through whom all orders issuing from the central power are transmitted. The Caucasus, Siberia, and central Asia are ruled by their respective governors

general, who have all the powers of imperial lieutenants. The division of the empire into governments is purely administrative. The officials at the head of them are called civil governors, but many of them are military men. They all have above them general governors, who are invariably military men. These general governors are not dependent on the minister of the interior, but make their reports directly to the senate and the war office, and can be appointed and dismissed only by the emperor. There are 14 military general governorships of this description, viz.: those of St. Petersburg, Finland, Wilna, Warsaw, Kiev, Odessa, Kharkov, Moscow, Kazan, the Caucasus, Orenburg, West Siberia, East Siberia, and Turkistan. The judiciary system of Russia was entirely reorganized by a ukase of 1864. The courts are divided into two classes, courts of justices of the peace, with jurisdiction of civil cases not involving more than 500 rubles, and the general courts, consisting of the district courts and the courts of appeal. The decision of a justice of the peace can be appealed from to the assembly of all the justices of a given district, the senate remaining in all cases the highest court of cassation. The trial of criminal causes by jury was introduced in 1866. —No empire of the world contains so great a variety of nations and tribes as Russia; their number exceeds 100, and they speak more than 40 different languages. The smaller and the uncivilized tribes are rapidly being amalgamated with the ruling race, the Russians; but the Poles, the Lithuanians, the German element in the Baltic provinces, the Finns, and a few minor nationalities, do not yet give any indications of losing their distinct national character. The immense majority of the population are Slavs, in two principal divisions, Russians (56,600,000) and Poles (4,800,000), to which, as a third, though much smaller division, the Serbs and Slavic Bulgarians must be added, counting together about 70,000 souls, and mostly living in settlements on the Dnieper and the Inguletz. The Russians form almost the sole population of Great and Little Russia, and also preponderate in influence, if not in number, in South and West Russia and in the Volga and Ural provinces. The Russians are again subdivided into Great and Little Russians. The latter, also called Red Russians, Ruthenians, or Russins, include a large portion of the Cossacks, and inhabit Little Russia and South Russia, and, mixed with Poles, some districts of West Russia. The Great Russians are the predominant race, and their language is used throughout the empire by the government and the majority of the nation. The common people are vigorous and hardy, accustomed to the rigors of a severe and varying climate, and the hardships entailed by oppression, a merciless conscription, and occasional famines. They are of a cheerful temper, fond of song and frolic, and addicted to excessive drinking. Though slavish,

resigned, and generally good-natured, they are not unapt to fly into passion and commit acts of revenge, and both murder and arson are frequent. Theft is very common. They are both gregarious and migratory in their habits, easily adapting themselves to changed circumstances, and are possessed of unusual mechanical skill. As soldiers they are remarkable for endurance and blind obedience rather than for personal courage. The use of vapor baths is general, though cleanliness is far from being a national virtue. Gross superstition prevails among the lower classes, and among the higher alternates with radical unbelief and subversive notions. The houses are adorned with painted images of saints, on whom various forms of adoration are lavished. The churches in the towns, consisting chiefly of frame houses, are striking by their gaudy domes and spires and lofty double crosses, which from a distance attract the eye of the traveller, and relieve the monotony of the vast plains. The mass of the Great Russians are agriculturists, mechanics, laborers in towns, or itinerant traders; the Little Russians are largely engaged in rearing cattle and horses. Among the non-Slavic nations the following are the most important: 1. The Letts have maintained themselves almost pure in the Baltic provinces, especially in Courland; while, as Lithuanians, in the governments of Wilna, Grodno, and Kovno, they have largely amalgamated with Poles. 2. The Germans are, though not a majority, the predominant race in the Baltic provinces. They also have flourishing settlements throughout southern Russia, and large numbers of German scholars, physicians and druggists, artisans, mechanics, miners, military men, &c., are found in the large cities. 3. The Finns have from the oldest times occupied the northern part of European Russia and a portion of Siberia. To them belong the Finns strictly so called and the Lapps in Finland, the Tchuds, the Vots, the Livs, and the Esths (in Courland, Livonia, Esthonia, Vitebsk, Pskov, St. Petersburg, Archangel, and Olonetz), and a number of tribes on the Volga and in the adjoining territories. (See FINNS.) 4. The Tartar race is represented by the Tartars proper in the Crimea, Transcaucasia, Astrakhan, and West Siberia; the Nogais on the Kuban and Don, and in Taurida; the Meshtcheriaks in Orenburg; the Bashkirs in Orenburg, Ufa, and Perm; the Kirghiz between the Ural and Irtysh rivers; and Yakuts in Yakutsk and Yeniseisk. 5. The Mongolian race in the wider sense, which embraces the two preceding races, is further represented by the Buriats, Tungusians, Ainos, and other tribes in East Siberia; the Calmucks in Astrakhan, the Don Cossack country, Caucasia, and Siberia; the Samoyeds and Ostiaks on both sides of the Obi; and Uzbeks, Turkomans, and Tajiks in the recently annexed territories of central Asia. 6. Among the numerous Caucasian tribes, the Circassians,

Lesghians, Georgians or Grusians, and Mingrelians are the most prominent. 7. The Persians and Armenians are represented in Transcaucasia. The Jews are most numerous in Poland and West Russia. Formerly they were not allowed to live in Great Russia, from which they had been expelled in the 11th century; and even now they are admitted there and in some other parts only under various restrictions, and nowhere in the empire do they enjoy full rights of citizenship. Greeks are especially found in Odessa and some other large cities. As to social position, the population is divided into three classes with hereditary rights, the nobles, the inhabitants of towns, and the country people. Peter the Great abolished the dignity and official privileges of the boyars (see *BOYAR*), and since then the nobility have lost their prerogatives as a caste, and the offices of the empire are accessible to all. In 1722 he established a regulation of class (*tain*), which is still in force, concerning the rank of the officers of state, dividing them into fourteen classes, the first eight of which have hereditary nobility conferred on them, while the members of the other six obtain only a personal nobility. In 1872, according to Lindheim (*Die wirtschaftlichen Verhältnisse des Russischen Reiches*, 1873), there were 591,266 noblemen of hereditary and 327,764 of personal rank. The legal relations of the inhabitants of the towns were reorganized by a ukase in June, 1870. The citizens of a town elect a magistrate or town council (*duma*), which in turn elects a committee (*uprava*) and the mayor. In smaller towns no committee is elected, but its functions are performed by the mayor. The aggregate population of the towns amounted in 1872 to 6,907,071. The bulk of the population consists of the peasants, numbering about 56,300,000. Before the act of emancipation, they were divided into three classes, viz., free peasants, peasants under the special administration of the crown, and serfs. The first class included the *odnodvortzi* or freeholders, who until 1845 formed a subdivision of the country nobility, but were transferred to the class of peasants when, by order of the emperor, the titles of nobles were examined. The second class comprised the crown peasants, holders of land by socage, some 16,000,000; the domain peasants; the peasants bestowed on nobles and merchants in some manufacturing districts, on condition that they should return to the crown in case the manufactories were closed; and the exiles in Siberia. The serfs numbered about 22,000,000, and belonged partly to the crown and partly to the nobles. Russian serfdom dates from the beginning of the 17th century, when the field laborers were gradually deprived of the right to move at will from master to master. They were attached to the soil, which they could not leave without the consent of the master; the latter, on the other hand, not having the right to dispose of the serfs with-

out the land. In the spring of 1861 an imperial manifesto, dated Feb. 19 O. S. (March 3), providing for the emancipation of the serfs, was read in all the churches of the empire. —The great majority of the inhabitants belong to the Russian church, which in doctrine entirely agrees with the other branches of the Greek church, while in administration it is distinct. Since the times of Peter the Great it has been governed by a "holy synod," which is one of the supreme boards of the empire. It is dependent on the emperor in questions of administration, but not of dogma or of rites. The bishops composing the holy synod reside partly in St. Petersburg and partly in their dioceses. The church is divided into 52 archiepiscopal dioceses or eparchies. The church in 1870 had 62 archbishops and bishops, 385 monasteries with 5,750 monks, 154 nunneries with 3,226 nuns, 1,334 arch priests, 40,852 priests, 11,852 deacons, and 70,280 clerks, who discharge the duties of readers, chanters, sacristans, beadles, and singers. The total number of churches was 33,100, including 59 cathedrals. The four ecclesiastical academies at St. Petersburg, Moscow, Kiev, and Kazan have of late been reorganized; in 1872 they numbered 106 professors and 410 students, and there were also 51 theological seminaries with 15,585 students. The lower clergy are mostly poor and ignorant, but the government of the present emperor has made better provisions for their theological education, and established a central relief fund for raising their salaries, the minimum of which was fixed in 1869 at 300 rubles. The church service is performed in the Old Slavic language, which the mass of the people do not understand at all. The liturgy contains, besides the prayers common to all the liturgies of the Greek church, special prayers for every separate member of the imperial family. Sermons were formerly a rare exception at divine service; but recently, owing to the better education of a portion of the clergy, the movement for making the sermon a part of the service is gaining ground. Every member of the Greek church is obliged to take the sacrament once a year. The established church has some special privileges, as the ringing of the larger bells, public processions, &c. None of its members are allowed to secede to another denomination, and all children born of mixed marriages are claimed for it. All foreign princesses marrying into the imperial family must likewise embrace the national religion. In other respects Catholics and Protestants enjoy equal civil rights with members of the established church, and are equally admissible to the highest offices of the empire; while unconverted Tartars are admitted to military offices. The political separation of the Russian church from the main body of the Greek church took place after the flight of the Greek patriarch from Constantinople to Moscow in the 16th century. Archbishop Isidore of Kiev and Moscow in 1439

visited the council of Florence to promote a union of the eastern churches with the Latin, but on his return was arrested and deposed. Feodor I. in 1589 appointed the first Russian patriarch, and even obtained for the new dignity in 1593 the recognition of the four oriental patriarchs. The patriarchate was again abolished by Peter I., who transferred the supreme administration to the "holy synod," reserving for himself and his successors the headship of the church. To a still higher degree was the church stripped of her independence under Catharine II., the secular government assuming all the property of the church and the education and appointment of the clergy. In point of zeal and activity the Russian church cannot compare with the Roman Catholic and the Protestant churches. A Bible society was organized under Alexander I.; it was suppressed during the reign of Nicholas, but has resumed its operations under Alexander II. A number of years ago a few members of the highest Russian aristocracy joined the Roman Catholic church; and Prince Gagarin (who entered the order of the Jesuits) maintained that there was in the Russian church a considerable party favorable to a corporate union of the church with Rome. There is also a small party which endeavors to establish closer relations with the churches of the Anglican communion and with the Old Catholics. The membership of the established church in 1871 was stated at 53,139,000 in Russia proper, 30,000 in Poland, 42,000 in Finland, 1,930,000 in Caucasia, and 2,875,000 in Siberia. In central Asia the population connected with the Greek church was estimated in 1874 at about 130,000. Thus in the whole empire the population belonging to this church is supposed to exceed 58,000,000. There is, however, a vast number of sects, some of which are recognized by the government and their statistics given (although said to be under-estimated) by the minister of public worship. Of the latter there are the Dukhobortzi, or Champions of the Holy Spirit; the Molokoni, or Milk Drinkers; the Khlysti, or Flagellants; and the Skoptzi, or Eunuchs, also called White Doves, who practise castration. These last have existed from ancient times, and have their adherents chiefly among the wealthy. Besides these, writers mention the Little Christians, Helpers, Non-Payers of Rent, Napoleonists, and others. The largest body, the existence of which the government ignores, is the Ras-kolniks, whose origin is assigned to the popular opposition to certain reforms introduced in the 17th century by the patriarch Nikon, especially to changes in the Slavic translation of the Bible and in the Slavic liturgical books. They call themselves Starovertzi or Old Believers. As their antipathy to change often extends to political measures, they have been generally persecuted by the government. Their history is but little known, and accurate statistics cannot be obtained. Their number has been

variously estimated at from 1,000,000 to 17,000,000; the best authorities incline toward the highest estimate. The United Greek church some years ago numbered about 230,000, all Ruthenians in Poland; in the spring of 1875, however, the bulk of them joined the Orthodox church. The Gregorian Armenian church has six eparchies: Nakhitchewan, Bessarabia, Astrakhan, Erivan, Gruso-Imerethia, Karabagh, and Shirvan. The most celebrated literary institution of this church is the Lazareff institute for oriental languages at Moscow, which provides for the education of 20 youths. The number of Gregorian Armenians is said to be 37,000 in European Russia, and 561,000 in the Caucasus. The Roman Catholic population is given as 2,883,000 in Russia proper, 4,326,000 in Poland, 830 in Finland, 18,000 in the Caucasus, and 25,000 in Siberia. The Protestant population, a large majority of whom are Lutherans, is 2,234,000 in Russia proper, 331,000 in Poland, 1,797,000 in Finland, 10,600 in Caucasia, and 5,700 in Siberia. The number of Mohammedans amounts to 7,225,000: 2,359,000 in European Russia, 1,960,000 in Caucasia, 61,000 in Siberia, and 2,843,000 in central Asia. The Lutheran church is divided into six consistorial districts. The general consistory has its seat at St. Petersburg. A Lutheran theological faculty is connected with the university of Dorpat. The Reformed denomination has about 30 churches, mostly in Lithuania, where they are organized into a synod. The scattered Reformed congregations in other parts of the empire are under the direction of Lutheran consistories. The Mennonites claimed in 1873 a population of nearly 40,000, chiefly in South Russia; but as the new military law abolished the exemption from military duty which had formerly been conceded to them, they resolved to emigrate to the United States. (See MENNONITES.) The Moravians have prosperous missions in Livonia and Esthonia, where they have more than 250 chapels and 60,000 members. Recently the Baptists have also established a few missions, which in 1873 resolved upon forming a Russian organization. The Jews number about 2,647,000 (1,829,000 in Russia proper, about 800,000 in Poland, and the remainder in Caucasia and Siberia). The most numerous of the pagans, whose number is estimated at about 550,000, are the Buddhists, with 380 places of worship and 4,400 priests.—The cause of public education was first effectively promoted by Peter the Great, who caused Russia to take the first step toward European civilization. Catharine II. founded many schools and literary institutions. Alexander I. made great efforts in behalf of the people, and tried to establish a complete system of public instruction. The principal departments of education, with the exception of the military schools, are under the superintendence of the ministry of public instruction, established in 1802. The empire (excepting Finland) is divided for educational purposes into

ten circles, each of which is under the superintendence of a curator, viz.: St. Petersburg, Moscow, Dorpat, Kiev, Warsaw, Kazan, Kharkov, Wilna, Odessa, and the Caucasus. There are eight universities: at St. Petersburg, Moscow, Dorpat, Kiev, Warsaw, Kazan, Kharkov, and Odessa. Finland has a university of its own at Helsingfors. Dorpat is the only one which has a theological faculty. The number of professors at the eight universities in 1873 was 545; of students, 6,697. The number of lyceums and gymnasiums was 126, of pro-gymnasiums 32; the aggregate attendance of these institutions was 42,791. According to the report of the minister of public instruction in 1872, the number of popular schools was 19,658, with 761,129 pupils, of whom 625,784 were boys and 135,345 girls. The number of special schools was 206, with 41,553 pupils. The number of learned societies in connection with the ministry of public instruction in 1873 was 32, of which 9 belonged to universities or similar institutions and 23 had an independent existence. The imperial academy of science at St. Petersburg, founded in 1723-'5, ranks high among societies of this class. Several scientific establishments belong to other departments of the state; among them are institutions dependent on the ministry of the navy, a law school, polytechnic schools, commercial academies, a considerable number of agricultural and mining schools, and navigation schools. The study of oriental languages has been cultivated of late with special zeal, and no other university of Europe has so many active professors of Asiatic languages as that of Kazan. The number of newspapers in 1868 was 219, of which 117 were published in Russian, 30 in German, and 20 in Finnish. According to official accounts, there were in 1872, in 197 towns, 360 printing establishments, 366 publishers and booksellers, and 261 circulating libraries. There are few public libraries outside of St. Petersburg, Moscow, and Warsaw; but the foundation of such institutions has been laid in many of the provincial towns, and the so-called imperial public library of St. Petersburg contains 1,100,000 volumes in all languages. The position of women in Russia, up to the time of the empress Catharine, was very much degraded. That sovereign did all in her power to raise both their intellectual and social standing. Among other measures was the establishment of a seminary for girls in St. Petersburg; the girls who entered this were not permitted to leave before seven years, when their education was considered complete. The seminary was divided into two parts, one of which belonged to the nobility and the other to the middle class; the number of girls educated therein was 500. Since that time (1764) institutions for female education have been constantly increasing all over Russia. Female gymnasiums have been established throughout the country, the number of which was given in 1873 as 200,

and that of the pupils 23,000. These institutions are all supported by special municipal tax, and have not only contributed to the education of Russian women, but also diminished the antipathies and prejudices arising from inequality of birth, social position, and fortune. The pupils are admitted to the gymnasiums without distinction of parentage, and they wear in many instances a uniform dress. Where the population is mixed, no distinction is made even in the nationality of the pupils, so that the Tartar and the Bashkir girls in the east are brought together with the Russian girls, just as the Polish are in the west. Taking into consideration the comparatively recent date at which the education of girls in Russia has been cared for, the Russian women have shown remarkable aptitude. Out of 63 female students at the university of Zürich in 1872, 54 were Russians. The question of religion is not regarded in the admission of pupils into the schools; all denominations have an equal right in this respect, and there are priests and parsons attached to the establishments to give religious instruction. Even the Jews and Mohammedans form no exception. Where the number of pupils belonging to a certain sect is not sufficient to warrant the retention of a clerical teacher, the parents are left to provide religious instruction.—The penalties of death and of corporal punishment have been almost entirely abolished in Russia. The former is pronounced now only for high treason, and no criminal court of the land can inflict it; only special high tribunals appointed for exceptional cases having that power. Corporal punishment is maintained only in Siberia as a disciplinary measure among the convicts. The criminal statistics of 1860-'68 show an average of 534,000 civil, criminal, and police cases in the whole empire; the number of persons sentenced was about 84,000, or less than 17 per cent. of the whole number brought to trial; of these, 1,211 persons were sentenced to hard labor, 2,172 to exile in Siberia, 2,488 to transportation, 6,667 to enrolment in convict companies which are kept in the fortresses for heavy manual labor, 13,669 to imprisonment, and 57,757 to smaller punishments; 31 per cent. of the whole number were cases of theft, and only 2 per cent. were cases of murder and homicide; the number of women included in the 84,000 convicts was 8,800, or a little more than 10 per cent.—The silver ruble is established by an imperial decree of 1839 as the legal and unalterable metallic unit of the money current in the empire. Its value is equal to 37½d. in English, or 73½ cts. in American money. A ruble is divided into 100 copecks. Gold pieces of 3 and 6 rubles, and a few platinum pieces of the same value, are coined; but the main medium of circulation is paper money, which stands abroad at over 15 per cent. discount. The English inch and foot are generally used throughout Russia, except in measuring timber for the export duties. The

arshin and the *sazhen* are used as measures of length. The *arshin* equals $2\frac{1}{4}$ English feet; the *sazhen*, 7 English feet. For the measurement of distances they have the *versta* (verst), equal to 3,500 feet, or a little less than two thirds of an English mile. The smallest weight is the *zolotnik* = 6 grains; 3 *zolotniks* = 1 *loth*; 32 *loths* = 1 pound (the Russian pound is the same for gold, silver, and merchandise); 40 pounds = 1 *pood*; 1 *pood* = 36 lbs. 1 oz. 10 drs. *avoirdupois*. Time continues to be reckoned in Russia by the Julian calendar; yet in business with foreign countries the Russians use both the Julian and Gregorian dates.—The finances of the empire suffered greatly from the European wars which were carried on under Alexander I.; but they were somewhat improved under the able administration of Count Kankrin. During the reign of Nicholas no reports of the condition of the finances were published; and it is only since 1862 that any publication of this kind has taken place. Now, however, the government publishes annually a budget, though both the receipts and expenditures are frequently manipulated so as to produce a more favorable impression than the truth would warrant. Subjoined is a table showing the general condition of the finances from the beginning of this century:

YEARS.	Revenue, rubles.	Expenditure, rubles.	Surplus (+) or deficit (-).
1800	65,700,000	69,100,000	+ 2,600,000
1810	64,188,000	71,245,000	- 7,057,000
1820	128,220,000	134,000,000	- 5,780,000
1830	116,245,000	118,817,000	- 2,572,000
1840	165,190,000	187,979,000	- 22,789,000
1850	224,640,000	287,186,000	- 62,546,000
1860	386,916,000	438,239,000	- 51,323,000
1861	411,584,000	418,796,000	- 2,212,000
1862	379,373,000	389,186,000	- 9,763,000
1863	418,974,000	438,998,000	- 20,024,000
1864	393,721,000	444,979,000	- 51,258,000
1865	418,897,000	432,107,000	- 13,210,000
1866	352,695,000	413,298,000	- 60,603,000
1867	419,838,000	424,904,000	- 5,066,000
1868	421,560,000	441,282,000	- 19,776,000
1869	457,496,000	468,797,000	- 11,301,000

It appears from this table that, while both the revenue and expenditures during the period from 1800 to 1869 increased more than six-fold, yet the expenditures regularly exceeded the revenue. Since 1871 both the budgets and the accounts of actual receipts and disbursements, as published by the government, bear a more favorable aspect, as is partially shown by the following table:

YEARS.	BUDGET.		ACTUAL.	
	Revenue, rubles.	Expenditure, rubles.	Revenue, rubles.	Expenditure, rubles.
1871...	470,692,000	510,618,000	508,188,000	499,735,000
1872...	497,178,000	469,400,000	527,621,291	523,783,508
1873...	517,349,000	517,322,000
1874...	539,851,000	536,688,000

The only direct tax of the empire is a poll tax (in 1874, 94,631,469 rubles) levied from the

peasantry and raised at little expense. Customs (53,068,000) of a protective nature, and the excise duties (206,068,044), mostly laid on spirits, beer, salt, and tobacco, form the bulk of the indirect taxes. The largest branches of expenditure are those for the army (170,192,553 rubles), the navy (24,847,685 rubles), and the national debt (93,257,877 rubles), the last named branch comprising interest and sinking fund. The public debt in January, 1873, was as follows:

	Rubles.
I. Funded debt	905,693,564
1. Foreign redeemable debt...	157,492,827
2. Home " "	270,348,860
3. Foreign irredeemable debt..	275,728,199
4. Home " "	202,123,688
II. Debts not entered in the great book.....	552,618,672
III. Debts of the Imperial Russian bank.....	816,769,328
Total.....	2,277,081,564

From these amounts may be deducted the sum of 412,000,000 rubles which has been advanced to railway companies, to corporations, and to towns, leaving an actual debt of about 1,864,000,000 rubles. Banking business has of late years received a considerable impulse. There are not fewer than 40 joint-stock banks in Russia, with an aggregate capital of 104,000,000 rubles. Five of these are in St. Petersburg. There are also a number of territorial (*zhemski*) banks, by means of which the government was enabled to carry through the emancipation of the peasants. The government advanced to landowners from 1861 to 1873 the sum of 628,439,844 rubles. The entire amount, with interest, is to be redeemed by the peasants, but in the mean time the state assumes the responsibility for its repayment.—The ukase of Nov. 16 (4 O. S.), 1870, announced the adoption by the Russian government of the principle of universal liability to military service, and another of Jan. 13, 1874, reorganized the entire military system. The armed forces of the empire are now to consist of a standing army and of a militia. The standing army embraces the land and naval troops. The land troops comprise: 1, the active army, which is to be kept up by annual recruitings; 2, a reserve force, formed of men whose term of service in the active army has expired; 3, the Cossacks and other regular troops of various Asiatic tribes. The militia is composed of all men from 20 to 40 years of age, capable of bearing arms, who do not belong to the standing army; a portion of this militia, containing the younger men, can in time of war be employed for filling up the irregular forces. Every Russian subject who has attained his 20th year and is not physically incapacitated is liable to service, immunity from which by purchasing a substitute is prohibited; the period of service is fixed at 15 years, six of which are to be spent in an active force, and nine in the reserve; the recruiting is done by drawing lots, and those who do not enter into the regular army have to serve in the militia. The entire empire is divided into

recruiting districts. Young men who belong to the so-called liberal professions, and have received a certain degree of education, have the duration of their service in the active army restricted to six months, 18 months, three years, or four years, according to the degree they have attained; there are also volunteer engagements of three months, six months, and two years, as in France, equally in accordance with the educational privileges of the young men. But a nine years' reserve service is obligatory upon all such men. The infantry and the cavalry of the army, now (1875) in course of reorganization, are to have for their military unit the division, composed of four regiments; the artillery, riflemen, and engineers are to be formed into brigades. Twelve regiments *d'élite* and a brigade of riflemen will still form the corps of imperial guards stationed at St. Petersburg, while the remaining 45 divisions of infantry are to be formed into 15 corps, each consisting of three divisions of infantry, one of cavalry, and a number of Cossacks, artillery, and engineers. Each division of infantry consists of two brigades, each brigade of two regiments of three battalions each, each battalion of four companies, and each company of 250 men. Each division of cavalry is to consist of two brigades, each brigade of three regiments, and each regiment of four squadrons of 250 horses. The cavalry brigade consists of a regiment of dragoons, a regiment of lancers, and a regiment of hussars. A brigade of artillery consists of six batteries of eight guns each. Of these batteries, three are of nine-inch guns, two of four-inch guns, and one of mitrailleuses. The whole regular army will thus consist of 192 regiments of infantry, 56 regiments of cavalry, and 2,256 guns, besides seven brigades of riflemen (one of the guards). The engineer corps is composed of six brigades of sappers and six half battalions of pontoniers. The Cossacks are divided into regiments of 10 *sotnias* of 100 men each; they now comprise 153 mounted regiments, with 37 battalions on foot, and 28 batteries. The number of these troops can be increased *ad libitum* at any time, as all the Cossacks are liable to life-long service. The army is now (1875) estimated at 750,000; but the whole military force of Russia in case of war can be brought to 1,500,000, with 300,000 horses, half of which is designed to be used for offensive operations, and the other half for defensive only. The Russian navy is commanded by 81 admirals and 2,990 officers of all ranks, and contains 25,500 sailors and marines. The fleet consists of 225 steam vessels, with 521 guns, of a total tonnage of 172,501 and total horse power of 31,978, distributed as follows: Baltic fleet, 27 ironclads with 200 guns, 40 steamships with 170 guns, and 70 transports; Black sea fleet, 2 ironclads with 8 guns, 25 steamships with 45 guns, and 4 transports; Caspian fleet, 11 steamships with 45 guns, and 9 transports. There are also

37 steamers with 53 guns, of a tonnage of 2,424 and a horse power of 2,250, scattered in the sea of Aral and on the Pacific and Arctic coasts. The administration of the navy is in the hands of the minister of marine, assisted by an admiralty council, but the supreme command of the fleet is vested in the grand admiral, now the grand duke Constantine, brother of the czar. The great naval stations are Cronstadt in the gulf of Finland and Sebastopol on the Black sea. The great navy yards are those of St. Petersburg at the mouth of the Neva, and Nikolayev in the Black sea.—The ancient history of Russia is involved in great obscurity. (For an account of theories concerning the name Rus in its earliest connections, see JAPHETH.) The Greek and Roman writers mention the Scythians and the Sarmatians as the inhabitants of the vast and unknown regions of the north, especially of the country between the Don and the Dnieper, a description of which is given by Herodotus. Strabo and Tacitus say that the Roxolani, a Scythian tribe, which according to the testimony of the later writer Spartianus was ruled by kings, lived on the Don. The Greeks entered into commercial relations with them, and established some colonies in their territory. During the migration of nations in the 4th and the following centuries, Russia witnessed the movements of hordes of Goths, Alans, Huns, Avars, Bulgarians, and others. Soon after the name of the Slavs appears for the first time, a race, according to the general opinion of historians, identical with the Sarmatians, and believed to have extended northward as far as the upper Volga. The Slavs found scattered Finnish tribes dwelling in these territories, and drove them higher north toward Finland and the region of the Arctic sea. Such of these people as did not remove became amalgamated with the invaders, and gave their descendants that indifferent color of hair and sallow complexion which most Russians of our day possess. Thus the people now known as Russians are a compound product of the various Slavic tribes, of many Scythic tribes, especially the Tartars, who in the middle ages oppressed Russia for centuries, and of Finns. (See SLAVIC RACE AND LANGUAGES.) The Slavs founded the towns of Novgorod and Kiev, both of which became the capitals of independent Slavic principalities. After a history of about 100 years, of which nothing is known, the principality of Novgorod, of unknown extent, and surrounded by a number of tribes of Finns of the Tehudic branch, appears struggling against the invasion of the Varangians (called by the Slavs Rus), a tribe of Northmen, who succeeded in making both the Slavs and Finns tributary. For a time the Slavs threw off the yoke of the Varangians, but sinking into anarchy and feeling themselves unable to cope with internal and external foes, they, together with some of the neighboring Finnish tribes, invited Rurik, the

prince of the Varangians, to Novgorod, where he arrived about 862, with his brothers Sineus (or Sinaf) and Truvor, and laid the foundation of the great Russian empire. For nearly 200 years Russia remained under the autocratic power of the descendants of Rurik. He died in 879, leaving the empire, not to his son Igor, who was only four years old, but to his cousin Oleg, a great conqueror and wise ruler. Oleg (879-912) conquered the principality of Kiev and united it with his own, vanquished the Khazars (probably a people of Turanian origin, who in the 7th and 8th centuries had established a powerful kingdom between the Dnieper and the Caspian, being ruled for a time by a dynasty converted from Islam to Judaism), drove the Magyars out of the borders of Russia toward the country now occupied by them, and made an expedition by land and sea (with 900 vessels) against the emperor of Constantinople, with whom in 911 he concluded an advantageous peace. Igor, the son of Rurik (912-'45), put down an insurrection of the Drevlians on the Pripet, conquered the Petchenegs, who lived on the coasts of the Black sea from the Danube to the mouths of the Dnieper, made an unsuccessful war against the emperor of Constantinople in 941, and was slain in a second war against the Drevlians. During the minority of his son Sviatoslav (945-'72), his widow, the celebrated Olga, held the reins of government with wisdom and energy. In her reign Christianity began to spread in Kiev, and Olga herself was baptized in 957 at Constantinople. Her son Sviatoslav, who remained a pagan, won new victories over the Khazars, subdued the Bulgarians and Petchenegs, and was slain by the latter, while returning through their territory from a war against Constantinople. He had extended the borders of the empire to the sea of Azov, and in 970 divided it among his three sons, giving Kiev to Yaropolk I. (972-'80), the country of the Drevlians to Oleg, and Novgorod to Vladimir. In a war which arose between the three brothers, Oleg was slain and Vladimir fled, and the whole empire was reunited under Yaropolk; but in 980 Vladimir returned with Varangian hordes, conquered Novgorod and Kiev, and, having put his brother to death, became the ruler of all Russia. Vladimir, surnamed the Great on account of the benefits he conferred on the empire, conquered Red Russia and Lithuania, and made Livonia tributary. He at first opposed Christianity, but subsequently declared himself ready to embrace the doctrines of the Greek church, married the sister of the emperor of Constantinople, and was baptized in 988 on the day of his wedding. He soon after ordered the introduction of Christianity into the entire empire, established churches and schools, and founded new towns. He divided the empire among his twelve sons, who, even before the death of the father in 1015, engaged in a fratricidal war, in which at length Sviatopolk, a son of Vladimir's broth-

er Yaropolk I., but adopted by Vladimir, possessed himself of the throne, after murdering three of his brothers. Another brother, Yaroslav, allied himself with the emperor Henry II. of Germany against Sviatopolk, and the father-in-law of the latter, King Boleslas of Poland. The war lasted till 1019, when a three days' battle decided in favor of Yaroslav, and Sviatopolk died on his flight in Poland. Yaroslav (1019-'54) for some time was sole ruler; but in a war against his brother Mstislav, prince of Tmutorakan on the strait of Yenikale (who in 1016 had destroyed the Crimean remnant of the kingdom of the Khazars, and in 1022 subdued the Circassians), he was routed in 1024, and purchased peace by ceding to his brother one half of the empire. After the death of Mstislav in 1036, the entire empire became once more united under Yaroslav. By several successful wars he considerably enlarged its territory, and like his father introduced many useful reforms. He caused the translation of many Greek works into Slavic, built churches and schools, increased the number of towns, peopled many waste tracts of land, and ordered the compilation of the *Russkaya Pravda*, the first Russian code. Three of his daughters were married to the kings of Norway, France, and Hungary. A few days before his death he divided the empire among his four sons, with the provision that the three younger ones should obey the eldest brother Izaslav, to whom he gave Kiev and Novgorod. But this provision proved of little avail; the four divisions of the empire were again subdivided, and the Russian monarchy was finally changed into a confederacy. The power of the nation was broken by a never ceasing internal war, and large territories in western Russia were taken possession of by the Poles, Lithuanians, Danes, Teutonic knights, and others. Yet many important cities were founded during this period, as Moscow about 1147; and Kiev and Novgorod took their place among the wealthiest and most prosperous cities of Europe. The calamity of civil war was soon followed by one still greater. From eastern Asia innumerable hordes of Mongols under Genghis Khan and his sons advanced toward Russia. The princes made a fruitless attempt to arrest their course. The danger from abroad did not cure the internal dissensions; and after the invaders, who had won the bloody battle of the Kalka, turned back to Asia, internecine war recommenced, accompanied by famine and pestilence. In 1230, 30,000 men died of the plague in Smolensk, and 42,000 in Novgorod. Soon after the Mongols returned under Batu. Many towns and villages were sacked, and far and wide the soil reeked with the blood of the murdered inhabitants. The princes had to pay heavy tribute to the Mongols, and though many of them occasionally gained some victories, they did not succeed in restoring the independence and greatness of Russia. Alexander

Nevski (1247-'63), at first prince of Novgorod, which state had remained almost independent of the Mongols, won signal victories over the Swedes, Livonians, and Lithuanians on the Neva (hence his surname). With reference to the Tartar invaders, a better era began only with Ivan (John) I. Kalita, prince of Moscow (1328-'40). He united the principality of Tver with Moscow, embellished his capital with many new churches, and in 1339 began the reconstruction of the Kremlin. Some time before his death he retired into a convent and died as a monk. He managed to keep up friendly relations with the Tartars, and thus gave the people a chance to recover their strength and to organize a new army, which, under one of his successors, Demetrius (Dimitri), routed the Mongols in 1378, and again in 1380 on the Don (hence his surname Donski), where 100,000 Mongols are said to have been slain. But in 1382 they again returned, burned Vladimir and Moscow, and slew in the latter city alone 24,000 inhabitants. Demetrius was obliged to purchase peace by heavy sacrifices, after which he took revenge on the Russian princes to whose defection he owed his last defeat, and all of them save the prince of Tver were subjected to his rule. The power of the grand principality (improperly called grand duchy) of Moscow was greatly increased during the reign of Basil (Vasili) II. (1389-1425) by the incorporation of Nizhni Novgorod and Suzdal, and under Basil III. (1425-'62) by the incorporation of Halicz, Mozhaïsk, and Borovsk. During the reign of the latter the metropolitan Isidore of Kiev took part in the general council of Florence (1439), and subscribed to the act of union of the Greek and Latin churches; but Basil disapproved this step, and ordered Isidore to be thrown into prison, whence after some years he escaped into Italy. A new period in the history of Russia begins with its entire deliverance from the rule and influence of the Mongols through Ivan III., surnamed the Great (1462-1505). Having strengthened his power by a victory over the khan of Kazan, whom he made tributary in 1469, and by the conquest and annexation of Novgorod, Perm, and Pskov, he declared to the ambassadors of the Mongols that Russia would henceforth cease to pay them tribute, and successfully resisted their renewed invasion. He then conquered and annexed several more Russian principalities, and a part of Siberia in 1499. But in a war against the Livonians, who were aided by the Teutonic knights, he was totally routed in 1501, and was compelled to conclude a truce for six years, and a little later a peace for 50 years. He married Sophia, a princess of the late imperial house of Constantinople, and, by right of his consanguinity to that house, adopted the double-headed eagle for his escutcheon. He improved the laws, regulated the public taxes, and was the first who assumed the title of autocrat of all the Russias. Under the reign of Basil IV. (1505-'33), the last semi-

independent principality ceased by the final incorporation of Pskov in 1510. The hereditary war of the Russians against Lithuania, which had become united with Poland under the Jagellos, was carried on by him with varying success; but the Tartars of Kazan were completely routed in 1524 and 1530 and made tributary. His son Ivan IV. (1533-'84) soon restored order by cruel energy, and history has surnamed him the Terrible. Yet he contributed more to the greatness of Russia than any of his predecessors. In 1545 he created a standing army, called the *strieltzi* (archers), in 1552 reconquered Kazan, whose ruler during his minority had made himself independent, in 1553 opened a commercial road to Archangel, in 1554 subdued Astrakhan, made successful campaigns in Livonia and Esthonia, and in 1570 united the country of the Don with his empire. In 1581-'2 a Cossack freebooter, Yermak Timofeyeff, conquered for him Siberia. But his attempt to drive the Teutonic knights out of Livonia failed, because the Germans, Poles (under Stephen Báthori), Danes, and Swedes united against him; and at the peace, concluded in 1582, he had to cede Livonia to Sweden. He greatly encouraged commerce, concluded commercial treaties with England, called many foreigners, especially Germans and Englishmen, into his empire, and in 1569 established a printing office in Moscow. In Novgorod, which he hated on account of the free spirit of the citizens, he put more than 60,000 men to death in 1570, adding to the slaughter the most exquisite tortures. Similar scenes occurred in Tver and Moscow. Finally, however, struck with remorse, he intended to abdicate and retire into a convent, but died before this design could be executed. His son Feodor (or Fedor) I. (1584-'98) was weak in mind and body, and, according to an order of his father, was assisted in the government by a state council. In 1588 his brother-in-law Boris Feodorovitch Godunoff, a man of great talents but immoderate ambition, obtained the sole control of state affairs. He aspired to the throne, and many of his rivals and several members of the imperial family were exiled or poisoned. Feodor himself is believed to have died of poison, and with him the house of Rurik became extinct. Boris Godunoff was called by the boyars to the throne. He established serfdom, but his reign was in many respects beneficent; law was impartially administered, arts and trades encouraged, many intelligent foreigners called into the empire, and the enlightenment of the people promoted. Yet civil war, cruelty against the boyars, and a terrible famine in 1601, by which in Moscow alone upward of 100,000 persons perished, created great dissatisfaction. An impostor, who claimed to be Demetrius the son of Ivan, and was aided by Polish magnates, stirred up a rebellion, and, after the sudden death of Boris Godunoff in 1605, dethroned Feodor, the son of the latter, and was himself

crowned as czar. But in the next year he lost crown and life in a conspiracy, and the Russian grandees made the boyar Shuiski czar, who was crowned on June 1, 1606, as Basil V. Ivanovitch. Another pseudo Demetrius rose against him, and, supported by the Poles, advanced victoriously toward Moscow. Basil sought and obtained an alliance with the Swedes, which induced Sigismund III. of Poland to espouse openly the cause of the pseudo Demetrius. The Swedish troops soon went over to the Poles, Moscow was forced to surrender (1610), and the czar was taken prisoner and died the next year in a Polish prison. Moscow was burned in 1611 by the Poles, who had been attacked there, and tens of thousands of the inhabitants were slaughtered; but in 1612 the Poles were forced by Pozharski and other popular leaders to evacuate Russia. In the next year the Russians elevated to the throne Michael Feodorovitch Romanoff, the first czar of the present imperial family. He was a son of Feodor, archbishop of Rostov and afterward patriarch of Moscow under the name of Philaret, whose grandfather had been connected by marriage with the house of Rurik. Michael (1613-'45) concluded in 1617 a peace with Gustavus Adolphus of Sweden and with the Poles, and devoted his whole energy to promoting the internal prosperity of his empire. Commerce, which had been entirely prostrate, was revived by treaties with England, France, Persia, and China; and the borders of his Asiatic possessions were extended in 1639 to the Pacific. Under his son Alexis (1645-'76) the Cossacks, who had risen under Chmielnicki against Poland, in 1654 acknowledged the sovereignty of the czar. A war with Poland ended with the restoration or annexation to Russia of Tchernigov, Smolensk, Kiev, and the Ukraine. The reign of his son Feodor III. (1676-'82) was signalized by many important reforms. According to his last will, not his imbecile brother Ivan, the heir apparent, but his half brother Peter, whose eminent talents he seems to have anticipated, was to succeed him. But the sister of Ivan, Sophia, plotted a conspiracy, in consequence of which both Ivan and Peter were proclaimed czars, and she herself obtained the regency of the empire. In 1689, however, Peter overthrew her rule, and shut her up for the remainder of her life in a convent. Ivan gladly abandoned his claim to the throne, which was now mounted by Peter, known in history as the Great. In a brief time he transformed the entire nation, though personally betraying barbarous impulses till his death. Russia became the most powerful empire of northern Europe, and henceforth regarded herself and was generally regarded as a leading member of the European family of states. In 1703 he founded a new capital, St. Petersburg, which soon became one of the richest cities of Europe. The victory over Charles XII. at Poltava (1709) destroyed the superiority of Sweden, and in the peace of

Nystad (1721) Peter incorporated Ingria, a part of Karelia, Esthonia, and Livonia with Russia. He was equally successful against Persia, which in 1723 ceded the provinces of Daghestan and other territories on the Caspian, with the towns of Baku and Derbent. His wife and successor, Catharine I. (1725-'7), guided and supported by two favorites of Peter, Menshikoff and Buturlin, made likewise many important improvements. She increased the army and navy, diminished the taxes, and recalled the exiles from Siberia. She concluded an offensive and defensive alliance with Austria, and sent an ambassador to China to propose a commercial treaty. She was succeeded by Peter II. (1727-'30), a grandson of Peter I., only 11 years old, during whose brief reign the princes Menshikoff and Dolgoruki successively controlled affairs. At his sudden death the crown devolved on Anna, the daughter of Ivan Alexeyevitch (half brother of Peter the Great), and widow of the duke of Courland. An attempt was made to force on her a "capitulation," restricting the rights of the crown in favor of the boyars; but Anna soon discarded the compact, exiled the princes Dolgoruki and Gallitzin, abolished the privy council, and reorganized the senate on an entirely new basis. The Kirghiz tribes in 1731 submitted to the protectorate of Russia, but the Persian provinces were lost. Under her reign the N. E. coast of Siberia and the Aleutian islands were discovered, and the incorporation of Siberia was completed. In the war of the Polish succession Anna took sides with Augustus III., who promised to her favorite, Duke Biron, the duchy of Courland, then a Polish fief. The success of Augustus secured the Russian influence in Polish affairs. In the war against Turkey, Moldavia was conquered by Münnich; but when Austria concluded the unfavorable peace of Belgrade (1739), Russia also laid down her arms and gave up Moldavia. After Anna's death (1740), her grandnephew Ivan, only a few months old, was proclaimed czar under the regency of Duke Biron of Courland; but he was soon dethroned by Elizabeth (1741-'62), the daughter of Peter the Great and Catharine I. In the first years of her reign Sweden was instigated by France to a war against Russia, which was terminated in 1743 by the peace of Abo, and secured to Russia the possession of some districts of Finland. In the seven years' war Elizabeth supported Austria, and the victories of Gross-Jägerndorf and Kunersdorf, and even the defeat of Zorndorf, apprised Europe of the great improvements introduced into the Russian army. Under her reign the death penalty and the rack were abolished, but sentences of exile, and cruel punishments dictated by her own resentment, were numerous. She established the academy of fine arts at St. Petersburg, the first Russian university at Moscow (1755), two colleges, and several other important literary institutions. She was succeeded by Peter III., the son of her sister, formerly

duke of Holstein, who immediately on his accession gave up the alliance with Austria, and concluded, first a peace, and soon after an offensive alliance with Frederick the Great. After a reign of only a few months, Peter lost the crown and his life by a court revolution, at the head of which was his own wife, a daughter of the duke of Anhalt-Zerbst, who now ascended the throne as Catharine II. (1762-'96). During her reign Russia gained a leading and decisive influence in the system of European policy, and was generally recognized as one of the great powers of Europe. Catharine fully comprehended the necessity of external peace for the development of the internal resources of the empire, and soon after her accession recalled the Russian troops who were taking part in the seven years' war. She surrounded her throne with a host of statesmen and warriors, more famous for ability than character, such as Gallitzin, Rumiantzeff, Panin, Orloff, Soltikoff, Suvaroff, Tchernitcher, Repnin, and Potemkin. She took a prominent part in the nefarious dismemberments of Poland in 1772, 1793, and 1795, and received herself the lion's share, consisting of nearly two thirds of the Polish kingdom; and in a number of successful wars she wrested from the Turks the Crimea, Azov, and several other territories. Altogether the territory of Russia was enlarged during her reign by nearly 225,000 sq. m., Courland being among the acquisitions. The internal progress was no less signal. More than 50,000 industrious foreigners settled in the fine agricultural districts of southern Russia as colonists, and a large number of new educational and charitable institutions were established. Commerce, navigation, and industry greatly improved under Catharine; the administration of the empire was thoroughly reorganized, and in 1766 the empress even convoked a general assembly of delegates from the provinces to consult respecting the compilation of a new code of laws. Her son, Paul I. (1796-1801), took an active part in the European war kindled by the French revolution, forming a defensive and offensive alliance against France, with England, Austria, Naples, and the Porte. His armies were sent in 1799 against the French republic to Italy, Switzerland, and Holland, and his chief commander, Suvaroff, not only increased the fame of the Russian arms, but greatly strengthened the Russian influence on European policy. Dissatisfied with his allies, Paul soon recalled the army, concluded with Denmark and Sweden a convention of armed neutrality, and even made friendly advances toward France, when a conspiracy of Russian nobles, who had suffered much from his despotic caprices, led to his assassination. His son, Alexander I. (1801-'25), was strongly inclined in favor of a peaceful policy, though he found it impossible to keep out of the general war. In 1801-'2 he was active in promoting the treaties which led to the gradual dissolution of the German

empire. About this time he incorporated with Russia all the provinces of Georgia. The faithlessness of Napoleon toward Naples and Hanover, and the execution of the duke d'Enghien (who was carried off from Baden), induced Alexander to enter into an anti-French alliance with Austria, England, Sweden, and Naples. A grand army under Kutuzoff marched into Moravia, united with the Austrians, and with them was routed at Austerlitz, where Alexander was himself present, Dec. 2, 1805. Not more fortunate was the alliance of Alexander with Prussia. After the indecisive battle of Eylau, Feb. 7, 8, 1807, the Russians were totally defeated in the bloody battle of Friedland (June 14), and Alexander was forced to conclude the peace of Tilsit (July 7), by a secret article of which he surrendered the Ionian islands to France, while he received from Prussia the district of Bialystok, with 184,000 inhabitants. Moreover, Russia had to give its adhesion to the continental system, and to close its ports to British vessels. A war with the Turks, which had been instigated by Napoleon, terminated in favor of the Russians, who occupied Moldavia and Wallachia. The peace of Tilsit raised two new enemies against Russia: England, which desired to take revenge for the adhesion of Russia to the continental system, and inflicted great damage on Russian commerce; and Gustavus IV. of Sweden, who in a brief and unfortunate war lost the crown for himself and for his race, while Sweden, in the treaty at Frederikshamn, Sept. 17, 1809, ceded Finland, the Aland islands, and a portion of Bothnia, a territory with 900,000 inhabitants. For five years Alexander remained on good terms with Napoleon, and in the treaty between France and Austria at Schönbrunn (Oct. 14, 1809) Russia received from Austria the district of Tarnopol in Galicia, with 400,000 inhabitants. Turkey, in the peace at Bucharest in 1812, was obliged to cede Bessarabia and a part of Moldavia; and Persia, in the peace at Gulistan in 1813, to surrender Daghestan and Shirvan, former conquests of Peter the Great. Another great war with France became inevitable when Alexander found it necessary, by a ukase of Dec. 31, 1810, to set aside one of the provisions of the peace of Tilsit. In 1812 Napoleon invaded Russia with an army of 500,000 men, for which Italy, the kings of Prussia and Saxony, and other vassals had been compelled to furnish large contingents. The Russians lost the bloody battle on the Moskva, Sept. 7, and even Moscow fell into the hands of the French; but the burning of the city by the Russians was the beginning of a frightful retreat of the French, during which nearly the whole grand army was destroyed. On Feb. 28, 1813, Russia was joined in her war against France by Prussia, and in August by Austria; two months later the battle of Leipsic decided the issue of the great Franco-Russian war, and in 1814, and again in 1815, Alexander entered

Paris as the foremost among the allied monarchs to whom Napoleon succumbed. In the congresses of Vienna (1814-'15) and Aix-la-Chapelle (1818), which reorganized the political relations of the European states, the influence of Alexander, the founder of the "holy alliance," was paramount; the duchy of Warsaw, which Napoleon had created, was surrendered to him, and transformed into a kingdom of Poland under the Russian sceptre; and in the contest which soon sprung up throughout Europe between the liberal and democratic tendencies of the age and the hereditary rights of the princes, Russia was regarded as the chief support of the latter. At the same time Alexander was eagerly intent on promoting the civilization of his empire and developing its immense resources. The system of public instruction was greatly improved, and religious reforms were encouraged; serfdom had been abolished in Courland and Livonia. The death of Alexander, Dec. 1, 1825, accelerated the outbreak of a conspiracy which had wide ramifications throughout Russia, and especially in the army; but his brother and successor, Nicholas I. (1825-'55), suppressed it with great energy, and the leaders of the conspiracy were either put to death or exiled to Siberia. A war, begun by Persia immediately on receiving the intelligence of the death of Alexander, was victoriously terminated by Paskevitch; and by the peace of Turkmanchai, Feb. 22, 1828, Russia gained the provinces of Erivan and Nakhitchevan, 80,000,000 rubles as indemnity, and the exclusive control of the Caspian sea. A war against Turkey commenced in 1828 was equally successful, the Turks being obliged to cede in the peace of Adrianople (Sept. 14, 1829) several fortresses on the frontier and the mouths of the Danube, and to pay a large indemnity. The heroic efforts of the Polish nation in 1830-'31 to recover its independence at length succumbed to the overwhelming power of the czar, who by a ukase of 1832 declared the kingdom of Poland a Russian province without diet and without its own army, and openly announced his intention gradually to transform the Poles into Russians. The same plan was pursued with regard to the numerous other tribes and nationalities of the empire, and no means was left untried to extend the dominion of the Russian language and the Russian church. A war against the independent tribes of the Caucasus, who after 1834 were led by Shamyl, was carried on, with but little interruption and with varying success, through the entire reign of Nicholas. In 1849 a Russian army was sent to the aid of Austria against the Hungarians, and assisted in the suppression of the revolution. In 1853 Russia demanded from the Turkish government certain guarantees of the rights of the Greek Christians of Turkey, which the Porte believed to involve an actual abdication of its sovereignty, and which it therefore refused to concede. This led in the same

year to the beginning of the "eastern war," in which France, England, and Sardinia took sides (1854) with Turkey, on the ground that the existence of the latter empire and the equilibrium of political power in Europe were endangered by Russia. This war, which culminated in the siege and capture of Sebastopol, was terminated under Nicholas's son and successor, Alexander II., who ascended the throne on March 2, 1855. (See CRIMEA.) By the treaty of Paris (March 30, 1856) Russia lost a small strip of land in Bessarabia, and her naval preponderance in the Black sea. She recovered the latter, however, by withdrawing from the treaty of Paris in 1870, when France was engaged in a disastrous war, while England alone was unable to compel Russia to respect the treaty. A large fleet for the southern waters is now (1875) in course of construction. The reign of Alexander II. opened with a series of liberal reforms, which at once aroused the slumbering energies of the nation. (See ALEXANDER II., and GORTCHAKOFF.) The war in the Caucasus terminated with the capture of Shamyl in 1859. A new rising in Poland, which broke out in January, 1863, was crushed in the following year, and in consequence of it the administration of that country was entirely assimilated to that of Russia proper, the long exercised Russianizing process being developed with the utmost rigor. (See POLAND.) Favorable commercial treaties were concluded in 1858 and 1860 with Japan and China, and from the latter power a valuable and extensive tract of land on the river Amoor was acquired, while the Japanese have ceded to Russia all their claims on the island of Saghalien. On the other hand, Russia sold to the United States in 1867 the vast territory of Alaska, which had been occupied since the reign of Paul. A telegraph line has been completed from St. Petersburg to Yokohama, and the Siberian railway is speedily pushing forward toward the Pacific coast. Another railway line, the Central Asian, is in process of construction to Tashkend, a very important commercial town, and the rendezvous of the caravans of Turkistan.—The Russian conquests in central Asia have recently attracted general attention, though the Russian advance into these regions began centuries ago, when the czars of Moscow, freed from the Tartar invasion, began to retaliate upon the invaders, and endeavored to find a market for their manufactures, which, being of a very inferior quality, had no sale in Europe. Between the Ural river, which forms a part of the natural eastern boundary of European Russia, and the Irtysh, formerly on the S. W. frontier of Siberia, extended boundless steppes, the whole population of which consisted of a few thousand wandering Kirghiz. These tribes, when not fighting among themselves, united in attacks upon the Russian frontier settlements, and compelled the Russians to pursue them into the interior of the steppes. During these continued fights

some of the tribes submitted to the Russian rule, but for two centuries no one could say who was the real master of the vast tracts of land which lay between the rich and fruitful khanates of central Asia and the banks of the Ural and Irtish. There was much trade between these khanates and the towns of Astrakhan and Orenburg, but it was carried on chiefly by Bokhara merchants coming across the steppes, not by Russian merchants venturing abroad; for while the former managed to get safely with their caravans through the wilderness and to make good bargains with the Muscovites, the latter ran great risk of being robbed and killed in the steppes, or robbed and sold into bondage in the khanates themselves. So great was the desire of the Russians to get the silk and cotton of Bokhara and Khiva in exchange for their own products, that the merchants of the khanates trading in Russia were exempt from all taxes and duties, notwithstanding the bad treatment the Russian merchants underwent in the khanates and the heavy duties levied upon their wares. Under the emperor Nicholas the first attempts to compel the khanates to a fairer way of trading were made, but with little success. The expedition of Count Perovsky in 1839-'40 perished under the combined influence of want of water and food and of constant fights with the overwhelming forces of the khans and the hostile nomadic tribes. But toward the end of the reign of Nicholas the steppes beyond the river Ural came, somehow or other, to be considered as Russian territory; they were called domains of the Kirghiz of Orenburg and of the Kirghiz of Siberia respectively, and some outpost settlements were established, not only on the steppes, but even beyond them on the banks of the Sir Darya. Of these Fort Perovsky, which was almost a fortress, was both the most distant and the most important, since it enabled the Russians to launch two steamers on the sea of Aral, and thence to navigate a portion of the Sir Darya. Yet occasionally whole settlements were exterminated by the wandering tribes, and many of the fortified outposts were regularly besieged by the united troops of the khan of Khokan and the emir of Bokhara. A special committee appointed to investigate the state of affairs in the Asiatic dominions pronounced it absolutely necessary to "unite the new outpost line on the Sir Darya with the advanced posts on the southern frontier of Siberia." This resolution practically meant the erection of new fortified places further along the Sir Darya to the foot of the Thian-shan mountains and to the lake of Issik-kul, and had been approved by Nicholas when the Crimean war caused the government to postpone all its projects in Asia. About 1860 the project was resumed, the first steps being taken from Siberia by the construction of Forts Viernoye and Kastek at the foot of the Thian-shan. A double advance was executed in 1863 by

small detachments toward and along the Sir Darya. The Khokan fortresses Pishpek and Tokmak, and Yeni Kurgan, were occupied. About the beginning of 1864 the two detachments were comparatively near each other, and in June the western, commanded by Col. Verefkin, took Hazret-i-Turkistan; while about the same time the eastern, commanded by Col. Tcherniayeff, captured the fort of Auliet. The ends of the two lines were thus nearly joined, and in October Col. Tcherniayeff, commanding the united detachments, entered Tchemkend. The original object of the Russian government was thus accomplished, and it was Alexander's intention to stop any further advance of his troops; but the khans of Bokhara and Khokan, and subsequently of Khiva, by their constant attacks on the Russian outposts, compelled the generals to advance further. Tashkend was taken in 1865, Khojend in 1866, and Samarcand, by Gen. Kaufmann, in 1868. The same general vanquished the khan of Khiva in 1873 (see *KHIVA*), and in September, 1875, after another victory, took the city of Khokan. The cessions which the khan of Khiva was forced to make brought the entire E. coast of the Caspian sea into the hands of Russia, so that she can now keep her military lines of operation in perfect order by constant supplies by rail, river, and the sea, from St. Petersburg and the Baltic. The Russian government has determined to connect the Caspian sea and the sea of Azov (and through the latter the Black sea) by a canal 750 m. long, which, it is estimated, can be finished in six years at a cost of about \$62,000,000. By it the military strength of the whole southern coast region will be materially increased, for through it fleets will be able to penetrate from the Black sea into the Caspian, and there unite for a combined attack or a common defence. Such is the military importance of the Caspian sea in the estimation of Russia, that while reserving to herself the unrestricted use of its waters, she has imposed a treaty on Persia which prevents that power from maintaining any vessels of war upon it, notwithstanding that its S. and S. W. shores are part of its territory. There is an active commercial movement on the Caspian, but it is almost exclusively Russian. More than 800 vessels annually enter its ports, engaged in trade with Persia, Tartary, and the Caucasus. —But the greatest event in recent Russian history is the emancipation of the serfs, decreed by Alexander II. on March 3 (Feb. 19, O. S.), 1861. The early history of Russia was marked by unlimited despotism on the part of the princes, and equally unlimited insurrectionary tendencies on the part of the subjects. The murdering of princes was common, and it was only by organizing large body guards that they maintained their power. These guards subsequently became nobles and were largely endowed with territorial possessions. The peasants worked on these estates, with perfect freedom to move from one to another,

until the close of the 16th century, when they were "fastened" to the soil, that is to say, were no longer permitted to move from the places where the ukase found them. The object of this fastening of the peasants to the land on which they lived was not so much to enrich the landowners by giving them serfs, as to secure the revenues of the crown; for as long as the peasants were free to move about, they actually formed a vast body of wanderers constantly avoiding all payment of taxes or any other contribution to the government. To take a census under such circumstances was impossible, and that is one of the reasons why the early statistical data concerning the population of Russia are so highly untrustworthy. Such lands as did not in the stricter sense belong to the princes or the nobles were at all times considered as constituting the property, not of individual peasants, but of whole communities. They were periodically, generally every nine years, divided among the families of the community, in equal lots, according to the number of heads, and without regard to former tenantry; only the dwellings, cattle, and horses forming personal property. This system of division and rotation excluded both destitution and a regular cultivation of the land; and in it lies the explanation of the great favor which communistic views have at all times found in Russia. Trade and industry being at a very low stage of development, few private fortunes were accumulated as in other parts of the world. The wealth of representative men in Russia came mainly as the gift of the sovereign, and from the large extent of territory, the want of proper communications, and the impossibility of gathering information concerning distant regions, the princes very frequently made presents to the nobility of land not vacant, but belonging to one or more communities of peasants. The inherent right of peasants to own a certain portion of land was tacitly acknowledged by the legislation on emancipation; for instead of being simply declared free, every one of them was endowed, according to the fertility of the land, with from 5 to 25 acres, with a house and a bit of orchard attached to it, for which he is bound to pay, during a stated number of years, a certain tax to the government, which undertook to compensate the landowners. The great result achieved by this reform is that there is now no agricultural laborer in any part of the empire who is not a small landowner and a householder. The agricultural classes are in so far incomparably better off than the artisans, mechanics, or even members of the liberal professions.—Among the numerous works on Russia, besides those in Russian by Karamsin, Polevoi, Pogodin, Ustrialoff, Solovieff, and others, the following are prominent: Strahl and Hermann, *Geschichte von Russland* (6 vols., Hamburg, 1832-'60); J. G. Kohl, various books of travel through European Russia (1841 *et seq.*); Haxthausen, *Studien über die innern Zustände, das Volksleben und insbesondere die*

ländlichen Einrichtungen Russlands (3 vols., Hanover, 1847-'52); N. Turgeneff, *La Russie et les Russes* (3 vols., Paris, 1847); Schnitzler, *Histoire intime de la Russie sous les empereurs Alexandre et Nicolas* (2 vols., Paris, 1847), *Les institutions de la Russie depuis les réformes de l'empereur Alexandre II.* (2 vols., 1867), and other works; Gurowski, "Russia as it is" (New York, 1854); Pauly, *Description ethnographique des peuples de la Russie* (St. Petersburg, 1862); Golovin, *Études et essais: Richesse de la Russie, &c.* (Paris, 1864), and other works; Köppen, *Statistische Reise in Russland* (St. Petersburg, 1864); Buschen, *Aperçu statistique des forces productives de la Russie* (Paris, 1868); Eckardt, *Die Baltischen Provinzen Russlands* (Leipsic, 1868), *Baltische und Russische Culturstudien* (Leipsic, 1869; both translated under the title of "Modern Russia," &c., London, 1870), and *Russlands ländliche Zustände seit Aufhebung der Leibeigenschaft* (Leipsic, 1870); W. Hepworth Dixon, "Free Russia" (2 vols., London, 1870); Barry, "Russia in 1870" (London, 1871); Mrs. Guthrie, "Through Russia from St. Petersburg to Astrakhan and the Crimea" (2 vols., London, 1874); Ralston, "Early Russian History" (London, 1874); and Lengenfeldt, *Russland im XIX Jahrhundert* (Berlin, 1875). Erman established in Berlin in 1841 the *Archiv für wissenschaftliche Kunde von Russland*, a periodical exclusively devoted to the geography and history of Russia, and still (1875) continued. Dilke, Fadefeff, Hellwald, Mitchell, Kinglake, Sarauw, Stumm, Trench, Vámbéry, Vincent, Wirmann, and others have written upon Russia in central Asia and the Russian eastern question. (See p. 888.)

RUSSIA, Language and Literature of. The Russian language is the most widely spread and important idiom of the great Slavic family of languages, of which it forms the easternmost branch. It is distinguished by regularity, flexibility, a fitting mixture of softness and force, and especially by copiousness, as it has assimilated and worked up an immense number of Scandinavian, Tartar, Finnish, and other non-Slavic roots. The alphabet consists of 36 letters representing the following sounds or marks: А, а, It. *a*; Б, б, *b*; В, в, *v* (also *f*); Г, г, hard *g* (also *h* and *y*); Д, д, *d*; Е, е, It. *e*, also *ye*, as in Eng. *yellow*, and *u*, as in *but*); Ж, ж, Fr. *j* (*zh*); З, з, *z*; И, и, It. *i*; І, і, І, the same; К, к, *k*; Л, л, *l*; М, м, *m*; Н, н, *n*; О, о, It. *o*, also Eng. *o*, as in *hot*; П, п, *p*; Р, р, *r*; С, с, *s*; Т, т, *m*, *t*; У, у, It. *u*; Ф, ф, *f*; Х, х, *kh* (Ger. *ch*); Ц, ц, *tz* (It. and Ger. *z*); Ч, ч, *tch* (Pol. *cz*); Ш, ш, *sh*; Щ, щ, *shch* (Pol. *szcz*); Ъ, ъ, mark of hardness; Ы, ы, Ger. *ü* (nearly; Pol. *y*); Ь, ь, mark of softness; Э, э, *ye*; Ъ, ѡ, *e*; Ю, ю, *yu*; Я, я, *ya*; Ѡ, ѡ, *f*; Ѳ, ѳ, *v*, It. *i* (also *v*); Ѵ, ѵ, *y* consonant (Ger. *j*). The grammatical structure is like that of the Polish, but the accent is varied. The following examples will show some of the gram-

matical features: Masculine noun declined: nom. sing. *tzar*, (a, the) czar or king; gen. *tzarya*; dat. *tzaryu*; acc. *tzarya*; voc. *tzar*; instrumental, *tzarem*; indicative, *tzarye*; pl.: *tzari*, *tzarei*, *tzaryam*, *tzarei*, *tzari*, *tzaryami*, *tzaryakh*. The indicative is always used with a preposition, of, on, or the like: *o tzarye*, of the czar; *na tzaryakh*, on the czars. Feminine noun, sing.: *ruka*, hand, *ruki*, *rukye*, *ruku*, *ruka*, *rukoyu*, *rukye*; pl. *ruki*, *ruk*, *rukam*, *ruki*, *ruki*, *rukami*, *rukakh*. Neuter noun, sing.: *zerkalo*, looking glass, *zerkala*, *zerkalu*, *zerkalo*, *zerkalo*, *zerkalom*, *zerkalye*; pl.: *zerkala*, *zerkal*, *zerkalam*, *zerkala*, *zerkala*, *zerkalami*, *zerkalakh*. Adjective masc. sing.: *mudry*, wise, *mudravo*, *mudromu*, *mudravo*, *mudry*, *mudrym*, *mudrom*; pl.: *mudryye*, *mudrykh*, *mudrym* (*mudrykh*), *mudryye*, *mudrymi*, *mudrykh*. The personal pronouns are the following: *ya*, I; *ty*, thou; *on*, he; *ona*, she; *ono*, it; *my*, we; *vy*, ye; *oni*, *onye*, they. The first 10 numerals (masc.) are: *odin*, *dva*, *tri*, *chetyre*, *piat*, *shest*, *sem*, *osem* or *vosem*, *desiat*, *desiat*. The perfect of the verb *bit*, to be, is—sing.: *ya byl*, I have been, *ty byl*, *on byl*, *ona byla*, *ono bylo*; pl.: *my byli*, *vy byli*, *oni* and *onye byli*. How far the language is susceptible of assimilating foreign words, especially German and French, can be seen from a few examples: general, *heneral*; civilization, *tzivilizatzia*; department, *departament*; ministry, *ministerstvo*; poetry, *poezia*; prose, *proza*; theatre, drama, tragedy, comedy, *teater*, *drama*, *trahedia*, *comedia*, and so on. Among the best grammars of the Russian language for the use of foreigners are those in German by Heym, Vater, Schmidt, Tappe, Oldekop, Boltz (2d ed., 1854), Joël (1860), and Boech-Arkossy (1864), and in French by Langen (1825) and Reiff (2d ed., 1859). Among the best dictionaries are those of Heym, *Russisch-deutsches und deutsch-russisches Wörterbuch* (Riga, 1795-'8; Russian, German, and French ed., Leipsic, 1844); Tatishcheff, *Nouveau dictionnaire françois-russe* (2 vols., Moscow, 1832); Oldekop, *Russisch-deutsches und deutsch-russisches Wörterbuch* (last ed., St. Petersburg, 1843); and Makaroff's French-Russian and Russian-French dictionaries (St. Petersburg, 1868). There is an English-Russian grammar and dictionary by Constantino (3 vols. 8vo, London).—The first germs of literary life in Russia appear in the time of the introduction of Christianity by Vladimir the Great (about 990). The Slavic translation of the Bible and the introduction of Old Slavic liturgical books by Cyril and Methodius led to the general adoption of the Old Slavic as the written language, while the common Russian language began to form itself from the various dialects of the mixed population. No monuments whatever are left to show the condition and growth of the Russian language at this early stage; even the popular songs which elucidate the beginning of many other literatures have reached us only intermixed with later alterations. In the Old Slavic lan-

guage we have the treaties of the princes Oleg and Igor with the Greeks of the years 911 and 944, and an address of Sviatoslav; but whether their origin really belongs to this ancient time, or whether they are more recent translations from the Greek, is uncertain. An important Old Slavic work, *Russkaya Pravda* ("Russian Justice"), which was composed during the reign of Yaroslav (about 1020), was discovered in 1738 by Tatishcheff, and published by Schlözer (St. Petersburg, 1767). Nestor, the father of Russian history, belongs to the same period (died about 1114). The rule of the Mongols over Russia interfered but little with the growth of Russian literature, for the conquerors spared the convents, in which science found a safe refuge. Among the few works of this early period which have been preserved are the "Annals" of Simon, bishop of Suzdal (died 1226), a work of the metropolitan Cyprian (died 1406), a part of the "Sophia Chronicles" from 862 to 1534 (published by Stroyeff, Moscow, 1820-'22), and a considerable number of fables and tales, mostly centring round Vladimir and his knights, and bearing great resemblance to the tales of the round table. Among the most celebrated old Russian poems is the *Pesnia o polku igorevom* (on the expedition of Igor against Polotzk), written about 1200. It was discovered in 1796 by Count Mussin-Pushkin at Kiev, and has since been often published (with a German translation by Hanka, Prague, 1821). The long duration of the Mongol rule caused a number of Mongol words to be received into the Russian language, which are still in use. After the expulsion of the Tartars, Ivan III., Ivan IV., and especially Michael Romanoff, gave a new impulse to the progress of Russian literature, by establishing new schools, encouraging scholars, and calling distinguished foreigners into the empire. Among the authors of this period are the metropolitan Macarius (died about 1564), who wrote biographies of saints, Russian divines, &c., and Matvieyeff, the author of several historical works. Nikon, patriarch of Russia (died 1681), had the Bible translated into the Slavic language, and caused a revision of the Slavic liturgical books after the Greek originals, for which purpose more than 500 Greek manuscripts were collected by his order. But the great drawback to the rise of a truly national and popular literature, the use for literary purposes of another language than that of the people, was not removed until the reign of Peter the Great, under whom the intellectual condition of Russia underwent a revolution no less thorough than the material. He abolished the use of the Old Slavic as the official language of the government, and took energetic steps for superseding it as the language of literature. He fixed the alphabet of the common Russian language, superintended at Amsterdam the casting of the first types, and gave to a printer of Amsterdam, who in 1699 published the first book in the Russian lan-

guage, the monopoly of printing Russian books for 15 years. The first newspaper was established in Moscow in 1704, and the first in St. Petersburg in 1705. Peter instituted the imperial academy of science according to a plan of Leibnitz; it was opened shortly after his death, by Catharine I. (1725). The impetuosity with which Peter endeavored to give to his empire a literature did not leave him time to establish it on a native basis, and to develop the national resources; the writers whom he urged on to write naturally brought many foreign and heterogeneous elements into the rising literature. An Italian theatre was opened at the Russian court in 1730, and a German one in 1738. Among the principal authors of this time were Demetrius, metropolitan of Rostov (1651-1709), who wrote biographies of the saints (4 vols., Kiev, 1711-'16); Theophan Procopovitch (1681-1736), metropolitan of Novgorod, who left about 60 theological and historical works; Basil Nikititch Tatishcheff (1686-1750), who wrote a history of Russia in 4 vols.; Prince Cantemir, a satirical poet; the two Cossack poets Klimovski and Daniloff; the historian Prince Khilkoff (died 1718), who wrote a "Summary of Russian History;" Ivan Kyriloff, a statistician and geographer; and Basil Grigorovitch, who described a journey to western Europe. Trediakovski improved Russian prosody, but his poems exhibit more learning than poetical genius.—The work begun by Peter the Great was carried on with great vigor and success by the empresses Elizabeth and Catharine II. Elizabeth, who regarded art and science as the brightest ornaments of her court, founded the university of Moscow, and the academy of arts in St. Petersburg. Catharine II. added new and immense fields to the literary production of the country, by establishing public schools throughout the empire. She also established normal schools, liberally supporting the pupils, enlarged and patronized the academy of sciences and the academy of arts, and established in 1783 the academy for the perfection of the Russian language and history. At the head of the authors of this period stands Lomonosoff (died 1765), the father of the modern Russian language. He wrote the first critical Russian grammar, was the first to write pure and genuine Russian prose, and is still valued as a lyric poet. The first dramatic writer of note was Sumarokoff (died 1777), who with almost equal success wrote also historical and other poetical works. For the exhibition of his dramas national theatres were established at St. Petersburg (1756) and Moscow (1759). Among the other distinguished poets of this time were Kheraskoff (1733-1807), one of the most prolific writers of Russia, and Bogdanovitch, whose romantic poem *Dushenka* has become one of the favorites of the nation. Derzhavin (1743-1816) exhibited a greater originality than any of the preceding poets. His lyric, didactic, and dramatic works still hold

a high rank, and his "Ode to God" has been translated into nearly all civilized languages. Von-Vizin (died 1792) was particularly successful as a writer of comedies, some of which, as his *Nedorosl*, are still performed at the national theatres; he was also the best prose writer of this period. Kapnist as a lyric poet equalled Derzhavin in tenderness and purity of language, and was his superior in poetical genius. In dramatic poetry Kniazhnin (died 1791) is almost the peer of Sumarokoff. Count Khvostoff deserves honorable mention for his comedies, and Prince Dolgoruki (1764-1823) for his philosophical odes and epistles. Platon, metropolitan of Moscow, wrote numerous works on ecclesiastical history. A "History of Russia" was written by Shtcherbatoff (1733-'90); Boltin (1735-'92) wrote critical essays on the ancient history of Russia; Tchul-koff, a "History of Russian Commerce;" Golikoff, "Collections for a Biography of Peter the Great;" and Pleshtcheyeff, "Statistics of Russia." Muravieff (1757-1807) wrote many pedagogical, moral, and historical essays, all of which exhibit depth and nobility of feeling, keenness of thought, and an accomplished style. Novikoff (1744-1818) founded a typographical society, and established a satirical journal which had considerable influence in literary circles. The critical study of the language was greatly promoted by a "Comparative Dictionary of the Russian Language" (St. Petersburg, 1787-'9), for which Catharine II. herself drew up the plans.—The history of Russian literature in the 19th century exhibits steady progress. Alexander I. was a liberal patron of literature; he increased the number of universities and established many new literary institutions. Under Nicholas I. Russian literature emancipated itself fully from the controlling influence of foreign elements, assumed a thoroughly national character, and received new inspiration from the rise of the Pan-slavic movements, both political and literary, in which Russia, as the foremost representative of the race, seemed to be required to play a prominent part. The new period beginning with the 19th century was opened in a worthy manner by Nicholas Karamsin (1765-1826), who delivered Russian prose from the dominion of bombast, and set a brilliant example of a plain, flowing, and sprightly language, especially in his chief work, a "History of Russia," in 12 vols. He seems to have taken Wieland as a model. Many of his followers even outdid him in imitating the German classics, and there was danger of Russian literature becoming Germanized, when a reaction arose through Shishkoff (1754-1841), minister of public instruction, and a distinguished poet, philologist, and translator. The old Russian and purely national tendencies found a centre in the "school of Moscow." The victory of that school is in great part due to the genius of Pushkin (1799-1837), whose poems afford a faithful and patriotic reflection of Russian life, which forms the subject of

nearly all his works. He is, in particular, the founder of the national tragedy (by his "Boris Godunoff," 1831), for which he used, following the example of Zhukovski, the iambic metre, which was adopted by many, although others retained the Alexandrine verse. Zhukovski himself (1783-1852) is one of the greatest poets of Russia; he was the founder of a romantic school, and distinguished himself in almost every kind of poetry. Dmitrieff (1760-1837) distinguished himself equally in satire, epistle, hymn, and epigram. The poets Kryloff, Khomiakoff, and Koltzoff also belong to this period. Among the followers of Pushkin must be named Baratynski (died 1844), Delvig (1798-1831), Benedictoff, and Podolinski. One of the favorite lyric poets of modern times is Lermontoff (1814-'41), whose works have been translated into many languages. Pushkin and Lermontoff were beyond question the two most talented poets Russia has ever produced, and their works have exercised the most powerful influence on the mind of the young generation. Pushkin is the Byron of Russia, Lermontoff its Schiller. Other lyric poets of distinction are Viazemski (born 1792), a writer of elegies, and Gneditch, an excellent translator of the *Iliad*, "King Lear," and other foreign poems. Among the dramatic poets of distinction was Ozeroff (1770-1816), who was the first to fully comprehend the essence and objects of dramatic poetry. His tragedies ("Cedipus," "Fingal," &c.) are written in the Alexandrine verse; and although the language is not pure, and the structure of the verse is frequently heavy, these faults are fully outweighed by the vigor of thought and expression. Prince Shakhovski (died 1846) and Glinka are authors of many comedies. Among the more recent dramatic poets, Polevoi and Kukolnik, both of whom took the subjects of their dramas from Russian history, are the most important. Gogol (died 1852) in his comedies and novels pictured with great talent and intense sarcasm the provincial life of Russia. The historical novel has been cultivated with particular success by Bulgarin, who, however deficient his works may be from an æsthetical point of view, has the merit of having first ventured to portray actual life. Zagoskin, an imitator of Walter Scott, pictured the life of the lower classes, and Count Solohub that of the higher classes of St. Petersburg. Other distinguished writers in this branch of literature are Prince Odoyevski, Masalski, Senkovski, and Dahl. The idyllic life of the Cossacks was represented with great freshness and talent in the works of Gogol, Grebenka, and Kvitka, some of whom used the peculiar dialect of Little Russia (Ruthenian). Collections of popular tales and songs, to which in Russia as in all Slavic countries much attention is paid, were made by Novikoff, Maximovitch, Makaroff, and Sakharoff, and more recently by Afanasieff. Among the prominent historians are Ustrialoff, professor at St. Petersburg, whose "History

of Russia" (German translation, 3 vols., Stuttgart, 1840), which urges the gradual Russification of all the non-Russian tribes of the empire, has been officially introduced as a text book into the Russian colleges; Pogodin, the author of valuable critical works on the ancient history of Russia; Polevoi ("History of Russia"); and Danilevski, the author of some able though partial works on the wars of Russia with Napoleon I. Able historical investigations have also been made by Bestuzheff-Riumin, Sniegireff, Sreznevski, the academician Solovieff, and Arsenieff. Philosophical studies are still in their infancy, and mostly lean on modern German philosophy. Scientific theology is cultivated still less. A "Cyclopædia of Law" has been written by Nevolin, and a "History of Russian Law" by Moroshkin. As is the case with all despotic countries, Russia has a very stringent and annoying system of censorship, which has proved to be a great impediment to literature, yet at the same time a great promoter of it. All the writers of the 50 years preceding the accession of Alexander II. were turned into a kind of political martyrs. The independent study of sciences, the free culture of poetry, fiction, and the fine arts, were constantly checked, and despotism was rampant everywhere. The writers naturally strewed their pages with political allusions and recriminations, which exposed them to prosecution on the part of the government, causing their productions to be read by people who would not otherwise have taken any interest in them. In this way the progress of Russian literature since the accession of Nicholas to the throne in 1825 has been amazing. He began his reign amid a military revolution with which a few of the literary people were indirectly concerned. The leaders of the movement were hanged, and the others exiled to Siberia; but an impetus was given to liberal ideas which could not easily be checked. These ideas broke out again in 1848-'9 with Petrashevski's conspiracy. During that period Pushkin, Lermontoff, and Gogol were the leading writers, whom, moderate though they were in their views, the government never ceased to persecute. They were all exiled or banished at different times, but still went on with their liberal propaganda, embittered by the persecution and rendered immensely popular by their wonderful talents. Among those connected with the later revolutionary movements were two other young men, wealthy and well educated, Herzen (1812-'70) and Ogareff. They managed to escape to London, established there a Russian press, and began a series of publications of which the *Kolokol* ("The Bell"), a political newspaper, became the most celebrated. Russian travellers smuggled it into the empire in large quantities, and its fierce attacks on the government greatly contributed to awaken a feeling of patriotism among the more enlightened of the population. The Crimean war showed even to Nicholas that his system, far

from strengthening his empire, paralyzed its natural resources, and rendered worthless even the army, for which he had sacrificed everything else. When peace was concluded, and Alexander, who always had the reputation of a liberal and good-natured prince, ascended the throne, the progressive elements of the country naturally came to the front. Within less than five years after the conclusion of the peace of Paris, the party which consisted formerly of very moderate liberals, and never asked for anything beyond a reasonable amount of freedom of the press and public life, was transformed into ultra radicals. The teachings of modern materialistic philosophy, which had been rapidly gaining ground in western Europe, were eagerly adopted by the young generation of *littérateurs* and students, and within two or three years a school was formed, the radicalism of which outstripped anything that could be well imagined. Vogt, Moleschott, and Büchner became the theological and philosophical idols of the Russian youth; Fourier, Saint-Simon, Robert Owen, and Proudhon became their social teachers; and a system of cosmical, political, and moral conceptions was formed, which would have frightened the very writers whose authority it invoked. The disciples of this school were known as Nihilists, or believers in nothing. Its leaders were Tchernyshevski and Dobroluboff, and their organ was the *Sovremennik* ("The Contemporary"), a monthly magazine owned and ably edited by the poet Nekrasoff. It had speedily created a large party among the young men in the universities and public schools, and the spreading movement frightened the government, which prosecuted everybody who showed the slightest sympathy with it. All the conspiracies and political prosecutions which have taken place in Russia since 1862 have been connected with Nihilism. Among the prominent men of the party, besides Tchernyshevski, who was exiled to Siberia, and Dobroluboff, who died at the age of 26, were Pisareff (drowned by accident), Shelgunoff (exiled to Siberia), Mikhailoff (died in Siberia), Serno-Solovievitch (died in Siberia), and Pomialovski (died from overwork and excessive drinking at 23). The party is now considerably reduced. Whatever remains of it is under the leadership of Antonovitch and Zhukovski, two journalists of indifferent talent, but of more knowledge than their predecessors possessed. Foolish and extreme as are the views of that party, it has immensely contributed to the spread of knowledge throughout Russia. The works of Buckle, Huxley, Darwin, Tyndall, John Stuart Mill, Helmholtz, Virchow, and many others have been translated and passed through several editions. Some of the medical students (who joined the movement *en masse*) have made themselves favorably known all over Europe through their researches in physiology and biology. The movement did not exclude women, many of whom began to study medicine and natural

sciences, and took their degrees, mostly at the university of Zürich, as the doors of the Russian universities are still closed against them. Among the most celebrated of contemporary Russian authors are the romancists Ivan Turgeneff, Gontcharoff, Dostoyevsky, Avdeyeff, Count Tolstoi, jr., Krestovski, Khvostchinski, and Panayeff; the poets Nekrasoff and Polonski; and the dramatists Ostrovski and Count Tolstoi, sr. Prominent among editors of newspapers and periodicals are Aksakoff, Krayefski, Stasulevitch, Korsh, and Katkoff. The historical writers occupying the highest position are Solovieff, Pypin, and Kovalevsky. For statistical work the highest reputation has been achieved by Semenoff and Korsak. The great philosophical writer is Lavroff. As a matter of course, the chief literary centres are the two capitals, St. Petersburg and Moscow. The post office of St. Petersburg sends out to the provinces more than 80,000 copies of daily and 40,000 of weekly papers, and about 50,000 of monthly periodicals. The highest circulation of any one newspaper has not yet exceeded 25,000, but the number of publications is constantly increasing. The growth of Russian literature with such marvellous speed has prevented its being thoroughly studied abroad, and there are very few works on the subject which bring it down to the present day.—See Gretsch, *Essai d'une histoire de la littérature russe* (4 vols., St. Petersburg, 1819–22); Bowring, "Specimens of Russian Poets" (London, 1821); Otto, *Lehrbuch der russischen Literatur* (Leipsic, 1837; translated by Cox, Oxford, 1839); Jordan, *Geschichte der russischen Literatur* (Leipsic, 1846); Talvi (Mrs. Robinson), "Historical View of the Languages and Literature of the Slavic Nations" (New York, 1850); Khanikoff, *Études sur l'instruction publique en Russie* (Paris, 1865); and Petroff, "Sketch of Russian Literature" (French by Romald, Paris, 1872). Of late years many articles on Russian literature have appeared in foreign magazines, and especially in the Paris *Revue des Deux Mondes*.

RUSSIAN AMERICA. See ALASKA.

RUSO-TURKISH WAR. See supplement.

RUSTCHUK, a fortified town of Bulgaria, European Turkey, capital of the vilayet of Tuna ("province of the Danube"), on the right bank of the Danube, nearly opposite Giurgevo, 250 m. N. W. of Constantinople; pop. about 30,000. It is the seat of a Greek archbishop, and contains nine mosques, Greek and Armenian churches, and several synagogues. Silk, wool, cotton, leather, and other goods are made, and the trade has lately increased. Many engagements have taken place here during the past century between the Turks and the Russians. In 1810 it surrendered to the latter after a long siege. After evacuating the place in 1812 the Russians burned it, but it was soon rebuilt. The fortifications, razed after the treaty of Adrianople (1829), were rebuilt after 1853.

RUSTIGE, Heinrich von, a German painter, born at Werl, Westphalia, April 12, 1810. He

studied under Schadow in Düsseldorf, was a teacher at the Stadel institute in Frankfurt, and in 1844 became professor at the school of art in Stuttgart. He paints historical and genre pictures, as "The Gueux Sermon," "Raphael and the Fornarina," "The Recovered Child," "The Duke of Alva in the Castle of Rudolstadt," "The Funeral of the Emperor Otho III.," and "The Emperor Frederick II. and his Court at Palermo." He has published poetry and dramas, including *Attila* and *Ludwig der Baiern*, and a popular military song, *Deutscher Marsch*, set to music by Kücken.

RÜSTOW, Wilhelm, a German military writer, born in Brandenburg, May 25, 1821, died Aug. 28, 1878. He joined the army in 1838, and became an officer of engineers. He was indicted in 1850 for a publication on the military condition of Germany and fled to Zürich, where he became a teacher and major in the army. In 1860 he joined Garibaldi in Sicily, and afterward returned to Switzerland. In conjunction with Köchly he wrote *Geschichte des Griechischen Kriegswesens* (Aarau, 1852), and translations and commentaries relating to Greek military writers (2 vols., Zürich, 1854-'5). He also wrote on Julius Cæsar's military operations and Napoleon III.'s history of the same, on the first Napoleon's campaigns in Italy and Germany, on the Crimean war, and on the Franco-German war of 1870-'71. Prominent among his theoretical works are: *Die Feldherrnkunst des 19. Jahrhunderts* (Zürich, 1857; 2d ed., 1866); *Geschichte der Infanterie* (2 vols., Gotha, 1857-'8); *Allgemeine Taktik* (Zürich, 1858); *Militärisches Handwörterbuch* (2 vols., 1859; supplement, 1867); and *Strategie und Taktik der neuesten Zeit* (1872).—His brothers ALEXANDER and CÆSAR, Prussian officers, both killed in battle in 1866, were also authors of military works.

RUTA BAGA. See TURNIP.

RUTGERS COLLEGE, an institution of learning in New Brunswick, N. J., established by royal charter in 1770, under the name of Queen's college. It was connected with the general synod and theological seminary of the Protestant Reformed (Dutch) church till 1865, when it became an independent literary college, on the condition, however, that its president and three fourths of its trustees should be members in full communion of that church. It received its present name in 1825 in honor of Col. Henry Rutgers, who contributed \$5,000 to its fund. Previous to that time its exercises were thrice suspended, once by the revolutionary war and twice by financial embarrassments. The first president was the Rev. Dr. J. R. Hardenbergh, and the second the Rev. Dr. J. H. Livingston. The main college building was erected in 1809, through the efforts of the Rev. Dr. Ira Condict, president *pro tem*. The Rev. Dr. Philip Milledoler was president from 1825 to 1840, the Hon. A. B. Hasbrouck from 1840 to 1850, and the Hon. Theodore Frelinghuysen from 1850 to 1862. In consequence of its

small endowment and of the confusion of the civil war, the college was rapidly losing ground when the Rev. Dr. W. H. Campbell was appointed president in 1863. Under his administration several hundred thousand dollars have been added to its endowment; six new professorships have been created; a large geological hall, a chapel and library, an astronomical observatory, and a new grammar school building have been erected; and the number of students has increased from 60 to more than 200 now (1875) in actual attendance. In 1866 the state college of agriculture and the mechanic arts was opened as a department of Rutgers college, with a farm of 100 acres. In this department there are three courses of study, one in civil engineering, one in chemistry and agriculture, and a special course in chemistry, so arranged that either a two years' or a four years' course may be pursued, the latter being required for the degree of bachelor of science. Rutgers college has now 12 professorships, affording instruction in Biblical literature, constitutional law, military drill, agriculture, mining, metallurgy, analytical chemistry, engineering and graphics, and other branches common to American colleges. Its library numbers 7,000 volumes, and provision has been made for considerable additions. It has graduated 1,095 classical, 78 medical (from 1792 to 1816), and 71 scientific students, making a total of 1,244. The college has also a grammar school with nearly 200 pupils.

RUTH, Book of, one of the canonical books of the Old Testament. By many ancient and modern writers it has been regarded as an addition to the book of Judges, because the transactions which it relates happened in the time of the judges of Israel. (Ruth i. 1.) The book contains the history of Ruth, a Moabitish woman, who, after the death of her husband, a Hebrew emigrant from Judah, left her home, and followed her mother-in-law Naomi to Bethlehem, where Boaz, a relative of her deceased husband, attracted by her appearance as a gleaner in his field, married her. She was the mother of Obed, whose son Jesse was the father of David. The mention of comparatively late national customs (as in iv. 7), and the occurrence of Chaldaisms, are considered sufficient proofs that this book was composed in the times of the Hebrew monarchy. The alleged proofs of its composition long after the time of David, in the later Chaldee period of the language, are not conclusive, while there are clear indications of an earlier date. (See "Ruth, Book of," added to the American edition of Smith's "Bible Dictionary," p. 2755, and the authorities there referred to.) Christ's descent from Ruth (Matt. i. 5) is authenticated in this portion only of the Old Testament. Its canonical authority has never been questioned.—See Bertheau, *Richter und Rut* (*Exegetische Handbuch*, 1845); Keil, *Biblische Commentar*, *Josua*, *Richter und Ruth* (1863; translated in Clark's "Foreign and The-

ological Library," vol. viii.); Wright, "Book of Ruth, in Hebrew and Chaldee" (1865); Cassel, *Das Buch der Richter und Ruth* (in Lange's *Bibelwerk*, 1865); and Wordsworth, "The Holy Bible with Notes" (1865).

RUTHENIANS, or **Rusniaks** (Pol. *Rusini*, Hung. *Oroszok*), a branch of the Slavs, inhabiting E. Galicia and Bukowina, adjoining parts of Poland and West Russia, and N. E. Hungary. In Galicia and Bukowina they number about 2,500,000, and in Poland and Hungary about 500,000 each; in Russia they are generally classified with the Little Russians, to whom they are closely related. They are mostly agriculturists or graziers; in the Carpathian regions many are engaged in salt mining. Their language, which occupies a middle ground between Polish and Russian, is softer and more melodious than either. The prevailing religion is the United Greek in the Austrian territories, and Orthodox Greek in the Russian. The nobility is mostly Polonized. As a national element the Ruthenians are important only in Galicia, where they are antagonistic to the Poles, and where considerable efforts have been made to develop a Ruthenian literature, though as yet with insignificant results, and more recently to assimilate it to the Russian. The literary association *Halicko-Russka Matica* has been particularly active in the anti-Polish agitation. (See GALICIA, and SLAVIC RACE AND LANGUAGES.)

RUTHENIUM, one of the platinum group of metals, closely allied to osmium in many of its chemical relations. It was first observed by Prof. Osann in ores from the Ural mountains, and was named by him from Ruthenia (for Russia). It was afterward fully described by Prof. Claus, to whom the credit of the discovery is usually ascribed. The platinum ores of Russia, America, and Borneo contain it, and it has been detected by Wöhler in combination with osmium and sulphur in the mineral laurite found in Oregon and Borneo. To prepare ruthenium, Deville employs iridosmine, a refuse alloy from gold pen manufactories and assay offices. This alloy is fused with four or five times its weight of zinc in a carbon crucible; the heat is then raised sufficiently to volatilize all of the zinc, and the resulting mass is again fused with three parts of barium binocide and one part of saltpetre; the crucible is broken up, and its contents are treated with nitric and sulphuric acids. The oxide of ruthenium thus obtained is fused in a lime or magnesia crucible by means of the oxyhydrogen blowpipe. After osmium it is the most infusible of all metals, and it is only possible to melt small quantities in the hottest portion of the oxyhydrogen flame, at a temperature that would convert gold and platinum into vapor. The specific gravity of the fused metal is 11.4. Its symbol is Ru. It can be alloyed with other metals, such as zinc and tin, but is of no particular value as an alloy. Schönbein discovered that ruthenium in the form of sponge

would decompose water in the presence of chlorine. If some of the sponge be projected into chlorine water, oxygen gas is at once liberated and hydrochloric acid formed; the metal is not at all affected, and if chlorine were to be slowly conducted into the water, the liberation of the oxygen could be made continuous.

RUTHERFORD. **I.** A S. W. county of North Carolina, bordering on South Carolina and drained by the head waters of Broad river, a branch of the Congaree; area, about 850 sq. m.; pop. in 1870, 13,121, of whom 2,642 were colored. It has a hilly surface, and but a portion of the soil is fertile. The chief productions in 1870 were 24,406 bushels of wheat, 272,485 of Indian corn, 39,678 of oats, 26,474 of sweet potatoes, 122 bales of cotton, 13,119 lbs. of tobacco, 9,509 of wool, 77,609 of butter, 25,015 of honey, and 17,015 gallons of sorghum molasses. There were 1,142 horses, 747 mules and asses, 1,966 milch cows, 3,384 other cattle, 6,496 sheep, and 9,738 swine. Capital, Rutherfordton. **II.** A central county of Tennessee, intersected by Stone river, a branch of the Cumberland; area, about 550 sq. m.; pop. in 1870, 33,289, of whom 16,478 were colored. It has a diversified surface and a very fertile soil. It is intersected by the Nashville, Chattanooga, and St. Louis railroad. The chief productions in 1870 were 174,745 bushels of wheat, 867,443 of Indian corn, 63,514 of oats, 22,141 of Irish and 24,299 of sweet potatoes, 2,490 tons of hay, 23,285 lbs. of wool, 291,844 of butter, 8,412 bales of cotton, and 14,969 gallons of sorghum molasses. There were 7,953 horses, 3,493 mules and asses, 5,862 milch cows, 8,184 other cattle, 17,183 sheep, and 33,376 swine; 4 flour mills, 3 saw mills, and 4 wool-carding and cloth-dressing establishments. Capital, Murfreesboro.

RUTHERFORD, Lewis M. See supplement.

RUTLAND, a W. county of Vermont, separated from New York partly by Lake Champlain, and drained by Black, White, Quechee, and Paulet rivers, and Otter creek; area, about 1,000 sq. m.; pop. in 1870, 40,651. The surface is elevated, in some parts mountainous; soil fertile. Iron ore abounds, and a range of marble quarries extends along its whole length. The marble as well as the iron is excellent. It is intersected by several railroads, centring in Rutland. The chief productions in 1870 were 23,191 bushels of wheat, 180,780 of Indian corn, 246,092 of oats, 22,127 of buckwheat, 617,094 of potatoes, 110,624 tons of hay, 425,216 lbs. of wool, 1,190,645 of butter, 1,369,844 of cheese, 522,177 of maple sugar, and 25,504 of honey. There were 5,623 horses, 19,594 milch cows, 1,227 working oxen, 12,208 other cattle, 83,870 sheep, and 4,566 swine; 6 manufactories of agricultural implements, 2 of boats, 3 of boots and shoes, 19 of carriages and wagons, 8 of cheese, 11 of men's clothing, 13 of furniture, 2 of forged and rolled iron, 4 of castings, 14 of leather, 4 of machinery, 13 of marble and stone work, 6 of tombstones, 1 of

lead and zinc, 1 of slate pencils, 28 of roofing materials, 1 of scales, 15 of tin, copper, and sheet-iron ware, 2 of woollen and 1 of worsted goods, 38 saw mills, and 14 flour mills. Capital, Rutland.

RUTLAND, a town and village, county seat of Rutland co., Vermont, on Otter creek, at the junction of the Rutland, the Harlem Extension, the Rutland and Washington, and the Rensselaer and Saratoga railroads, 50 m. S. S. W. of Montpelier; pop. of the town in 1850, 3,715; in 1860, 7,577; in 1870, 9,834, of whom 2,963 were foreigners. The village (pop. in 1875, about 9,000) is built in the valley of the creek near the centre of the town, and is the second place in importance in the state. It is pleasantly situated between two lines of hills, the Green mountain range on the east and the Taconic range on the west. The Clarendon springs are 6 m. distant, and there are several prominent peaks in the vicinity. The village is laid out at right angles. The business blocks are of brick and marble; the residences principally of wood. The public buildings (of brick) are the post office and United States court house, the county court house, and the town hall. There are three large brick hotels; three national banks, with an aggregate capital of \$1,000,000; a savings bank, with about \$700,000 deposits; two daily and weekly newspapers, one of which, the "Herald," was established in 1794; and ten churches. The town is divided into 18 school districts, including the graded district in the village, having 25 school buildings, with 60 teachers and 2,300 pupils. There are several private schools, including the Rutland military institute, with 100 students. There are no large manufactories. The production of marble is the chief industry, employing about 1,500 men. The annual yield is about 400,000 cubic feet. The quarries, first opened about 1840, are the largest and most valuable in the state, furnishing large and sound blocks of white marble quite as fine as the statuary marble of Carrara. Beautiful specimens of variegated and brecciated marble are also found.—The town was chartered in 1761 and settled in 1770. A centennial celebration was held in October, 1870. It was one of the capitals of the state from 1784 to 1804. The village was incorporated in 1847.

RUTLANDSHIRE, an inland county of England, bordering on Lincolnshire, Northamptonshire, and Leicestershire; area, 149 sq. m.; pop. in 1871, 22,070. The scenery is beautiful, and the soil fertile. It is the smallest county in England, and is remarkable for its wheat and cheese; but barley is the principal production. The chief town is Oakham.

RUTLEDGE. **I. John**, an American statesman, of Irish parentage, born in Charleston, S. C., in 1739, died there, July 23, 1800. He studied law in London, returned to Charleston in 1761, and attained the foremost rank as an advocate. He was a member of the stamp act congress at New York in 1765, of the South

Carolina convention in 1774, and in the same year a delegate to the continental congress at Philadelphia. He was reappointed to the congress of 1775; and in 1776, in the convention of South Carolina, he was chairman of the committee which prepared the constitution, and was elected president of the new government. When Fort Moultrie was attacked by the British in June, he sent to it 500 lbs. of powder, against the advice of Gen. Lee, and directed Col. Moultrie not to evacuate it without an order from him. In 1779 he was chosen governor, and when Charleston was threatened with a siege he was clothed by the legislature with dictatorial power. In May, 1780, when Charleston fell, Rutledge retired to North Carolina, and for nearly two years accompanied the southern army. In 1782 he was elected to congress, and in 1784 chosen chancellor of the state; and he was a member of the convention for framing the federal constitution, the ratification of which he supported in the state convention. In 1789 he was appointed an associate judge of the United States supreme court, and in 1791 elected chief justice of South Carolina. He was appointed chief justice of the United States in July, 1795, and presided at the succeeding term of the supreme court; but the senate, for political reasons, refused to confirm the appointment. **II. Edward**, a signer of the Declaration of Independence, brother of the preceding, born in Charleston, Nov. 23, 1749, died Jan. 23, 1800. He studied law in London, practised in Charleston, and in 1774-'7 was a member of the continental congress. In June, 1776, he was a member of the first board of war, and in September was associated with Dr. Franklin and John Adams as a committee to confer with Lord Howe on Staten island as to terms of accommodation. In 1779 he was again appointed to congress, but was prevented by illness from taking his seat. During the siege of Charleston in 1780 he was taken prisoner and detained for 11 months at St. Augustine. In the legislature of 1791 he drew up the act for the abolition of the rights of primogeniture. From 1798 till his death he was governor of the state.

RÜTLI. See GRÜTLI.

RUTULI, a Pelasgian people of ancient Italy, on the coast of Latium, whose chief town, Ardea, became a Roman colony about 490 B. C. In Virgil, King Turnus of the Rutulians is mentioned as an enemy of Latinus, who gave his daughter Lavinia, previously promised to Turnus, in marriage to Æneas. Their name disappears after the time of the Roman kings.

RUYSDAEL, **Jacob**, a Dutch painter, born in Haarlem about 1630, died there in November, 1681. He abandoned his original profession of surgery and rose to great distinction as a landscape and marine painter. The figures in some of his pictures were executed by Ostade, Wouvermans, Berghem, and others.

RUYSSSELEDE, a town of West Flanders, Belgium, 14 m. S. S. E. of Bruges; pop. about

7,000. It is the seat of a celebrated reformatory, which was opened by the government in 1849. Although under one direction, it is divided into three distinct schools, two for boys at Ruyselede and Wynghe, near each other, and one for girls at Beernem, about two miles distant. The children received are vagrants, truants, street beggars, and the like, not properly criminals, but in danger of becoming so. The age of admission is from 7 to 18 years; the term of committal is during minority; the average stay is about three years, some going away in three months, while others remain eight or ten years. The institution is conducted on the congregate plan, the boys sleeping in large dormitories. The principal labor is farm work on 240 acres, including a kitchen garden of 19 acres, with a large stock of horses, cows, sheep, and hogs, and model farm buildings. In winter various trades are carried on. The wool and flax grown on the farm are spun, woven, and made up into garments; the straw is plaited and made into hats; and the hides are tanned and shoes made. Even the table beer is brewed on the farm. The institution is not only entirely self-supporting, including the expenses of administration, but in 1871 there was a net profit of 3,000 francs, and in the previous four years a total gain of 10,000 francs. In August, 1872, there were 522 boys at Ruyselede. At Wynghe there were 50 boys in training for a seafaring life, but also working on the farm and in the shops. The reformatory at Beernem, opened in 1853, contained in August, 1872, about 250 girls, chiefly employed in lace making, sewing, and laundry work. They are in charge of a religious sisterhood, but under the general superintendence of the director at Ruyselede. The girls gain in proportion to their number more than the boys, their earnings amounting to 100,000 francs a year. From 1849 to 1873 about 5,000 boys had been received. The present director, Eugene Poll, believes that substantially all the children sent to Ruyselede are saved, as the percentage of those who turn out badly is almost zero.

RUYTER, Michael Adriaenszoon de, a Dutch admiral, born in Flushing, Zealand, in 1607, died in Syracuse, Sicily, April 29, 1676. He was apprenticed by his parents to a shoemaker at the age of 11 years, but ran away and engaged as cabin boy, and gradually rose to the highest rank. When in 1641 Holland undertook to assist Portugal against Spain, De Ruyter, then rear admiral, commanded the Dutch fleet. In 1647 he attacked and sunk an Algerine squadron of four times his own number of vessels off the port of Salé. In 1652, England and Holland being at war, while convoying a fleet of merchantmen, he met the English fleet off Plymouth, and repulsed it, saving his entire convoy. During the next two years he commanded a division of the Dutch fleet under Admiral Van Tromp, and fought two naval battles, one of which was successful. In 1655

he was again sent against the Algerine pirates, whom he chastised terribly, hanging at the yardarm the famous renegade, Armand de Diaz. In 1659 he was sent to the assistance of Denmark against Sweden, and for his services the Danish king ennobled him and his whole family. In 1665, war having again broken out between England and Holland, he was put in command of the fleet, but Prince Rupert confined him to the Dutch coast. In June, 1666, he gallantly fought the English for three days in the Irish sea, but eventually withdrew. In 1667 he renewed the attack, ascended the Thames as far as the Medway, burned the shipping at Sheerness, and compelled England to sign a treaty of peace at Breda. In 1671 De Ruyter was put in command of the fleet in the war against France and England, and in 1672 fought the combined fleet long and obstinately, but without decisive results. In 1675 he was sent to the Mediterranean to aid the Spaniards against the French, and in 1676 fought a desperate battle against a greatly superior French force under Admiral Duquesne off the E. coast of Sicily, and was finally worsted, and retreated with his fleet into the harbor of Syracuse. He lost both legs in the fight, and died of his wounds.

RYCAUT, Sir Paul. See **RICAUT**.

RYE, a cereal grain, *secale cereale*, much cultivated in temperate climates. The genus *secale* belongs to the subtribe of grasses with wheat and barley (*hordeineæ*) in which the inflorescence is in a dense spike, the spikelets being sessile at the joints of a zigzag rachis; the chief botanical difference between rye and wheat is that in the former the spikelets are only two-flowered, with the abortive rudiment of a third flower, while in wheat the spikelets have three to several perfect flowers; the lower palets of the flowers of rye are long-awned, and the grain is brown. As with other cultivated grain, the origin of rye is uncertain; De Candolle thinks the evidence points to the country between the Alps and the Black sea as its native region. It appears to have varied less under cultivation than any other grain, there being only two recognized varieties, the winter and spring, produced as with wheat by the manner of cultivating; it succeeds upon a much poorer soil than wheat, and is well suited to those light sandy soils which will profitably produce neither wheat nor barley. The cultivation of rye does not differ from that of wheat; it is sown in September, at the rate of one to two bushels to the acre; it is sometimes sown among Indian corn, the seed being covered with a cultivator or hoe, leaving the surface as level as possible; the corn is cut as soon as ready and removed to one side of the field, and the rye thoroughly rolled. The straw of rye is often of more value than the grain, and hence great care is taken of it in harvesting; it is frequently cut with the cradle, and in order to keep the straw unbroken thrashed with a flail; the straw is

in demand for bedding, bringing a good price in cities; it is used for making straw mats for covering hotbeds and other garden uses, for stuffing horse collars, and other mechanical purposes. As a green fodder crop rye is valuable; the herbage after it is well established may be pastured late in autumn, and in early spring it affords succulent and nutritious food, which may be cut for cows from the time it is six inches high until the head is formed, when the stems become dry and useless. Rye is held in but little favor in England, its cultivation being confined to some of the northern counties, while on the continent it is largely used, and in some localities is the common breadstuff of the population; its color is less pleasant than that of wheat, the bread made from it has a very dark color, and its taste and odor are to some disagreeable; it is capable of making a light wholesome bread, though less nutritious than that of wheat, as

Rye (*Secale cereale*).—Head reduced, and single Spikelet enlarged.

the grain contains from 2 to 3 per cent. less of nitrogenous principles. It was formerly the custom in England to sow two or three parts of wheat with one of rye, the grains being harvested and threshed together; the mixture, called maslin or meslin (Lat. *miscel-lanea*), is said to be better when thus grown together than can be made from the grains grown separately; bread from maslin is regarded as more nutritious than that from the poorer kinds of wheat. Rye meal is an ingredient in the New England brown bread, the other ingredient being an equal or larger amount of Indian corn meal. The Swedish peasantry subsist largely upon rye cakes, which are thin flat disks with a hole in the centre by means of which they are strung upon sticks to dry; they are baked only twice a year, and must be dried thoroughly. Rye is somewhat laxative, and a mush made from the meal is a suitable food for those troubled with con-

stipation. The roasted grains have long been used as a substitute for coffee. Rye is used in Russia to distil a spirit called *quass*; in Holland it is employed together with malt to make gin; and in this country much whiskey is made from it. The grain is sometimes attacked by a minute fungus which causes it to change its form and grow into a horn-like body several times larger than the grain itself, and known as spurred rye; where this occurs great caution should be observed in using the grain for food, as it is highly poisonous. (See *ERGOT*.)—The total production of rye in the United States, according to the census of 1870, was 19,918,795 bushels. The states producing the largest quantities were: Pennsylvania, 3,557,641 bushels; New York, 2,478,125; Illinois, 2,456,578; Wisconsin, 1,325,294; Kentucky, 1,108,933; Ohio, 846,890; Virginia, 582,264; New Jersey, 566,575; Missouri, 559,532; and Kansas, 505,807.

RYE GRASS. See DARNEL.

RYERSON, Adolphus Egerton, a Canadian clergyman, born near Victoria, Upper Canada (now Ontario), March 24, 1803. After being a teacher, he was ordained deacon in the Methodist church in 1825, and for four years was an itinerant minister. In 1829 he became editor of "The Guardian," the official Methodist newspaper; in 1832, 1836, and 1840 was a delegate to the British conference; and in 1842 became principal of Victoria college at Cobourg. In 1844 he was appointed superintendent of public schools for Upper Canada, and in 1849 submitted a plan for the organization of the public school system, which was adopted. He is now (1875) chief superintendent of education for Ontario. He has published a history of Canada, and has prepared a treatise on the "United Empire Loyalists," who emigrated from the United States to British America in 1783.

RYLAND, John, an English clergyman, born in Northampton, Jan. 29, 1753, died in Bristol, May 25, 1825. He was the son of the Rev. John Collett Ryland, Baptist pastor at Northampton and afterward principal of a seminary at Enfield, author of "Contemplations on the Beauties of Creation," &c. (3 vols.), and other works. The son could read the Psalms in Hebrew at five years of age, and had read through the Greek Testament before he was nine. In 1770 he preached before the Baptist congregation of Northampton, and for the next five years assisted his father in his school, and preached occasionally. In 1776 he became pastor of the Northampton congregation. In 1791 he wrote the circular letter which led to the formation of the English Baptist missionary society, in the organization of which he took part at Kittering in 1792. In 1793 he was called to Bristol as pastor of the Baptists in that city and president of the Baptist college, continuing in both offices for nearly 33 years. In 1815 he was chosen secretary of the Baptist missionary society. He published

many sermons and several volumes on theological topics.

RYLE, John Charles. See supplement.

RYMER, Thomas, an English antiquary, born in Yorkshire about 1640, died in London, Dec. 14, 1713. He was a member of Gray's Inn and historiographer to King William, and was chosen to edit the whole body of existing documents relating to state transactions between England and other countries. The result was the collection entitled *Fœdera, Conventiones, Literæ et cujuscumque Generis Acta Publica inter Reges Angliæ et alios quosvis Imperatores*, &c., commonly called "Rymer's Fœdera;" 15 volumes were printed before Rymer's death, and Robert Sanderson, who was appointed his assistant in 1707, published the remainder (together 20 vols. fol., 1704-'35). Rymer wrote a play entitled "Edgar, or the English Monarch" (1678), and "A Short View of Tragedy of the Last Age," with reflections on Shakespeare and "other Practitioners for the Stage"

(1693); and left several volumes in manuscript on the history and government of England, which are in the British museum.

RYSWICK (Dutch, *Ryswyk* or *Rijswijk*), a village of the Netherlands, in the province of South Holland, 2 m. S. E. of the Hague; pop. about 2,900. A treaty of peace was concluded here in 1697 by Louis XIV. of France on the one part and the German empire, England, Spain, and Holland on the other, which terminated the long war that followed the league of Augsburg in 1686. By that treaty Louis acknowledged William of Orange as king of Great Britain and Ireland, and restored his conquests in Catalonia, and a large part of Flanders to Spain, and others on the Rhine, as well as Lorraine, to the German empire; but Strasburg and other places in Alsace were definitively ceded to France. The villa where the treaty was concluded was demolished in 1783, and a commemorative pyramid was erected on the spot in 1792.

S

S THE 19th letter, 15th consonant, and chief sibilant in the English alphabet. It is a linguo-dental, and represents the hissing made by driving the breath between the end of the tongue and the roof of the mouth, just above the upper incisors. It is found in most languages, and is one of the most abundant consonants in English. Its sound varies, being strong, like *c* soft, in *this, sun*, and softer, like *z*, in *these, wise*. Among the Hebrews, the tribe of Ephraim uttered *s* for the aspirated *sh*, which they could not articulate (Judg. xii. 6); and lisping, which is not uncommon, especially in children, consists in uttering the aspirated *th* for *s*. Its symbol in Hebrew signifies tooth, and in its original shape it may have represented three teeth, since in Hebrew, Greek, and Etruscan it consists of three strokes, which in altered positions have the same relative situation to each other. In the Phœnician the angles are rounded, and approach the serpentine form of the Roman character.—In words common to the Greek and Latin, the latter language often has an *s* initial in place of the aspirate in the former; thus *ἔξ, ἑπτά, ἥλιος, ἵδωρ, ὕλη, ὕς*, become *sex, septem, sol, sudor, sylvæ, sus*. Before words borrowed from the Latin having *s* initial, the French often prefix a vowel; thus *spiritus, spatium, spes*, become *esprit, espace, espérance*; and by an abbreviation *schola, scribere, status*, become *école, écrire, état*. In the middle of words the dropped *s* is replaced by a circumflex (Λ); thus *tempestat, magister, bestia, epistola*, become *tempête, maître, bête, épître*; and the Italian *medesimo, testa, presto*, become *même, tête, prêt*. In modern English, French, Spanish, and Portuguese, *s* final is the usual sign of the plural of nouns. In some

declensions of Greek, Latin, and the Teutonic languages (in English in all substantives singular) it serves to mark the genitive. It is subject to interchanges with *t* (Ger. *das* and *dass, Fuss, gross, Biss*, Eng. *that, foot, great, bite*), *th* (*loves, loveth, hates, hateth*), *z* (in the Somersetshire dialect of England; Dutch *zuster, zomer*, Eng. *sister, summer*), *sch* (Ger. *schlagen*, Eng. *slay*), and other consonants.—As an abbreviation it stands for *societas* or *socius*, for the proper name *Sextus*, anciently for the numeral 7, for *solo* in Italian music, and for south in books of navigation and geography.

SAADI, Sheikh Moslih ed-Din, a Persian poet, born in Shiraz, died in 1291, at the age of 102, or according to some authorities at a still higher age. He studied at Bagdad, became a dervish, made 15 pilgrimages on foot to Mecca, travelled in India and Egypt, and fought against the crusaders in Syria, where he was taken prisoner. A merchant of Aleppo ransomed him and gave him his daughter in marriage, with whom he led an unhappy life. After 30 years' wanderings, he returned to Shiraz and built himself a hermitage, where he passed his remaining years. He possessed great scientific knowledge, and was familiar with the principal oriental languages and Latin. His collected productions include the *Gulistan* ("Flower Garden"), *Bostan* ("Fruit Garden"), *Pend Nameh* ("Book of Counsels"), numerous gazels or odes, elegies, &c. The whole, in Persian and Arabic, edited by Harrington, were printed at Calcutta in 1791 (2 vols. small fol.); and of the *Gulistan* editions have been published with a parallel English translation by James Dummoulin (Calcutta, 1807), and with a vocabulary by Eastwick (Hertford, 1850), who translated

it into English prose and verse (1852). The *Gulistan* has been translated into German by Olearius (Schleswig, 1654) and Graf (Leipsic, 1846); and into French by Gaudin (Paris, 1791), Semelet (1828; 2d ed., 1834), and Charles De-frémery (1858). (See PERSIA, LANGUAGE AND LITERATURE OF, vol. xiii., p. 323.)

SAADIA (or **Saadiah**) **BEN JOSEPH**, a Jewish writer, born in Egypt in 892, died in Babylonia in 941 or 942. He became the leading teacher (*gaon*) at the great school of Surā in Babylonia in 928. His principal work is "Religions and Doctrines," written in Arabic, and now generally known under its title *Emunoth v'edebth* in Judah ben Tibbon's Hebrew translation (German translation by Fürst, Leipsic, 1845). He translated the Hebrew Scriptures into Arabic, and wrote in Hebrew didactic poems on the laws and history of the Jews.

SAARBRÜCK, or **Saarbrücken**, a town of Rhenish Prussia, 40 m. S. E. of Treves, on the Saar, which here becomes navigable; pop. in 1871, 7,686. A bridge connects the town with the suburb Sanct-Johann (pop. 9,143). There are Catholic and Protestant churches, and a palace, once the residence of the princes of Nassau-Saarbrück. The town is an important centre of the coal trade, the adjoining mines producing in 1871 upward of 60,000,000 quintals and employing about 15,000 persons. Saarbrück was bombarded by the French, under Gen. Frossard, on Aug. 2, 1870, in the presence of Napoleon III., who reported that his son there received the "baptism of fire;" but four days afterward the French, intrenched on the Spichern heights, were defeated by the Germans.

SAARDAM, or **Zaandam**, a town of the Netherlands, in the province of North Holland, at the junction of the Zaan with the Y, 5 m. N. W. of Amsterdam; pop. in 1867, 12,341. It is surrounded by hundreds of windmills, some of them of enormous size, used for grinding corn, and for making oil and paper. Peter the Great of Russia worked here in disguise as a ship carpenter for a short time in 1697, and the house where he lived was bought by the late queen of Holland, a sister of Alexander I., who had a marble tablet placed over the chimneypiece. The celebrated ship yards have almost all disappeared.

SAAVEDRA, **Ángel de**. See **RIVAS**.

SAAVEDRA Y FAXARDO, **Diego**. See **FAXARDO**.

SABA. See **ARABIA**, vol. i., p. 620, and **SHEBA**.

SABEANS. See **SHEBA**.

SABAISM (Ar. *tzaba*, to rise in splendor, as a star; Heb. *tzeba hashshamayim*, the host of heaven, the stars, *tzebaoth*, the heavenly host), the name given to the worship of the heavenly bodies as deities. It prevailed in antiquity, under various forms, in large parts of western Asia, was kindred to the element worship of the Persians and other nations, gave rise to astrology, and in Mesopotamia maintained itself to a late period. Arabian historians speak of it as the oldest religion in the world, and

Palgrave finds many traces of it in modern Arabia. According to one tradition, it was handed down from Enoch; according to another, from Sabai, son of Seth, son of Adam. Ibn el-Wardi mentions two Sabian works, a book of prayers and the "Book of the Law," which were attributed to Enoch.

SABBATH (Heb. *shabbath*, day of rest), the name of the seventh day of the week among the Hebrews, dedicated to an entire cessation from worldly labor. It began on Friday evening, and extended to the evening following. Whether it was instituted by Moses or was of ante-Mosaic origin is disputed. A wilful violation of the sabbath was punished with death. In later times the provisions of the Mosaic law respecting the sabbath were greatly extended by the Jews; travelling was forbidden, and only "a sabbath day's journey" (2,000 paces beyond the limits of one's town or village) allowed. In the time of the Maccabees many zealous Jews permitted themselves to be slaughtered by the enemy rather than defend themselves on the sabbath. Christ reproached the sect of the Pharisees for the stress they laid on a mere external strictness in observing the sabbath without corresponding purity of heart and life. The Mishnah enumerates 39 principal sorts of business which must not be performed on the sabbath, and each of them has again its subdivisions. Stated meetings for worship seem not to have been connected with the sabbath until after the exile. The sabbath before the passover was called the great sabbath. Every seventh year was called the sabbatical year, in which the fields remained uncultivated and debts could not be collected. The great majority of the Christian churches celebrate the first day of the week, Sunday, instead of the seventh (sabbath); but a few small denominations, as the Seventh Day Baptists, the adherents of Joanna Southcote, &c., maintain that the change was made without Scriptural warrant, and therefore adhere to the religious celebration of the seventh day. There is also a small sect of Sabbatarian Christians in Transylvania. (See **LOEP'S DAY**.)

SABELLIANS. See **SABELLIUS**.

SABELLIUS, the originator of the doctrine described in the history of the church as Sabellianism. He was a native of Africa, a presbyter of Ptolemais, a city of the Libyan Pentapolis, and lived about the middle of the 3d century. The doctrine of Sabellius, so far as it can be gathered from the fragments preserved in the writings of his opponents, differed from the Patristic tenets of Noëtus and Praxeas. They held that the divine in Christ was God or the Father, who became and was called the Son only when he willed to become incarnate. Sabellius taught that the Logos or Word existed before the incarnation, but not as a distinct person, being immanent in the essence of the Deity as the divine reason. He was regarded as therein differing from St. John in the fourth gospel,

denying that the Logos, the creating, revealing, and redeeming principle, is a person really and eternally distinct from the Father. Wishing to preserve the revered Scriptural terms of "Father, Son, and Holy Ghost," used by the old Monarchians and by Christians generally, Sabellius rejected the ecclesiastical conception of these terms, as involving a trinity of distinct personal existences in the Godhead, and opposed to the prevailing theology a trinity of manifestations or offices. God in himself, according to Sabellius, is one and personal; but this one divine person, subsisting in the absolute simplicity of the divine nature, becomes Father, Son, and Holy Ghost, according as he shows himself in creating, redeeming, and sanctifying mankind. Thus God, remaining ever one, shows himself in three ways. These three historic forms are not persons in the Deity, but aspects of it. The titles are contingent, as the offices which they represent are temporary; the manifestations cease when the work of the Son and the Holy Ghost is accomplished, both being reabsorbed in the absolute Deity. The most conspicuous opponent of Sabellius, through whom indeed his views and those of his party are best known, was Dionysius of Alexandria. In his controversy with Dionysius of Rome, while pointing out sharply the distinction between the Son and the Father which Sabellius denied, he went so far as to expose himself to the charge of denying their unity of nature. His hostility did not prevent the Sabellian opinion from finding partisans. Epiphanius, in the 4th century, says that the Sabellians were to be found in considerable numbers, not only in Mesopotamia, but in the neighborhood of Rome. The council of Constantinople, in 381, by rejecting their baptism, testified to their importance. Augustine, a few years later, believed them to be extinct; but their opinions continued to flourish under other names. Marcellus and Photinus, in the 4th century, were only the first of a long line of eminent teachers who have sustained after Sabellius the theory of a trinity of offices rather than a trinity of persons in the Godhead.—The doctrine of Sabellius is very fully discussed in the various histories of dogmas, especially by Martini, Möhler, Baur, Meier, Dörner, and by Schleiermacher in his treatise on the opposition between the Sabellian and the Athanasian theory of the Trinity.

SABINE, a river which rises in Hunt co. in N. E. Texas, runs S. E. about 250 m., when it reaches the E. boundary, and then generally S. with a curve to the east, separating Texas and Louisiana, and enters Sabine lake near the coast, the entire length being about 500 m. It has no large tributaries, and is navigable only in some parts, and that for very small vessels.—Lake Sabine lies between Texas and Louisiana, about 5 m. from the gulf of Mexico, with which it communicates by Sabine pass. It receives the waters of the Sabine and Neches rivers, and is about 18 m. long by 9 m. broad.

SABINE. **I.** A W. parish of Louisiana, separated from Texas by the Sabine river, and drained by several of its tributaries, among which are the bayous St. Patries, San Miguel, Lennau, and Tureau; area, about 1,300 sq. m.; pop. in 1870, 6,456, of whom 1,847 were colored. It has a nearly level surface and fertile soil. The chief productions in 1870 were 74,520 bushels of Indian corn, 15,032 of sweet potatoes, and 2,350 bales of cotton. There were 736 horses, 1,521 milch cows, 5,022 other cattle, 1,512 sheep, and 9,091 swine. Capital, Manny. **II.** An E. county of Texas, separated from Louisiana by the Sabine river; area, 525 sq. m.; pop. in 1870, 3,256, of whom 1,107 were colored. It has an undulating surface covered with forests, and a very fertile soil. The chief productions in 1870 were 86,839 bushels of Indian corn, 19,680 of sweet potatoes, 1,722 bales of cotton, 1,766 lbs. of wool, and 1,918 gallons of molasses. There were 831 horses, 1,634 milch cows, 983 working oxen, 4,120 other cattle, 1,598 sheep, and 10,640 swine. Capital, Hemphill.

SABINE, Sir **Edward**, a British physicist, born in Dublin in October, 1788. He was educated in the military schools at Marlow and Woolwich, entered the royal artillery in 1803, became captain in 1813, served in the war with the United States, commanding the batteries in the siege of Fort Erie in 1814, and in 1818–19 accompanied Ross and Parry in their first arctic expedition. In 1821 he began a series of investigations in terrestrial physics in several voyages from the equator to the arctic circle. In these investigations, the results of which were published in 1825, he determined the requisite length of the pendulum to beat seconds in different latitudes, and thus laid the basis for an accurate determination of the figure of the earth. In 1838 he presented a memoir on the magnetic isoclinical and isodynamic lines of the British islands, and published "Variability of the Intensity of Magnetism upon Many Parts of the Globe." His discoveries led to the establishment of permanent magnetic observatories in Great Britain and the colonies, the latter under his superintendence, and from 1840 to 1860 he published the results of magnetic observations at the Cape of Good Hope, Hobart Town, St. Helena, and Toronto, in several 4to volumes. He has been a fellow of the royal society since 1818, was vice president from 1850 to 1861, and president from November, 1861, to November, 1871, when he resigned. He was made a knight of the bath in 1869, and general in 1870.

SABINE, **Lorenzo**, an American author, born in Lisbon, N. H., Feb. 28, 1803, died in Boston, Mass., April 14, 1877. He had been a merchant and bank officer, and was for some time secretary of the Boston board of trade. He was three times elected to the Maine legislature from Eastport; was an agent of the United States treasury department in Massachusetts; and was a member of congress from that state

in 1852-'3. He published a "Life of Commodore Preble" (1847); "Biographical Sketches of the Loyalists of the American Revolution" (1847; enlarged ed., 2 vols. 8vo, 1864); a "Report on American Fisheries" (1853); "Notes on Duels and Duelling" (1855); and an "Address on the One Hundredth Anniversary of the Death of Gen. Wolfe" (1859).

SABINES, an ancient people of Italy, embracing a large number of tribes conspicuous in the legends and history of Rome. They formed three principal groups: the Sabines proper; the Sabelli, divided into Vestini, Marsi, Marrucini, Peligni, Frentani, and Hirpini; and the Samnites. They were migratory, and early spread over the central and southern regions of the peninsula. They were renowned for bravery, rustic simplicity of manners, love of freedom, and religious character. In peace they were ruled by republican magistrates, in times of war by sovereign commanders, called by the Roman historians dictators or kings. The Sabines proper, the least warlike of all, inhabited a mountainous district in the central Apennines, between the rivers Tiber, Nar (now Nera), and Anio (Teverone), and surrounded by Latium, Etruria, Umbria, Picenum, and the territories of the Sabellians and Samnites. Their principal towns were Amiternum on the Aternus (Pescara), Cures, the birthplace of Numa Pompilius, Reate (Rieti) on the Nar, Nursia (Norcia), and Nomentum. The Sabines formed one of the constituent elements of the Roman people, a portion of them having become incorporated, according to the legend, with the subjects of Romulus on the termination of the war waged to revenge the rape of the Sabine women by the Roman youths. The remainder of the people continued independent, but early in the 3d century B. C. received the full Roman franchise and were finally merged in the republic.

SABLE, a carnivorous animal of the weasel family, and genus *mustela* (Linn.), of which the generic characters have been given under FISHER; it is the *M. zibellina* (Linn.). In size

Sable (*Mustela zibellina*).

it is about equal to the pine marten (see MARTEN), and its color in summer is brownish, with white spots on the head and grayish neck; in winter it is much darker, though not so dark as to justify the use of its name as an epithet signifying deep blackness. The feet are hairy

to the toes, indicating its residence to be a snow-covered region; it inhabits the frozen mountains of European and Asiatic Russia, where its chase is attended by great hardships on account of the severity of the climate and the barren nature of the country. The dark winter fur is highly esteemed, and forms an important article of commerce to the Russians; considerable numbers are carried to Russia and western Europe, where they bring almost fabulous prices, a single skin being worth from \$20 to \$60; the hairs are so soft that they will lie any way in which they are placed. It lives principally in trees, lying concealed during the day and hunting by night; it will destroy a hare, though larger than itself, and kills ermines and other small weasels; it may be tamed, and is very docile if taken young. It is by some regarded as a variety of the pine marten (*M. martes*, Linn.); but, though not uncommon, enough specimens do not exist in museums to determine the question. It has from three to five young, late in March or early in April. The American sable is the American pine marten (*M. Americana*).

SABLE ISLAND (Fr. *sable*, sand), a low island in the Atlantic ocean, about 100 m. S. E. of Nova Scotia, to which it belongs; length about 25 m., breadth from 1 to 5 m. It consists of two nearly parallel ridges of sand joined at the ends, which enclose a lake about 11 m. long and in some places 12 ft. deep. There are two kinds of grass, wild peas, strawberries, cranberries, &c. The island supports about 500 wild horses, and some horned cattle. There are valuable fisheries in the vicinity. Many fatal shipwrecks have occurred upon Sable island and the sand banks and shoals which surround it. An establishment for the relief of persons thrown upon its shores is supported by the Dominion of Canada. In 1871 the population consisted of five families, comprising 27 persons, connected with this establishment. In 1873 the government established two lighthouses, one at the W. end (lat. 43° 57' N., lon. 60° 8' W.), with a revolving light 123 ft. above the sea, and the other 1½ m. from the E. end (lat. 43° 58' 30'', lon. 59° 46'), with a fixed light 128 ft. above the sea.

SAC, a W. county of Iowa, watered by Boyer and Coon rivers and other streams; area, 576 sq. m.; pop. in 1870, 1,411. The surface is rolling and the soil fertile. The chief productions in 1870 were 37,090 bushels of wheat, 42,267 of Indian corn, 38,831 of oats, and 30,120 lbs. of butter. Capital, Sac City.

SACAPA. See ZACAPA.

SACCATOO. See SACKATOO.

SACCHINI, Antonio Maria Gasparo, an Italian composer, born in Pozzuoli about 1735, died in Paris, Oct. 7, 1786. He was educated under Durante, produced numerous works in Italy and Germany, and arrived in 1772 in England, where he remained till 1784, when he established himself in Paris. His operas, once famous over Europe, are now scarcely

known by name even, notwithstanding they are skilfully and richly harmonized and abound in beautiful melodies. The most celebrated in their day were *Il Cid*, *Tamerlano*, *Montezuma*, *Rinaldo*, and *L'Amore soldato*, composed for the London opera house, and *La colonie*, *L'Olympiade*, and *Œdipe à Colonne*. The last named, his best work, was brought out at Paris the year after his death.

SACHEVERELL, Henry, an English clergyman, born in Marlborough, Wiltshire, about 1672, died in London, June 5, 1724. He was educated at Oxford, obtained a fellowship, received holy orders, and in 1705 was appointed preacher of St. Saviour's, Southwark. In 1709 he delivered two political sermons, the one at the Derby assizes on Aug. 15, the other before the lord mayor at St. Paul's on Nov. 5, in which he maintained the doctrine of passive obedience, and denounced the act of toleration. These sermons were widely circulated by the opponents of the existing government. The whigs being then in power under the ministry of Godolphin, Dr. Sacheverell was ordered to be impeached; and the trial commenced before the house of lords, Feb. 27, 1710. On March 23 he was found guilty, sentenced to three years' suspension from preaching, and the two sermons were ordered to be burned by the common hangman. This light sentence was considered a tory victory, and the excitement created by the affair contributed to the fall of the whig ministry. At the expiration of his sentence the house of commons, then led by tory influences, appointed him to preach before them on the restoration day, and the queen presented him to the living of St. Andrew's, Holborn. Bishop Burnet says: "He possessed little of religion, virtue, learning, or good sense;" and he was afterward seldom heard of except through his quarrels and law-suits with his parishioners.

SACHS, Hans, a German poet, born in Nuremberg, Nov. 5, 1494, died in January, 1576. He was a cobbler, and was instructed in singing and verse making in Munich by Lienhart Nunnenbeck, a *Meistersinger*. He produced, it is said, 6,000 poems of all kinds, about one fourth of which only are in print. These include 53 sacred and 78 profane plays, 64 farces, and 59 fables. Many of his dramatic pieces are brief comedies called *Schwänke*, full of coarse, strong satire on the times. Since the appearance in 1570-'79 of the collective edition of his works in 5 vols. fol., and the reprint in 1612-'17 in 5 vols. 4to, several editions of selections from them have been published, the latest forming vols. iv., v., and vi. of the collection of *Deutsche Dichter des 16. Jahrhunderts*, by Goedeke and Tittmann (8 vols., Leipzig, 1870-'72; new ed., 1874). He was called "honest Hans Sachs." A monument was erected to him in Nuremberg in 1874.

SACKATOO, or *Sokoto*. I. A Foolah monarchy of central Africa, in Soodan, E. of the Niger and N. of the Benooe, and largely identical

with the territories of Houssa except in its western provinces. Inclusive of the tributary state of Adamawa or Fumbina on the south-east, it extends from about lat. 6° 30' to 14° N., and from lon. 5° to 15° E., and is bounded N. by the Sahara, N. E. and E. by Bornoo and Baghirmi, S. by unexplored regions, and W. by Gando. Its estimated area, including Adamawa, is about 170,000 sq. m., and it forms a portion of the extensive region conquered by the Foolahs, who, although they have been the dominant race since about 1800, constitute but a minority of the entire population, which is estimated by Behm at 12,000,000, though other authorities make it much smaller. The surface of the country is very uneven. The higher portions are dry and generally barren, but the valleys are extremely fertile. The climate of the northern portion is salubrious, except in the valleys during the rainy season. The productions are iron of very good quality, cotton, rice, tobacco, and sorghum. Sheep, cattle, horses, asses, and camels are raised. The sultan, a descendant of the Foolah chief Othman, resided at Wurno, 15 m. from the city of Sackatoo, when Barth visited the country in 1853. His income at that time was reckoned at £10,000 in shell money, with an equal amount annually in slaves and cloth. Sackatoo has been a somewhat noted field of African exploration, having been visited by Clapperton, Lander, Richardson, and Barth. (See ADAMAWA, FOOLAHS, and HOUSSA.) II. A city and former capital of the above described country, situated on a long ridge sloping toward the Sackatoo or Rima river, a tributary of the Niger, in lat. 12° 59' N., lon. 5° 12' E.; pop. more than 20,000. Its name, according to Clapperton, signifies "a halting place." It is laid out in the form of a square, each side of which is about 1½ m. long, and is surrounded by a wall upward of 12 ft. high. Eight gates are indicated on Barth's map, two on each side of the city. An important market is held here, at which an extensive traffic is carried on in slaves, horses, cattle, leather, iron, and articles of food. The principal industry is the manufacture of leather goods, including bridles, bags, cushions, and many other articles, which are celebrated in central Africa for their excellent quality and fine workmanship. Sackatoo has been rendered particularly prominent in the record of African travel by the death of the British explorer Clapperton in its vicinity in 1827.

SACKBUT, a wind instrument of the trumpet species, capable of being drawn out to different lengths, and probably identical with the modern trombone, which is said to have been modelled by the Italians from an ancient one excavated at Pompeii, and which on its first introduction into England was called a sackbut.

SACKETT'S HARBOR (or more correctly SACKETT's), a village in the town of Hounsfield, Jefferson co., New York, on the S. shore of Black River bay, an inlet of Lake Ontario, at the terminus of the Utica and Black River railroad,

10 m. W. S. W. of Watertown; pop. in 1875, 734. The harbor, one of the best on the lake, is divided by a crescent-shaped tongue of land, which extends from the lower part of the village, into the outer and inner harbor. The latter has sufficient depth of water for large vessels to within two fathoms of the shore. Its commerce, formerly extensive, has been mostly diverted to other channels. The Madison barracks, built by the government in 1816-'19, at a cost of \$85,000, are situated here.—In the war of 1812 Sackett's Harbor was the headquarters of the northern division of the American fleet, and several war vessels were built and expeditions fitted out here. It was twice attacked by the British, who were repulsed, the last time with a loss of 150 men.

SACKVILLE. **I. Thomas**, earl of Dorset, an English statesman, born at Buckhurst, Sussex, in 1536, died in London, April 19, 1608. He was educated at Oxford and Cambridge, was called to the bar, was elected to the house of commons, and was created Baron Buckhurst in 1567. In 1570 he was sent as ambassador to France; in 1587 he was ambassador to the Netherlands; and from 1599 till his death he was lord treasurer. In March, 1603, he was created earl of Dorset. He planned the "Mirror for Magistrates," a collection of rhymed stories from English history by different authors, and produced the earliest known tragedy in the English language, "Gorboduc," or "Ferrorex and Porrex," played before Queen Elizabeth in 1562. His works were edited by the Rev. Sackville West in J. R. Smith's "Library of Old Authors" (London, 1859). **II. Charles**, sixth earl of Dorset, born Jan. 24, 1637, died in Bath, Jan. 16, 1706. He was a wit, and a favorite of Charles II., and William III. appointed him lord chamberlain. His best composition was the song written before a naval engagement with the Dutch admiral Opdam, beginning "To all you ladies now at land."

III. George, a soldier and statesman, first Viscount Sackville, son of the first duke of Dorset, and grandson of the preceding, born Jan. 26, 1716, died Aug. 26, 1785. He entered the military service as Lord George Sackville, was present at the battles of Dettingen and Fontenoy, served under the duke of Cumberland against the young pretender, and rose to the rank of lieutenant general. At the battle of Minden, Aug. 1, 1759, he commanded the allied cavalry, and for his failure to execute the commander-in-chief's order to charge the retreating French infantry, he was court-martialled and dismissed from the service. George II. struck his name from the list of privy councillors; but on the accession of George III. he was again taken into favor. In 1775, under the name of Lord George Germain (assumed in compliance with a will), he entered the cabinet of Lord North as secretary of state for the colonies, retaining the office during the American revolutionary war, and incurring great unpopularity by his opposition to efforts for

the termination of hostilities. In February, 1782, the king created him Viscount Sackville.

SACO, a river of New England, rising in the White mountains, in Coös co., N. H., and formed by the junction of three principal branches at Bartlett, Carroll co. It flows S. E. until it enters Maine, then makes an abrupt turn N., and again pursues a S. E. direction through that state to the ocean below Saco. The main branch passes through the noted Notch of the White mountains. Its falls afford valuable water power. The principal of them are the Great falls, at Hiram, 72 ft.; Steep falls, at Limington, 20 ft.; Salmon falls, at Hollis and Buxton, 30 ft.; and Saco falls, 42 ft. This last fall is about 4 m. from the mouth of the river, and is at the head of tide water. The river has an ordinary rise in the spring of from 6 to 15 ft., but it has frequently very far exceeded that height, causing destructive inundations. The entire length of the river is estimated at 160 m.

SACO, a city, port of entry, and one of the shire towns of York co., Maine, on the E. bank of the Saco river, about 4 m. from its mouth, and on the Portland, Saco, and Portsmouth, and the Boston and Maine railroads, 13 m. S. W. of Portland; pop. in 1870, 5,755. It is connected with Biddeford, an active and thriving city on the opposite side of the river, by four bridges. The sea beach within the city (the part of which called Old Orchard beach is $3\frac{1}{4}$ m. from the railroad depot) has unsurpassed facilities for driving and bathing, and has several hotels. It has little foreign commerce, but a considerable coasting trade. The number of vessels belonging to the port on June 30, 1874, was 23, aggregate tonnage 3,766. Ship building is carried on. A few vessels and boats are engaged in the cod and mackerel fisheries. Cotton goods, cotton machinery, boots and shoes, belting, brick, brushes, carriages, hubs and wheels, loom harnesses, lumber, and leather are manufactured. There are two national banks, with a joint capital of \$200,000; two savings banks, with about \$1,500,000 deposits; a fire insurance company, a weekly newspaper, an Athenæum with a library of 2,000 volumes, and Baptist, Christian Congregational, Episcopal, Freewill Baptist, Methodist, and Unitarian churches.—Saco was separated from Biddeford as Pepperellboro' in 1762. The name was changed in 1805, and in 1867 a city charter was obtained.

SACRAMENT (Lat. *sacramentum*, the military oath or its obligation), in Christian theology, an external ordinance or rite of divine institution, significant of a supersensual grace or spiritual effect. Its earliest usage in the Old Italic version of the New Testament and in the Latin Vulgate means something sacred and hidden, and *sacramentum* is thus taken as an equivalent for the Greek *μυστήριον*, a secret; hence the early church fathers used the word to denote any mysterious doctrine or thing pertaining to the Christian belief or worship.

Subsequently *sacramentum* in the Latin church and *μυστήριον* in the Greek were restricted to certain rites or ordinances divinely instituted for imparting to the recipient an invisible grace in conformity with the visible ceremony. Both these churches believe that there are seven such sacraments, viz.: baptism, confirmation, penance, the eucharist, extreme unction, order or ordination, and matrimony. Baptism, confirmation, and order can only be received once, and are considered to impress on the soul an indelible seal or character. Baptism and penance are called "the sacraments of the dead," because ordained by Christ to restore the soul dead by sin to the life of sanctifying grace. Baptism is validly conferred on infants without the exercise of reason; but its worthy reception by the adult requires faith in the redeeming merits of Christ and compunction for past offences. The five other sacraments are called "sacraments of the living," because the first requisite condition for their worthy reception is, that the soul of the recipient should be in a state of sanctifying grace.—In the church of England many distinguished theologians, especially in recent times, have inclined to the opinion that there are in the Christian church two primary and five secondary sacraments. The majority, however, with Protestants generally, believe in but two sacraments, baptism and the Lord's supper, on the ground that the New Testament mentions only these two as having been instituted by Christ. The "Apology" for the Lutheran confession of Augsburg mentions also penance or "absolution" as a true sacrament; but this was afterward omitted from the list of the sacraments, and confession was retained by the Lutheran churches as a mere ecclesiastical institution. The sacrament of ordination has also found advocates among modern High Lutherans. A violent controversy about what constitutes the substance of each sacrament was carried on between the Lutherans and the Reformed churches in the 16th century. As to the efficacy or operation of the sacraments, a wide difference of opinion has existed between Protestant and Roman Catholic theologians, arising in a great measure from the widely different meaning applied by the disputants to the term "faith," and to other interior dispositions required of the recipient of the sacraments. The Friends regard the rites of baptism and the Lord's supper as Jewish customs which ceased to be obligatory after the apostolic age. The Dunkers, Mennonites, Winebrennarians, and others, consider the "washing of feet" and the Lord's supper as coördinate and of equal obligation.

SACRAMENTO, a river of California, draining with the San Joaquin the central valley of the state. It rises on the southern slope of Mt. Shasta, in lat. 41° 25' N., and runs principally S. 370 m. to its mouth in Suisun bay, which communicates through San Pablo and San Francisco bays and the Golden Gate with the

Pacific ocean. It is navigable to Sacramento, about 80 m. from Suisun bay, by vessels drawing 3 ft. of water, and to Tehama, 180 m. further, by steamboats drawing 15 in. The chief tributaries are the Pitt, Feather, and American rivers, all coming in from the eastward. Pitt river is longer and larger than the Sacramento at the junction, and is named on some of the maps, but not in common usage, the Upper Sacramento. It rises in the N. E. corner of the state, and in wet seasons is the outlet of Goose lake, the basin of which extends into Oregon.

SACRAMENTO, a central county of California, bounded N. by the American river, S. by the Calaveras and San Joaquin, and W. by the Sacramento, and intersected by the Mokelumne and Cosumnes rivers; area, 1,026 sq. m.; pop. in 1870, 26,830, of whom 3,596 were Chinese. It has a diversified surface, nearly level in the west and hilly toward the east, and the soil is generally fertile. The E. portion contains deposits of gold. It is traversed by the Central Pacific and other railroads. The chief productions in 1870 were 126,135 bushels of wheat, 62,280 of Indian corn, 589,513 of barley, 72,055 of Irish and 148,920 of sweet potatoes, 74,797 gallons of wine, 515,213 lbs. of wool, 319,500 of hops, 439,835 of butter, 88,050 of cheese, and 21,827 tons of hay. There were 9,462 horses, 9,050 milch cows, 13,149 other cattle, 113,304 sheep, and 14,749 swine; 2 manufactories of bags, 4 of boots and shoes, 6 of brick, 5 of carriages and wagons, 10 of men's clothing, 4 of confectionery, 4 of cooperage, 5 of furniture, 2 of gas, 5 of malt liquors, 3 of machinery, 2 of engines and boilers, 10 of saddlery and harness, 2 of sash, doors, and blinds, 5 of tin, copper, and sheet-iron ware, 1 of woollen goods, and 3 flouring mills. Capital, Sacramento.

SACRAMENTO, a city and the capital of California, county seat of Sacramento co., the second city in the state in population and importance, 83 m. by the California Pacific railroad and 139 m. by the Central Pacific railroad E. N. E. of San Francisco; lat. 38° 33' N., lon. 121° 20' W.; pop. in 1850, 6,820; in 1860, 13,785; in 1870, 16,283, of whom 6,202 were foreigners, including 1,370 Chinese; in 1875, locally estimated at 24,000, of whom 2,000 were Chinese. It is situated in an extensive plain on the E. bank of the Sacramento river, here spanned by a fine bridge, immediately S. of the mouth of the American river, and is one of the handsomest cities W. of the Rocky mountains. The streets are wide and straight, and cross each other at right angles. Those running E. and W. are named by the letters of the alphabet; those crossing them N. and S. are numbered. The shops and stores are mostly of brick, the dwellings mostly of wood and surrounded by gardens. Shade trees are abundant. The streets in the business portion are paved with Nicolson pavement and cobblestones. The city is supplied with gas, and water is pumped

up from the Sacramento river, and distributed through the streets in pipes. The climate is semi-tropical, and a luxuriant growth of flowers and shrubs may be seen in the open air at all times of the year. The only important public building is the state capitol, one of the finest structures of the kind in the United States. It is situated almost in the heart of the city, and the grounds cover 18 blocks, beautifully laid out with trees, shrubs, and flowers. The Oregon division of the Central Pacific railroad, which runs to Redding, 170 m. N., connecting by stage coaches with the Oregon and California railroad for Portland, Or., brings to Sacramento a vast amount of trade from N. California, embracing the best grain-growing section of the state. The Placerville and Sacramento Valley railroad, extending to Shingle

three banks incorporated under state law, combining a savings and commercial business, and a national gold bank. There are 19 public schools (1 high, 1 grammar, 5 intermediate, and 12 primary), a female college, and a normal school; a Roman Catholic college, under the charge of the Christian brothers; a conventual school, under the charge of the sisters of mercy; and a number of private schools. The state library in the capitol has more than 35,000 volumes, and the Sacramento library, in a fine building belonging to the association, about 7,000. The state agricultural society has ample accommodations for the exhibition of stock and one of the finest race courses in the world. It holds a fair annually about the middle of September. Three daily, two semi-weekly (one German), and two weekly newspapers and a

monthly periodical are published. There are 14 churches, viz.: Baptist (3), Christian, Congregational, Episcopal, German Lutheran, Latter Day Saints', Methodist (3), Presbyterian, Roman Catholic, and Spiritualist.—The first white settlement on the site of Sacramento was made in 1839 by J. A. Sutter, a Swiss by birth, but a naturalized American citizen, who obtained a grant of 11 square leagues of land, in 1841 built a fort which he called New Helvetia, took the neighboring Indians into his service, collected a few white men, and, by virtue of his remote position and the number of his adherents, secured influence and importance in the territory.

State Capitol of California.

Springs, El Dorado co., 48 m., brings immense quantities of bowlders and granite for the San Francisco market, and also of marble from the Indian Diggings quarries. This is the only marble of any consequence yet discovered on the Pacific coast; it is of fine quality, and is extensively used in San Francisco and Sacramento. Steamers run to San Francisco, Marysville, and various points on the Sacramento river. The chief manufactories are one of agricultural implements, one of carriages, one of brandy, one of beet sugar, two of chicory, one of furniture, one of pails, tubs, and wash boards, several box factories and planing mills, smelting and refining works for the reduction of ores, a woollen mill, and three flouring mills. The machine, repair, and car shops, rolling mills, &c., of the Central Pacific railroad employ from 1,000 to 1,500 hands. There are

This fort was the first point in California reached by immigrants crossing the continent. In 1848 nearly all persons going to the mines went up the Sacramento river in boats to New Helvetia, and thence proceeded by land. With the increase of the mining population and the gold yield the trade and importance of New Helvetia kept pace, and in October, 1848, there was an auction sale of lots in the town of "Sacramento," which was first named in the advertisement of the sale. In January, 1849, the first frame house on the bank of the Sacramento was commenced. The site of the city was originally only about 15 ft. above low-water mark, and as the river frequently rises 20 ft. it was subjected to overflow. In January, 1850, in March, 1852, and in January, 1853, the city was flooded so that boats were used in

going from house to house, some of the streets having 5 ft. of water in them, and not more than a dozen houses being on land above the water level. To prevent similar disasters the streets were filled in 5 ft. deep with earth, and the city surrounded by a levee, which last alone saved the place from overflow during the flood in the spring of 1861. The business portion of the city is now about 8 ft. above the original level. On Nov. 3, 1852, a conflagration destroyed 600 houses and other property, in all estimated to be worth \$5,000,000; and in July, 1854, another large fire occurred, the loss by which was estimated at \$650,000. The capital was established at Sacramento by an act of the legislature on Feb. 25, 1854; and in 1861 the work was commenced on the capitol, the officers having previously occupied the present county buildings. Sacramento was incorporated as a city in 1863.

SACRED HEART, *Ladies of the*, a religious congregation in the Roman Catholic church, devoted to education, founded in Paris, Nov. 21, 1800. Two fruitless attempts to establish a society of women devoted to the education of young ladies of the higher classes had been made by Père de Tournely, when in 1800 his successor, Joseph Désiré Varin, superior of the Fathers of the Faith, found in Madeleine Sophie Louise Barat and Octavie Bailly persons fitted for his design; and on Nov. 21 they consecrated themselves to the Heart of Jesus, and opened a school in Paris. In 1801 they went to reside in Amiens, where their community as well as their pupils increased rapidly in number. In 1802 Mme. Barat, then in her 21st year, was chosen superior, and a temporary rule was drawn up by Père Varin. Branch establishments were founded, and in 1806 a first chapter of the order was held, at which Mme. Barat was chosen superior general, which post she retained till her death in 1865. The ladies of the Sacred Heart were placed under the control of a secular priest, who, by an attempt to change their rules, created a division among them. This checked their growth for a brief space; but the innovations being discountenanced in Rome, Père Varin completed his draught of the proposed constitutions in 1825, and they were approved by Leo XII., Dec. 22, 1826. The pope at once invited the ladies to open a house in Rome, assigning them the convent and church of Trinità de' Monti. They spread thence to the chief cities of Italy, and soon owned flourishing schools in Austria, Bavaria, Prussia, Belgium, England, and Ireland. They had come to the United States in 1817, with Bishop Dubourg of New Orleans, and founded a house near St. Louis, Mo.; but their increase in this country is chiefly due to the late Archbishop Hughes, to Mme. Elizabeth Gallitzin, and especially to Mme. Aloysia Hardey, who founded most of the American houses. They opened successfully a school at the corner of Houston and Mulberry streets, New York, then at As-

toria, and finally at Manhattanville. In 1842 Mme. Hardey founded establishments in the Pottawattamie missions, and at McSherrystown, Md. Thenceforward the order spread to the principal states of the Union, and to the Canadian provinces, Cuba, and Chili.—The rules and constitutions are closely modelled on those of the society of Jesus, in all that regards the conditions for membership, the careful and long training for the final profession, the degrees which obtain among the members, the election of the superior general and the appointment by her of all inferior officers, the distribution of the entire body into assistancies and provinces, the rigorous obedience and poverty practised by the sisterhood, and the effective methods used to maintain the religious spirit among them. But, beyond the mere fact of the instrumentality of Père Varin in founding this society, there is no dependence on the Jesuits and no connection between the two societies. The members employed in the higher functions of teaching and governing are designated as "choir religious," the others as lay sisters. In 1875 the order had in France 8 provinces and 42 establishments, including one in Algiers; the province of Belgium and Holland, with 4 establishments; that of England and Ireland, with 5; that of Italy, with 5; that of Spain, with 3; and that of Austria, with 5. In America, they had in the United States 3 provinces with 21 houses, the province of Canada with 5, and the province of Chili with 5, besides an establishment at Havana. The number of choir religious was 2,325, and that of lay sisters 1,947; total, 4,272. The central house of the whole order and the residence of the superior general is in the boulevard des Invalides, Paris.

SACS, or **Sanks**, an Algonquin tribe of Indians, formerly on the Detroit river and Saginaw bay, but driven beyond Lake Michigan by the Iroquois. They settled near Green bay, where they subsequently welcomed the Outagamies or Foxes, with whom they have ever since been closely associated. They were roving and restless, were constantly at war with the Sioux and the Iroquois, and aided the French against the latter. A part of the tribe at first joined the Foxes in their hostility against the French at Detroit, but soon abandoned their cause. They took part with Pontiac, and during the revolution were under English influence. In the second war with England the Rock river Sacs joined the English side. Treaties were made specially with the tribe in 1804 and 1815-'16, ceding lands. Their later history is that of the Foxes. (See **FOXES**.) The Sacs were divided into a great number of clans, the Great and Little Bear, Great and Little Fox, Wolf, Owl, Eagle, Tortoise, and four others. The children of each family as they are born are marked white or black alternately, and each color forms a distinct band in the nation, the white or Kiscoquah and the black or Oshkosh. When

Black Hawk with the British band of Sacs began war in 1832 to recover the ceded lands on Rock river, Keokuk, chief of the Kiscoquah band, a great warrior and negotiator, remained faithful. The united Sacs and Foxes numbered 8,000 in 1822, but were reduced in 1874 to 1,135, of whom 338 were in Iowa, 97 in the Great Nemaha agency, Nebraska, 200 in Kansas, and 500 in Indian territory.

SACY. **I. Antoine Isaac Sylvestre de**, baron, a French orientalist, born in Paris, Sept. 21, 1758, died there, Feb. 21, 1838. After studying law, he devoted himself to oriental languages, and published in 1793 his *Mémoires sur diverses antiquités de la Perse*. He became in 1795 professor of Arabic at the oriental academy, in 1806 professor of Persian at the collège de France, and in 1815 rector of the university of Paris. Many of the most distinguished orientalist of the period were among his pupils. He was also politically active, espousing the side of the royalists. His principal works are: *Chrestomathie arabe* (3 vols., 1806); *Grammaire arabe* (2 vols., 1810); *Nouveaux aperçus sur l'histoire de l'écriture chez les Arabes* (1827); *Anthologie grammaticale arabe* (1829); and *Exposé de la religion des Druses* (2 vols., 1838). He published annotated editions and translations of several oriental writers, a valuable catalogue of his own library, and memoirs on minor subjects of oriental literature, history, and numismatics. **II. Samuel Ustazade Sylvestre de**, a French author, son of the preceding, born in Paris, Oct. 17, 1801. After practising law, he became a prominent writer in the *Journal des Débats* as an opponent of Charles X. (1828-'30), and as a supporter of Louis Philippe (1830-'48). After the *coup d'état* of Dec. 2, 1851, he wrote chiefly on literary subjects. He was also keeper of the Mazarin library from 1836 to 1848, and subsequently its administrator. In 1854 he was elected to the academy, and in 1864 became a member of the council of education, and in 1867 of the senate. Among his works are *Variétés littéraires, morales et historiques* (2 vols., 1858; 2d ed., 1861), and editions of various authors, including *Lettres de Madame de Sévigné* (11 vols., 1861-'4).

SADDUCEES, the name of a Jewish sect, derived according to a Jewish tradition from Zadok, its reputed founder, in the 3d century B. C.; but Epiphanius derives it from the Hebrew word *tsaddik* (just), and says that the followers of the sect assumed this name. The Sadducees appear in history for the first time under the Maccabæan Jonathan, about 144 B. C. They acknowledged only the written law, rejecting the obligatory character of all traditions, and, according to Josephus, held that the soul dies with the body, denied providential interference, and made all human actions, with their good and evil results, solely dependent on the free will of men. In comparison with their opponents both in the religious and the political sphere, the more austere and pop-

ular Pharisees (see PHARISEES), the sect was never numerous, but it was highly influential, as it mostly recruited itself from the educated and wealthy classes, and for a long time held the high-priestly office in its control. Toward the close of the existence of the Jewish state the Sadducees were excluded from Judaism, and gradually disappeared; but some of their principles were revived by the sect of Caraites.—See Grossmann, *De Philosophia Sadducæorum* (Leipsic, 1836), and Wellhausen, *Die Pharisäer und die Sadducæer* (Greifswald, 1874).

SADI. See SAADI.

SADLER, Sir **Ralph**, an English statesman, born in Hackney, Middlesex, in 1507, died at Standon, Hertfordshire, March 30, 1587. Henry VIII. employed him in the dissolution of the religious houses, and he shared in the spoils. Between 1537 and 1543 he was sent on several diplomatic journeys to Scotland. In 1547 he distinguished himself at the battle of Pinkie, and was knighted. The king named him in his will one of 12 councillors to the 16 nobles to whom the care of the kingdom was intrusted. On the accession of Mary he retired to his estate near Hackney. When Elizabeth came to the throne he was called into the privy council, and on the imprisonment of Mary queen of Scots in the castle of Tutbury, he was appointed her keeper. After the execution of Mary he was sent to Scotland to pacify King James.—See his "State Papers and Letters," edited by Arthur Clifford, with a memoir and notes by Walter Scott (Edinburgh, 1809).

SADLIER, **Mary Anne** (MADDEN), an American authoress, born at Cootehill, county Cavan, Ireland, Dec. 31, 1820. She began contributing to a London magazine when scarcely 18. Having emigrated to Montreal, she published by subscription "Tales of the Olden Time." In 1846 she married James Sadlier, then of the firm of D. and J. Sadlier and co., Catholic publishers of New York and Montreal, since deceased; she now (1875) resides in New York. She has written a great number of tales, among which are: "The Daughter of Tyreconnell" (1863); "Con O'Regan" (1864); "Heiress of Kilorgan" (1867); "MacCarthy More" (1868); and "Maureen Dhu" (1870). She has also translated several religious works, tales, and dramas from the French.

SADO, an island of Japan, a few miles W. of the main island, between lon. 138° and 140° E., intersected by the 38th parallel of N. latitude; length 40 m., general breadth about 8 m.; pop. about 130,000, chiefly miners. The surface is mountainous, and the soil indifferent. Sado is noted for its gold mines, discovered in the 17th century and continuously worked since then. The entire island is a mass of auriferous rock, though the deposits are not extremely rich. The mines, mostly in the E. part, furnish lead, silver, copper, and gold. The rude native processes have recently been superseded by foreign machinery supervised by American miners. The average annual yield

for many years was 500 lbs. of gold and 700 lbs. of silver. The chief harbor is Ebisuminato.

SADOLETO, Jacopo, an Italian ecclesiastic, born in Modena, July 14, 1477, died in Rome, Oct. 18, 1547. In 1502 he went to Rome, became attached to the household of Cardinal Oliverio Carafa, and was ordained a priest. In 1511 he entered the service of Cardinal Fregosio, was elected member of the Roman academy, and published several Latin poems. Leo X. on his accession in 1513 chose him as one of his secretaries, and he distinguished himself by avoiding all offers of wealth, associating with Gaetano of Tiene and Giovanni Pietro Carafa (afterward Pope Paul IV.) in public benevolence. In 1517 he was appointed bishop of Carpentras in France. In the controversies between Luther and the Roman theologians, Sadoletto was urged to act as mediator, but conciliated neither party. The correspondence that he then began with Erasmus is thought to have prevented the latter from openly joining the reformers. During the reign of Adrian VI. he was neglected and lived in obscurity. Clement VII. in 1523 appointed him his secretary. When Clement had declared for France against the emperor Charles V., Sadoletto withdrew to his diocese, ten days before the sack of Rome by the Spanish troops (1527). In 1536 he published in Venice a commentary on St. Paul, offering a middle ground between the extreme opinions on grace and free will. This was followed by *Hortensius, sive de Laudibus Philosophiæ* (Lyons, 1538; last ed., Paris, 1853, with a French translation). He was now made a cardinal, and bent all his energies toward effecting reforms and winning back those who had embraced the Lutheran doctrines. In his own diocese he successfully resisted the spread of Calvinism, while he besought the clemency of Francis I. in favor of the Waldenses of Mérindol and Cabrières, and protected them against the ruthless oppression of the Toulouse magistrates. In the same conciliatory spirit he wrote a famous letter to the magistrates and citizens of Geneva; and his treatise *De Extructione Ecclesiæ Catholicæ* is almost the only instance of a passionless discussion in the religious literature of that age. He was sent by Paul III. in 1542 as legate to Francis I., to effect a reconciliation between him and the emperor. Failing in this, and grieved to see the pope sacrificing the highest interests of the church to the promotion of his own family, he retired to Carpentras and resigned his bishopric. The pope compelled him to go to Rome in 1546, and he was chosen to preside in the council of Trent as papal legate, but resisted the appointment on the score of his extreme poverty. His collected works, except the letters, were published at Verona (4 vols. 4to, 1737-'8); his letters, *Epistolarum Libri XVII.*, appeared at Lyons in 1550 (best ed., including the letters and Latin poems of Paolo Sadoletto, his nephew and successor as bishop of Carpentras, 5 vols. 8vo, Rome, 1759

-'67). His life, by Fiordibello, was published with a new edition of his treatise on education, *De Libris recte Instituendis* (Paris, 1855). See also Joly, *Étude sur Sadolet* (Caen, 1857).

SADOWA, a small village in Bohemia, on the Bistritz river, 8 m. N. W. of Königgrätz, and 58 m. E. N. E. of Prague. It was the scene of the decisive battle, July 3, 1866, between the Prussians commanded by King William I. and the Austrians under the command of Benedek, often called the battle of Königgrätz. The Prussian armies had two days before effected their junction. More than 400,000 men were engaged in this action, which lasted from 8 A. M. till 4 P. M., and resulted in the total rout of the Austrians, who lost 40,000 killed and wounded, 20,000 prisoners, and 174 guns. The Prussian loss was estimated at 10,000. The great difference in the losses of the two armies was mainly due to the greater rapidity of fire and longer range of the needle gun used by the Prussians. This battle decided the double German-Italian war of 1866.

SAFE, a strong box or closet for the preservation of money, valuable papers, &c., usually made of iron, and as nearly proof against fire and burglars as possible. Until the present century the most usual safes were boxes of oak or other hard wood, strengthened by iron bands and provided with several locks. The first English patent for a fire-resisting safe was to Richard Scott in 1801. It consisted of an inner and an outer casing of metal, the space between being filled with charcoal or wood treated with an alkaline salt. The first American safes that attained any celebrity were those constructed under the patent of C. J. Gayler, issued in 1833. They were double chests with spaces between them for air, or other good non-conductors of heat. The great fire in New York of 1835 gave rise to several new inventions for increasing the fire-proof quality of safes. That patented by Mr. B. G. Wilder of New York obtained the precedence, and the safes made on this plan are still in extensive use in this country and in Europe. They consist of a double box of wrought-iron plates strengthened at the edges with bar iron, and in the larger sizes with a bar across the middle. The space between the outer and inner plates is filled with the patented composition of plaster of Paris and mica. The use of asbestos with plaster of Paris has also been patented. The latter answers a very good purpose used alone, and other good incombustible non-conductors also employed for filling are clay, hydraulic cement, and a mixture of alum, fire clay, and carbonate of lime or chalk. An excellent filling is a mixture of alum and plaster of Paris. Within a few years great ingenuity has been employed in the construction of safes and locks, and it has become an important industry in the United States. Safes are now made to defy opening by any manipulation (see Lock), and there are devices which make it difficult or impossible for a burglar

to introduce gunpowder without consuming a long time in boring. A contrivance to prevent boring has been patented by Mr. Henry Geering of Birmingham, England, which consists in placing in front and on each side of the lock a set of movable cylindrical steel bars, so that when the burglar's drill has penetrated through the outer plate it cannot get a bearing upon the rotating bars.

SAFETY LAMP. See LAMP.

SAFFI, or **Asfi**, a seaport of Morocco, on the W. coast, S. of Cape Cantin, 75 m. N. by E. of Mogador; pop. about 10,000. It is surrounded by a massive wall 30 ft. high, with a ditch on the land side. The country around it is sterile, and water is scarce. The harbor is large and generally safe, but is exposed to W. winds. Before the rise of Mogador Saffi controlled most of the commerce of Morocco with Europe. The entries at the port in 1873 were 180 vessels, of 35,376 tons; value of cargoes, \$568,590, of which \$300,000 was in specie; clearances the same, value \$1,388,140. The principal exports are grain, beans, eggs, goat skins, wool, oranges, and slippers.—Saffi is on the site of the Portus Rhusibis of Ptolemy, supposed to have been built by the Carthaginians. It was held by the Portuguese and Spaniards from 1508 to 1641.

SAFFLOWER, a dyeing material, the florets of *carthamus tinctorius*, also called bastard and dyer's saffron, and in this country, incor-

Safflower (*Carthamus tinctorius*).

rectly, saffron. The genus *carthamus* (from *kartam* or *quortom*, the Arabic name of the plant) belongs to that tribe of *compositæ* which includes the thistles, and contains about 20 species, the most important being the safflower; this is an annual, which has been so long cultivated in the East that its native country is unknown; it is from 1 to 3 ft. high, the stem branching above, and furnished with oval, half-clasping leaves, with spiny teeth; the flowers are in thistle-like heads at the ends of the

branches, with a leafy and prickly involucre; the florets are all tubular, and of a dark orange color; akenes (popularly seeds) without pappus, four-sided, white or brownish, and very smooth. The plant will perfect itself in the northern states, and is often seen in the gardens of those who raise medicinal herbs. When the florets are fully expanded, they are pulled out of the head and dried. The principal supply of commerce is from the East Indies, where the florets are pressed into small cakes an inch or two in diameter, and dried in kilns; afterward they are packed in bales of about 2 cwt. Formerly safflower was largely used in measles and other diseases accompanied by an eruption of the skin, and it is still kept in the drug stores, there being some demand for it in domestic practice; the home-grown, dried loosely, is preferred. It has at most a slightly diaphoretic effect. Safflower is sometimes used to adulterate the true saffron, a more expensive drug. (See SAFFRON.)—The chief use of safflower is as a dye, and before the introduction of aniline colors it was largely employed to impart to silk various shades of pink, rose, crimson, and scarlet; the colors, though fugitive, are very brilliant. It contains a yellow coloring principle, which is soluble in water and of no value, and a red coloring matter, carthamine or carthamic acid, which is insoluble in water, but soluble in alkaline liquids, from which it is precipitated by acids. When used as a dye, the yellow color is first extracted by kneading the safflower in bags under water; it is then treated with a solution of carbonate of soda; in the liquid thus obtained the silk, previously mordanted with lemon juice, is immersed. The pink saucers, sold for dyeing and for toilet purposes, are small white saucers with a thin coating of carthamine. Rouge is also prepared from it. (See ROUGE.)

SAFFORD, Truman Henry, an American mathematician, born in Royalton, Vt., Jan. 6, 1836. While a child he attracted public attention by his remarkable powers of calculation. He could mentally extract the square and cube roots of numbers of 9 and 10 places of figures, and at 14 produced the elliptic elements of the first comet of 1849. At this time he was widely known as the Vermont boy calculator. He graduated at Harvard college in 1854, and spent some time in professional studies in the observatory of that institution. Between 1850 and 1862 he computed the orbits of many planets and comets, and his labors were published in the monthly notices of the royal astronomical society of England, the *Astronomische Nachrichten*, and the "Astronomical Journal." From 1863 to 1866 he was connected with the Harvard observatory, part of the time as acting director, and was chiefly employed in observations for a standard catalogue of right ascensions. In the single year 1863 he determined the right ascension of 1,700 stars, and the declination of 450. In 1865 he became professor of astronomy in the univer-

sity of Chicago and director of Dearborn observatory. The first two years here were chiefly devoted to work upon the nebulae, many new ones being discovered. From 1869 to 1871 he was engaged upon the great catalogue of stars now forming by the coöperation of English, German, Russian, Norwegian, Swiss, and American astronomers. This undertaking, however, was interrupted by the total loss of the means of the Chicago observatory, and since 1872 Prof. Safford has been much employed in latitude and longitude work in the territories, by the United States engineers, for whom he has also prepared a star catalogue, which was published by the war department. He is now (1875) working upon another. He has edited vol. iv. (part i.) and vol. v. of the "Annals of Harvard College Observatory." The latter volume is taken up by the report of Prof. G. P. Bond's discoveries in the constellation of Orion, which Prof. Safford wrote out fully after Bond's death. Other contributions of Prof. Safford may be found in the same periodical, and also in the "Proceedings of the American Academy."

SAFFRON (Arab. *zafran*, from *asfar*, yellow), a drug consisting of the dried stigmas of *crocus sativus*. The genus *crocus* is famil-

Saffron Crocus (*Crocus sativus*).

iar through the spring-flowering garden sorts; the saffron crocus resembles these, but blooms in autumn; the flowers are pale violet, veined with purple, and very fragrant; the leaves appear soon after the flowers; the corm or bulb is rather larger than in the spring crocuses. The important part of the plant is the stigma, which is orange-red, with three drooping divisions, each about an inch long, and usually with a crest at the end; these are protruded beyond the flower. Saffron is mentioned by Solomon (Canticles iv. 14), and has been known and cultivated from very early times, so that its home is very doubtful; it grows spontaneously in Greece, but may have been intro-

duced by the early cultivators. The stigmas are collected and dried in sieves over a gentle fire, the operation being completed in half an hour. It requires the stigmas of 4,320 flowers to make an ounce of the dried saffron. In the genuine article the stigmas are loose and distinct; this is called hay saffron, to distinguish it from a factitious preparation of various substances pressed together on paper, called cake saffron. The principal production of the drug is in lower Aragon and other parts of Spain; a considerable amount of excellent quality is gathered in the department of Loiret, France; some is produced in Austria; and a small quantity is cultivated by the Germans in Lancaster co., Pa. It was formerly cultivated in England at Saffron Walden, but the supplies from that source have ceased. The cultivation sometimes fails entirely, on account of a fungus which destroys the bulbs. The drug has always borne a high price, on account of the labor required to collect the small stigmas which compose it, and has been subject to various adulterations; one of the most common is the admixture of safflower; another is the petals of the garden marigold; even shreds of beef have been used. All such adulterations are easily detected by soaking a small quantity of the drug in warm water; the peculiar form of the stigmas, with three long lobes, allows the true to be distinguished from the false at once. Saffron was formerly regarded as of so much importance that various countries had most stringent laws against its adulteration. In Germany in 1444 a man was burnt with his adulterated saffron, and in 1456 two men and a woman were buried alive in the same country for falsifying the drug. Saffron is of no value for any medicinal effect; it is now used but little in pharmacy, and then solely for its color. Its taste is of a warm, bitterish character, its odor sweet and penetrating, and its color a rich deep orange. A single grain of saffron rubbed to a fine powder with a little sugar will impart a distinct tint of yellow to 700,000 grains (10 gallons) of water. The coloring matter, termed polychroite, in allusion to the diversity of tints it is capable of assuming, is soluble in water and alcohol, but varies by the action of different acids. It is a peculiar glucoside, which by the action of acids splits into sugar, volatile oil, and a new coloring matter called crocine.

SAGA, a city of Japan, in the province of Hizen, at the head of the bay of Shimabara, island of Kiushiu; pop. about 100,000. It is regularly laid out, the streets crossing at right angles, is the principal seat of the trade of Kiushiu, and manufactures the famous Hizen porcelain ware. It has an ancient castle, a telegraph station, and government schools. It was the former capital of the prince of Nabeshima, one of the 18 semi-independent daimios, and the scene of much active labor by Jesuit missionaries in the 16th and 17th centuries. In 1872 it was the centre of a party which took up arms to compel the resignation

of the Tokio cabinet, and the acquiescence of the government in the projected invasion of Corea. This rebellion was suppressed in a few days, several regiments of the national army in government transports and chartered American steamers arriving at Saga, and after a battle and some skirmishing restoring the authority of the central government. The principal leader and 13 others, including two students educated abroad, were decapitated; 195 persons were condemned to various punishments; more than 7,500 insurgents surrendered; and 50 villages in the vicinity and about 1,000 houses in Saga were burned.

SAGADAHOC, a S. county of Maine, bordering on the Atlantic, and intersected by the Kennebec river; area, about 300 sq. m.; pop. in 1870, 18,803. Nearly half the county is composed of small islands at the mouth of the Kennebec, and it has numerous bays and channels. The soil is fertile. The inhabitants are largely engaged in ship building, fishing, and the coasting trade. It is intersected by the Portland and Kennebec, the Bath and Rockland, and the Androscoggin railroads. The chief productions in 1870 were 18,225 bushels of Indian corn, 15,849 of oats, 21,951 of barley, 103,928 of potatoes, 25,060 tons of hay, 29,416 lbs. of wool, and 264,862 of butter. There were 1,340 horses, 3,125 milch cows, 1,668 working oxen, 2,835 other cattle, 8,151 sheep, and 1,098 swine. The county contained 37 saw mills. Capital, Bath.

SAGAN, a town of Prussia, in the province of Silesia, on the Bober, 45 m. N. W. of Liegnitz; pop. in 1871, 10,433. It has a fine palace, four churches, and a Catholic gymnasium, and cloth and other manufactories. It is the capital of a mediatized principality, which in 1627 became the property of Wallenstein, in 1646 of Prince Lobkowitz, and in 1786 of Duke Peter of Courland, whose daughter Dorothea bequeathed it in 1862 to her son Prince Louis Talleyrand, duke of Sagan and of Valençay.

SAGAPENUM, a gum resin, of unknown botanical origin, which has been used in medicine. Its properties were known to the ancients, and it is spoken of by Hippocrates, Dioscorides, and Pliny. But at present it can scarcely be procured genuine even at Bombay, whither it is sometimes brought from Persia. It is received in agglutinated fragments of brownish and reddish yellow colors, of consistence like wax, of a garlicky odor, less disagreeable than that of asafoetida, and of a hot, nauseous, bitterish taste. It has no medicinal value.

SAGE (*Fr. sauge*), the name given to species of *salvia*, of the labiate family, and especially to the common or garden sage, *S. officinalis*. The genus *salvia* (Lat. *salvare*, to save, in reference to reputed medicinal qualities) is a large one, containing more than 400 species, distributed in nearly all parts of the world, and including plants which are very unlike in external appearance, and mainly distinguished by the structure of the anthers, which have the two cells widely separated by a transverse connec-

tive, one cell being perfect and producing pollen, while the other, at the opposite end of the connective, is deformed and abortive. There are two native species in the middle states, four others in the southern, and several others in the far western and southwestern states.

Garden Sage (*Salvia officinalis*).

The garden sage, the best known species, is a hardy, half shrubby plant from the south of Europe; its oblong-lanceolate leaves are rough with a fine network of veins, minutely pubescent, and of a dull hoary green color; the flowers are in whorled spikes, usually blue, but the varieties present other colors. The plant has a peculiar aromatic odor and a warm and bitterish taste. Besides the common form, there are broad and narrow-leaved varieties, and variegated forms, one of which, under the name of *salvia tricolor*, is cultivated as an ornamental plant. Sage has been used medicinally since very early times, its Latin name indicating the esteem in which it was formerly held; besides being an aromatic stimulant, it has tonic and astringent properties, and its infusion is frequently given in domestic practice; it is a useful gargle in sore throat with relaxed uvula. But its chief use is as a condiment or seasoning for stuffings, sausages, and other cookery; and it is sometimes used to flavor cheese. The market gardeners around New York cultivate sage entirely as an annual; seeds are sown in a bed in April, and in June or July the plants are set out in rows 12 in. apart, on land from which cabbages, peas, or other early crops have been removed, and the plants are cut in September or later. Where sage is dried and pressed into cakes for market, it is treated as a perennial; the flower spikes are cut out as they appear, and the leafy shoots gathered and dried.—Clary is a species of sage (*S. sclarea*), with much larger leaves than the common, with a strong and to many persons unpleasant flavor; it is rarely seen in our gardens, but is used in Europe for flavoring soups.

The scarlet sage, *S. splendens*, from Brazil, is a common and much esteemed garden plant, usually called by its botanical name, salvia; it is a smooth and much-branching species, with dark green ovate leaves, and long spikes of flowers of the most brilliant scarlet; the calyx is of the same color with the corolla, and each flower is subtended by a conspicuous floral leaf or bract, also scarlet; as these bracts remain after the flowers have fallen, much of the effectiveness of the plant is due to them. It is a tender perennial, but will flower the first year from the seed; it is often treated as an annual, but it is most frequently raised by cuttings from plants kept in a greenhouse for the purpose. A sport from this has pure white flowers, and there are several garden forms, one more dwarf than the type. *S. fulgens*, from Mexico, and *S. coccinea*, from Central America, are scarlet-flowered species, sometimes cultivated. The blue sage, *S. patens*, from Mexico, has flowers of the most charming blue, but the plant has a coarse weedy habit. The silver-leaved sage, *S. argentea*, from the Mediterranean, with very large ovate or roundish, radical leaves, covered with white woolly hairs, is sometimes cultivated for its foliage only; the flowers are white, and not showy.—Some of the native species suitable for the garden are *S. azurea* of the southern states, 2 to 4 ft. high, with fine blue flowers; *S. Pitcheri*, growing from Kansas to Texas, covered with a soft down; and *S. farinosa*, of Texas, white-hoary, with light blue flowers.

SAGE, Antoine René le. See LE SAGE.

SAGE BUSH. SEE ARTEMISIA.

SAGHALIEN, or *Saghalin*, an island of Russia, formerly jointly claimed and occupied by Russia and Japan, off the E. coast of Asia, between lat. 45° 56' and 54° 25' N., and intersected by the meridians 142° and 143° E.; length about 600 m., breadth from about 20 to 80 m.; area, 24,560 sq. m.; pop. about 16,000, including Russians, Japanese, Chinese, Ainu and other natives, and some persons of European and American extraction. The entire coast does not present a single safe harbor, and the largest bays are so shallow that ships can rarely go nearer than 1 m. to the shore. The strait of Mamio Rinzo, between Cape Muraviev in the Littoral province of Siberia and the island, is not more than 5 m. wide, and is frozen over three or four months in the year, affording connection by dog teams over the ice with the continent. The strait of La Pérouse separates Saghalien from the Japanese island of Yezo. Through the entire length of the island, almost on meridian 143°, is a range of mountains more than 2,000 ft. high, and in the S. part are peaks of 4,000 ft. Below lat. 52° there is a parallel range on the E. side. None of the mountains are volcanic. As yet the exploration is but partial, and the exact topography of the island is unknown. There are rich deposits of coal along the entire shore on the W. side. The two principal riv-

ers, Baronai and Tymi, rise near each other in lat. 50° 40', the first flowing S., the second N., neither more than 106 or 112 m. long, and both navigable for boats. There are four lakes of from 15 to 37 sq. m., all united with the sea by small and deep channels, and numerous lesser lakes in the northwest. The climate is cold, damp, and foggy, with abundant rain in summer; and snow falls for days together in winter and lies on the mountains till the middle of May. The mean temperature is 62° F. in July, and 14° in January. The soil varies in quality, and is little cultivated, the inhabitants subsisting chiefly upon fish and game, while corn is imported from Russia and rice from Japan. There are a few plains and natural meadows. Besides coal and petroleum, the natural riches of the island are the woods, furs, and fisheries. The woods covering the mountains consist of Norway spruce, fir, Siberian silver fir, pines, and deciduous trees from the birch to the elm. The hunting grounds furnish sable, fox, deer, and bear skins. Seals, sea lions, and whales abound in the neighboring seas. Fish are plentiful in the estuaries and rivers, particularly salmon, and in autumn swans, geese, ducks, and other wild fowl. Large quantities of dried and salted salmon and herring are sent to Japan. Most of the furs go to Russia, some to Japan, and a few to the United States. The chief trading posts are at Aniva bay on the S. end of the island, and the trade is carried on mainly by barter.—About 1780 the Japanese began to settle the shores in the S. part, while the Russians were invading the N. part. In 1804 the two nations unsuccessfully attempted to fix upon a boundary of occupation. In 1852 some Americans tried to found a post to open trade with the continent, and Russia immediately took formal possession of the island, sending men from Siberia to build forts and establish posts, and in 1853 they opened some of the coal mines. In 1854 Russia renewed negotiations as to boundary with Japan, and the island was declared "still unpartitioned," Japan claiming all below lat. 50°, while the Russians had actually colonized considerably S. of that parallel. A joint occupation was agreed upon, and in 1875 the Japanese portion of the island was formally ceded to Russia. In 1873 Russia made its colony a penal settlement and sent convicts to work the coal mines.

SAG HARBOR, a village and port of entry in the towns of East Hampton and Southampton, Suffolk co., New York, on the S. side of Gardiner's bay, near the E. extremity of Long Island, and at the terminus of a branch of the Long Island railroad, by which it is 107 m. E. of New York; pop. in 1870, 1,723; in 1875, 2,100. It has a good harbor, and is largely engaged in the coasting trade, being the only outlet of a good farming district. The whale fishery, once extensive, is now extinct. Sag Harbor is much resorted to in summer. Two lines of steamers run to New York and one to the Connecti-

cut river. The village contains a cotton mill, a flour mill, three cigar manufactories, a savings bank, two private banks, a union school, two weekly newspapers, and Baptist, Episcopal, Methodist, Presbyterian, and Roman Catholic churches.

SAGINAW, a river of Michigan, formed at Saginaw City by the confluence of the Cass, Shiawassee, and Tittibawassee rivers. It flows nearly N. for 18 m., and empties into Saginaw bay. It is navigable by the largest steamers. Its branches and tributaries, flowing from all points, drain a large area.

SAGINAW, an E. county of Michigan, drained by the Saginaw river and its affluents; area, about 900 sq. m.; pop. in 1870, 39,097. The surface is level or gently undulating, and the soil very fertile. The principal exports are fish and pine lumber. Water power is abundant. It is intersected by several railroads centring at Saginaw. The chief productions in 1870 were 37,255 bushels of wheat, 43,349 of Indian corn, 52,295 of oats, 86,999 of potatoes, 14,926 tons of hay, 16,086 lbs. of wool, and 318,275 of butter. There were 1,894 horses, 3,077 milch cows, 3,775 other cattle, 5,258 sheep, and 3,216 swine; 36 manufactories of carriages and wagons, 42 of salt, 86 saw mills, 6 planing mills, 5 flour mills, and 7 breweries. Capital, Saginaw.

SAGINAW, or **Saginaw City**, a city and the capital of Saginaw co., Michigan, on the W. bank of the Saginaw river, here formed by the confluence of the Cass, Shiawassee, and Tittibawassee rivers, and crossed by three bridges, 18 m. above Saginaw bay, and partly opposite East Saginaw, 115 m. N. W. of Detroit; pop. in 1860, 1,699; in 1870, 7,460; in 1874, 10,064. It is finely situated and tastefully laid out and built. The ground rises from the river to a moderately elevated table land. The corporate limits extend about 4 m. along the river, with an average width of 2 m. Washington street, a fine avenue, extends through the city parallel to the river. E. of it are most of the business places, while on the W. side are the county buildings and most of the churches, school houses, and residences. A good supply of water is furnished, on the Holly plan. Horse cars run to East Saginaw. The city is connected with Detroit and other points in the state by the Michigan Central, the Flint and Père Marquette, and the Saginaw Valley and St. Louis railroads. Saginaw has an extensive business in furnishing supplies for the lumber regions, and possesses large interests in saw mills and salt works in the adjacent country. The principal manufacturing establishments within the city limits are eight large saw mills, three planing mills, sash and door manufactories, extensive stave and barrel works, four shingle mills, and eight salt works. The city contains a national bank, a private bank, several hotels, a central and five ward schools, two weekly newspapers, and Baptist, Episcopal, German Lutheran, Methodist, Presbyte-

rian, Reformed Lutheran, and Roman Catholic churches.—Saginaw was first settled in 1822, and received a city charter in 1859.

SAGINAW, East. See EAST SAGINAW.

SAGINAW BAY. See HURON, LAKE.

SAGO, a form of starch obtained from the trunks of several species of palm. *Sagu* (also written *zagu* and *saga*) is the Malay name for the starch and the tree which yields it, and is in Java the name for bread prepared from the farina. It was formerly supposed that sago was the product of *cycas revoluta*, a palm-like tree belonging to a very different family, which is even mentioned in some recent works as its source, and the tree is still to be found in greenhouse collections as the "sago palm;" while its trunk contains starch, it affords none of the sago of commerce. Several of the

Sago Palm (*Sagurus Rumphii*).

palms, especially those which flower but once, accumulate in the tissues of their trunks a large amount of starch, as a preparation for the nourishment of the future flower and fruit; and in countries where palms abound, the inhabitants make use of this as food, while it is not known in commerce. (See PALM.) The sago of the shops is mainly produced by *sagurus levis*, the smooth, and *S. Rumphii*, the prickly sago palm, both natives of the islands of the Indian archipelago and other islands of that part of the world; the smooth species grows from 25 to 50 ft. high, while the other, which mainly differs in having its leaf stalks and the spathe or sheath to the flower cluster armed with sharp prickles, is rarely over 30 ft. Both have graceful crowns of large pinnate

leaves, and a one-seeded fruit an inch and a half in diameter, covered with shining reversed scales. Left to themselves, the trees attain their full growth in about 15 years, flower, produce their fruit, which is about three years in coming to perfection, and then die. To obtain the sago, the trees are felled as soon as they show signs of flowering; it is often stated that the starch is obtained from the pith of the trees, but palms have no true pith, and the starch, accumulated to nourish the fruit, is found to be deposited all through the tissues of the trunk, except in the hard rind; when allowed to bear fruit, the trunk finally becomes a nearly hollow shell. The trunk is cut into convenient lengths, which are split in halves, and the interior soft portion is scraped out and pounded in successive waters until all the starch is separated; the water in which the starch is suspended is allowed to stand until this settles, and the fibrous matter, which floats, is poured off with the water. The sediment is repeatedly washed, and when freed of all extraneous matter it is dried, and is then called sago meal. In this form it is but little known in this country, that which is imported being consumed in manufacturing processes; it is the crude starch of the palm. The form in which sago is usually seen is that called granulated or pearl sago; the wet starch is dried, broken up, and pounded and sifted until of a somewhat regular size, the larger grains being of the size of mustard seed, intermixed with numerous smaller ones; the process of granulation is not known in full, but it is said that heat and mutual attrition by rubbing in a bag are used to form and shape the grains. Sago meal, the unprepared starch, presents under the microscope a great many muller-shaped granules, *i. e.*, elongated, rounded at one end and truncate at the other; the granules of pearl sago are larger and less regular, being changed by the heat used in preparing it. Sago is usually of a pinkish or slightly brownish tint, but it is sometimes artificially bleached and pure white; it swells up in cold water, and does not completely dissolve by boiling. It has the general properties of other amylaceous foods, and is principally eaten in the form of sago pudding. A facitious sago is sometimes met with, in which the grains are much larger and more regular than in the true, and of a pure white; this is made from potato starch, and may be readily detected under the microscope, as the potato starch granules are much larger than those of sago and of a different shape.

SAGOSKIN. See ZAGOSKIN.

SAGUACHE, a S. county of Colorado, forming the N. extremity of San Luis park, bordered on three sides by mountains, and watered by affluents of the Gunnison and Arkansas rivers; area, about 2,500 sq. m.; pop. in 1870, 304. The valleys are natural meadows, covered with a rich vegetation, and the table lands afford fine natural pasturage. In the S. part is a

lake, 24 by 10 m., which has a regular ebb and flow. The chief productions in 1870 were 5,921 bushels of wheat, 5,527 of oats, 1,061 of potatoes, 6,800 lbs. of wool, 6,250 of butter, and 174 tons of hay. There were 129 horses, 2,052 milch cows, 1,751 other cattle, and 3,100 sheep. Capital, Saguache.

SAGUENAY, a river of Quebec, Canada, flowing from Lake St. John by two outlets, which unite 9 m. E. of the lake (see QUEBEC, vol. xiv., p. 135), to the St. Lawrence at Tadoussac, 120 m. below Quebec; length about 100 m. From the junction it flows S. E. with a stream from $\frac{1}{2}$ m. to 2 m. in width, at first between gently sloping banks; but below Grand or Ha! Ha! bay it forces its way through perpendicular cliffs of granite and syenite, one of them, Cape Trinity, towering 1,500 ft. above the river, and another near it, called Pointe d'Éternité, still more lofty. Ha! Ha! bay is on the W. side of the river, about 60 m. from its mouth, and is about 9 m. wide and 9 m. long, with a depth of from 15 to 35 fathoms. The depth of the river is remarkable; 34 m. from its mouth there is a recess or bay which is $1\frac{1}{2}$ m. deep; and at another point, a little lower down, called St. Jean's bay, the depth is $1\frac{1}{2}$ m. Its average depth in mid-channel, according to Admiral Bayfield, is 145 fathoms. It is navigable for steamboats to Chicoutimi, 75 m. from its mouth; above that point the rapids prevent navigation, and at low water a bar about 60 m. from its mouth prevents large vessels from ascending.

SAGUENAY, the N. E. county of Quebec, Canada, bordering on the river and gulf of St. Lawrence; area, 68,840 sq. m.; pop. in 1871, 5,487, of whom 3,519 were of French and 390 of English origin or descent, and 1,309 were Indians. It includes the island of Anticosti, and embraces the portion of Labrador belonging to the province. The Saguenay river intersects the S. W. extremity, and numerous other rivers flow into the river and gulf of St. Lawrence. The settlements are scattered along the coast, and the inhabitants are engaged in fishing. Capital, Tadoussac.

SAGUNTUM, or **Saguntus**, an ancient town of Spain, the ruins of which, consisting of a theatre and a temple of Bacchus, are still visible at Murviedro in the province of Valencia, near the mouth of the river Palancia in the Mediterranean. It was founded, according to tradition, by a Greek colony from Zacynthus (Zante), who named it after their native island, but owes its celebrity in history to its destruction by Hannibal, 219 B. C., which immediately led to the second Punic war. It was rebuilt by the Romans and made a colony. The name of the modern town on its site is derived from *muri veteres* (old walls). The ruins of the ancient theatre, the general form of which is still perfect, were enclosed with a wall in 1867.

SAHAPTINS, or **Saptins**, a family of North American Indians, living west of the Rocky

mountains and extending from the Dalles of the Columbia to the Bitter Root mountains, on both sides of the Columbia, and on forks of the Lewis and the Snake or Sahaptin rivers. They have the Selish family on the north and the Shoshones on the south. The family embraces the Nez Percés or Sahaptin proper (see NEZ PERCÉS), the Palus, the Tairtla, the Wallawallas, the Yakamas and Kliketats, and according to some the Wailatpus or Cayuses.

SAHARA, the largest desert in the world, occupying an area estimated at from 1,500,000 to 2,500,000 sq. m., in the N. portion of Africa, across which it extends 3,000 m. from the Atlantic ocean to the valley of the Nile, with a width of 1,000 m. between Soodan and the countries bordering the Mediterranean sea. As the same sterile region is renewed beyond the Nile, its E. and W. boundaries may be regarded as coterminous with those of the continent itself, while the 15th and 30th parallels of N. latitude mainly form its southern and northern limits. Under the name of the Algerian Sahara, it extends considerably N. of the 30th parallel along the southern base of the Atlas, and closely approaches the Mediterranean W. of the gulf of Cabes. Here the marshy depressions known as *shotts*, of which the so-called Melrir lake is best known, constitute a basin into which it has been proposed to admit the waters of the sea by means of a canal. Continuations of the Sahara stretch eastward and northward through Arabia, Persia, and central Asia into Mongolia, where they terminate in the desert of Gobi. The great desert of Africa presents an alternation of immense burning wastes of loose and moving sand, with tracts of barren rock, stony plains of gravel, many of which are covered with saline deposits, and elevated and rocky plateaus rising into mountains with extensive valleys and expanses of sand between them. The average elevation of the Sahara above the sea is estimated at 1,500 ft., although the surface is known to be depressed in many places below the level of the ocean. Its most mountainous portion lies along the caravan routes between Tripoli and Bornoo and Houssa, where the general altitude of the table land, beginning on the north in the plateau of Hamadah, ranges from 1,000 to 2,000 ft., amid peaks of double these heights, attaining the maximum in the mountains of the oases of Asben, 5,000 ft. The desolate region of the west, called Sahel (the plain), comprises the greatest expanse of sand and salt desert. Its hills encroach upon the Atlantic in a long line of banks pushing out into the sea between Cape Bojador and Cape Blanco. In this portion of the desert oases are few and small, and there is little travel. East of the oasis of Fezzan the Sahara becomes known as the Libyan desert, and is comparatively level, sloping toward the Mediterranean with a gentle gradient. (See LIBYAN DESERT.) Here oases, the only permanently inhabited places of the desert, are

most numerous. (See OASIS.) The character of the S. border of the Sahara is imperfectly known, but is believed to be mountainous. In the north it is skirted by extensive treeless pasture lands along the base of the Atlas range, reaches the shores of the Mediterranean at the gulf of Sidra, and further E. is bounded by the table land of Barca.—A climate of burning aridity prevails on the great desert of Africa. Rain is utterly unknown except in the oases and on the mountains, where it occasionally falls with such violence as to produce torrents that suddenly pour down into the valleys, and almost as suddenly disappear. The sterility of the Sahara is largely attributable to the fact that the prevailing N. E. trade winds which blow over its surface bring it no moisture, having been almost drained of aqueous vapor in their long continental journey over Europe and Asia. On the mountains S. of the Mediterranean they deposit more than they have collected in their brief passage over that sea. When they reach the heated desert beyond, where the absorptive capacity of the air is greatly increased by the access of temperature, they bear away moisture instead of bringing it, and it is not condensed into rain until it reaches the mountains of central Africa. The Sahara is probably subject to a higher temperature than any other region on the globe; the thermometer there has been known to register 133° F. This terrific heat imparts their dreaded characteristics to the simoom and other similar winds which blow off the desert. (See AFRICA.) Notwithstanding the obstacles to travel offered by the desert, it is constantly crossed on various routes by caravans of traders. In the absence of watercourses, were it not for the camel, well termed in oriental language "the ship of the desert," these wastes would be impassable to man. Nocturnal radiation is extremely rapid, and the nights are usually cold.—The geological formation is unfavorable to fertility, and although in some localities a growth of thorny bushes and plants peculiar to the desert is met with, the vast bodies of silicious sand afford little or no nutriment to vegetation, and their unstable nature is opposed to its development. Even in mineral productions the desert maintains its character as a barren waste. No useful products are obtained except salt, which is collected by caravans and sold in Soodan. The fauna of the desert proper includes snakes, lizards, scorpions, and ants; but the animals of its borders and the oases comprise about 50 species of mammals, including the lion and leopard, the giraffe, and various antelopes. The marked distinction between the faunas of N. and S. Africa, separated by the desert, is explained by the supposition that a portion of the Sahara was submerged beneath the sea during the pliocene period of geology. Marine shells have been discovered S. of the Atlas, and lines of sea beach, showing that at no very remote geological period the plains formed the bed

of the ocean. According to Sir Charles Lyell, the Sahara was under water between lat. 20° and 30° N. at one time during the glacial epoch, so that there was water communication between the southern part of the Mediterranean and that portion of the Atlantic ocean now bounded by the W. coast of Africa. A project has of late been advocated of reconverting the deeper part of the Sahel, an area of about 126,000 sq. m., into a sea, by cutting a canal from the Atlantic through the sand hills which form the western border.

SAIDA (anc. *Sidon* or *Zidon*), a town of Syria, in the pashalic of Acre, 24 m. S. S. W. of Beyrout, on the N. W. slope of a promontory projecting into the Mediterranean; lat. 33° 34' N., lon. 35° 23' E.; pop. about 6,000,

principally Moslems and Greeks. It has several great khans or caravansaries. The harbor was filled up by the emir Fakhr ed-Din in the 17th century, and is now only accessible for boats. A ruinous old castle, supposed to have been built about the beginning of the Christian era, occupies a large artificial rock or mole at the mouth of the harbor, and is connected with the city by a bridge of nine arches. The chief trade of the town is in silk. The environs are famous for their fruit. The ruins of ancient Sidon are about 2 m. inland. On Jan. 20, 1855, a sarcophagus, now in the Louvre, was discovered among these ruins, with a Phœnician inscription 22 lines in length, indicating that it had been the resting place of Eshmunazar, king of the Sidonians, of uncer-

Saida.

tain date. About the same time several pots of gold coin, of the age of Alexander the Great, were disinterred here; the whole amount was of the value of about \$40,000. The ancient necropolis was excavated in 1860 by the French expedition under M. Renan.—Saida was bombarded and taken by the allied Turkish, Austrian, and English fleets in 1840. (See *SIDON*.)

SAID PASHA, viceroy of Egypt. See *EGYPT*, vol. vi., p. 467.

SAIGON, or *Saigon*, a city of Further India, capital of French Cochinchina, on the river Saigon, 35 m. from its mouth; pop. estimated at from 60,000 to 120,000. It consists of two separate towns connected by a navigable river and a road 2 m. long. The citadel was begun by a French engineer in 1790, and now includes barracks, officers' quarters, and a governor's residence. There are a large naval yard, an arsenal, two pagodas, and extensive rice magazines. The river Mekong communicates with the Saigon by a canal. The city is an important seat of commerce, exporting rice, cinnamon, and valuable woods, and is a

convenient station for commercial and postal steam lines.—Saigon formerly belonged to Anam. It was captured and occupied by the French under Admiral Rigault de Genouilly, Feb. 17, 1859, and it became French territory by treaty, June 5, 1862.

SAIMIRI. See *MONKEY*.

SAINFOIN (Fr., wholesome hay), a fodder plant (*onobrychis sativa*) of the order *leguminosæ*, growing spontaneously in the limestone districts of England, middle and southern Europe, and Asia. Its roots are perennial, and are capable of penetrating to a great depth; its stems recumbent or nearly upright, 2 or 3 ft. long; its smooth pinnate leaves consist of 9 to 15 opposite and acute leaflets; the flower stalks are axillary, longer than the leaves, terminated in July by spikes of pink flowers, which are followed by small, flat, hard, one-seeded pods, having raised veins and often prickly on the edges. The plant has been cultivated since very early times, its botanical

name being the ancient Greek one. It was introduced into Great Britain about the middle of the 17th century, and is there a valuable crop on chalk lands, but on alluvial soil is in-

Sainfoin (*Onobrychis sativa*).

ferior to lucern; it is cut and made into hay; too close pasturing kills the roots. Occasional experiments have been made with it in this country, but as it requires three or four years to become thoroughly established, it is not suited to our agriculture. (See LUCEEN.)

SAINT. See CANONIZATION.

SAINT ALBANS, a town and the capital of Franklin co., Vermont, bordering on Lake Champlain, at the junction of several divisions of the Central Vermont railroad, 52 m. N. W. of Montpelier, 23 m. N. by E. of Burlington, and 14 m. S. of the Canada line; pop. in 1850, 1,814; in 1860, 3,637; in 1870, 7,014. The surrounding country abounds in fine scenery. The principal village is on an elevated plain 3 m. from the lake. In its centre is a neat park of four acres, around which are the county buildings, hotels, one of the school houses, and several churches. In the vicinity are quarries of calico stone and variegated marble, and a sulphur spring. There is a market every Tuesday, when the farmers from the adjacent country assemble, and large quantities of dairy products are sold. The quotations of butter and cheese at St. Albans affect the market throughout the eastern states. About 350,000 lbs. of butter and 5,000 lbs. of cheese, worth \$110,000, are shipped annually, chiefly to Boston. The town contains the extensive car shops of the railroad company, a manufactory of carriages, several marble shops, iron and steel works, a rolling mill producing steel rails, and manufactories of mowers, stoves, and various kinds of castings. There are two national banks, a savings bank and trust company, six hotels, graded and grammar schools occupying two buildings, two daily newspapers, one issuing a semi-

weekly and the other a weekly edition, a nunnery, and six churches.

SAINT ALBANS, a town of Hertfordshire, England, 20 m. N. W. of London; pop. in 1871, 8,303. It is built on the summit and side of a hill, has little trade, and the principal manufacture is straw plaiting and straw bonnet making. The cathedral-like abbey church was part of a Benedictine monastery founded in 795, and St. Michael's church contains the remains of Lord Bacon. The town was disfranchised for bribery in 1852.—St. Albans was built in 950, and incorporated by Edward VI. in 1553. It is near the site of the Roman Verulamium (Verulam), ruins of whose walls are still visible. During the wars of the roses two battles were fought here: on May 22, 1455, when the duke of York gained the day and the duke of Somerset, who led the Lancastrians, was killed; and on Feb. 17, 1461, when Queen Margaret, commanding the Lancastrians, gained a victory over the Yorkists, led by the earl of Warwick, and rescued Henry VI. from captivity.

SAINT ALBANS, Harriet Mellon, duchess of, born about 1775, died Aug. 6, 1837. She was a popular comic actress, when she married Mr. Coutts, a wealthy London banker. She soon after became a widow and sole mistress of a colossal fortune. On June 16, 1827, she married the duke of St. Albans, and when she died left him an income of £10,000 per annum with a life interest in some landed estates; but the great bulk of her vast property was left to Miss Angela Georgina Burdett, daughter of Sir Francis Burdett and granddaughter of her first husband. (See BURDETT-COUTTS.)

SAINT ANDREWS, a city and parish of Fifeshire, Scotland, on the North sea, between the mouths of the friths of Forth and Tay, 31 m. N. E. of Edinburgh; pop. of the city in 1871, 6,316. It is the seat of the university of St. Andrews, founded in 1411, and comprising St. Leonard's and St. Salvator's colleges (now united) and St. Mary's divinity college. The library of the united colleges has about 100,000 volumes. The university is the oldest in Scotland. The Madras school, the chief object of which is the gratuitous instruction of poor pupils, was founded by Dr. Andrew Bell.

SAINT ANDREWS, a port of entry and the capital of Charlotte co., New Brunswick, on a low narrow peninsula between Passamaquoddy bay and the mouth of the St. Croix river, at the S. terminus of the New Brunswick and Canada railroad, 65 m. S. S. W. of Fredericton; pop. in 1871, 2,961. The situation is convenient for commerce and the fisheries. The harbor is entered by two passes from the mouth of the St. Croix, and admits vessels of any size. The lumber trade and ship building are the chief industries. The value of imports for the year ending June 30, 1874, was \$107,065; of exports, \$66,798.

SAINT ANTHONY, Minn. See MINNEAPOLIS.

SAINT ANTHONY'S FIRE. See ERYSIPELAS.

SAINT-ARNAUD. See LEROY DE SAINT-ARNAUD.

SAINT AUGUSTINE, a city, port of entry, and the county seat of St. John's co., Florida, on the E. coast, 33 m. S. S. E. of Jacksonville; pop. in 1870, 1,717, of whom 594 were colored; in 1875, about 2,000. It occupies a peninsula, formed by the Matanzas river on the east and the St. Sebastian on the south and west. Directly in front is Anastasia island, forming a breakwater. Along the E. front of the city, about a mile, is a sea wall 4 ft. wide, built by the United States in 1837-'42, affording a delightful promenade on moonlight evenings. On the N. end of Anastasia island (S. side of the entrance to the port) is a revolving light, lat. 29° 53' N., lon. 81° 16' W. The streets, which are generally narrow, cross each other at right angles. In the centre is a fine public square, called the "Plaza de la Constitucion," on which are the custom house and post office, an imposing structure, formerly the residence of the Spanish governor, remodelled by the United States; the Roman Catholic cathedral, a large edifice in the Moorish style, erected in 1793; the Episcopal church, the old convent, and the ancient markets. Until within a few years the only material used in building was the coquina rock, a conglomerate of small sea shells, quarried on Anastasia island, and dried hard in the sun. The barracks are among the finest and most complete in the country. The building was formerly a Franciscan monastery. The old Spanish wall, which extended across the peninsula from shore to shore, and protected the city on the north, is in ruins. The principal object of interest to visitors is the old fortress of San Marco, now Fort Marion. It is of coquina, is well preserved, and will accommodate a garrison of 1,000 men. It was finished in 1756, after having been more than a century in construction, and was built entirely by Indian slaves. On account of the mildness of its climate, St. Augustine is much resorted to in the winter from the north; the number of visitors in 1874-'5 was more than 7,000. The mean annual temperature is 70°; frosts seldom occur, and semi-tropical fruits flourish. The chief business is the manufacture of "palmetto straw" work, which is largely shipped to the north. There is some coasting trade. Two lines of sailing packets run to New York. A railroad, 14 m. long, extends to Tocoi on the St. John's river, whence steamers ply to Jacksonville. There are four hotels, with accommodations for 700 guests; two free schools, one conducted by the sisters of charity, the other supported by the Peabody fund, each having about 200 pupils; two weekly newspapers; a public library of about 1,000 volumes; two convents; and five churches, viz.: Baptist (colored), Episcopal, Methodist (colored), Presbyterian, and Roman Catholic. About four fifths of the white inhabitants are of Spanish origin, and belong to the Catholic church.—St. Augustine is the

oldest town in the United States, a fort having been built here by the Spaniards under Menendez in 1565. It was several times attacked by the French, English, and Indians. With the rest of Florida it came into the possession of the English by the treaty of 1763, was ceded to Spain in 1783, and transferred to the United States in 1819.

SAINT BARTHOLOMEW, an island in the N. E. angle of the West Indian archipelago, about 25 m. N. of St. Christopher; area, 8 sq. m.; extreme length 6 m., greatest breadth 3 m.; pop. about 2,900, chiefly colored. The shores are deeply indented; the surface consists of barren hills and fertile valleys, yielding fruit, vegetables, sugar, cotton, and tobacco. The highest point, 992 ft., is near the E. end. Fuel and water are scarce. The climate is warm but healthful, owing to the trade wind. Gustavia, the capital, is on an arm of the sea opening into a bight on the S. W. side; it is a free port, but the harbor is too shallow to admit large vessels. The island was settled by the French in 1648, and finally came into the possession of Sweden in 1785. It is the only Swedish colony in the West Indies.

SAINT BARTHOLOMEW, Massacre of. See BARTHOLOMEW, SAINT.

SAINT BERNARD, a S. E. parish of Louisiana, between the gulf of Mexico and the Mississippi river, having Lake Borgne on the north; area, 620 sq. m.; pop. in 1870, 3,553, of whom 1,913 were colored. The surface is level and the soil fertile, the higher portions producing large crops of sugar cane. The chief productions in 1870 were 12,775 bushels of Indian corn, 32,767 of sweet potatoes, 190,480 lbs. of rice, 61 bales of cotton, 680 hogsheds of sugar, and 42,580 gallons of molasses. There were 7 molasses and sugar establishments. Capital, St. Bernard.

SAINT BERNARD. I. Great, a mountain pass in the Pennine chain of Alps, between Martigny in the Swiss canton of Valais and the Piedmontese valley of Aosta. There is no mountain bearing the name. The highest point of the pass is about 8,000 ft. above the sea. On the east is Mont Velan and on the west the Pointe de Dronaz. At the highest elevation of the pass, near the line of perpetual snow, is the *hospice* or monastery of St. Bernard, the highest dwelling in Europe. Its inmates are Augustinian monks, assisted by lay brethren (*marronniers*), celebrated with their dogs for rescuing travellers. In their hospice at times as many as 500 or 600 travellers have been accommodated at once. The snow around the hospice averages 7 to 8 ft. in depth, and the drifts sometimes rest against it and accumulate to the height of 40 ft. The severest cold recorded was 29° below zero, and the greatest heat 68° F. A monastery is believed to have existed on the Great St. Bernard previous to the foundation of the present hospice by St. Bernard of Menthon, in 962. Its most flourishing period was at the end of the 15th century, but it now depends on gifts and

collections. The route over the Pennine Alps by the Great St. Bernard was traversed by Roman armies, by armies under Charlemagne and Frederick Barbarossa, and in May, 1800, by a French army under Napoleon. A wagon road from Martigny to Liddes was completed in 1850. **II. Little**, a mountain of the Graian Alps, S. of Mont Blanc, on the frontier of Savoy, about 7,200 ft. high. It has a comparatively easy pass leading from the valley of the Isère into that of the Dora Baltea, which is believed to have been traversed by Hannibal in his descent into Italy. At a height of 7,076 ft. above the level of the sea is another convent founded by St. Bernard of Menthon for the relief of travellers.

SAINT-BRIEUC, a town of Brittany, France, capital of the department of Côtes-du-Nord, on the Gouet, 2½ m. from its mouth in the bay of St. Brieuc, 233 m. W. by S. of Paris; pop. in 1872, 15,253. It has a school of hydrography, a cathedral of the 13th century, and a statue of Du Guesclin. It is largely engaged in the whale and cod fisheries, and has an active trade in butter and cider. The port, called Légué, is 2 m. down the stream.

SAINT CATHARINES, a town, port of entry, and the capital of Lincoln co., Ontario, Canada, on the Welland canal and the Great Western and Welland railways, 35 m. S. of Toronto; pop. in 1861, 6,284; in 1871, 7,864. It is celebrated for its mineral springs, and is the centre of a large and rapidly increasing business. It contains five or six large flouring mills, several saw and planing mills, foundries and machine shops, a sewing machine factory, soap and candle factories, tanneries, woollen mills, breweries, ship yards, &c. There are three branch banks, excellent hotels, a hospital, grammar school, commercial college, three daily and three weekly newspapers, a convent, and churches of seven denominations. The value of imports for the year ending June 30, 1874, was \$1,066,589; of exports, \$34,803.

SAINT CHARLES. I. A S. E. parish of Louisiana, bounded N. by Lake Pontchartrain, and intersected by the Mississippi river; area, about 340 sq. m.; pop. in 1870, 4,867, of whom 3,963 were colored. There are several lakes and bayous on its borders; the surface is generally level and the soil fertile in the higher parts. It is intersected by Morgan's Louisiana and Texas railroad, and the New Orleans, Mobile, and Texas railroad. The chief productions in 1870 were 129,564 bushels of Indian corn, 32,767 of sweet potatoes, 2,238,200 lbs. of rice, 207 bales of cotton, 3,914 hogsheads of sugar, and 247,120 gallons of molasses. There were 527 horses, 1,287 mules and asses, 258 sheep, and 505 swine; and 21 molasses and sugar establishments. Capital, St. Charles. **II.** An E. county of Missouri, bounded N. and N. E. by the Mississippi river and S. E. by the Missouri, and drained by Cuivre river and several creeks; area, about 480 sq. m.; pop. in 1870, 21,304, of whom 1,922 were colored. The surface is

varied, occupied in part by a range of highlands, and the soil fertile. There are extensive coal mines. It is traversed by the St. Louis, Kansas City, and Northern railroad. The chief productions in 1870 were 760,980 bushels of wheat, 968,161 of Indian corn, 278,235 of oats, 16,143 of barley, 97,623 of potatoes, 6,882 tons of hay, 146,754 lbs. of tobacco, 41,003 of wool, 158,268 of butter, and 5,704 gallons of sorghum molasses. There were 5,788 horses, 1,815 mules and asses, 4,863 milch cows, 7,146 other cattle, 10,527 sheep, and 31,393 swine; 6 manufacturing of brick, 18 of carriages and wagons, 2 of furniture, 1 woollen mill, and 9 flour mills. Capital, St. Charles.

SAINT CHARLES, a city and the county seat of St. Charles co., Missouri, on the left or N. bank of the Missouri river, and on the St. Louis, Kansas City, and Northern railroad, 22 m. N. W. of St. Louis; pop. in 1850, 1,498; in 1860, 3,239; in 1870, 5,570, of whom 434 were colored; in 1875, about 7,500. The river is here crossed by a magnificent iron bridge for railroad and ordinary travel, completed in 1871 at a cost of \$1,750,000. There are seven river spans, and the entire length, including the viaduct approaches, is 6,535 ft. The city is lighted with gas and has a good fire department. The trade is considerable, and the manufactures are of some importance, the principal establishments being a foundry and machine shop, six flouring mills, two woollen mills, a furniture factory, a car factory, a starch factory, two tobacco factories, a broom factory, a plough factory, and five cooper shops. There are a national bank, two savings banks, a mutual fire insurance company, and a pork-packing establishment. Besides three public schools and several parochial schools of different denominations, the principal educational institutions are St. Charles college, the Lindenwood female college, and the convent of the Sacred Heart (female). St. Charles college was organized in 1836 and chartered in 1838, and is under the control of the Methodist Episcopal church, South. It was closed during the civil war, but has since been maintained as a high school. Four weekly newspapers (two German) and a monthly periodical are published. There are 11 churches, viz.: Baptist, Episcopal, Evangelical Protestant, German Evangelical, German Evangelical Lutheran, German Methodist, Methodist Episcopal, South, Presbyterian (2), and Roman Catholic (2).—St. Charles is one of the oldest settlements in Missouri, a post having been established here under Spanish authority by Louis Blanchette in 1769. It was incorporated as a town in 1809 and as a city in 1849.

SAINT CHRISTOPHER, an island of the British West Indies, often called St. Kitt's, in the Leeward group, separated from Nevis on the southeast by a strait 2 m. wide; length 23 m., breadth of its main body nearly 5 m.; area, 67 sq. m.; pop. in 1871, 24,440. A range of mountains traverses the island from S. E. to N. W.; the highest is Mt. Misery, over 4,000

ft. The skirts of the mountains, the higher parts of which are wooded, together with the valley of Basseterre, form the arable portion of the island, and are devoted mainly to sugar. The government consists of a president, an executive council appointed by the crown, and a legislative assembly, half of whose members are elected. Nevis has been recently united with St. Christopher for the purposes of executive government. In 1869 the imports were valued at £198,712; exports, £222,712. Capital, Basseterre.—St. Christopher was settled by English colonists under Sir Thomas Warner in 1623, was held afterward by the English and French, and finally was ceded to Great Britain by the treaty of Versailles in 1783. In 1872 it joined the confederation of the Leeward Islands, the legislature of which sits at St. John's, Antigua, and Basseterre in alternate years.

SAINT CLAIR, a lake lying between Michigan and Ontario, Canada, 30 m. long, with a mean breadth of 12 m., at its widest part 20 m.; area, 360 sq. m.; mean depth, 20 ft. It is 6 ft. higher than Lake Erie, which, according to J. T. Gardner's calculations (United States survey reports, 1873), is 573 ft. above the sea. Through St. Clair river, about 40 m. long and $\frac{1}{2}$ m. wide (which forms a part of the boundary between the United States and British America), it receives the waters of Lakes Huron, Superior, and Michigan, which it discharges through the Detroit river into Lake Erie.

SAINT CLAIR. I. A N. E. county of Alabama, bounded E. and S. E. by Coosa river; area, about 700 sq. m.; pop. in 1870, 9,360, of whom 2,065 were colored. It is mountainous, and has large forests of oak and other timber and a good soil. Extensive beds of bituminous coal are worked. It is traversed by the Alabama and Chattanooga railroad. The chief productions in 1870 were 29,778 bushels of wheat, 157,268 of Indian corn, 7,895 of oats, 1,293 lbs. of tobacco, 4,451 of wool, 1,244 bales of cotton, and 3,547 gallons of molasses. There were 970 horses, 452 mules and asses, 1,621 milch cows, 622 working oxen, 1,922 other cattle, 3,578 sheep, and 8,775 swine. Capital, Ashville. II. An E. county of Michigan, lying on Lake Huron, St. Clair river, and Lake St. Clair, which separate it from Canada, drained by Bell and Black rivers, and traversed by several railroads; area, about 900 sq. m.; pop. in 1870, 36,661. The surface is rolling, and much of it is heavily timbered with pine and other trees. The soil is fertile in the south and sandy in the north and west. The chief productions in 1870 were 224,242 bushels of wheat, 102,066 of Indian corn, 368,034 of oats, 210,848 of potatoes, 39,477 tons of hay, 128,020 lbs. of wool, 663,610 of butter, and 46,660 of hops. There were 6,398 horses, 8,014 milch cows, 9,922 other cattle, 32,587 sheep, and 9,438 swine; 19 manufactories of carriages and wagons, 13 of clothing, 3 of iron castings, 10 of tanned and curried leather, 3 of machinery, 5 of sash,

doors, and blinds, 1 of woollen goods, 6 flour mills, 20 saw mills, and 7 breweries. Capital, Port Huron. III. A S. W. county of Illinois, lying on the Mississippi river, opposite St. Louis, drained by Kaskaskia river and Cahokia, Silver, and Richland creeks, and intersected by several railroads; area, 630 sq. m.; pop. in 1870, 51,068. The surface is undulating and the soil very fertile. Along the Mississippi are rich coal mines. The chief productions in 1870 were 1,565,071 bushels of wheat, 1,423,121 of Indian corn, 476,851 of oats, 48,192 of barley, 265,169 of potatoes, 10,438 tons of hay, 5,347 lbs. of wool, 336,362 of butter, and 44,711 gallons of wine. There were 8,457 horses, 2,565 mules and asses, 6,338 milch cows, 4,616 other cattle, 3,782 sheep, and 29,785 swine; 36 manufactories of agricultural implements, 14 of brick, 61 of carriages and wagons, 21 of cooperage, 10 of cabinet furniture, 3 of wrought iron, 3 of castings, 4 of machinery, 4 of malt, 1 of vegetable oil, 1 distillery, 14 breweries, 3 planing mills, 4 saw mills, 18 flour mills, and 2 woollen mills. Capital, Belleville. IV. A W. county of Missouri, intersected by Osage river and drained by Sac river; area, 650 sq. m.; pop. in 1870, 6,742, of whom 152 were colored. The surface is varied, partly prairie and partly timber, and the soil tolerably fertile. It is traversed by the Sedalia division of the Missouri, Kansas, and Texas railroad. The chief productions in 1870 were 35,060 bushels of wheat, 200,368 of Indian corn, 56,186 of oats, 3,766 tons of hay, 2,410 lbs. of tobacco, and 10,376 of wool. There were 2,284 horses, 2,137 milch cows, 5,204 other cattle, 5,773 sheep, and 8,433 swine. Capital, Osceola.

SAINT CLAIR, a borough of Schuylkill co., Pennsylvania, on both sides of Mill creek (crossed by several bridges), a tributary of the Schuylkill river, and on the Philadelphia and Reading railroad, 3 m. N. of Pottsville; pop. in 1870, 5,726. It is on level ground, surrounded by hills under which are inexhaustible beds of anthracite. It is supplied with pure water from a large reservoir among the mountains 5 m. to the north. On the border the largest coal works in the world are in course of erection, to be completed in two or three years. Here the Primrose vein, 13 ft. thick, has been struck at a depth of 1,600 ft. Tunnelling for the Mammoth vein, which is expected to be from 40 to 50 ft. thick, is to begin at once (1875). The borough contains a blast furnace, a shovel factory, a manufactory of squibs (used in blasting), three public school buildings, a weekly newspaper, and 11 churches.

SAINT CLAIR, a city of St. Clair co., Michigan, on the St. Clair river, at the mouth of Pine river, 45 m. N. N. E. of Detroit; pop. in 1870, 1,790; in 1874, 2,003. A branch of the Canada Southern railway terminates at Court-right on the Canada side of the river. The Michigan Midland and Canada railroad extends W. to Ridgeway on the Grand Trunk railway. St. Clair contains two saw mills, an exten-

sive woollen mill, a large tannery, two flouring mills, a shingle mill, a large carriage factory, a foundry, two large brick yards, and two ship yards. It is the most extensive hay-shipping point in the northwest. There are a national bank, a union school, a weekly newspaper, and five churches. It was incorporated in 1858.

SAINT CLAIR, Arthur, an American general, born in Thurso, Scotland, in 1734, died near Greensburg, Pa., Aug. 31, 1818. He was a grandson of the earl of Roslyn, was educated at the university of Edinburgh, and studied medicine under John Hunter, but entered the army as an ensign, and came to America with Admiral Boscawen. He served under Amherst at Louisburg, and under Wolfe at Quebec. In 1762 he resigned his commission, and in 1764 settled in the Ligonier valley, Pennsylvania, where he erected mills, and held several important civil offices. In January, 1776, he was created a colonel in the continental army, and in August a brigadier general, and was in the battles of Trenton and Princeton. In 1777 he was made a major general and commanded Ticonderoga, but was compelled to evacuate it before Burgoyne. For this he was tried by court martial, but acquitted. In 1781 he remained at Philadelphia to protect congress while Washington marched to Yorktown, but joined the main army before Cornwallis surrendered. In 1786 he was sent to congress, of which he became president in 1787. When in 1789 the government of the Northwest territory was organized, he was made governor, and held that post till 1802. In 1791 he became commander-in-chief of the army operating against the Miami Indians. He was surprised on Nov. 4, near the Miami villages, and his force cut to pieces. Washington refused a court of inquiry, and St. Clair resigned; but congress appointed a committee of investigation, which exonerated him.

SAINT CLOUD, a city and the county seat of Stearns co., Minnesota, on the W. bank of the Mississippi river, 67 m. in a direct line and 100 m. by the course of the river N. W. of St. Paul; pop. in 1870, 2,161; in 1875, about 2,800. It is connected with St. Paul by the first division of the St. Paul and Pacific railroad, which continues N. up the Sauk valley. Another railroad up the Mississippi, intersecting the Northern Pacific 65 m. distant, is graded (1875). Steamers ply in summer to the falls of St. Anthony at Minneapolis. The city is surrounded by a country unexcelled for grain growing and stock raising. A rapid in the Mississippi here affords one of the best water powers in the country, and a company organized for the purpose is improving it. Some of the manufactories are now run by steam. There are two saw mills, two flouring mills, two planing mills, and sash, door, and blind factories, an iron and brass foundry, one large and three smaller furniture manufactories, a plough factory, four wagon factories, marble works, brick yards, potter-

ies, &c. In the immediate vicinity are several beds of superior granite, which is cut in the city, and shipped to Chicago and other points. St. Cloud contains a fine brick court house, a large hotel, two banks, one of the state normal schools, two graded public schools, four weekly newspapers (one German), and seven churches.

SAINT-CLOUD, a town of France, in the department of Seine-et-Oise, on the left bank of the Seine, 2 m. W. of the *enceinte* of Paris; pop. about 5,000. It received its name from a monastery built by Clodoald, a grandson of Clovis. In the royal palace here, which was originally a country house, Henry III. was assassinated in 1589. The duke of Orleans, brother of Louis XIV., added a magnificent park and gardens, and the place became celebrated for sumptuous entertainments and historical associations. Marie Antoinette, Napoleon I., Louis XVIII., Charles X., Louis Philippe, and Napoleon III. successively resided at St. Cloud. The overthrow of the first republic was initiated here by Bonaparte on the 18th Brumaire (1799). The capitulation of Paris in 1815 and the ordinances of Charles X. were signed here. The palace was almost entirely burned during the siege of Paris in October, 1870, though many works of art were saved.

SAINT CROIX. **I.** A river, also called Passamaquoddy and Schoodic, which forms a portion of the N. E. boundary between the United States and British America. It rises in Grand lake, and flows in a very winding course, though generally S. S. E. for about 125 m., separating Maine from New Brunswick, and falling into Passamaquoddy bay. It is navigable to St. Stephen, N. B., about 20 m. from its mouth. **II.** A river of Wisconsin, rising in Douglas co., near the W. part of Lake Superior, and flowing S. W. to the E. line of Minnesota, where it becomes the boundary between that state and Wisconsin. Its general direction in this part of its course is S., and it falls into the Mississippi, 38 m. below St. Paul. Its whole length is about 200 m., and its width at its mouth 100 yards. An expansion in the lower part of its course, for about 36 m., is called St. Croix lake. The river has several fine falls.

SAINT CROIX, a N. W. county of Wisconsin, separated by the St. Croix river from Minnesota, and drained by Willow, Apple, and Rush rivers; area, 750 sq. m.; pop. in 1870, 11,016. The surface is uneven, and most of it covered with pine forests. It is traversed by the West Wisconsin and the North Wisconsin railroads. The chief productions in 1870 were 823,678 bushels of wheat, 42,461 of Indian corn, 447,775 of oats, 27,664 of barley, 61,972 of potatoes, 7,058 tons of hay, 3,343 lbs. of wool, 229,615 of butter, and 4,200 of hops. There were 3,032 horses, 3,232 milch cows, 4,085 other cattle, 1,435 sheep, and 3,481 swine. Capital, Hudson.

SAINT CROIX, a West India island. See SANTA CRUZ.

SAINT-CYR, a village in the park of Versailles, 9 m. S. W. of Paris, celebrated for the female seminary (*maison de St. Cyr*) built here in 1686, after the designs of Mansard, by Louis XIV., under the auspices of Mme. de Maintenon, for the education of 250 daughters of the nobility. For this school, at the request of Mme. de Maintenon, Racine wrote *Athalie*; and she made it her home after the death of Louis XIV. The school was converted in 1793 into a military hospital, and in 1806 the military academy of Fontainebleau was transferred to it by Napoleon. This academy became known as *Vécole spéciale militaire de St. Cyr*, and is still the principal institution for training officers for the army and navy.

SAINT-CYR, Laurent Gouvion. See **GOUVION SAINT-CYR**.

SAINT-DENIS, a town of France, in the department of the Seine, 2 m. N. of the *enceinte* of Paris; pop. in 1872, 31,993. Dagobert I. built here, over the grave of St. Denis, an abbey which soon became the richest in France. One of its manors was held in fief by some of the early Capetians, who adopted as their standard the *oriflamme*, originally the banner of the convent, and chose the crypt of the church as their burial place. In 1793, by order of the convention, the tombs of the kings were destroyed and their remains removed. The church, restored by Napoleon and subsequent governments, ranks among the best specimens of Gothic art. The convent is occupied by a school for female orphans of members of the legion of honor.

SAINT DOMINGO. See **HAYTI**, and **SANTO DOMINGO**.

SAINTE-ALDEGONDE. See **ALDEGONDE**.

SAINTE-BEUVE, Charles Augustin, a French author, born in Boulogne, Dec. 23, 1804, died in Paris, Oct. 13, 1869. His mother, a woman of English descent, instructed him in the English language and literature. He completed his studies at Charlemagne and Bourbon colleges, Paris, studied medicine, and was attached to the hospital of St. Louis till 1827. He began his literary career about 1824 as a writer for the *Globe*. In 1828 he became known as a critic by his *Tableau historique et critique de la poésie française et du théâtre français au XVI^e siècle* (enlarged ed., 1843). He subsequently published poetry which was bitterly assailed by the adherents of the classical school. The revolution of July transferred the *Globe* to the St. Simonians, whose doctrines he then advocated; but he soon joined the newly established *Revue des Deux Mondes* and his friend Armand Carrel's *National*. In 1837 he delivered lectures at Lausanne, which formed the groundwork of his history of Port Royal. In 1840 he received from Thiers an office in the Mazarin library, which enabled him to complete that work. He was elected to the French academy in 1845. In 1848-'9 he gave lectures at Liège on *Chateaubriand et son groupe littéraire sous l'empire* (2 vols., 1860). He returned

to Paris in 1850 as a partisan of Louis Napoleon, connected himself with the *Constitutionnel*, and early in 1852 with the *Moniteur*. In the former appeared his *Causeries du Lundi*. He was then also appointed professor of Latin poetry in the collège de France, but the students hissed him on account of his imperialism, and he at once resigned. From 1857 to 1861 he was *maître de conférences* at the normal school. In 1865 he became a member of the senate, where his support of Renan made him obnoxious to the ultramontanes. As a subtle, discriminating, and impartial critic, he had no superior, and his originality and occasional partiality for the phraseology of the 16th century made Balzac say that he had invented a new language which should be called *le Sainte-Beuve*. He was equally remarkable for his intimate sympathy with the brilliant women and men who in previous periods adorned French society and literature, for his keen analysis of character, and for his rich store of anecdotes. His works include *Critiques et portraits littéraires* (5 vols., 1832-'9); *Volupté*, a rather pathological and singular novel (1834; 5th revised ed., 1861); *Poésies complètes* (1840; enlarged ed., 2 vols., 1863); *Port-Royal* (5 vols., 1840-'60; 3d ed., 6 vols., 1867); *Portraits littéraires* (2 vols., 1844; new ed., 3 vols., 1864); *Portraits de femmes* (1844; new ed., 1855); *Portraits contemporains* (2 vols., 1846; new ed., 3 vols., 1855); *Causeries du Lundi* (15 vols., 1851-'62); *Galerie des femmes célèbres* (1858), and *Nouvelle galerie des femmes célèbres* (1864), both extracted from the preceding, and translated into English by Harriet W. Preston under the title of "Portraits of Celebrated Women" (Boston, 1868); *Nouveaux Lundis* (10 vols., 1863-'8); *Madame Desbordes-Valmore, sa vie et sa correspondance* (1870; translated by Harriet W. Preston, Boston, 1872); and the posthumous *Causeries du Lundi* (3 vols., 1875; "English Portraits," selected from the same, London, 1875).

SAINTE-CLAIRE DEVILLE. See **DEVILLE**.

SAINTE GENEVIEVE, an E. S. E. county of Missouri, bounded N. E. by the Mississippi river, and drained by Rivière aux Vases, Isle au Bois, Saline, and Establishment creeks; area, about 400 sq. m.; pop. in 1870, 8,384, of whom 431 were colored. The surface is broken and hilly. There are quarries of marble, and valuable mines of lead and copper. The chief productions in 1870 were 155,228 bushels of wheat, 180,350 of Indian corn, 78,197 of oats, 5,970 lbs. of tobacco, and 10,327 of wool. There were 1,967 horses, 1,805 milch cows, 3,632 other cattle, 4,997 sheep, and 11,066 swine. Capital, Ste. Genevieve.

SAINT ELIAS, Mount, a volcanic peak on the border of Alaska and British America, lat. 60° 15' N., lon. 141° W. Its height has been variously estimated at 16,000 to 18,000 ft. More recently Dall from trigonometric calculation estimates it at 19,000 ft., which is higher than any other peak in North America.

SAINT-ELME, *Ida*, the *nom de plume* of a French courtesan (ELSELINA VANAYL DE YONGH), born at Valambrose, S. France, in 1778, died in Brussels, May 23, 1845. She is known chiefly by her publication entitled *Mémoires d'une contemporaine* (8 vols., Paris, 1827; new ed., 1863), purporting to contain her recollections of eminent personages under the republic, the consulate, the empire, and the restoration. As the mistress of several of Napoleon's generals and marshals, she professed to have peculiar materials of secret history. After the revolution of 1830 she resided in London, and made an attempt to levy blackmail upon Louis Philippe by forcing him to purchase letters written by him in 1809. She ended her life in a hospital of nuns.

SAINTE-MARGUERITE. See LÉRINS ISLANDS.

SAINTE (anc. *Santonnes*), a town of France, in the department of Charente-Inférieure, on the right bank of the Charente, 36 m. N. W. of La Rochelle; pop. in 1872, 9,998. It has many Roman antiquities, and a renovated cathedral which originated with Charlemagne. The crypt of the church of St. Eutrope forms the largest subterranean chapel in France. The trade is chiefly in wine, brandy, and grain. It is of great antiquity, and was one of the principal cities of Aquitania. In the middle ages it was the capital of the province of Saintonge. It suffered much during the religious wars.

SAINT-ÉTIENNE, a town of France, capital of the department of Loire, on the Furens, a branch of the Loire, 32 m. S. W. of Lyons; pop. in 1872, 110,814. It has several spacious streets lined with substantial houses built of freestone, originally white, but soiled from coal smoke. Among the churches, St. Étienne and Notre Dame are most noteworthy, and other public buildings are the town hall, theatre, museum of industry, gallery and school of fine arts, school of mines, and communal college. It was a place of some importance in the 15th century, and in recent times has become one of the principal manufacturing centres in Europe. It owes its recent rapid rise to the water power furnished by the Furens, and its situation in the midst of the most productive coal fields of France. The ribbon manufacture, the largest in the world, employs 40,000 weavers in the town and adjacent districts, and produces goods to the value of 80,000,000 francs per annum. The firearms factories employ 6,000 men, and in 1868 turned out 90,000 pieces, and the national arms factory, employing 4,500 men, made in 1868 200,000 Chassepot rifles. Sixty cutlery establishments employ 7,000 workmen and produce goods to the value of about 3,500,000 francs annually. The manufacture of Bessemer and Martin steel is extensive. Hemp cables for mines and inclined railway planes are made. Of coal about 500,000 tons a year are exported.

SAINT EUSTATIUS, an island of the West Indies, belonging to the Netherlands, in the Lee-

ward group, 12 m. N. W. of St. Christopher; area, about 8 sq. m.; pop. about 2,200. The N. part is broken into rugged hills from 500 to 900 ft. high; the S. is occupied by an extinct volcano, the summit of which is 1,950 ft. high. The climate is warm, but healthful. The soil is fertile, but covered with a wilderness of weeds; the chief product is yams, besides which the sugar cane is cultivated, yielding an average of 30,000 lbs. of sugar per annum. Orange, the chief town, is on the S. W. side, built partly on a small beach and partly on a steep cliff 130 ft. high; this cliff is composed of white argillaceous earth, which makes excellent cement for subaqueous as well as ordinary works. The only accessible point is on the beach under the town, and here the surf is dangerous. The landing is defended by a fort and several batteries. It has been a Dutch colony since about 1635, but was several times taken by the French and English, and the English language is spoken. It was at one time a place of great importance, being the seat of an extensive contraband trade, and the population in 1780 was 25,000; but it now has little trade.

SAINT-ÉVREMOND, Charles de Marguetel de Saint-Denis, seigneur de, a French author, born near Coutances, April 1, 1613, died in London, Sept. 20, 1703. He early acquired military and social distinction, but gave offence to Mazarin while holding a high command in which he amassed a fortune, and was imprisoned for three months in the Bastille. In 1661 he was banished for disparaging the treaty of the Pyrenees. In London, where he passed the rest of his life, he became an oracle in fashionable and political society, and Charles II. gave him a pension of £300. His principal works are: *Comédie des académistes* (1650); *Réflexions sur les divers génies du peuple romain* (1664); *Jugements et observations sur Sénèque, Plutarque, &c.*; and minor essays and dissertations on ancient and modern tragedy and ancient poetry. The first authentic edition of his works was partly prepared by himself and Des Maizeaux, and finished by the latter in conjunction with Silvestre (3 vols., London, 1705, with an English translation and biographical notice). A select edition was published in 1804 by Desessarts.

SAINT FRANCIS, an E. county of Arkansas, drained by the St. Francis and L'Anguille rivers; area, about 625 sq. m.; pop. in 1870, 6,714, of whom 2,446 were colored. The surface is nearly level, and the soil productive. It is intersected by the Memphis and Little Rock railroad. The chief productions in 1870 were 141,911 bushels of Indian corn, 8,850 of sweet and 2,440 of Irish potatoes, and 3,757 bales of cotton. There were 1,014 horses, 659 mules and asses, 1,662 milch cows, 368 working oxen, 2,449 other cattle, 924 sheep, and 8,060 swine. Capital, Madison.

SAINT FRANCIS RIVER. See ARKANSAS, vol. i., p. 714.

SAINT FRANÇOIS, an E. S. E. county of Missouri, drained by the Big river, a branch of the Maramec, and the sources of the St. Francis; area, 350 sq. m.; pop. in 1870, 9,742, of whom 518 were colored. The surface is broken and hilly, and includes a portion of the Iron mountain. It has extensive iron works. It is traversed by the St. Louis and Columbus and the St. Louis and Texas divisions of the St. Louis and Iron Mountain railroad. The chief productions in 1870 were 63,632 bushels of wheat, 247,581 of Indian corn, 125,803 of oats, 3,083 tons of hay, 9,490 lbs. of tobacco, 20,460 of wool, 66,133 of butter, and 12,354 of sorghum molasses. There were 1,927 horses, 732 mules and asses, 1,945 milch cows, 512 working oxen, 2,921 other cattle, 9,459 sheep, and 17,217 swine. Capital, Farmington.

SAINT GALL (Ger. *Sanct-Gallen*). I. A N. E. canton of Switzerland, bounded N. by Thurgau, N. E. by the lake of Constance, E. by the Rhine, which separates it from Vorarlberg and Liechtenstein, S. by Glarus, and W. by the lake of Zürich; area (exclusive of the canton of Appenzell, which it entirely encloses), 780 sq. m.; pop. in 1870, 191,015, nearly all Germans, and two thirds Roman Catholics. It is watered by tributaries of the Rhine, including the Thur, the Sitter, and the Necker. Lake Wallen is almost entirely in this canton. The S. part of the canton is one of the lofty Alpine regions of Switzerland, Mounts Scheibe, Graue Hörner, and Speerberg being within its limits. The whole surface of the canton is mountainous. The soil is generally fertile. The mountainous districts are covered with wood or rich pasture, and on the lower slopes are vineyards and orchards. The most important manufacture is that of cotton. The government is democratic. The great council is composed of 88 Catholics and 62 Protestants, elected for two years, and meeting twice a year. The executive council is composed of seven members, chosen by the great council from their own number and holding office four years. The canton was admitted to the confederation in 1803. It is divided into 15 districts. The constitution of 1861 made the church virtually independent of the state, and the latter controls education. II. A city, capital of the canton, on the Steinach, a branch of the Sitter, 43 m. E. of Zürich; pop. in 1870, 16,676. The suburbs are finely laid out, and command beautiful views. It is the centre of the manufacture of muslins and of the trade of N. E. Switzerland. The principal buildings are the cathedral, the restored Gothic church of St. Lawrence, and the new school house with a large library and museum. The city grew up around an abbey built by St. Gall in the 7th century. (See GALL.) It was received into the Helvetic confederation in 1454. The abbey was secularized in 1805; it is now the residence of the bishop, and contains an extensive library, remarkable for old German manuscripts.

SAINT-GERMAIN, or *St. Germain-en-Laye*, a town of France, in the department of Seine-et-Oise, 8 m. W. of the *enceinte* of Paris; pop. in 1872, 22,862. It was long a royal residence, and is now a fashionable summer resort. James II. of England died here. The revolution converted the palace into barracks; Napoleon I. made it a military prison, and Napoleon III. a museum of antiquities. Adjoining it is one of the largest forests in France.

SAINT-GERMAIN, *Count de*, a cosmopolitan adventurer of the 18th century, of unknown origin. He arrived in Paris about 1740, in company with the marshal de Belle-Isle, and created a prodigious sensation by his conversational powers, by his knowledge of chemistry and history, and by his unaccountable possession of diamonds of great value. The most fabulous stories were circulated about him, and his graphic and familiar delineations of personages long dead gave an impression that he had been their contemporary. For many years he was a favorite at court and in the highest society in Paris. He is said to have ended his life at the court of the landgrave of Hesse-Cassel. Voltaire called his life, in allusion to his title of count and to his stories (*contes*), *ce conte pour rire*. He is supposed to have been really a spy in the pay of various governments.

SAINT GOTHARD. See ALPS, vol. i., pp. 352 and 354. **Tunnel**. See supplement.

SAINT HELENA, an E. parish of Louisiana, bounded W. by the Amite river and drained by the Tickfah river and Natalbany creek; area, about 450 sq. m.; pop. in 1870, 5,423, of whom 2,914 were colored. The surface is gently undulating, and the soil fertile, especially along the streams. The chief productions in 1870 were 91,265 bushels of Indian corn, 38,961 of sweet potatoes, 3,875 lbs. of wool, and 3,284 bales of cotton. There were 807 horses, 1,823 milch cows, 3,999 other cattle, 1,858 sheep, and 8,977 swine. Capital, Greensburgh.

SAINT HELENA, an island belonging to Great Britain, in the S. Atlantic ocean, about 1,200 m. W. of Africa and 2,000 m. E. of South America; lat. 15° 57' S., lon. 5° 42' W.; area, about 47 sq. m.; pop. in 1871, 6,241, including natives of mixed European and Asiatic origin, west African negroes, and whites (government officials, the garrison, merchants, and farmers). Rugged and precipitous cliffs from 600 to 2,000 ft. high encircle the island. The principal inlets are James's bay, having an excellent harbor, on which is Jamestown, Rupert's and Lemon valley on the N. W., and Sandy bay on the S. E. side, all fortified. There are narrow ravines where landing is possible, which are also protected by small forts built during Napoleon's imprisonment, but now mostly unoccupied, as the entire garrison in 1874 numbered but 191 men. The island is of volcanic origin. From a crater on the S. side lava and other volcanic matters have flowed in every direction, the other side having, it is supposed, sunk into the ocean. A lofty ridge of calcareous rocks,

running nearly E. and W. with a bend to the S. at each extremity, intersects the island, and in this range are Diana's peak, 2,700 ft. high, Cuckold's point, 2,672 ft., and Halley's mount, 2,467 ft. The Flagstaff, 2,272 ft., and Barns-cliff, 2,015 ft., are prominent cliffs on the coast. Along the S. coast are many remarkable columns or basaltic rocks, two of which, Lot and Lot's Wife, are respectively 197 and 160 ft. high, and the Chimney, a noted hexagonal column, is 64 ft. Iron, gold, and copper have been found in small quantities. The climate is temperate and salubrious, and not unhealthy to European constitutions. The range of the thermometer is from 57° to 72°, the annual average 66°. The flora is interesting, though of more than 700 species but 52 are native. When the island was discovered it was covered with trees, which are now nearly destroyed. The vegetation is almost wholly European. There are several plains, the largest, Longwood, comprising 1,500 acres; but in a total area of about 30,000 acres not more than 500 are cultivated, and less than 8,000 are devoted to grazing. The soil is good and might be made productive, but almost every article of food or clothing is imported. Rice is brought from India, and with fish, which is abundant, forms the staple food of the poorer classes. The island never had any internal sources of income, but formerly it imported supplies for ships to and from India, and for whaling vessels; but the trade to the East is now almost entirely diverted through the Suez canal, and whaling vessels are rarely seen. It was made a crown colony in 1833, with a governor and other officers under the control of the home government. Its revenue from customs and taxes is not more than £15,000, and its total annual cost to the government is about £55,000, including a military expenditure of about £23,000.—The island was discovered on St. Helena's day, May 21, 1502, by Juan de Nova Castella, a Spanish navigator in the service of the Portuguese, from whom it was at a later period taken by the Dutch. From about 1650 to 1672 it was alternately occupied by the Dutch and the English. In 1673 Charles II. granted it to the East India company. It was Napoleon's place of exile from Oct. 16, 1815, till his death, May 5, 1821. In 1840 his remains were removed to France, which in 1858 bought the house at Longwood occupied by him, and the valley where he was buried, and appointed a perpetual guard for them.—See "St. Helena," by John Charles Melliss (London, 1875).

SAINT-HÉLIER, a market town, seaport, and the capital of the island of Jersey in the English channel, on the S. coast; pop. in 1871, 30,756. It is situated at the base of an amphitheatre of low hills sloping to St. Aubin's bay. The Victoria and Albert piers enclose a spacious harbor defended by Fort Regent and Castle Elizabeth. Near Castle rock is the hermitage said to have been the retreat of St. Hélier,

from whom the town takes its name. There are several main thoroughfares intersected by narrow and irregular streets, but well paved and drained and lighted with gas. The principal buildings are the court house built in 1647, in which is the public library founded in 1736, and the college erected in commemoration of the queen's visit in 1846. There are seven parish churches, St. Hélier's dating from 1341, 14 other places of worship for different denominations, several schools and benevolent institutions, six banks, a theatre, and a market house. Ship building is an important industry, and there are several founderies and breweries. The coasting trade in oysters and fish is extensive, and the fisheries and Newfoundland trade employ about 10,000 tons of shipping and 1,500 hands. The mild climate and cheap living make the place a favorite resort.

SAINT-HILAIRE, Auguste de, a French botanist, born in Orleans, Oct. 4, 1799, died there, Sept. 30, 1853. He was auditor in the council of state in Paris, explored Brazil, and published *Flora Brasiliæ Meridionalis* (3 vols., Paris, 1825-'32), and other works, which procured his admission to the institute.

SAINT-HILAIRE, Geoffroy. See GEOFFROY SAINT-HILAIRE.

SAINT-HILAIRE, Jules. See BARTHÉLEMY SAINT-HILAIRE.

SAINT-HILAIRE, Marco de, the pseudonyme of ÉMILE MARC HILAIRE, a French writer, born about 1790. At an early age he became one of the pages of Napoleon I., and afterward engaged in book making as a profession. His best known works are: *Mémoires d'un page de la cour impériale* (2 vols. 8vo, 1830); *Souvenirs de la vie privée de Napoléon* (1838); *Histoire populaire de Napoléon et de la grande armée* (large 8vo, illustrated, 1842); *Histoire de la garde impériale* (large 8vo, illustrated, 1845-'7); *Histoire de la campagne de Russie* (4 vols. 8vo, illustrated, 1846-'8); *Histoire des conspirations et exécutions politiques* (4 vols. large 8vo, illustrated, 1849), including France, England, Spain, and Russia; a continuation to 1850 of Anquetil's *Histoire de France* (1853); and *Histoire de Napoléon III.* (8vo, 1853).

SAINT HYACINTHE. I. A S. W. county of Quebec, Canada; area, 263 sq. m.; pop. in 1871, 18,810, of whom 18,075 were of French origin or descent. It lies between the Yamaska river on the east and the Richelieu on the west, and is traversed by the Grand Trunk railway. **II.** A city, capital of the county, on the W. bank of the Yamaska river, and on the Grand Trunk railway, 35 m. E. by N. of Montreal; pop. in 1871, 3,746. Steamers run daily in the season of navigation to St. Césaire, a village 20 m. above. The principal public buildings are the court house, city hall and market, Roman Catholic cathedral, bishop's palace, hospital and convent of gray nuns, and St. Hyacinthe college. The college is a fine building of cut stone, 700 ft. long. There are

manufactories of woollens, wooden ware, leather, lace, organs, iron castings, mill machinery, and boots and shoes, a grist and saw mill, a bank, a branch bank, several hotels, a telegraph office, a tri-weekly and two weekly newspapers, and a monthly periodical. One of the weeklies is published in English; the other publications are in French.

SAINTINE, the pseudonyme of **JOSEPH XAVIER BONIFACE**, a French author, born in Paris, July 10, 1798, died there, Jan. 21, 1865. He early won academical prizes for his poetry, and in 1837 the Montyon prize of 3,000 francs for his story of *Picciola* (37th ed., revised, 1861), which has been translated into many languages. He published many other stories, novels, and miscellaneous works, and (under the name of Xavier) hundreds of plays, the last in conjunction with other dramatists. Mrs. Wood (Anne T. Wilbur) published "The Solitary of Juan Fernandez, or the real Robinson Crusoe" (Boston, 1851), a translation of Saintine's *Sœur!* and "The Queen of the Danube" (1859), from his *Trois reines, chronique du XV^e siècle*; and Schele de Vere a translation of his *Mythes du Rhin* (London, 1874), with illustrations by Doré.

SAINT JAMES, a S. E. parish of Louisiana, having Lake Maurepas on the northeast and intersected by the Mississippi; area, 330 sq. m.; pop. in 1870, 10,152, of whom 6,877 were colored. The surface is level and the soil fertile. The plantations are chiefly on the river. It is intersected by the New Orleans, Mobile, and Texas railroad. The chief productions in 1870 were 91,105 bushels of Indian corn, 3,450 lbs. of tobacco, 934,915 of rice, 3,041 bales of cotton, 6,265 hogsheads of sugar, and 347,722 gallons of molasses. There were 66 molasses and sugar establishments. Capital, Couvent.

SAINT JEAN D'ACRE. See **ACRE**.

SAINT JOHN, a river of North America, called by the Indians Looshtook (Long river), which rises, under the name of the S. W. branch, in the highlands that separate Maine from Quebec, Canada, at the Metjarquette portage. It flows N. E. to the junction of the St. Francis, about 150 m., for 100 m. of which, commencing at the junction of the N. W. branch, it is known as the Walloostook. From the mouth of the St. Francis it flows E. N. E. and then S. E. to the Grand falls, where it has a perpendicular descent of 70 or 80 ft., thence nearly S. to lat. 46°, when it turns suddenly and flows E. for 100 m. to the entrance of the outlet of Grand lake, thence in a broad channel due S. to Kingston, then S. S. W. to Westfield, and finally S. E. to the bay of Fundy at St. John. Its whole course is about 450 m.; of this 225 m. of the lower portion is wholly within British territory; 75 m. from the Grand falls to the St. Francis forms the boundary between Maine and New Brunswick; the next 112 m. is in Maine; and from its source to lat. 46° 25' N., lon. 70° 4' W., 38 m., it forms the boundary between Maine and Que-

bec. It has 11 principal affluents, the largest being the Alleguash, St. Francis, Madawaska, and Aroostook. It is navigable for vessels of 120 tons to Fredericton, 84 m. from its mouth; small steamboats ascend to Woodstock, 75 m. further, and even at times to the Grand falls, 225 m. from its mouth; above this point it is navigated by steamboats 40 m., to the mouth of the Madawaska. It affords a vast water power. With its branches it furnishes 1,300 m. of navigable waters, and drains 17,000,000 acres, of which 9,000,000 are in New Brunswick, 2,000,000 in Quebec, and 6,000,000 in Maine.

SAINT JOHN, a lake of Canada. See **QUEBEC**, vol. xiv., p. 135.

SAINT JOHN, a S. county of New Brunswick, Canada, bordering on the bay of Fundy, and intersected by the St. John river; area, 585 sq. m.; pop. in 1871, 52,120, of whom 30,128 were of Irish, 13,772 of English, 5,785 of Scotch, 739 of German, 616 of African, 377 of Dutch, and 340 of French origin or descent. The surface is agreeably diversified and the soil fertile. The European and North American and the Intercolonial railways traverse the county. Capital, St. John.

SAINT JOHN, the chief city and seaport of New Brunswick, Canada, capital of St. John co., on a harbor of the same name, at the mouth of the river St. John in the bay of Fundy, 84 m. by the course of the river or 54 m. in a straight line S. S. E. of Fredericton, and 130 m. W. N. W. of Halifax, N. S.; lat. 45° 14' 6" N., lon. 66° 3' 30" W.; pop. in 1861, 27,317; in 1871, 28,805; in 1875, including suburbs, about 50,000. The greater portion of the city stands on a rocky peninsula projecting into the harbor on the E. side of the river. The site rises gradually from the harbor. The streets are wide, and chiefly laid out at right angles; some of them are very steep and cut through the solid rock to a depth of 30 or 40 ft. The buildings are principally of brick and stone, and there are many fine public edifices, the chief of which are the Roman Catholic cathedral, the provincial lunatic asylum, the city hospital, the court house and jail, the market house, the Carleton city hall, the opera house, the post office, the Victoria hotel, the marine hospital, the almshouse, the academy of music, the dramatic lyceum, the mechanics' institute, the skating rink, and the barracks. The Dominion penitentiary, a large granite building, is about a mile from the city, and about a mile and a half distant is the Rural cemetery, containing 110 acres. St. John is lighted with gas, and is supplied with water from Little river, 4 m. distant, by two iron pipes having a joint capacity of 5,500,000 gallons a day. Horse cars connect the city with Portland and Indian-town. On the W. side of the river is a portion of the city called Carleton. Adjoining the main portion of the city and practically part of it is the town of Portland (pop. in 1871, 12,520), which is well built, lighted with gas,

and supplied with water, and contains the residences of many St. John merchants, six churches, and several ship yards, saw mills, and founderies. St. John has communication with Halifax by the Intercolonial railway, and with Fredericton and Bangor, Me., by the European and North American railroad. Steamers run regularly to Fredericton and other points on the river, to St. Andrews and St. Stephen, to Annapolis, Yarmouth, and other points in Nova Scotia, and to Portland, Me., and Boston. The harbor is one of the finest in America, and is never blocked with ice. The entrance, about 2 m. S. of the city, is protected by Partridge island, on which are a quarantine hospital and a lighthouse with a light 166 ft. above the sea. The passage W. of the island has 10 ft. of water and that E. of it 16 ft., while abreast of the city there is from 8 to 22 fathoms. On the E. side of the channel below the city a breakwater has been constructed as a protection against southerly gales. There is a peculiar phenomenon at the entrance of the river into the harbor about $1\frac{1}{2}$ m. above the city; the stream, discharging an immense body of water, is forced through a rocky gorge, 160 yards wide and 400 long, and makes a fall of about 17 ft. The tide in the harbor rises ordinarily 21 ft., but at the vernal equinox 25 ft. At low water the waters of the river are about 12 ft. higher than those of the harbor, at high water 5 ft. lower, while for 15 or 20 minutes of each ebb and flow of the tide they are at the same level, during which vessels can pass the falls. Above the falls the tide seldom rises more than 4 ft. Spanning the gorge, about 100 ft. above low water, is a magnificent suspension bridge, 640 ft. long. The value of foreign commerce for the three years ending June 30, 1875, was as follows:

YEAR.	Imports.	Exports.
1873	\$8,118,758	\$4,107,550
1874	8,415,986	8,915,362
1875	8,312,753	8,642,895

The entrances during the last named year were 1,131, tonnage 377,614, of which 419, tonnage 122,567, were in ballast; clearances, 1,141, tonnage 443,981, of which 16, tonnage 6,535, were in ballast. The number of vessels belonging to the port on Jan. 1, 1875, was 807, with an aggregate tonnage of 263,401. The exports consist chiefly of lumber, which is shipped to Great Britain, the West Indies, and the United States. The manufactures of St. John are of considerable importance, the amount of capital invested, according to the census of 1871, being \$1,225,942; number of hands employed, 4,103; value of products, \$5,094,976. The number of ships built during the year ending Dec. 31, 1874, was 58, with an aggregate tonnage of 35,872. Among the other articles of manufacture are iron castings, nails, edge tools, lumber, leather, boots and shoes,

soap and candles, paper, cotton goods, rolling mill products, rope, hats, and carriages. There are two banks with a joint capital of \$2,000,000, three branch banks, a savings institution, and three banking firms. St. John is divided into nine wards, and is governed by a mayor, nine aldermen, and nine councilmen. It has a police force and a good fire department, with a fire alarm telegraph. There are several good hotels, three orphan asylums, an industrial school, a grammar and several common schools, several private or denominational schools and academies, a historical society, a natural history society, a young men's Christian association, four daily, one tri-weekly, and nine weekly newspapers, a bi-weekly periodical, and 31 churches, viz.: 5 Baptist, 1 Calvinistic Baptist, 1 Christian, 1 Congregational, 6 Episcopal, 2 Free Christian Baptist, 1 Methodist Episcopal, 6 Presbyterian, 1 Reformed Presbyterian, 2 Roman Catholic, and 5 Wesleyan Methodist.—St. John was founded by American loyalists who left the United States at the close of the revolution, and was created a city by royal charter in 1785.

SAINT JOHN, Henry. See BOLINGBROKE.

SAINT JOHN. I. James Augustus, an English author, born in Carmarthenshire, Sept. 24, 1801. He went to London at the age of 17, edited a newspaper at Plymouth, published a poem entitled "Abdallah," and became sub-editor with James Silk Buckingham of the "Oriental Herald." He afterward travelled in the East and resided abroad for many years, and while writing at Chantilly, France, his "History of the Manners and Customs of Ancient Greece" (3 vols. 8vo, London, 1842) became nearly blind. Among his other works are: "Description of Egypt and Nubia" (8vo, 1834); "History, Manners, and Customs of the Hindoos" (2 vols., 1834-'5); "Isis, an Egyptian Pilgrimage" (2 vols., 1852); "The Nemesis of Power: Forms and Causes of Revolutions;" "There and Back again in search of Beauty: Italy" (2 vols., 1853); "Philosophy at the Foot of the Cross" (1855); "History of the Four Conquests of England, Roman, Anglo-Saxon, Danish, and Norman" (2 vols., 1861); and "Life of Sir Walter Raleigh" (2 vols., 1868). He has also published four novels, entitled "Tales of the Ramad'han," "Margaret Ravenscroft," "Sir Cosmo Digby," and "Weighed in the Balance." **II. Percy Bolingbroke**, an English author, son of the preceding, born in Plymouth, March 4, 1821. He accompanied his father in his travels, and assisted him in the preparation of some of his works, and received from the Greek parliament a vote of thanks for his activity in the cause of the Greeks before the Crimean war. He also travelled in America. He has published "The Young Naturalist's Book of Birds" (London, 1844); "Three Days of the French Revolution" (1848); "Quadroona, or the Slave Mother" (1861); "The Creole Bride" (1864); and "Good as Gold" (1870). **III. Bayle**, an English

traveller, brother of the preceding, born in London, Aug. 9, 1822, died there, Aug. 1, 1859. His chief works are: "Adventures in the Libyan Desert;" "Manners and Politics in the Ottoman Empire;" "Two Years' Residence in a Levantine Family;" "Views in the Oasis of Siwah" (fol.); "The Subalpine Kingdom," containing some curious documents on the life of Rousseau; "Purple Tints of Paris: Sketches and Manners;" "The Turks in Europe" (1853); "The Louvre, or Biography of a Museum" (1855); "Legends of the Christian East" (1857); and "Montaigne the Essayist" (1857). **IV. Spenser**, brother of the preceding, born in London, Dec. 22, 1826. He studied the Malay language, and was for several years consul general in Borneo. In 1861 he became chargé d'affaires and subsequently minister to Hayti. He has published "Life in the Forests of the Far East" (London, 1862). **V. Horace Roscoe**, brother of the preceding, born in Normandy in 1830. He was editor for a time of the "London Leader," and with his brothers Bayle and Percy for a short time conducted the "Utopia." He has published "Life of Columbus" (London, 1850), "History of the British Conquests in India" (2 vols., 1852), and "The Indian Archipelago" (2 vols., 1853). His wife has published "Audubon, the Naturalist in the New World" (1856), "English Women and the Age" (1860), and "Masaniello of Naples" (1865).

SAINT JOHN OF JERUSALEM, Knights Hospitallers of the Order of (also called knights of Rhodes and knights of Malta), a religious and military order which originated in the middle of the 11th century. In 1048 permission was granted to a few merchants from Amalfi to build a chapel for Latin pilgrims near the holy sepulchre, and to connect with it two hospitals or hosteleries, one for men and the other for women. The chapel, common at first to both sexes, was called St. Mary of the Latins; a second chapel attached soon afterward to the female hospital was called after St. Mary Magdalen. The hospital for men bore the name of St. John the Almoner, a native of Cyprus and patriarch of Alexandria (died about 616), who had sent money and provisions to Jerusalem in 614, after it had been sacked by Chosroes II. The service in the hospitals was performed by a confraternity of pilgrims of both sexes, under the direction of Gerard (called also Bienheureux Pierre Gérard and Gerard the Blessed), the whole establishment as well as the confraternity being called after St. John the Almoner. They displayed such heroic charity on the occasion of the capture of Jerusalem by the crusaders, July 15, 1099, that several noble knights, among them Raymond du Puy or del Puich, joined them as hospitallers. Godfrey de Bouillon bestowed on them the lordship of Montboire in Brabant, and other princes imitated his example. When peace was restored to the city, Gerard and his associates bound themselves to labor for ever in the hospitals

"as the servants of the poor and of Christ," and the members of both sexes assumed for their distinctive habit the black robe of the Augustinians, with a white linen cross of eight points on the left breast. The order was approved by Pope Paschal II., Feb. 15, 1113, under the appellation of "Brothers Hospitalers of St. John in Jerusalem." Extensive additions were made to the original establishments, and a magnificent new church was erected to St. John the Baptist on the traditional site of his parents' abode. Gerard then took the title of guardian and provost of the order, and built for the accommodation of pilgrims hospitals in the chief maritime towns of western Europe, which afterward became commanderies of the order. Gerard died in 1118, and was succeeded by Raymond du Puy, who, to protect the Christians of Jerusalem and the bands of pilgrims against the Moslems, armed himself and his former brother knights among the hospitallers. This met with general approbation in Palestine and in Europe, and attracted to the order the élite of the young nobility. To their original and common monastic vows the hospitallers now added a solemn vow of bearing arms in defence of Christendom, and of defending all Christians from insult and wrong. Raymond du Puy divided the order into knights, priests, and brothers servants. There also grew up a numerous intermediate class of sergeants (old Fr. *serfjents*, serving men) or half knights, who rendered important services in the field and the infirmary, and were in course of time assigned separate commanderies. As the new church of St. John the Baptist quite eclipsed the former modest chapel, the order under its new organization was called after St. John the Baptist. Raymond exchanged the title of guardian for that of master; the title of grand master was first assumed by Hugues de Revel in 1267. Raymond du Puy drew up constitutions based on the Augustinian rule, which together with the other changes in the order were approved by Pope Calixtus II. in 1120. The great influx of members caused the order to be divided according to nationalities or "languages," there being at first seven languages, those of Provence, Auvergne, France, Italy, Aragon, Germany, and England, to which were added subsequently the languages of Castile and Portugal. Du Puy during his period of office delivered from the Moslems the principality of Antioch, raised the siege of Jaffa, and aided powerfully in the fall of Tyre, besides driving the enemy from Cœle-Syria and Phœnicia, and contributing to the fall of Ascalon in 1153. The fame of these services brought them numerous valuable gifts, which soon proved detrimental to their efficiency. In 1168 the grand master Gûlbert d'Assalit and a majority of the knights were bribed by Amaury, king of Jerusalem, to engage in an expedition against Egypt, in violation of a solemn treaty. In 1187 the order was nearly annihilated by Saladin in the battle

of Tiberias. After the fall of Jerusalem it was established at the castle of Margat (the present Markab), the female branch of the order retiring to Europe. The knights were involved in disputes and hostilities with the templars, to the damage of both orders; but they continued to serve valiantly against the infidels. At the battle of Gaza, in 1244, both orders were nearly exterminated by the Kharemsians. When Acre fell into the hands of the Saracens (1291), the hospitallers removed to Limisso in Cyprus, where they were recruited by drafts on the European commanderies. In this insular residence originated their naval character, as their vessels conveyed pilgrims to the Holy Land. This led to sea fights, in which the brethren became as distinguished as they had been on land. They seized Rhodes in 1309, fortified it, and held it for more than two centuries against the utmost power of the Turks, and were hence called knights of Rhodes. Of the two memorable sieges they sustained there, the first, in 1480, under the grand master D'Aubusson, proved disastrous to the besiegers, and the second, under L'Isle-Adam, in 1522, after a heroic defence of six months, ended in the defeat of the knights and their evacuating the island. After taking refuge successively in Candia, Messina, and the mainland of Italy, they were in 1530 put in possession of the islands of Gozo and Malta and the city of Tripoli by the emperor Charles V. Malta, which the knights made one of the strongest places in the world, became thenceforward the bulwark of Christendom, and gave its name to the order. The Turks made a fruitless attack on the island in 1551, and renewed it in 1565, with an armament calculated to command success; but the grand master, Jean Parisot de la Valette, after four months of incredible endurance, forced the besiegers to depart. This defence raised the fame of the order to its height. They held Malta till June, 1798, when it was taken by Bonaparte, the grand master Hompesch having abdicated and been sent to Trieste. (See HOMPESCH.) Since this event the order has existed only in name. It was protected for a time by the emperor Paul I. of Russia, whose reported conversion to the Roman Catholic church caused him to be chosen grand master. The seat of the order was removed to Catana in 1801, to Ferrara in 1826, and to Rome in 1834. A fruitless attempt to restore it was made in 1850. Since 1805 the order has been administered by a lieutenant and a college residing in Rome.

SAINT JOHN'S, a N. E. county of Florida, lying between the St. John's river and the Atlantic, and drained by the St. John's and its affluents; area, 900 sq. m.; pop. in 1870, 2,618, of whom 681 were colored. The surface is flat and much of it marshy. There are some live oaks. The chief productions in 1870 were 7,630 bushels of Indian corn, 15,235 of sweet potatoes, 1,000 lbs. of rice, 67 hog-heads of sugar, and 3,457 gallons of molasses.

There were 5,664 cattle and 1,728 swine. Capital, St. Augustine.

SAINT JOHN'S, a S. W. county of Quebec, Canada, bordering on New York; area, 175 sq. m.; pop. in 1871, 12,122, of whom 9,415 were of French, 1,285 of English, and 963 of Irish origin. It is bounded E. by the Richelieu river, and is traversed by the Rouse's Point division of the Grand Trunk railway. Capital, St. Johns.

SAINT JOHN'S, the capital and commercial metropolis of Newfoundland, the easternmost town of North America, situated in the S. E. part of the island, on the N. side of a harbor of the same name on the E. coast of the peninsula of Avalon, 65 m. N. of Cape Race and 18 m. S. of Cape St. Francis, 550 m. E. N. E. of Halifax, Nova Scotia; lat. 47° 34' N., lon. 52° 42' W.; pop. in 1874, 23,890. The site ascends gradually from the harbor, the highest point being 225 ft. above the sea. Opposite the town, on the S. side of the harbor, the hills rise abruptly from the water's edge 700 ft.; but a small space at their base has been made available for building, and here have been erected warehouses and steam factories for the manufacture of seal and cod oil. The country around St. John's is picturesque and generally well cultivated. The town consists of three streets nearly parallel with the harbor, and others crossing these at right angles. A fourth main street, on which are situated the government house, colonial building, skating rinks, &c., is being rapidly built up. The streets are well drained and macadamized, and are lighted with gas. A supply of water was introduced in 1861, at a cost of \$360,000, from a large lake 5 m. distant, and elevated 150 ft. above the highest part of the town. The principal thoroughfare stretches along the water's edge about 1½ m., and is well built up with brick and stone. From it the wharves project into the harbor. On the other streets the houses are mostly of wood. The government house (residence of the governor) is a plain structure, erected at a cost of \$240,000. The colonial lunatic asylum is beautifully situated in wooded grounds about 3 m. out of town. Other public edifices are the colonial building (containing the public offices and legislative halls), custom house, colonial penitentiary, post office, court house, general hospital, smallpox hospital, market house, and poor-house (in the suburbs). The Roman Catholic cathedral is one of the finest church edifices in North America; it occupies the highest ground in town, and with the adjacent buildings cost \$800,000. The church of England cathedral, not yet completed, is a fine specimen of architecture, and is handsomely decorated within. The wharves and stages for drying fish, which line the shore, are a peculiarity of the town. The harbor is landlocked and somewhat crescent-shaped; it is deep, and has good anchorage. The entrance is through the "Narrows," a gorge between two steep and rugged cliffs,

220 yards wide and 660 yards long, with 12 fathoms of water in mid-channel. The cliffs were formerly fortified by several batteries, but these have become dismantled since the withdrawal of the British garrison. On the S. cliff is a lighthouse, with a light 114 ft. above the sea. There are also two lights in the town serving as a guide to the harbor. The harbor is $1\frac{1}{2}$ m. long, and from 500 yards to a little more than $\frac{1}{2}$ m. wide. On the S. side is a dry dock capable of raising vessels of 600 tons, and a marine railway for a smaller class of vessels. The N. and S. sides are connected by a causeway and bridge. It is open the entire year. There is regular steam communication with Europe and America, and steamers and sailing packets run to different points in the island. The trade consists chiefly in supplying the fishermen of Newfoundland with clothing, provisions, and tackle, and in exporting the products of the fisheries, chiefly codfish, seal skins, and cod and seal oil, which are mostly taken to Great Britain, Spain, Portugal, and Brazil. Another important industry is the fitting out of vessels for the seal fishery. The value of imports during 1874 was about \$6,000,000; of exports, about \$5,000,000. The number of entrances was 898, tonnage 220,916; clearances, 724, tonnage 195,392. About 80 per cent. of the imports and 75 per cent. of the exports of the island pass through this port. The number of vessels engaged in the seal fishery from St. John's in 1874 was 24 (13 steamers and 11 sailing vessels), with an aggregate tonnage of 4,801 and crews numbering 2,841 men; number of seals taken, 150,000. The number of vessels owned at the port in 1874 was 1,319, with an aggregate tonnage of 67,185, of which 18, tonnage 5,447, were steamers, and 1,301, tonnage 67,185, sailing vessels. The latter are scattered throughout the island and owned or sailed by dealers or mercantile houses in St. John's. The manufactures of St. John's are of secondary importance and of limited extent. The principal establishments are three foundries, three breweries, a distillery, two tanneries, a rope factory, a block factory, several manufactories of boots and shoes, several of carriages, one of cabinet ware, one of nets, four biscuit bakeries, and several oil refineries. There are two banks, a savings bank, and a marine insurance company. There is no municipal corporation, the town being governed directly by the colonial legislature. The only local taxation is a rate levied on houses under acts of the legislature for water and sewerage. The town is well policed, and there are several volunteer fire companies. The principal charitable institutions not already mentioned are a Roman Catholic orphanage for girls, an asylum for widows and orphan girls, and another for boys, in connection with the church of England. The educational institutions include St. Bonaventure college (Roman Catholic), a church of England, a Wesleyan, and a general Protestant academy, a Presby-

terian school, an industrial school and an orphan asylum school under the control of the benevolent Irish society, a number of common schools under the control of the government boards or of the colonial and continental church and school society, and several private schools. There are two public libraries, having together 5,000 or 6,000 volumes. The principal one is in connection with the St. John's Athenæum (which is now erecting a large building for lectures, concerts, and other purposes), and the other with the Catholic institute. Three tri-weekly, four semi-weekly, and three weekly newspapers are published. There are 11 churches, including the cathedrals, viz.: 3 church of England, 1 Congregational, 2 Presbyterian (one in connection with the established and one with the Free church of Scotland), 3 Roman Catholic, and 2 Wesleyan Methodist. The church of England has here a theological institute for the training of young men for mission work in the colony.—St. John's appears to have been resorted to by fishermen (chiefly French and Spanish) in the early part of the 16th century. The harbor was entered by Sir Humphrey Gilbert in 1583, who took formal possession of the island in the name of Queen Elizabeth. The town was several times the scene of conflict between the French and English until the island came finally into the possession of the latter by the treaty of Utrecht in 1713. It has been visited by several conflagrations, the most destructive in 1846.

SAINT JOHNS (Fr. *St. Jean*), a town, port of entry, and the capital of St. Johns co., Quebec, Canada, 20 m. S. E. of Montreal; pop. in 1871, 3,022. It is situated on the W. bank of the Richelieu river, here spanned by a fine bridge, and by means of canals affording a navigable connection between Lake Champlain and the river St. Lawrence. Divisions of the Grand Trunk and Central Vermont railways intersect here with the Southeastern and the Stanstead, Shefford, and Chambly railways. There is a large trade in lumber, grain, and other produce. The town contains saw, grist, and planing mills, brick yards, two breweries, and manufactories of iron castings, leather, earthenware, &c. It is the seat of a lunatic asylum, and has a bank, a branch bank, about 40 stores, commodious barracks, two weekly newspapers, and four or five churches. The value of imports for the year ending June 30, 1874, was \$717,174; of exports, \$4,873,812.

SAINT JOHN THE BAPTIST, a S. E. parish of Louisiana, intersected by the Mississippi river, bordering N. W. on Lake Maurepas, N. E. on Lake Pontchartrain, and S. W. on Lake Des Allemands; area, about 250 sq. m.; pop. in 1870, 6,762, of whom 4,044 were colored. The surface is level and the soil fertile. The chief productions in 1870 were 106,884 bushels of Indian corn, 1,360 tons of hay, 4,962 hogsheads of sugar, 346,100 gallons of molasses, and 632,670 lbs. of rice. There were 337 horses, 1,570 mules and asses, 1,157 cattle, 294

sheep, and 381 swine. The parish has railroad communication with New Orleans. Capital, Edgard.

SAINT JOHNSBURY, a town and the county seat of Caledonia co., Vermont, on the Passumpsic river, and on the Portland and Ogdensburg and the Connecticut and Passumpsic Rivers railroads, 38 m. E. N. E. of Montpelier; pop. in 1850, 2,758; in 1860, 3,469; in 1870, 4,665. It contains three villages, St. Johnsbury, St. Johnsbury Centre, and St. Johnsbury East. The first is much the largest, and has many neat residences and good public buildings. The court house is a fine structure, and in front is a soldiers' monument. The Athenæum, also a fine building, contains a public reading room with a library of more than 10,000 volumes and a gallery of choice paintings and works of art. The principal educational institution besides the free public schools is the St. Johnsbury academy. The town has two national banks, a savings bank, two weekly newspapers, and 11 churches. There are iron foundries and manufactories of agricultural implements, &c.; but the chief industrial feature is the extensive manufactory of the "Fairbanks standard scales," in St. Johnsbury village. The works occupy 15 acres and employ from 500 to 600 men; annual value of products, more than \$2,000,000.

SAINT JOHN'S RIVER. See FLORIDA.

SAINT JOSEPH. I. A N. county of Indiana, bordering on Michigan, drained by the St. Joseph and Kankakee rivers, and traversed by several railroads; area, 470 sq. m.; pop. in 1870, 25,322. The surface is nearly level, and is divided about equally into oak openings, forests, and prairie. The chief productions in 1870 were 503,757 bushels of wheat, 233,045 of Indian corn, 76,846 of oats, 19,910 tons of hay, 55,506 lbs. of wool, 352,577 of butter, and 61,024 of maple sugar. There were 5,700 horses, 5,537 milch cows, 6,197 other cattle, 16,639 sheep, and 13,560 swine; 6 manufactories of agricultural implements, 7 of brick, 15 of carriages and wagons, 3 of cutlery and edge tools, 15 of furniture, 3 of iron castings, 5 of sash, doors, and blinds, 1 of sewing machine fixtures, 3 of woollen goods, 28 saw mills, 2 planing mills, and 9 flour mills. Capital, South Bend. **II.** A S. W. county of Michigan, bordering on Indiana and drained by the St. Joseph, Portage, Prairie, Pigeon, and Fawn rivers; area, about 550 sq. m.; pop. in 1870, 26,275. The surface is rolling and the soil is very fertile. It is intersected by the Michigan Southern, Michigan Central, and other railroads. Large quantities of peppermint are raised in this county. The chief productions in 1870 were 756,428 bushels of wheat, 654,712 of Indian corn, 91,184 of oats, 400,201 of potatoes, 31,227 tons of hay, 203,223 lbs. of wool, 483,104 of butter, and 14,780 gallons of sorghum molasses. There were 7,362 horses, 5,792 milch cows, 6,203 other cattle, 46,128 sheep, and 21,020 swine; 10 manufactories of agricul-

tural implements, 19 of carriages and wagons, 3 of furniture, 3 of iron castings, 10 of leather, 7 breweries, 20 saw mills, 6 flour mills, and 4 ship yards. Capital, Centreville.

SAINT JOSEPH, a river of Michigan and Indiana, rises in Hillsdale co., Mich., and after making a circuit into northern Indiana returns into Michigan, and falls into Lake Michigan, at the village of St. Joseph, after a course of 250 m. Its general direction is nearly W., but its course is serpentine. It is navigable for small steamboats to Constantine, 120 m. from its mouth, where is a good harbor.

SAINT JOSEPH, a city and the county seat of Buchanan co., Missouri, on the great E. bend of the Missouri river, 260 m. W. by N. of St. Louis, and 390 m. W. S. W. of Chicago; pop. in 1860, 8,932; in 1870, 19,565, of whom 1,512 were colored; in 1875, about 25,000. It has a court house erected in 1875 at a cost of \$200,000, a handsome city hall and market house, a large convent, 17 church edifices, and several large hotels. The great iron bridge across the river at this point, for railway and ordinary travel, was built in 1873 by the city, at a cost of \$710,000. One of the state lunatic asylums is situated here; it was erected in 1874 at a cost of \$220,000, and has accommodations for 200 patients. The "Agricultural and Mechanical Exposition of St. Joseph" has extensive grounds and buildings, and holds an annual fair in September. Railway facilities have given St. Joseph its business importance. Five lines of railroad centre here, affording three separate and direct routes to St. Louis, three to Chicago and the east, three to Kansas City, one to Council Bluffs and Omaha, and one to Denver, viz.: the Kansas City, St. Joseph, and Council Bluffs; Hannibal and St. Joseph; St. Louis, Kansas City, and Northern; St. Joseph and Denver City; and St. Joseph and Topeka. The wholesale trade is the largest after San Francisco W. of St. Louis or Chicago, commanding the most productive agricultural portion of the far west; in 1874 it amounted to over \$18,000,000. The city has seven banking institutions, two being savings banks. It is the largest manufacturing point after San Francisco W. of the Mississippi, having five flouring mills, one large grain elevator, a starch factory with a capacity of 1,200 bushels of corn a day, two furniture factories, a woollen mill, nine saddlery and harness establishments, two foundries and machine shops, two boot and shoe factories, four pork-packing establishments, which packed 108,000 hogs in 1874, twelve wagon factories, a glue factory, a distillery, and a tannery. The city has a graded public school system, with 15 schools, including a high school, 52 teachers, and 3,362 pupils. There are also several academies and private schools, including St. Joseph college and several other Roman Catholic institutions. Three daily and four weekly newspapers are published, and there are two public libraries. The number of churches is

17, viz.: 3 Baptist, 1 Christian, 1 Episcopal, 1 Evangelical, 1 Jewish, 5 Methodist, 2 Presbyterian, and 3 Roman Catholic, including the cathedral.—St. Joseph was laid out in 1846, and incorporated as a city in 1857.

SAINT JOSEPH'S RIVER. See SAINT JOSEPH.

SAINT-JUST, Antoine Louis Léon de, a French revolutionist, born at Decize, near Nevers, in 1767 or 1768, guillotined in Paris, July 28, 1794. He early imbibed a very extravagant admiration of the ancient republics, and published several poems, and in 1791 a work entitled *Esprit de la révolution et de la constitution de France*. Through the influence of Robespierre he was in 1792 elected to the convention. He took the foremost rank among the violent spirits in that body, voted for the immediate execution of Louis XVI., advocated the concentration of all power in the convention, including the supervision of military operations, and urged the reign of terror as the only means of safety for France, declaring that "those who make half-way revolutions only dig their own graves." After the fall of the Girondists he became a member of the committee of public safety, and as commissioner to the army of the Rhine he established the guillotine in Alsace. In February, 1794, he was named president of the convention, and in March made the report against Danton and his partisans which insured their death. With Robespierre and Couthon he formed the triumvirate of the reign of terror. On the 9th Thermidor he tried by speaking to resist the public wrath, but the next day he was executed. His *Œuvres politiques* have been collected (1833-'4), and his life has been written by Fleury (2 vols., 1852) and Hamel (1859).

SAINT-LAMBERT, Jean François de, a French poet, born in Nancy, Dec. 26, 1716, died in Paris, Feb. 9, 1803. He was connected with the court of King Stanislas, where he met Voltaire and his mistress, the marchioness du Châtelet, who died in giving birth to a child by him. Voltaire continued to befriend him nevertheless. His next and lifelong mistress was Mme. d'Houdetot, with whom Rousseau was also in love. After serving in the army in 1756-'7, he was one of the leaders of literary society in Paris. He published miscellaneous works, of which his minor poems are the best. His elaborate poem *Les saisons* (1769; revised and enlarged ed., 1771) gained his admission to the academy.

SAINT LANDRY, a S. W. parish of Louisiana, bounded E. by the Atchafalaya river, and W. in part by Bayou Nezpique, and drained by numerous bayous; area, about 2,200 sq. m.; pop. in 1870, 25,553, of whom 11,694 were colored. The surface is high and undulating, and the soil fertile. The chief productions in 1870 were 368,897 bushels of Indian corn, 58,811 of sweet potatoes, 14,305 bales of cotton, 1,350 lbs. of tobacco, 33,375 of rice, 5,026 of wool, 1,988 hogsheds of sugar, and 118,110 gallons of molasses. There were 5,843 horses,

2,052 mules and asses, 8,455 milch cows, 3,049 working oxen, 15,074 other cattle, 9,398 sheep, and 17,188 swine. There were 17 molasses and sugar establishments. Capital, Opelousas.

SAINT LAWRENCE, a river and gulf of North America. The river proper begins at Kingston, at the foot of Lake Ontario, and flows N. E., first between New York and Ontario, Canada, and then through the province of Quebec, about 750 m., to the gulf. It insensibly expands into the gulf, but is usually considered as terminating between Cape Chatte on the south and Pointe des Monts on the north, about lat. 49° 15' N., lon. 67° W. At its issue from Lake Ontario it is 2½ m. wide, and in the narrowest parts its width is seldom less than 2 m. Below the city of Quebec it gradually expands, and at its mouth is upward of 30 m. wide. At Cape Gaspé the gulf is nearly 100 m. wide. The principal expansions above Quebec are Lake St. Peter, 80 m. long and 10 m. wide, just above Three Rivers; that containing the island of Montreal, Isle Jésus, and Isle Perrot; Lake St. Francis, a little further up; and the Lake of the Thousand Islands, near its issue from Lake Ontario, containing the celebrated Thousand islands. The principal island below Quebec is the isle of Orleans. The influence of the tide is felt as high up as Lake St. Peter. Its principal tributaries on the N. side are the Ottawa, the St. Maurice, the Saguenay, and the Betsiamite or Bersimis; those on the S. side, which are smaller and of less importance, are the Oswegatchie, Grass, Raquette, St. Regis, Sorel (also called the Richelieu, Chambly, or St. Johns), St. Francis, and Chaudière rivers. The St. Lawrence drains a territory of over 400,000 sq. m., and its basin, reckoned from its extreme source, was computed by Darby, before the discovery of the great African lakes, to contain "more than half of all the fresh water on this planet." Early French geographers, treating the great lakes as expansions of the stream, made the river Nipigon, on the N. side of Lake Superior, the head stream of the St. Lawrence. Others have considered as such the St. Louis river, emptying into the S. W. extremity of Lake Superior. In either case the total length would be upward of 2,000 m. Besides Lakes Ontario, Erie, St. Clair, Huron, Michigan, and Superior, there is a number of lakes N. and W. of Lake Superior, which together would about equal Lake Ontario. These all pour their waters into the ocean through the St. Lawrence. Regarding the chain as one stream, between Lakes Superior and Huron it is known as the St. Mary's river; between Huron and St. Clair as the St. Clair river; between St. Clair and Erie as the Detroit river; and between Erie and Ontario as the Niagara river. The St. Lawrence is navigable by sea-going vessels to Montreal. Above that city its navigation is impeded by rapids, of which the Cedar and Lachine are the most considerable. The inclination of these rapids is so regular, that

steamboats drawing 7 ft. of water can descend the river safely; and for the purpose of obviating the difficulty of ascent (Lake Ontario being 231 ft. above the ocean level according to former measurements, and according to J. T. Gardner's recent calculations several feet higher), seven different canals have been constructed, of an aggregate length of 41 m., which will admit the passage of vessels of 1,000 tons. A canal has also been constructed from Lake Ontario to Lake Erie, called the Welland canal, 28 m. in length, and having capacity to pass a vessel of 500 tons burden. There is also a ship canal of large size around the falls of St. Mary, between Lake Huron and Lake Superior. A vessel of 500 tons may load from the mouth of the St. Louis river at Duluth, Minn., or from Chicago, and, without breaking bulk, pass down the St. Lawrence to any port in the world. An enlargement of the St. Lawrence and Welland canals is now (1875) in progress. When this is completed, the locks will each have 270 ft. of chamber, with a width of 45 ft., and a depth of 14 ft. over the mitre sills. The enlargement was at first intended to give only 12 ft. of water, and to obtain this depth the official estimate of cost was \$10,000,000. From one third to one fourth of the vessels employed on the upper lakes are too large to pass through the existing Welland canal into Lake Ontario; the enlarged canals, which may be ready for the season of 1880, will be able to pass the largest vessels used on those waters. Enormous as is the water supply of the St. Lawrence canals, it is subject to considerable periodic changes of level; and the proposed 14 ft. of water in them is estimated from the lowest levels that have been reached in 55 years, during which the difference between the highest and the lowest levels has been $5\frac{1}{2}$ ft. in Lake Ontario; and to secure the required depth it is intended to sink the locks 15 ft. below the low-water mark. The annual rise is from 10 to 20 in.; but besides this there is an irregularly recurring change of level, extending over a series of years, which cannot be calculated. The number of days during which the canals have been open during the past 24 years has varied, in the case of the Lachine canal, from 197 to 233, the average probably being 220; of the Beauharnois, from 209 to 229, with an average a little higher than the Lachine. In 1874, 1,000,573 tons of shipping passed through the St. Lawrence canals, and 1,389,173 tons through the Welland.—The gulf of St. Lawrence, which receives the waters of this mighty river, is bounded N. by Labrador, E. by the islands of Newfoundland and Cape Breton, S. by Nova Scotia, and W. by New Brunswick and Quebec. It has an estimated area of 80,000 sq. m. It has three channels of communication with the ocean, viz., between Newfoundland and Cape Breton, by the strait of Belle Isle on the north, and through the gut of Canso on the south. It has numerous islands, among which

the largest are Anticosti, Prince Edward, and the Magdalen group. Its principal bays are those of Chaleurs, between New Brunswick and Quebec; Miramichi, in New Brunswick; St. George, in Nova Scotia; and St. George's, in Newfoundland.

SAINT LAWRENCE, a N. county of New York, bordered N. W. by the St. Lawrence river, drained by the Indian, Oswegatchie, Grass, Raquette, St. Regis, and Deer rivers and their affluents, and traversed by several railroads; area, 2,900 sq. m., being the largest county in the state; pop. in 1870, 84,826. It has three lakes of considerable size, Long, Black, and Cranberry, besides several smaller ones. The southern portion of the county is as yet but thinly settled, and is heavily timbered. Along the St. Lawrence the surface is generally level and very productive. There are mines of lead and specular iron ore. The chief productions in 1870 were 569,701 bushels of wheat, 35,295 of rye, 174,840 of Indian corn, 1,077,345 of oats, 196,421 of barley, 57,078 of buckwheat, 1,217,894 of potatoes, 269,250 tons of hay, 281,962 lbs. of wool, 8,419,695 of butter, 1,710,082 of cheese, 157,275 of hops, 104,266 of flax, 1,063,592 of maple sugar, and 23,283 of honey. There were 24,126 horses, 87,293 milch cows, 1,612 working oxen, 31,693 other cattle, 62,632 sheep, and 16,981 swine; 4 manufacturing of agricultural implements, 8 of pot and pearl ashes, 10 of brick, 46 of carriages and wagons, 20 of cheese, 8 of iron castings, 26 of tanned and 20 of curried leather, 9 of machinery, 30 of saddlery and harness, 9 of starch, 19 of tin, copper, and sheet-iron ware, 11 of wooden ware, 8 of woollen goods, 7 wool-carding and cloth-dressing establishments, 25 flour mills, 97 saw mills, and 3 planing mills. Capital, Canton.

SAINT LEONARDS, Edward Burtenshaw Sugden, baron, an English jurist, born in London in February, 1781, died there, Jan. 29, 1875. He studied law at Lincoln's Inn, was admitted to practice in 1807, gave up his chamber practice, and confined himself to the chancery bar in 1817, became king's counsel and bencher of Lincoln's Inn in 1822, and was elected to parliament for Weymouth in 1828, and for Ripon in 1837. He was knighted in 1829, and was solicitor general in 1829-'31, lord chancellor of Ireland in 1835 and again in 1841-'6, and lord chancellor of England for a few months in 1852, when he was raised to the peerage. He published "A Concise and Practical Treatise of the Law of Vendors and Purchasers" (London, 1805; 14th ed., 1862; 7th American ed., New York, 1851); "A Practical Treatise on Powers" (1808; 8th ed., 1861); "Letters to a Man of Property, on Sales, Purchases, Mortgages," &c. (1809; 5th ed., 1829); a "Treatise on the Law of Property, as administered in the House of Lords" (1849); and "A Handbook on Property Law" (1858; 8th ed., 1869).

SAINT-LÔ, a town of Normandy, France, capital of the department of La Manche, on the

Vire, 158 m. W. by N. of Paris; pop. in 1872, 9,287. The beautiful Gothic church of Notre Dame was formerly a cathedral, and the church of Sainte Croix, said to have been built by Charlemagne, was generally regarded as the completest monument of Saxon architecture; it was entirely rebuilt in 1860, and the old church of St. Thomas de Cantorbéry has been converted into a town hall. Fine cloths, drugget, ribbons, linen, lace, and leather are made.

SAINT LOUIS. I. A N. E. county of Minnesota, bounded N. E. by the chain of small lakes which separate that state from British America, S. E. by Lake Superior, and drained by St. Louis, Vermilion, and other rivers; area, 6,500 sq. m.; pop. in 1870, 4,561. The county is interspersed with lakes, the largest of which are Vermilion and Pelican. It contains much timber. The value of manufactures, according to the census of 1870, was \$262,000, the chief establishments being three saw mills. The Northern Pacific and Lake Superior and Mississippi railroads terminate at the capital, Duluth. II. An E. county of Missouri, occupying the tongue of land formed by the junction of the Mississippi and Missouri rivers, and drained by the Maramec; area, 550 sq. m.; pop. in 1870, 351,189, of whom 26,387 were colored. The surface is varied and the soil very fertile. There are extensive mines of coal and quarries of marble, and the W. part extends into the great iron region of the state. The chief productions in 1870 were 454,026 bushels of wheat, 1,023,978 of Indian corn, 280,783 of oats, 24,062 of barley, 377,316 of potatoes, 30,333 tons of hay, 14,570 lbs. of tobacco, 15,537 of wool, 288,615 of butter, 39,815 of cheese, and 46,836 gallons of wine. There were on farms 7,037 horses, 2,229 mules and asses, 8,216 milch cows, 5,136 other cattle, 6,692 sheep, and 27,198 swine. Capital, St. Louis.

SAINT LOUIS, the chief city of Missouri, county seat of St. Louis co., and the commercial metropolis of the central Mississippi valley, on the right bank of the Mississippi river, 20 m. below the entrance of the Missouri, about 175 m. above the mouth of the Ohio, 1,170 m. above New Orleans, and 125 m. E. of Jefferson City; lat. 38° 37' 28" N., lon. 90° 15' 16" W.; pop. in 1810, 1,600; in 1820, 4,598; in 1830, 5,852; in 1840, 16,469; in 1850, 77,860; in 1860, 160,773; in 1870 (when it was the fourth city in the United States in population), 310,864, of whom 22,088 were colored; in 1875, estimated by local authorities as high as 490,000. Of the population in 1870, 161,796 were males and 149,068 females, 198,615 natives and 112,249 foreigners, of whom 2,652 were born in Bohemia, 2,008 in British America, 2,788 in France, 59,040 in Germany, 5,367 in England, 32,239 in Ireland, 1,202 in Scotland, and 2,902 in Switzerland. There were 59,431 families, with an average of 5.23 persons to each, and 39,675 dwellings, with an average of 7.84 to each. Of the 108,691 persons 10 years old and over returned

as engaged in all occupations, 810 were employed in agriculture, 41,418 in professional and personal services, 28,219 in trade and transportation, and 38,244 in manufactures and mining.—The city is many feet above high water. It is built on three terraces, the first rising gently from the river for about 1 m. to 17th street, where the elevation is 150 ft. above the stream. The ground then gently declines, rises in a second terrace to 25th street, again falls, and subsequently rises in a third terrace to a height of 200 ft. at Côte Brillante or Wilson's hill, 4 m. W. of the river. The surface here spreads out into a wide and beautiful plain. The corporate limits extend 11½ m. along the river, and in extreme width 3 m. back from it; area, 13,216 acres or 20½ sq. m. The densely built portion is comprised in a district of about 6 m. along the river and 2 m. in width. The city is for the most part regularly laid out, the streets near the river running parallel with its curve, while further back they are generally at right angles with those running W. from the river bank. Grand avenue, in part 120 ft. wide, extends through the city from N. to S., and in the centre is about 3 m. from the river. Washington avenue, one of the widest and finest in St. Louis, runs back from the river; at its foot is the terminus of the great bridge. Front street, 100 ft. wide, extends along the levee, and is built up with massive stone warehouses. The wholesale trade is chiefly on Main and 2d streets, but is extending into Washington avenue and 5th street. The fashionable promenade is 4th street, containing the leading retail stores. There are 14 street railroad companies, running to various parts of the city, and one over the bridge to East St. Louis. The city is remarkably well built, largely of brick or stone. The principal public buildings are the city hall, the court house, erected at an expense of \$1,200,000, the jail, the county insane asylum, the Masonic temple, the polytechnic building, the custom house and post office, costing \$350,000, the United States arsenal (a large and imposing structure in the S. E. part of the city, surrounded with fine grounds), the merchants' exchange, the mercantile library hall, the city hospital, the marine hospital, the high school building, Washington university, St. Louis university, several hotels (the chief of which are the Southern, Planters', Barnum's, Lindell, and Laclede), the Roman Catholic cathedral (136 ft. long and 84 ft. wide, with a front of polished free stone), St. George's (Episcopal) church, the church of the Messiah (Unitarian), the first and second Presbyterian churches, the Baptist church at 6th and Locust streets, the Jewish temple at 16th and Pine streets, the Union Methodist church at 11th and Locust streets, the Lutheran church at 8th and Walnut streets, the Congregational church at 10th and Locust streets, and the Presbyterian churches at 11th and Pine and 16th and Walnut streets. A new custom house and post office

and a new exchange are in course of erection (1875). The public squares and parks embrace in the aggregate about 2,000 acres. Missouri park, Hyde park, Gravois park, Jackson place, Carr place, St. Louis place, and Washington square, with from $1\frac{1}{2}$ to 12 acres each, are

acres), in the N. part of the city, about a mile from the river. On the opposite bank of the Mississippi is East St. Louis, a city of St. Clair co., Ill., incorporated in 1865, and containing in 1875 upward of 10,000 inhabitants. It has a river front of 2 m., numerous manufacto-

New Court House.

within the settled portion of the city. Lafayette park, in the S. portion, contains about 30 acres; it is handsomely laid out, and surrounded by elegant dwellings. The Northern park, 180 acres, on the bluffs in the N. portion, is noted for its fine trees. Lindell park, 60 acres, on the line of Forest Park boulevard, is tastefully laid out, and filled with native forest trees. Forest park, 1,350 acres, still mostly covered with primitive trees, W. of the centre of the city and about 4 m. from the river, is bounded by wide boulevards. Lindell boulevard (194 ft. wide) and Forest Park boulevard (150 ft. wide), each about 2 m. long, extend from it toward the heart of the city. The Des Pères river meanders through this park. Other public grounds are Carondelet, Laclede, and Benton parks, Exchange square, and Clinton and Marion places. Tower Grove park, adjoining Shaw's botanical garden, is in the S. W. part of the city, and contains 277 acres. The garden (109 acres) is owned by Henry Shaw, who has opened it to the public, and intends it as a gift to the city. The fair grounds of the St. Louis agricultural and mechanical association, 85 acres, N. W. of the centre of the city, are handsomely laid out and ornamented, and contain extensive buildings; the amphitheatre will seat 25,000 persons. The handsomest cemeteries are Bellefontaine (350 acres) and Calvary (262

acres), in the N. part of the city, about a mile from the river. On the opposite bank of the Mississippi is East St. Louis, a city of St. Clair co., Ill., incorporated in 1865, and containing in 1875 upward of 10,000 inhabitants. It has a river front of 2 m., numerous manufacto-

ries, several railroad shops, an elevator, and the extensive national stock yard. It is connected with St. Louis by ferry and by the great bridge, before the completion of which it was the terminus of all the railroads extending east. The bridge is of steel, and rests on four piers. (See BRIDGE, vol. iii., p. 276.) It passes over a viaduct of five arches (27 ft. span each) into Washington avenue. The lower roadway runs into a tunnel, 15 ft. wide, 17 ft. high, and 4,800 ft. long, which passes under a large portion of the city, terminating near 11th street, where a great central railroad depot is in

course of construction (1875).—St. Louis communicates by river and rail with a vast extent of fertile country. Sixteen lines of railroad centre here, viz.: the Ohio and Mississippi; Chicago, Alton, and St. Louis; Indianapolis and St. Louis; Atlantic and Pacific; Missouri Pacific; St. Louis, Kansas City, and Northern; St. Louis and Iron Mountain; St. Louis, Vandalia, Terre Haute, and Indianapolis; Rockford, Rock Island, and St. Louis; Belleville and Southern Illinois; Toledo, Wabash, and Western; St. Louis and Southeastern; Illinois and St. Louis; Missouri, Kansas, and Texas; Illinois Central; and Cairo and St. Louis. The arrivals of barges and canal boats in 1874 numbered 951; of steamers, 2,332, viz.: from the upper Mississippi, 1,063; lower Mississippi, 752; Illinois river, 269; Missouri river, 104; Ohio river, 113; elsewhere, 31.

RECEIPTS OF FREIGHT FOR FOUR YEARS.

YEAR.	By rail.	By river.	Total.
1871....	2,298,321 tons.	884,401 tons.	3,182,722 tons.
1872....	2,888,364 "	863,819 "	3,752,183 "
1873....	3,245,178 "	801,055 "	4,046,233 "
1874....	3,165,093 "	732,765 "	3,897,858 "

SHIPMENTS OF FREIGHT FOR FOUR YEARS.

YEAR.	By rail.	By river.	Total.
1871....	959,582 tons.	776,498 tons.	1,736,080 tons.
1872....	1,204,664 "	805,282 "	2,009,946 "
1873....	1,155,416 "	783,256 "	1,938,672 "
1874....	1,118,150 "	707,325 "	1,825,475 "

The principal articles of receipt and shipment are breadstuffs, live stock, provisions, cotton, lead (from the Missouri mines), hay, salt, wool, hides and pelts, lumber, tobacco, and groceries. The trade in dry goods is also extensive.

There are, including those in East St. Louis, six grain elevators and warehouses, five establishments for storing and compressing cotton, and two stock yards. The movement of breadstuffs for ten years has been as follows:

St. Louis is noted for the manufacture of flour, being in this respect the first city in the Union. There were 24 mills in operation in 1874. The production for ten years has been as follows: 1865, 743,231 bbls.; 1866, 818,300; 1867, 765,298; 1868, 895,154; 1869, 1,068,592; 1870, 1,351,773; 1871, 1,507,915; 1872, 1,494,798; 1873, 1,420,237; 1874, 1,573,202. The movement of live stock and provisions for ten years was as follows:

The number of hogs packed for a series of years has been as follows: 1869-'70, 241,316; 1870-'71, 305,600; 1871-'2, 419,032; 1872-'3, 533,000; 1873-'4, 463,793. The cotton trade has increased rapidly during the past few years. The receipts and shipments of cotton, together with the receipts and consumption of lead, for five years, are shown in the following table:

YEAR.	COTTON, BALES.		LEAD, PIGS.	
	Receipts.	Shipments.	Receipts.	Consumption.
1870...	11,372	6,692	237,089	205,600

1873...	83,439	70,949	356,037	255,938
1874...	185,943	122,694	479,448	200,000

St. Louis is a port of delivery in the customs district of New Orleans, and a port of entry under the act of 1870 permitting the shipment of foreign goods in bond to interior ports from the port of first delivery. The value of direct importations under this act in 1873 was \$1,120,455; in 1874, \$843,313. The value of foreign goods warehoused during the latter year was \$4,046,428; remaining in warehouse

on Dec. 31, \$276,547; amount of import duty collected during the year, \$1,674,116 53.—Notwithstanding the extent of its commercial interests, the prosperity of the city is chiefly due to its manufactures, in which it is surpassed only by New York and Philadelphia among the cities of the Union. The number of establishments in the county (mostly within the city limits), according to the United States census of 1870, was 4,579, employing 425 steam engines of 15,118 horse power, and 40,856 hands, of whom 32,484 were males above 16, 3,455 females above 15, and 4,917 youths; capital invested, \$60,357,001; wages paid during the year, \$24,221,717; value of materials used, \$87,388,252; of products, \$158,761,013. The particulars of some of the principal branches are contained in the following table:

INDUSTRIES.	No. of establishments.	Hands employed.	Amount of capital invested.	Value of materials used.	Annual value of products.

There has been a large increase since 1870 in nearly all branches of manufacture except iron, which since the panic of 1873 has declined; the value of products for 1874 has been estimated at nearly \$240,000,000. Extensive Bessemer steel works are now (1875) in course of erec-

tion. There are 7 national banks, 19 state banks, and 30 savings institutions, with an aggregate capital of about \$20,000,000. On July 1, 1874, the aggregate deposits were \$42,088,-214 59; loans and discounts, \$48,544,501 51; cash and exchanges, \$11,903,758 03. The city

contains a safe deposit company and 31 insurance companies, of which five are life insurance companies. There are a chamber of commerce, a merchants' exchange, a board of trade, a cotton exchange, a mechanics' and manufacturers' exchange, and a mining exchange.—St. Louis is divided into 12 wards, and is governed by a mayor and a city council composed of two members from each ward, elected biennially. There are also a comptroller, treasurer, and auditor. The United States courts for the E. district of Missouri and terms of the state supreme court are held here. The special city courts are the court of criminal correction and four police courts. The headquarters of the United States army were established here in 1874. The police force is under the control of five commissioners, including the mayor *ex officio*, whose jurisdiction extends over 30 sq. m. of territory beyond the limits of the city. The force on April 1, 1875, numbered 462 officers and men. The fire department comprises 18 engine companies, 14 hose companies, and three hook and ladder companies; the number of men is 150. The water supply of the city is taken from the Mississippi at Bissell's point, near the N. boundary. It is raised into four reservoirs, each 240 by 660 ft., with an average depth of about 20 ft., by two pumping engines, each with a capacity of 17,000,000 gallons a day. In these reservoirs it remains 24 hours, to free it from sediment. It then passes into a small reservoir near the two high-service engines, which raise it to the storage reservoir, covering about 17 acres on Compton hill, 26 ft. above the highest street grade. The board of health consists of five members, including the mayor as president *ex officio*. It is asserted that St. Louis is one of the healthiest cities in the country. The number of deaths for eight years, according to the health officer's report, has been as follows: 1867, 6,167, or 28·2 per 1,000; 1868, 5,193, 20·6; 1869, 5,884, 20·6; 1870, 6,670, 21·3; 1871, 5,265, 16·8; 1872, 8,047, 18·2; 1873, 8,551, 21·36; 1874, 6,506, 14·45. Of the deaths in 1874, 30·43 per cent. were from zymotic, 18·29 from constitutional, 41·74 from local, and 6·56 from developmental diseases, and 2·99 per cent. from violence. The number of deaths from consumption was 581, being 8·93 per cent. of the whole. The assessed value of property in 1864 was \$63,059,078; in 1874, \$172,109,270. The balance in the treasury on April 14, 1874, was \$289,404 20; receipts during the following year, \$6,003,819 56, of which \$2,236,121 86 were from taxes, 2,005,120 from the sale of bonds, \$1,150,000 from temporary loans, and \$612,577 70 from miscellaneous sources; expenditures, \$6,231,286 72, of which \$372,000 were for the payment of matured bonds, \$1,035,631 38 of interest on debt, \$1,450,000 of temporary loans, and \$3,373,665 34 for other purposes; balance, April 12, 1875, \$61,937 04. The bonded debt on April 13, 1875, was \$15,-

993,000, on which the annual interest is \$950,710; temporary debt, \$1,027,000. The assets of the city on the same date amounted to \$13,044,315 38, including, besides a sinking fund of \$738,126 65, the water works, engine houses, public parks, &c. There are 2·61 m. of paved and macadamized wharf, 220·81 m. of macadamized streets, 10·2 m. of Nicolson pavement, 40·68 m. of improved alleys, 162 m. of sewers, and 160 m. of water pipe. The public institutions not already mentioned are the workhouse, house of refuge, female hospital, city dispensary, and quarantine hospital. Under the management of various societies, there are 9 hospitals and 27 asylums and homes, including a deaf and dumb asylum conducted by the sisters of St. Joseph, and St. Vincent's insane asylum.—The public schools of St. Louis are under the control of a board of 24 members, two from each ward, which appoints a superintendent and two assistants. There are three courses of study, viz.: the normal school course, for females only, two years; the high school course, four years; and the district school course, eight years. There are also separate schools for colored children, and evening schools, the O'Fallon polytechnic institute serving as an evening high school. German is taught in the district schools to such pupils as elect to study it. According to the school census taken in April, 1874, there were 138,133 persons from 5 to 21 years of age inclusive, of whom 95,539 were from 6 to 16; there were 33,511 attending public schools and 21,789 attending private schools; total attending school, 55,300. In 1866 there were only 30 school houses, with 11,055 seats; number of pupils enrolled, 16,228; average attendance, 9,597; average number of teachers, 236; total expenditures, \$331,694 36. In 1874-'5 there were 57 day schools (1 normal, 6 high and branches, 44 district, 6 colored); number of pupils enrolled, 35,941; average attendance, 24,438; number of teachers, 654; number of evening schools, 21; pupils enrolled, 5,751; average attendance, 2,644; teachers, 115; number of school houses, 56; rooms, 525; seats, 30,070; value of school lots, \$715,736; of school buildings and furniture, \$1,715,230; expenditures, \$792,019 37, of which \$522,350 09 were for teachers' salaries, \$44,345 57 for permanent improvements, and \$225,323 71 for current expenses. The public school library contains about 38,000 volumes, and has a good reading room; it is open to the public for consultation. Several scientific and other societies have merged their collections with it. There are about 70 parochial schools, under the management of the Roman Catholics and other denominations, and a number of academies and private schools, including one for the deaf and dumb. There are also seven medical colleges and a college of pharmacy. The St. Louis university, under the direction of members of the society of Jesus, was founded in 1829, and incorporated in 1832.

It has a very valuable museum, philosophical and chemical apparatus, and a library of more than 16,500 volumes. The select libraries open to the students form a separate collection of more than 8,000 volumes. The university has a classical course of six years, a commercial course of four years, and a preparatory class. The number of instructors in 1874-'5 was 22; of students, 353. Washington university, incorporated in 1853, is intended to embrace the whole range of university studies, except theological. It comprises the academy, essentially a preparatory school to the higher departments, with a primary class; the Mary institute, organized in 1859; the college, 1859; the O'Fallon polytechnic institute, or polytechnic school, 1857; and the St. Louis law school, 1867. The college course is similar to that of other American colleges. The Mary institute is a female seminary, with studies of all grades. In the polytechnic school there are five regular courses, each occupying four years, viz.: civil engineering, mechanical engineering, chemistry, mining and metallurgy, and building and architecture. An evening school is conducted by the O'Fallon institute under the supervision and control of the board of public schools. The number of instructors and students in the different departments in 1874-'5 was as follows:

DEPARTMENTS.	Instructors.	Students.
Academy	23	321
Mary institute.....	17	260
College	5	30
Polytechnic school (exclusive of evening school).....	13	32
Law school.....	8	57
Total (deducting repetitions) ..	58	700

The college has a library of 5,500 volumes, the polytechnic school one of 30,000 volumes, and the law school one of upward of 2,500 volumes. The college of the Christian Brothers (Roman Catholic) was chartered in 1855 and organized in 1859. It has a library of 10,000 volumes. Concordia college and theological seminary (German Evangelical Lutheran) was organized in 1839 and chartered in 1853. It has a library of 4,500 volumes. The Missouri institution for the education of the blind was established in 1851. The academy of science, founded in 1856, has a large museum and a library of 3,000 volumes. Other libraries are the mercantile, 43,000 volumes; St. John's circulating library, 27,000; and the law library, in the court house, 7,100. The Missouri historical society, established in 1865, has a large historical collection. The newspapers and periodicals are as follows: 10 daily (4 German), 4 tri-weekly, 1 semi-weekly, 32 weekly (5 German), 5 semi-monthly (1 German), 28 monthly (2 German), 1 bi-monthly, and 3 quarterly. There are 162 churches and missions, viz.: 16 Baptist (6 colored), 3 Christian, 4 Congregational, 15 Episcopal (1 colored),

1 Evangelical Lutheran, 1 Free Methodist, 1 Friends', 9 German Evangelical, 12 German Evangelical Lutheran, 2 Independent Evangelical Protestant, 4 Jewish, 13 Methodist Episcopal (4 colored), 9 Methodist Episcopal, South, 2 New Jerusalem (1 German), 23 Presbyterian, 38 Roman Catholic, 2 Unitarian, and 7 miscellaneous.—In 1762 M. d'Abbadie, director general of Louisiana, granted to a company of merchants, of whom Pierre Liguette Laclède was the leader, the exclusive right of trade with the Indians on the Missouri. This company after careful examination established themselves on the present site of St. Louis, Feb. 15, 1764, and erected a large house and four stores. In 1770 the number of settlers had increased to 40 families, and a small garrison was maintained. On Aug. 11, 1768, a company of Spanish troops under Capt. Rios took possession of it in the name of the king of Spain, under whose sway it remained till the cession of Louisiana in 1800 to France, which in 1803 sold the territory to the United States. In 1780 an unsuccessful attack, supposed to have been instigated by the British, was made upon it by a considerable body of Indians. For many years it was only a trading post for the fur traders, and the furs collected there reached an annual value of about \$200,000 at the beginning of the present century. It was incorporated as a town in 1809. The first newspaper was published in 1808, the first brick house erected in 1813, and the first bank established in 1816. In 1817 the first steamboat arrived, and the same year the first board of school trustees was formed. In 1822 St. Louis was chartered as a city. The growth of Illinois, which began to be rapid after 1825, gave St. Louis its first great impulse; and the ascent of steamers to the Great falls soon created a thriving trade, which began to assume magnificent proportions in 1840. The city suffered from cholera in 1832, and from cholera and fire in 1849. In 1851 the first railroad was begun, and to the extension of its railroad facilities is mainly due its rapid growth since that date. By a legislative act of 1867, taking effect in 1870, Carondelet, adjoining it on the south, was annexed to the city.

SAINT LUCIA, an English island of the West Indies, in the Windward group, between St. Vincent and Martinique, crossed by the parallel of 14° N. and the meridian of 61° W.; length 26 m., breadth 11 m.; area, 248 sq. m.; pop. about 33,000. The surface is mountainous, with a small plain near the S. end and marshes on the coast. Two conical mountains rise abruptly out of the sea on the W. side to elevations of 2,680 and 2,710 ft.; an extinct volcano 1,000 ft. high, containing an inexhaustible mass of sulphur, occupies the S. W. part of the island. The soil is fertile; the mountains are clothed with forests containing valuable timber and dyewoods; the valleys are well watered, yielding abundant crops of sugar cane and cacao. The average annual value

of exports is \$812,000; of imports, \$630,000. The climate is warm, damp, and unhealthy, and destructive hurricanes occur. The chief town, Castries, is on the shore of an excellent harbor on the W. coast, 9 m. from the N. end. The island was first settled in 1605 and 1639 by English colonies, and has been several times taken by the French, but the English have held possession since 1803.

SAINT-MALO, a fortified town of Brittany, France, in the department of Ille-et-Vilaine, on the rocky peninsula of Aron, near the mouth of the Rance in the bay of St. Malo, 40 m. N. N. W. of Rennes; pop. in 1872, 12,316. It is connected with the mainland by a causeway called the Sillon. The harbor is large and safe, but encumbered by shoals at its entrance, and the tide rises sometimes to the height of 45 ft., while at low water the port is dry. The town is largely engaged in fisheries, and has an active trade with England. The cargoes cleared in 1874 from St. Malo and the adjoining port of St. Servan, in sailing ships only, amounted to 4,402,600 francs. Lamennais was born here, as also Chateaubriand, whose tomb is on a rock in the harbor. A monument to him by Millet was erected Sept. 5, 1875, in the place St. Vincent, since known as place Chateaubriand.

SAINT-MARC GIRARDIN. See GIRARDIN.

SAINT MARTIN, a S. parish of Louisiana, bordered E. by Atchafalaya and Grand rivers, S. W. by Chetimaches lake, and intersected by Teche bayou; area, about 500 sq. m.; pop. in 1870, 9,370, of whom 5,064 were colored. The surface is level and the soil fertile. The chief productions in 1870 were 192,840 bushels of Indian corn, 9,898 of sweet potatoes, 3,428 bales of cotton, 1,494 hogsheds of sugar, and 75,740 gallons of molasses. There were 2,413 horses, 1,372 mules and asses, 3,101 milch cows, 7,401 other cattle, 3,769 sheep, and 5,109 swine, and 30 molasses and sugar establishments. Capital, St. Martinsville.

SAINT MARTIN, an island in the N. E. angle of the West Indian archipelago, 5 m. S. of Anguilla, in lat. 18° 5' N., lon. 63° 3' W.; area, about 30 sq. m.; pop. about 6,600. The shore is deeply indented, and the surface hilly, the summit being 1,360 ft. above the sea. The soil is not rich; the climate is warm but healthy. The northern part (pop. 3,600, area, 13,166 acres) belongs to France; one third of it is cultivated, yielding annually 2,000,000 lbs. of sugar, 25,000 gallons of molasses, and 50,000 of rum. The southern part, belonging to Holland (pop. 3,000), is less fertile, but yields annually 2,500,000 lbs. of sugar, 130,000 gallons of rum, great quantities of salt collected from marshes bordering the coast, and fine tobacco. Mari-got is the capital of the French, Philipsburg of the Dutch colony. The island was first settled in 1638 by both nations.

SAINT MARTIN, Alexis. See BEAUMONT, WILLIAM.

SAINT-MARTIN, Louis Claude, marquis de, a French metaphysician, born in Amboise, Jan.

18, 1743, died near Paris, Oct. 13, 1803. For a while he practised as an advocate at Tours, but in 1765 was a lieutenant in a regiment in garrison at Bordeaux, where he became interested in mystical speculations, and subsequently studied the works of Jakob Boehm and Swedenborg. In 1771 he left the army and went to Lyons, where he published his first book, *Des erreurs et de la vérité, par un philosophe inconnu* (1775), a refutation of the theories of materialism. He spent some years in Paris, visited England in 1786 and Italy in 1787, and after his return resided in Strasburg till 1791, then in Amboise till 1795, when he returned to Paris. His principal works are: *Tableau naturel des rapports qui existent entre Dieu, l'homme et l'univers* (Lyons, 1782), showing that we must explain things by man and not man by things; *L'Homme de désir* (1790); *Ecce Homo* (1792); *De l'esprit des choses* (1800); and *Le ministère de l'homme-esprit* (1802).—See his *Correspondance* with Kirchberger (Paris, 1862), and *Saint-Martin, le philosophe inconnu*, by Matter (1862).

SAINT MARY, a S. parish of Louisiana, bordered S. W. by several bays of the gulf of Mexico, and N. E. by Lake Chetimaches, and drained by Atchafalaya and Teche bayous; area, 860 sq. m.; pop. in 1870, 13,850, of whom 9,607 were colored. The surface is flat and marshy, and the soil highly fertile. The chief productions in 1870 were 186,842 bushels of Indian corn, 11,882 of sweet potatoes, 69,327 lbs. of rice, 6,591 hogsheds of sugar, and 341,445 gallons of molasses. There were 958 horses, 1,861 mules and asses, 3,717 cattle, 1,704 sheep, and 2,960 swine; 25 manufactories of cooperage, 2 of machinery, 5 of brick and stone, 31 of molasses and sugar, and 7 saw mills. Capital, Franklin.

SAINT MARY'S, a S. county of Maryland, bounded N. E. by the Patuxent, E. by Chesapeake bay, and S. W. by the Potomac; area, about 250 sq. m.; pop. in 1870, 14,994, of whom 7,726 were colored. It has numerous bays and creeks; the surface is nearly level. The chief productions in 1870 were 152,630 bushels of wheat, 274,457 of Indian corn, 44,379 of oats, 2,522,917 lbs. of tobacco, and 9,809 of wool. There were 2,577 horses, 2,260 milch cows, 5,714 other cattle, 3,982 sheep, and 11,302 swine. Capital, Leonardtown.

SAINT MARY'S STRAIT, or **River**, the connecting link between Lake Superior and Lake Huron, forming also the boundary between Ontario, Canada, and the upper peninsula of Michigan. Beginning at the head of Tequamenon bay, a frith of Lake Superior, the strait holds a general S. E. course of 63 m. to the head of Drummond island, in Lake Huron. One mile below Lake Superior are the rapids known as St. Mary's falls or Sault de Ste. Marie, and below these the strait spreads out into a broad lake. It is navigable up to the rapids for the largest vessels. These rapids have within the space of three quarters of a

mile a fall of 22 ft. A ship canal around the falls was completed May 19, 1855, the greater part of which is cut through solid rock. (See CANAL, vol. iii., p. 687.)

SAINT-MAUR, Congregation of, a congregation of reformed Benedictines in France. Their body was organized in 1618, and confirmed in 1621 and 1627. It comprised at one time about 124 houses, was divided into seven provinces, and was governed by a general residing in Paris. Literature owes to this congregation the best collective editions of the Greek and Latin fathers. Montfaucon, Mabillon, and Ruinart belonged to it. The congregation was broken up by the French revolution. In 1833 the convent was restored at Solesme in the diocese of Le Mans.

SAINT MAURICE, a river of Quebec, Canada, rising on the N. border of the province, and emptying into the St. Lawrence at Three Rivers, after a tortuous S. course of more than 400 m. Its banks are generally high, in some places from 200 to 1,000 ft., and are covered with groups of majestic trees. It expands into numerous lakes, contains several islands, and has a great variety of cascades and falls. The falls of Grande Mère and the Shawenegan falls, about 30 m. from its mouth, are particularly attractive. It is navigable for a few miles near its mouth, and after an interruption of about 40 m. there is another navigable stretch of 75 m. Its chief tributaries are the Manouan, Ribbon, Flamand, Vermilion, Rat, Mattawin or Mattuin, and Shawenegan from the west, and the Windigo, Trenche, Grande Pierriche, Croche, Grand Bostonnais, Petit Bostonnais, and Mekinak from the east.

SAINT MAURICE, a county of Quebec, Canada, bounded S. E. by the St. Lawrence, just below Lake St. Peter; area, 2,585 sq. m.; pop. in 1871, 10,658, of whom 10,519 were of French origin or descent. It extends N. W. from the river to the limits of the province, and is watered by several lakes and streams. Capital, Yamachiche.

SAINT MICHAEL (Port. *São Miguel*), the largest island of the Azores, in the North Atlantic ocean; extreme length 50 m., breadth of main parts 5 to 12 m.; area, 224 sq. m.; pop. about 115,000. The surface is mountainous, the highest peak, Vara, being 3,570 ft. above the sea. It is of volcanic origin, and contains warm mineral springs. The climate is temperate and equable; the thermometer ranges from 48° F. in January to 84° in July; the extremes, 45° and 86°, are of rare occurrence. The soil is fertile, yielding tropical and temperate plants equally well. The orange, pineapple, banana, and sugar cane are extensively cultivated. The annual value of oranges exported to England is about \$425,000; the total value of exports is \$450,000; of imports, \$500,000. Capital, Ponta Delgada.

SAINT MORITZ (Ger. *Sanct-Moritz*), a watering place of the canton of Grisons, Switzerland, in the Engadine valley, on the right bank

of the Inn, about 6,000 ft. above the sea and close to Lake St. Moritz. One of the two principal springs is named after Paracelsus, who visited the place, and the other is called St. Moritz. The water is chalybeate, abounding with carbonic acid, and is used for drinking and bathing, being heated for the latter purpose. It is considered stronger than that of Schwalbach and Pyrmont. The season lasts from June to September.—See "A Season at St. Moritz," by Dr. Burney Yeo (London, 1870), and *Der Kurort St. Moritz und eine Eisensäuerlinge*, by Dr. August Husemann (Coire, 1874).

SAINT-NAZAIRE, a town of France, in the department of Loire-Inférieure, on the right bank and at the mouth of the Loire, on a promontory between that river and the ocean, 30 m. W. of Nantes; pop. in 1872, 13,536. It consists of an old and a new town; the latter has grown up since the establishment of a floating dock in 1845, as an accessory harbor for large ocean vessels, which cannot enter Nantes. It is a station for the transatlantic steamers to West Indian and other ports.

SAINT-NICOLAS, a town of Belgium, in the province of East Flanders, 20 m. E. N. E. of Ghent; pop. about 22,000. It manufactures woollen goods, shawls, and linen, and is one of the greatest flax markets in the world.

SAINT-OMER, a town of France, in the department of Pas-de-Calais, at the junction of the canal of Neuf-Fossé with the river Aa, 130 m. N. of Paris; pop. in 1872, 22,381. It is strongly fortified and has an important artillery arsenal. It is the seat of an archbishop, and has a fine Gothic cathedral of the 14th century. There are also interesting remains of a Benedictine abbey, founded by St. Omer in the 7th century. Woollen goods, paper, leather, hats, distilled liquors, starch, and beet-root sugar are manufactured; and there is a trade in grain, wines, oil, brandy, and coal. A seminary for the education of English and Irish Roman Catholics still exists, taking the place of the celebrated English Jesuit college.

SAINT PAUL, a city and port of delivery, capital of the state of Minnesota and of Ramsey co., on the Mississippi river, 2,200 m. from its mouth, 8 m. in a direct line E. S. E. of the falls of St. Anthony, and 350 m. N. W. of Chicago; lat. 44° 52' 46" N., lon. 93° 5' W.; pop. in 1860, 10,401; in 1870, 20,030; in 1875, about 36,000. It was formerly confined to the left bank, the site embracing four distinct terraces, forming a natural amphitheatre with a southern exposure, and conforming to the curve of the river, which, here flowing N. E., by an abrupt circular sweep takes a S. E. course. The city is built principally upon the second and third terraces, which widen into level, semicircular plains, the last, about 90 ft. above the river, being underlaid with a stratum of blue limestone from 12 to 20 ft. thick, of which many of the buildings are constructed. The original town is regularly laid out, but the newer por-

tions are irregular. The principal public buildings are the capitol and the custom house, the latter including the post office. By vote of the people of Ramsey and Dakota counties, a portion of the territory of the latter, on the opposite bank of the river, embracing what was known as "West St. Paul," was ceded to St. Paul in November, 1874. This adds to the city about 3,000 acres, constituting the sixth ward, and from 1,200 to 2,000 people. The statistics below are exclusive of this addition. Tables of mortality show St. Paul to be one of the healthiest cities in the United States. A beautiful tract of 300 acres, lying on the shore of Lake Como, has been secured for a public park. St. Paul is remarkable for the expansion of its wholesale business. This trade in 1869 reached a total of \$7,500,000; in 1871, \$12,890,029; and in 1873, \$19,459,246. It is the centre of 11 railroads, over which arrive and depart 96 trains daily, viz.: the Lake Superior and Mississippi; Stillwater and St. Paul; St. Paul,

Stillwater, and Taylor's Falls; West Wisconsin; North Wisconsin; Chicago, Milwaukee, and St. Paul; St. Paul and Chicago; Burlington, Cedar Rapids, and Minnesota; St. Paul and Sioux City; and St. Paul and Pacific (two branches). It is the practical head of navigation on the Mississippi river, 5 m. below the mouth of the Minnesota, its most northerly navigable tributary. An average of 50 steamboats and 100 barges trade with this port, comprising a total carrying capacity of 45,000 tons, operated by 1,630 men. The average length of the season of navigation is $7\frac{1}{2}$ months, and the number of steamboat arrivals about 815 annually. There were in 1873 six national banks, with an aggregate capital of \$2,150,000, three private banks, and a savings bank. The average daily deposits were \$3,432,141; loans and discounts, \$3,603,079; and sales of exchange, \$30,987,024. There are a fire and marine and a life insurance company. The total assessed valuation of real and personal prop-

Saint Paul.

erty in 1874 was \$27,444,047, about 50 per cent. of its actual value. The total bonded debt was \$1,140,254, and the total tax levy $2\frac{1}{4}$ per cent. The principal manufactures are agricultural implements, sash, doors, and blinds, printing and blank books, ale and beer, boots and shoes, and wagons and carriages. The capital invested in manufactures in 1873 was \$3,500,000, the number of persons employed 2,646, and the value of manufactured articles \$5,350,000. There are two extensive grain elevators, one of which, completed late in 1874, is the largest in the state. In 1873 there were shipped 1,458,800 bushels of wheat and 180,112 bbls. of flour. The city is divided into six wards, and is governed by a mayor and a council of three members from each ward. The police force is under a chief, appointed by the mayor. The streets are lighted with gas, well graded and partially paved, and a system of sewerage is in progress. The city is supplied with water from Lake Phalon, 3 m. distant. It has a paid fire department and a fire-alarm

telegraph. Two lines of street railway, 4 m. in extent, are in operation. In 1873 there were published four daily, four tri-weekly (one German), and 12 weekly (two German, one Swedish, and one French) newspapers, and two monthly periodicals. There are ten public school buildings, which cost \$300,000. The number of departments is 55, and of teachers 73. The total enrolment of pupils for 1874 was 3,833, average enrolment 3,000, average daily attendance 2,586. There are also a female seminary and several private schools of high grade. The Roman Catholics have several institutions of learning, and have recently secured a large tract of land in the vicinity for an industrial school. The state reform school is located here. There are a commercial and business college, an academy of natural sciences containing 126,000 specimens, and a state historical society. The city contains four public and four private circulating libraries, the former including the state law library and those of the historical society and academy of sci-

ences, and comprising together about 24,000 volumes. The charitable institutions include a Catholic and a Protestant orphan asylum. The number of churches is 38, viz.: 3 Baptist, 1 Congregational, 4 Episcopal, 3 Evangelical, 1 Jewish, 5 Lutheran, 7 Methodist, 4 Presbyterian, 7 Roman Catholic, 1 Swedenborgian, 1 Unitarian, and 1 Universalist.—The first building was erected on the site in 1838, and it was simply an Indian trading post for several years. It was laid out into village streets in 1849, and a city government was obtained in 1854, when it contained about 3,000 inhabitants. It derived its name from that of a log chapel dedicated to St. Paul by a Jesuit missionary in 1841.

SAINT PAUL DE LOANDA, a decaying city of Angola proper, and the seat of government of the Portuguese possessions in Lower Guinea, a few miles S. of the mouth of the river Bengo; pop. about 12,000. It contains the ruins of two cathedrals, one of which was used as a college by the Jesuits in the 17th century. The harbor, formed by a low sandy island, is protected by three forts.

SAINT PETER, a city and the county seat of Nicollet co., Minnesota, on the W. bank of the Minnesota river, at the junction of the Winona and St. Peter and the St. Paul and Sioux City railroads, 75 m. S. W. of St. Paul; pop. in 1870, 2,124; in 1875, 3,310. It contains several furniture manufactories, three cooper shops, two grist mills, two sash, door, and blind factories, a marble shop, a foundery and machine shop, three breweries, and a national bank. There are a large graded school, with 11 departments and 750 pupils; a Roman Catholic school, with 75 pupils; two weekly newspapers, and 10 churches. The state hospital for the insane, completed in 1875, is of limestone quarried on the ground, and cost \$500,000. The Swedish Lutherans of Minnesota are erecting (1875) a large building for a college.

SAINT PETERSBURG, a N. W. government of Russia, bounded N. by the gulf of Finland, the government of Viborg, and Lake Ladoga, E. by Novgorod, S. by Pskov, and W. by Lake Peipus, which separates it from Livonia and Esthonia; area, 20,760 sq. m.; pop. in 1870, 1,325,471. It is drained by the Neva, Luga, and Narva, which discharge their waters into the gulf of Finland, and the Volkhov, Svir, and other streams, which flow into Lake Ladoga. The surface is low and flat, and in many places swampy, but there are some low hills in the northeast, and a spur of the Valdai mountains enters it on the south. The climate is severe, and the soil mostly barren. It nearly corresponds to the former province of Ingria, and was the principal theatre of the long wars between the Swedes and the Russians. Peter the Great finally conquered it, and it was secured to Russia by the peace of Nystad in 1721. In 1871 the city of St. Petersburg was erected into an administrative district by itself, which left in the old government about 500,000 inhabitants.

SAINT PETERSBURG, the capital of Russia, situated on and around the delta of the Neva, in lat. 59° 56' 30" N., lon. 30° 19' E., 13 m. E. of its port of Cronstadt, and 390 m. N. W. of Moscow; pop. in 1870, 667,026, including 76,831 Protestants and 20,882 Roman Catholics, more than 40,000 Germans, and many other foreigners. The Neva, as it approaches the gulf of Finland, turns first N. and then W., and soon divides into the Great and Little Nevka, and the Great and Little Neva. Beginning at the north, the first two enclose the Velaginski, Kamennoi, and Krestovski islands; between the Great Nevka and the Neva lies the large Aptekarski island; Citadel island is in the Neva; Petrovski island and several islets are between the Little Nevka and the Little Neva; while S. of the Little Neva and between it and the Great Neva are Volni and Vasili islands, the latter the largest of the delta. S. E. of this in the peninsula (converted into islands by canals) formed by the bend of the Neva is the admiralty quarter of the city. All these islands are included within the limits of the city, and the larger are very populous. They are connected with the peninsula and with each other by ten bridges, several of them very fine. Beyond the Neva at the east there is a large and rapidly growing suburb. The Neva, though broad and clear, is shallow, and a bar at its mouth forbids the passage of vessels drawing more than 9 ft. of water; and though the hulls of large ships are built at the city dockyards, they are floated to Cronstadt for their masts, rigging, and cargoes or armament. The city is not liable to an attack by sea, but it has no adequate defences against an approach by land.—The peninsular part S. of the Neva, with the finest buildings and streets, is called the Bolshaya Storona or Great side; the islands and settlements on the N. bank are collectively known as the Petersburg side. On the latter side, opposite the so-called English quay, are the exchange and most of the important docks and warehouses. The city is elevated but little above the Neva, which has more than once overflowed and caused great destruction of life and property. The peninsula, or Great side, is drained by canals, the principal of which are the Moika, the Catarina, the Fontanka, and the Zagorodnoi, connected with each other and with the Neva by cross canals. The banks of the principal canals are protected by walls of hewn granite, and crossed by numerous bridges. The quays along the Neva are of great extent and solidity. The admiralty building, on the S. side of the Great Neva, is an immense and massive pile with a lofty dome and spire, and is the central point of the S. or Great side. The statue of Peter the Great is on its S. W. side, and the column of Alexander I. on the N. E. From the galleries of this building the whole city can be seen. Radiating from it S. E., S. S. E., and S. are the three finest streets of the city, viz.: the Nevski Prospekt or Neva per-

spective, the Gorokhovaya Ulitza or Peas street, and the Voskresenski Prospekt or Resurrection perspective. The Neva perspective, 130 ft. broad and about 4 m. long, is one of the finest streets in Europe. It contains the cathedral of Our Lady of Kazan, profusely adorned with silver, gold, and gems, but without much architectural merit, and another Greek church, both with their blue domes decorated with stars; a Dutch church, a Protestant German church, a Catholic and an Armenian church, all costly and some of them very beautiful. Here too are the military headquarters, the palace of the archduke Michael, the great bazaar with its 10,000 merchants, the institution of St. Catharine, and a theatre. At the end of this street and near the city limits are the convent and church of St. Alexander Nevskoi, the latter containing a sarcophagus

the citadel, with a tall, slender, richly gilt spire, 208 ft. high, which can be seen from all parts of the city or its suburbs, contains the

Winter Palace.

remains of all the Russian monarchs since Peter the Great. The Isaac church, S. W. of the admiralty, in one of the largest open spaces of the capital, is celebrated for its simple but

The Isaac Church.

of pure silver in which the body of the saint is preserved, and the palace of the metropolitan. The church of St. Peter and St. Paul in

grand architecture, its noble proportions, and its imposing porches. Like the Greek churches generally, it is in the form of a Greek cross, and has four grand entrances, each approached by three broad flights of steps, each entire flight composed of a single piece of granite. Each entrance has a superb peristyle composed of monolithic columns of polished granite, each 60 ft. high and 7 ft. in diameter, and the whole surmounted by a cupola 120 ft. above the peristyles, covered with copper and richly gilt, and resting on 30 granite pillars. The foundation of this church, formed of several successive tiers of piles, is said to have cost \$4,000,000. The church of the Smolnoi convent, in the N. E. part of the peninsula, is of white marble, and is surmounted by five blue domes spangled with

golden stars. The Preobrazhenskaya church belongs to one of the oldest regiments of the guards, and is profusely decorated with-

in and without with military trophies. The English church, W. of the admiralty, is richly ornamented.—St. Petersburg is a city of palaces. The Winter palace is said when the emperor occupies it to have more than 6,000 inhabitants. It was burned in 1837, and rebuilt in 1839 on a more magnificent scale. It is one of the largest palaces in the world, and is in the form of a square, 455 ft. long and 350 ft. broad. Its halls are of wonderful beauty, and filled with the richest statuary, gems, and pictures, and magnificent tables and vases of malachite. The Hermitage, built by Catharine II., is connected with the Winter palace, and contains 40 rooms of paintings, a museum of statuary, arms, and gems, a theatre, and a library with many engravings. The marble palace, a massive, gloomy-looking building, lies near Troitzkoi or Trinity bridge, considerably E. of the Hermitage. A mile further E., on the banks of the Neva, is the Taurida palace, which has a ball room 320 ft. long and 70 ft. wide. The Annitchkoff palace, the favorite residence of the emperor Nicholas, is on the Neva perspective near the Fontanka canal. One of the finest new palaces is that of the grand duke Vladimir, completed in 1871. The government buildings are remarkable for their immense size, and some of them possess great architectural beauty. The principal are the admiralty, half a mile long and with two wings 650 ft. in length, the holy synod, the headquarters of the ecclesiastical direction of the Greek church, the *hôtel de l'état major*, and the war office; and on the opposite side of the Great Neva, on Vasili island, the exchange and custom house, both imposing edifices; on Citadel island, the citadel and the mint; and further down the river, on Vasili island again, the *hôtel des mines*, the academy of arts, the academy of sciences with its museum and observatory, and the fine barracks of the cadets.—The imperial library contains 1,100,000 volumes and 35,000 manuscripts, many of them of great value. The academy of sciences and the Hermitage have 120,000 volumes each. The academy of sciences, founded by Peter the Great under the direction of Leibnitz, has Asiatic, Egyptian, and ethnographic museums, and numismatic, anatomical, mineralogical, and other collections; in 1873 it was attended by 303 students. The academy of arts, recently much improved under the direction of Prince Gagarin, is noted for its galleries of pictures and sculptures. The museum of the mining school has a celebrated collection of minerals, and the Rumiantzeff museum of oriental objects. One of the most prominent learned bodies is the imperial geographical society. The university was founded in 1819, and in 1872 had 1,413 students. There are several colleges and special schools and institutions of all grades. Female gymnasia and a female normal school were opened in 1873, and new compulsory schools at the end of 1874. St. Petersburg has many extensive char-

itable institutions, including the famous foundling hospital. (See **FOUNDLING HOSPITAL**.) The Gostinnoi Dvor, the principal market, is a colossal pile of buildings, with many shops and warehouses, resembling a perpetual fair. The Great theatre for Italian opera, and the Michael for French and German plays, are most frequented; the Marie and Alexander are for Russian performances. The English club, called so after the original founders, though now not much frequented by Englishmen, is the principal one; the most exclusive is the imperial yacht club. The principal park is the Summer gardens; military reviews are held on an adjoining square. At the entrance of the park is a chapel erected in 1866 to commemorate the escape of the present emperor from assassination. The city is deserted in summer by the nobility. In winter it is one of the most brilliant and also most expensive capitals of Europe.—The mean annual temperature of St. Petersburg is 39° F.; the mean summer temperature is 62°, that of winter 18°. The extremes are 99° and -51°. The cold is very severe, but, protected by furs, the residents do not feel it so much as in milder climates. But the sanitary condition of the city is unsatisfactory, owing to the cellars of nearly all the houses being inhabited. The number of fever patients in the hospitals in the beginning of 1875 exceeded 10,000, or about 1 in 70 of the population, besides the sick in private houses, few of which were at that period free from typhus fever. The imperial manufactories of Gobelin tapestry, of glass, porcelain, malachite and other precious stones, military surgical instruments, and embroideries, are on a large scale. There are also extensive foundries of cannon, and manufactories of cotton, silk, muslin, and woollen goods, leather, fringes, paper, tobacco, soap, clocks, jewelry, &c. The commerce has received a new impulse from the opening of the Finland and Baltic roads, and about 3,000 vessels now arrive and depart annually. St. Petersburg is also the centre of the Russian book trade. The docks were in 1875 connected by rail with Moscow and other cities, and a canal to Cronstadt is expected to be completed in 1879.—St. Petersburg was founded May 27, 1703, by Peter the Great. He first erected a fortress on the site of the present citadel, and such were the obstacles with which he met in the treacherous character of the soil, the climate, and the insalubrity of the location, that a man of less resolute will would have abandoned the undertaking. But his perseverance triumphed over all difficulties, and in 1712 he declared it his capital, instead of Moscow. At his death the city had only a few good buildings. His successors embellished and almost created it, especially Catharine II. In 1824 it was visited with a terrible inundation. The city formed part of the government of St. Petersburg till 1871, when it was made a separate administrative district.

SAINT PIERRE, a fortified seaport of the island of Martinique, on the N. W. coast; pop. about 30,000. It was settled by the French in 1635, is the largest town in the French West Indies, and is well built. There is an old Catholic college and a botanic garden. The harbor is much exposed. A railway to Fort Royal or Fort de France, the capital, was in progress of construction in 1875.

SAINT PIERRE AND MIQUELON, a French colony, comprising the islands of St. Pierre and Great and Little Miquelon, off the S. coast of Newfoundland, and opposite the gulf of St. Lawrence; area, 81 sq. m.; permanent pop. in 1870, 4,750. It is of importance as a fishing rendezvous. The imports in 1870 were valued at 17,800,000 fr., the exports at 17,700,000 fr. The movement of shipping comprised 1,549 entrances and 1,539 clearances. Capital, St. Pierre; pop. 800. (See FISHERIES, vol. vii., p. 225.)

SAINT-PIERRE, Charles Irénée Castel, abbé de, a French philanthropist, born near Barfleur, Normandy, Feb. 18, 1658, died in Paris, April 29, 1743. He was educated by the Jesuits at Caen and joined the priesthood. In 1686 he went to Paris with the geometrician Varignon, and in 1695 succeeded Bergeret in the academy. In 1702 he became chaplain of the bishop of Orleans, who obtained for him the abbey of Tiron. In 1712 he attended the congress of Utrecht with Cardinal Polignac. His *Projet de paix perpétuelle* (3 vols., Utrecht, 1713-'17) was followed in 1718 by *Discours sur la polysynodie*, in which he severely judged Louis XIV., and advocated constitutional government. He was consequently expelled from the academy, but an association known as *club de l'entresol* gave him opportunities to expound his humanitarian schemes, and became the nucleus of the future academy of moral and political sciences. The club was closed in 1731 by Cardinal Fleury, after seven years' existence. Most of his writings are included in his *Ouvrages de politique et de morale* (18 vols., Rotterdam, 1738-'41).

SAINT-PIERRE, Jacques Henri Bernardin de, a French author, born in Havre, Jan. 19, 1737, died at Éragny-sur-Oise, Jan. 21, 1814. He was educated by a priest at Caen, and went with his uncle to Martinique as a sailor, but resumed his studies at Caen, and subsequently at the college and school of engineers at Rouen. He next served in the army as an engineer, and after various vicissitudes entered the Russian army. He submitted to the empress Catherine II. his scheme for establishing on the shores of the Caspian a republic after the model of that of Plato, which fell to the ground like most of his visionary conceptions. He next joined Radziwill in Poland, and in 1765 was repeatedly under arrest. A love affair with a Polish princess diverted his attention from the political affairs of Poland, and on her deserting him he went to Saxony, determined to have his revenge by fighting against the

Poles; but another romantic adventure drove him from Dresden, and failing to receive employment from Frederick the Great, he returned in November, 1766, to France, whence he sailed as an engineer to Madagascar. On discovering that the real object of the expedition was the slave trade, he left it and remained at the isle of France as an engineer till 1771, when he returned to Paris. Here he associated with Rousseau and other celebrities, and was noted for his eccentricities and love of solitude. In 1792-'3 he was director of the botanical garden; in 1794 he became professor of morals at the normal school, and in 1795 a member of the academy. Under the empire he had a pension of 2,000 francs. By his first wife, Mlle. Didot, he had two children, Paul and Virginia. He married a second time in his 63d year. His principal works are: *Voyage à l'île de France*, &c. (2 vols., Paris, 1773; new ed., 1835); *L'Arcadie* (Angers, 1781; new ed., 2 vols., Paris, 1796); *Études de la nature* (5 vols., Paris, 1784; new ed., 6 vols., 1835-'6; English translation by H. Hunter, 5 vols., 1796); *Paul et Virginie* (1788), his most celebrated work, which has been translated into many languages; *La chaumière indienne* (1790; new ed., including *Le café de Surate*, 1828); and *Harmonies de la nature* (3 vols., 1815; new ed., 4 vols., 1818). Aimé Martin, who married his widow, published his complete works with a biographical notice (12 vols., 1818-'20; new ed., 9 vols., 1835), his posthumous works (2 vols., 1833-'6), and his *Romans, contes et opuscules* (2 vols., 1834).

SAINT-QUENTIN, a town of France, in the department of Aisne, on the Somme, 80 m. N. E. of Paris; pop. in 1872, 34,811. It is well built, the principal streets converging into the Grande Place, which contains the Gothic town hall supported by eight columns. A still more celebrated Gothic building is the cathedral. The town is a great centre of the cotton manufacture, and many other articles are made here, including woollens, machinery, and beet-root sugar. There is a brisk trade in grain, flax, hemp, cattle, &c. The canal of St. Quentin, which connects the basins of the Oise and Somme with that of the Scheldt, upward of 50 m. long, is of great commercial importance. —Under the Romans the town was known as Augusta Vermanduorum. In the middle ages it was the capital of the duchy of Vermandois till 1215, when it was annexed to the crown. The Spaniards captured it in 1557 after a memorable battle (Aug. 10), and two years afterward it was restored to France. During the Franco-German war, Jan. 19, 1871, it was again the scene of a great battle, resulting in the disbandment of the French northern army under Faidherbe.

SAINT SEBASTIAN (Sp. *San Sebastian*), a seaport of Spain, capital of Guipúzcoa, on the bay of Biscay, 39 m. N. N. W. of Pamplona; pop. about 14,000. It occupies a low isthmus uniting Mt. Urgull, on which is the citadel, to

the mainland, and is walled and strongly fortified. The harbor is small. The city contains several churches and convents, civil and military hospitals, and public squares. It was captured by the French in 1719, 1794, and 1808, and by the English with great loss on Aug. 31, 1813, when most of it was burned.

SAINT-SIMON, Claude Henri, count de, a French socialist, born in Paris, Oct. 17, 1760, died there, May 19, 1825. In 1777 he entered the army, and in 1779 went to America, where he distinguished himself at the siege of Yorktown. On his home voyage he was captured by the English with the count de Grasse and detained at Jamaica till the peace of 1783. He then went to Mexico, vainly urging the construction of a Pacific-Atlantic canal, and in 1785 to Spain, where he was not more successful in his scheme for converting Madrid into a seaport. On the outbreak of the revolution he and M. de Redern bought real estate at very low rates. The latter, being the principal, gained by the speculation, while Saint-Simon, after his release from 11 months' imprisonment during the reign of terror, was said to have made only 150,000 francs. In 1801 he married Mlle. de Champgrand, from whom, in the vain hope of becoming the husband of the widowed Mme. de Staël, he was divorced in July, 1802. In 1807 he published his celebrated *Introduction aux travaux scientifiques du dix-neuvième siècle*, in which he expounded the basis of his theories for the reorganization of science and the reconstruction of society. Regarding the great *Encyclopédie* as merely a dictionary, he published in 1810 his *Prospectus d'une nouvelle Encyclopédie*; but Napoleon, to whom he had appealed, took no notice of him, and he was reduced to the most abject poverty. His friend Diard, who had often aided him, died in 1810; subsequently his relatives secured him a small pension. In conjunction with Augustin Thierry, his most devoted disciple, he published *De la réorganisation de la société européenne* (1814), and *Opinions sur les mesures à prendre contre la coalition de 1815* (1815). In *L'Industrie, ou Discussions politiques, morales et philosophiques* (4 vols., 1817-'18), Thierry, Saint-Aubin, and others assisted him. In 1819 he was indicted for asserting in a pamphlet (*Parabole*) that the death of men of science, artists, and artisans was a greater national calamity than that of kings and bishops and other people of mere rank and wealth. He was acquitted in March, 1820, and continued thereafter to devote all his means to defray the cost of publishing his writings. At length in March, 1823, he was driven to despair by the exhaustion of his resources, and shot himself; but the shot only destroyed one eye, and he survived to finish his *Catéchisme industriel* (1824) and his *Nouveau Christianisme* (1825), the crowning work of his life.—For his socialistic doctrines, which became known as St. Simonism, see SOCIALISM. See also *Saint-Simon, sa vie*

et ses travaux, by Hubbart (Paris, 1857). Enfantin published some of his posthumous writings, which are also included in *Œuvres choisies de Saint-Simon* (3 vols., Brussels, 1859; new ed., Paris, 1861). Of the complete edition proposed by Rodrigues, only two volumes appeared in 1832; but the members of the council appointed by Enfantin as the literary executors of Saint-Simon prepared a complete and joint edition of both Saint-Simon and Enfantin's works (20 vols., 1865-'9).

SAINT-SIMON, Louis de Rouvroy, duke de, a French writer of memoirs, born Jan. 16, 1675, died in Paris, March 2, 1755. Under the direction of his mother, Charlotte de l'Aubespine, he became proficient in Latin, German, and history. He served at the siege of Namur in 1691, and subsequently distinguished himself in various campaigns. In 1695 he married Gabrielle de Durfort, daughter of the marshal de Lorges. In 1702, failing to be promoted, he retired from the army. He was prominent at the French court, and was a strenuous opponent of the Jesuits. In 1704 he proposed to end the Spanish war of succession by giving the Spanish Low Countries to Austria and a portion of the Spanish possessions in Italy to a prince of the house of Savoy with the title of king; and his suggestion was to some extent adopted as a basis for the treaty of peace of Utrecht. After the death of Louis XIV. (1715) he aided the duke of Orleans in obtaining the regency, and was a member of the council. In 1721 he negotiated at Madrid the marriage between the infanta of Spain and Louis XV. On his return to Paris he found the cardinal Dubois, whom he had always opposed, more powerful than ever, and the legitimated bastards of Louis XIV. partly re-invested with royal dignities. Consequently he broke off his relations with the government until after the death of Dubois, shortly before that of the regent, upon which he retired to his estates. His *Mémoires*, which subsequently attained unusual celebrity on account of their boldness of expression and pungent satire, were removed to the public archives, and only Voltaire, Marmontel, Mme. du Deffand, and a few others were permitted to read them. Garbled extracts and editions were published in 1788 and 1791; the first authentic and complete series appeared in 1829-'30, and a greatly improved edition was published by Cheruel (20 vols., 1856-'9; abridged English translation by Bayle St. John, 4 vols., London, 1857; new ed., 3 vols., 1875). Among his posthumous papers were found hundreds of letters of the duke of Orleans, unpublished essays of Montaigne, and other valuable manuscripts, of which a full catalogue was obtained from the public archives by Armand Baschet, who published in 1874 *Le duc de Saint-Simon, son cabinet et l'histoire de ses manuscrits*.

SAINT STEPHEN, a town and port of entry of Charlotte co., New Brunswick, on the St. Croix river, opposite Calais, Me., and at the

terminus of a branch of the New Brunswick and Canada railway, 70 m. S. W. of Fredericton; pop. in 1871, 6,515. It is connected with Calais by bridges, and is lighted with gas from that town. The lumber trade and the fisheries are the chief industries. There are two banks, two weekly newspapers, and six churches. The value of imports for the year ending June 30, 1874, was \$261,289; of exports, \$101,818.

SAINT TAMMANY, a S. E. parish of Louisiana, lying on Lake Pontchartrain, bounded E. by Pearl river and drained by its tributaries; area, about 1,200 sq. m.; pop. in 1870, 5,586, of whom 2,175 were colored. The surface is uneven, partly pine barrens, and the soil not very fertile. The New Orleans, Mobile, and Texas railroad touches the S. E. corner. The chief productions in 1870 were 8,795 bushels of Indian corn, 13,266 of sweet potatoes, 26,225 lbs. of rice, 3,186 of wool, 34 bales of cotton, 36 hogsheads of sugar, and 660 gallons of molasses. There were 192 horses, 918 milch cows, 2,109 other cattle, 1,499 sheep, and 2,289 swine; 10 manufactories of brick, 8 ship yards, and 6 saw mills. Capital, Covington.

SAINT THOMAS, an island of the West Indies, in the Virgin group, 30 m. E. of Porto Rico, belonging to Denmark; area, about 35 sq. m.; pop. in 1870, 14,007, one tenth white, two thirds black, and the remainder mixed. The island is formed by a mountain ridge extending the whole length and attaining an elevation of 1,480 ft. The shores are deeply indented, and the adjacent waters are studded with islets and rocks. The climate is warm, the thermometer ranging from 70° to 90° F. Hurricanes pass over the island about once in 20 years, and do great damage. Earthquakes are very frequent, but serious shocks do not occur oftener than once in 50 years. There is no running stream, and only one small spring; rain water is collected, and droughts are frequent. The soil is not fertile, and the products of the island are insufficient for one twentieth of its inhabitants. In 1873 there were 571 deaths, the chief cause of which, among resident adults, was consumption. Charlotte Amalie, the only town, contains 11,380 inhabitants, and is built along the shore of an excellent bay on the S. side, in lat. 18° 20' N., lon. 64° 56' W. It is a free port. The streets are paved and generally clean; the houses are supplied with gas, and, although low and poorly built, are comfortable and healthy. The average annual value of imports is \$5,000,000, besides coal. Eight regular steam lines touch here, the total steam tonnage averaging 600,000 tons per annum, and the total entries of all classes of vessels 4,300 per annum. Negotiations for the transfer of the island to the United States having been commenced, a vote was taken in 1867, which resulted in 1,244 for and 22 against; but the project fell through in the United States senate.

SAINT THOMAS, an island of the gulf of Guinea, belonging to Portugal, in lat. 0° 20' N., lon. 6° 40' E.; area, 145 sq. m.; pop. about

20,000, mostly blacks. In its centre the peak of St. Anna rises to the height of 7,020 ft. The valleys are fertile. The climate of the lowlands is unhealthy, but the southern part is salubrious. Cotton, sugar, indigo, coconuts, cannella bark, sweet potatoes, manioc, dates, and maize are produced. The principal article of export is coffee. A Portuguese bishop resides at the capital, St. Thomas, which has about 4,000 inhabitants. The island was discovered on St. Thomas's day, 1471, by Vasconcellos.

SAINT THOMAS, Christians of. See **CHRISTIANS OF ST. THOMAS**.

SAINT VINCENT, an island of the British West Indies, in the Windward group, about 25 m. S. of St. Lucia; area, 131 sq. m.; pop. in 1871, 35,688, comprising 32,000 colored and 430 aborigines. The surface is divided in the middle by a ridge, culminating in the volcano Morne Garou, about 5,000 ft. high, which contains a crater half a mile in diameter and 500 ft. deep; the most recent eruption was on April 30, 1812. The soil is fertile; the mountains are clothed with valuable forests; the valleys are well watered and cultivated, yielding sugar cane, arrowroot, cotton, and cacao. The average annual value of exports is \$1,206,000; imports, \$760,000. The climate of the low lands is warm but healthful; the mountainous districts are cool. The chief town, Kingston, is on the shore of a fine bay on the S. W. coast.—St. Vincent was discovered by Columbus, Jan. 22, 1498, was first settled by African slaves shipwrecked on the island in 1675, and was subsequently taken possession of by the French, who in 1763 ceded it to Great Britain.

SAINT VINCENT, Earl of. See **JERVIS**, Sir JOHN.

SAINT VITUS'S DANCE, or *Chorea*, a disorder of innervation, characterized by an irregular action of the voluntary muscles, occurring usually in young persons from the age of 10 to 20 years, and more frequently in females. Its approach is heralded by languor and lassitude, slight dragging of one of the limbs, a furred tongue, general disorder of the stomach and bowels, occasionally pain in the occipital portion of the head, frequently a sense of awkwardness leading the patient to avoid the presence of strangers, and sudden muscular contortions, apparently involuntary. Gradually the muscles cease to be under the full control of the will; the head shakes upon the occurrence of the slightest excitement, and the patient cannot control its motion except by a violent and painful exercise of volition. If he attempts to carry food or drink to his mouth, the hand approaches part way and then moves off suddenly in another direction. The hands and feet will not keep still; the face is distorted by the spasmodic action of the muscles; the motions of the body in walking are very uncertain, and one leg and the opposite

arm will seem paralyzed. The articulation is impeded and painful, the temper variable, and the patient exceedingly sensitive. Occasionally the action is more violent. If watched or noticed, the spasmodic action is invariably aggravated. The most frequent predisposing causes are the changes which take place at puberty. Among the exciting causes are fright, irritation of the stomach and bowels, improper diet, and disordered menstruation.—Chorea is not usually dangerous or even obstinate, although cases have been known in which the involuntary movements were so violent and continuous as to exhaust the strength of the patient and produce death. As a general rule it is simply a manifestation of functional disturbance of the nervous system, dependent on the changes of approaching puberty; and it usually disappears spontaneously after a few weeks or months, when these changes have become fully established. The most effective treatment is hygienic: exercise in the open air, a healthy mental and bodily occupation, simple and nutritious food, the shower bath, and in some cases tonic medicines.

SAKI. See **MONKEY.**

SALA, George Augustus Henry, an English author, born in London in 1828. He is the son of an Italian gentleman and an English singer of West Indian extraction. He was educated for an artist, but became a literary contributor to "Household Words," the "Welcome Guest," "Illustrated London News," and "Cornhill Magazine." In 1860 he established "Temple Bar," a monthly magazine, and was its editor. In 1863 he was the correspondent in the United States of the London "Telegraph," and he has written for that journal from Algeria in 1864, from the Paris exposition in 1867, from the field of war in France in 1870, from Rome in the autumn of that year, and from Madrid, Venice, Algeria, and Morocco in 1875. He has published "A Journey due North, being Notes of a Residence in Russia in the Summer of 1856" (London, 1858); "Twice round the Clock, or the Hours of the Day and Night in London" (1859); "Seven Sons of Mammon" (1861); "Strange Adventures of Captain Dangerous" (1863); "My Diary in America in the Midst of War" (1865); "From Waterloo to the Peninsula" (1866); "Notes and Sketches of the Paris Exposition" (1867); "Rome and Venice" (1869); "Under the Sun: Essays mainly written in Hot Countries" (1872); and "Cookery in its Historical Aspects" (1875).

SALADIN (**MALEK AL-NASIR SALAH ED-DIN ABU MODHAFFER YUSUF**), sultan of Egypt and Syria, born in the castle of Tekrit on the Tigris in 1137, died in Damascus, March 4, 1193. He was the son of Ayub, a Kurd in the service of the famous Noureddin, sovereign of Syria, and in 1163 accompanied his uncle Shirkuh to Egypt as an officer in the army destined to reinstate the emir Shawer, and ultimately to reduce the country to the sway of Noureddin. During three campaigns he dis-

played great military capacity. In 1168 Shirkuh, having reduced the country, became Noureddin's lieutenant, and on his death in the same year his authority devolved upon Saladin, who paid nominal deference to Noureddin, but strengthened his own power. The death of Noureddin in 1173 or 1174 left him absolute master of Egypt, with abundant resources; and taking advantage of the disturbances which convulsed Syria, he invaded that country under pretence of delivering the youthful heir of Noureddin from the unjust tutelage of the regent Shems ed-Din. The latter was defeated in several great battles, and within four years Saladin made himself master of southern Syria and a considerable portion of Mesopotamia. After devoting several years to the affairs of Egypt, he completed in 1182-'4 the conquest of Syria; his brother subdued the richest portions of Arabia, and by 1185 his empire extended from Tripoli in Africa to the Tigris, and from Yemen on the Arabian sea to the Taurus, the Latin kingdom of Jerusalem being alone independent of him. The violation by Reginald de Châtillon of a truce concluded in 1185 between the Latins and Saladin, afforded the latter a pretext for invading the Holy Land with an army of 80,000. The Christian army was overthrown at the famous battle of Tibérias (July 4, 1187), with a loss of 30,000 men. Guy de Lusignan, king of Jerusalem, captured by Saladin, was treated with courtesy; but Reginald de Châtillon, his fellow captive, was decapitated, and the captured knights templars and hospitaliers were massacred. Acre, Ascalon, and other important towns were speedily subdued, and on Oct. 2, 1187, Jerusalem surrendered to him after a siege of two weeks. The inhabitants were offered their freedom at a moderate ransom, several thousand of the poorer classes being exempted from payment, and many being aided by the alms of the conqueror. Tyre, reinforced by Conrad of Montferrat, held out against him, and Saladin, after an unsuccessful siege, made a disgraceful retreat to Damascus. The third crusade (1189) aroused him to the defence of his new possessions, and for two years (1189-'91) he thwarted every attempt of the crusaders to retake Acre. When the city finally capitulated to Richard Cœur de Lion and Philip Augustus, the former, left by the departure of the French king sole commander of the Christian hosts, led the crusaders down the coast to Ascalon, his march of 100 miles being, as Gibbon says, "a great and perpetual battle of eleven days." At the battle of Arsuf, fought on St. George's day, in which the Moslems were routed, Saladin, seeing Richard fighting on foot, is said to have sent him his own horse as a present. Ascalon having fallen, the crusaders in the spring of 1192 advanced within a day's march of Jerusalem, but were induced by dissensions in their own ranks to retreat when the city seemed fairly within their grasp.

Tedious negotiations followed, but on Sept. 2 a three years' truce was concluded. The incessant toils of the last few years had impaired the health of Saladin, and he died of a bilious fever after an illness of 12 days.

SALADO RIVER. See ARGENTINE REPUBLIC, vol. i., p. 688.

SALAMANCA. I. A W. province of Spain, in Leon, bordering on Portugal and the provinces of Zamora, Valladolid, Ávila, and Cáceres; area, 4,940 sq. m.; pop. in 1870 estimated at 280,870. It is hilly in the north and mountainous in the south. The chief rivers are the Tormes, Yeltes, and Agueda, tributaries of the Douro, which forms part of the N. W. boundary line, and the Alagon, an affluent of the Tagus. Gold occurs in the Agueda and the Alagon; iron, copper, and lead are found, but few mines are now in operation; rock crystal and saltpetre are abundant; and there are numerous thermal springs. The soil is very fertile, and grain and fruits are plentiful; but much the larger part of the country is divided between forest and pasturage, and many animals are reared. The wines and oils of Salamanca are justly esteemed; but the once flourishing manufactures of carpets, laces, and leathers have become insignificant. Besides the capital, the chief towns are Ciudad Rodrigo, Bejar, Peñaranda, and Alba de Tormes. II. A city (anc. *Salmantica*), capital of the province, built on three hills, on the right bank of the Tormes, 110 m. W. N. W. of Madrid; pop. about 17,700. It is surrounded by ancient walls, and presents from without a quaint and picturesque appearance. The streets generally are very irregular; but the numerous public squares are fine and spacious, especially the Plaza Mayor, one of the largest in the kingdom. This square is flanked on every side by a magnificent colonnaded arcade, the lower portion of which is for the most part occupied by shops. On the N. side is the city hall; and the façades of the S. and W. sides are embellished with busts of sovereigns and great men of Spain. As many as 20,000 spectators commonly attended the bull fights of which this square was the scene as late as 1863. The number and beauty of its public edifices have gained for Salamanca the appellation of *Roma la Chica* (little Rome). Foremost among them is the cathedral, in the florid Gothic style, begun in 1513, after a plan of Juan Gil de Otañon, and consecrated in 1560. Near it is the old cathedral, a massive structure of Norman-French architecture, founded in 1102 by Gerónimo, the confessor of the Cid. The bridge over the Tormes, with 27 arches, was partly built by the Romans, and finished under Philip IV. The university, founded about 1200, was one of the most celebrated in Europe, having sometimes upward of 10,000 students; but it is now almost deserted. The chief libraries are those of the university and of the college of San Bartolomé. Woollens, leather, hats, and earthenware are manufac-

tured.—Salamanca was an ancient city of the Vettones. It was taken by Hannibal in 222 B. C. Under the Romans it was made a military station, and the remains of a road made by them and some monuments are still extant. It was captured and ravaged by the Moors, who were finally expelled from it in 1095. In the 12th century it was made a bishopric, and several councils were held here in the 14th and 15th. The battle of Salamanca, in which the French, after pillaging many of the public buildings and destroying 13 convents and 20 colleges, were defeated by Wellington, July 22, 1812, took place 4 m. S. E. of the city.

SALAMANDER, the popular name of most of the batrachian reptiles with persistent tail (*urodela*) which lose the gills in the adult condition (caducibranchiates). The family of *amphiumidæ* has been noticed under MENOPOMA. The family *salamandridæ* has been divided into two groups, the aquatic and terrestrial, of which the former will be described under TRITON. Schneider reunited the water and land salamanders into a single genus *salamandra*, comprising the genera *salamandra* and *triton* of Laurenti. Prof. Baird (in the "Journal of the Academy of Natural Sciences," vol. i., Philadelphia, 1850) makes no generic distinction between the aquatic and terrestrial species, though he subdivides *salamandra* into several genera established by Rafinesque, Tschudi, and others. The division into groups according to general habitat will be retained here, and the species now noticed will be those which belong to the old genus *salamandra* (Laurenti). In this group the body is lizard-like, the limbs four, the maxillary and palate bones with minute teeth, the tongue more or less pediculated and free; there is no sternum, the ribs are rudimentary, and the pelvis is suspended by ligaments; there are in the adults neither gills nor gill openings, and the lungs are well developed; the eyes are prominent and furnished with lids; the skin is without scales, and has numerous warty glands which secrete an acrid viscid fluid; the tail is generally cylindrical. They live on land in the adult state, and are found in the water only during the breeding season; they frequent damp places, and are found only in the northern hemisphere, in Europe, and especially in North America. The young, instead of being wholly developed in the water, in some are retained so long within the oviduct that they are born alive, having undergone a portion of their metamorphosis; the young live constantly in the water and breathe by external gills, which disappear with the gill openings when the respiration becomes pulmonary; the anterior limbs are developed earlier than the posterior, the former having four and the latter five toes. From large glands behind the eyes and on the body is secreted a yellow matter so abundantly and rapidly, that it gave rise to the popular belief, once extensively prevalent, that they possess the power of extinguishing and

of remaining unharmed in fire, to test which many have been cruelly destroyed; this acrid secretion seems to be poisonous to some of the lower animals, and has caused their bite and even their touch to be regarded as venomous. They rarely exceed $6\frac{1}{2}$ in. in total length. Some of the tritons are essentially terrestrial in their habits.—Among the North American species may be mentioned, in the genus *pseudotriton* (Tschudi), the red-spotted salamander (*P. ruber*, Tsch.; *S. rubra*, Daudin), 4 to 6 in. long, red above with many small, black points, sides red and abdomen orange red, both unspotted; it is very common under rocks and fallen trees, and preys on insects; it inhabits the Atlantic states from Massachusetts to Florida; it is handsome, and the same as the *S. maculata* (Green). In this species the body is very short, and the tail is equal to or less than the body. The blue-spotted salamander (*S. glutinosa*, Green; *plethodon*, Tsch.) is about 7 in. long, bluish black above, with small white spots on back and tail and larger ones of the same color on the flanks; the tail is nearly twice the length of the body. This is common from Massachusetts to the gulf of Mexico, living in preference under fallen trees; the specific name was derived from the great quantity of glutinous matter suddenly given off from the skin. The red-backed salamander (*S. erythronota*, Green; of the same genus of Tschudi) is about 3 in. long, with a reddish brown band from the snout to the end of the tail, the sides yellowish brown, and abdomen whitish; tail shorter than the body, and separated with great facility by the animal when seized by it, a faculty possessed by many of the family. It is very handsome and common, very agile, found under stones and dead trees with snails (*helix*) from the Lake Superior copper region to Pennsylvania; the eggs are deposited in packets under damp stones. The long-tailed salamander (*S. longicauda*, Green; *spelærpes*, Raf.) is about 6 in. long, of which the tail is more than half; the body is lemon yellow above with numerous small irregular black spots, tail with transverse black bands, and lower parts yellowish white; its habits are more aquatic than in most land salamanders; it is found from northern New York to Kentucky. The symmetrical salamander (*S. symmetrica*, Harlan; *notopthalmus miniatus*, Raf.) is about 4 in. long, brownish red above, with a row of symmetrically arranged deep red spots on each side; lower parts orange with black dots; tail longer than the body and compressed; skin rough. It is found from Maine to Florida; in young specimens the whole back is covered with minute black dots, and the sides have fewer spots. The violet salamander (*S. subviolacea*, Bart.; *amblystoma*, Tsch.) is about 6 in. long, body and tail above bluish black with a row of round or oval yellow spots on each side, the under surface of the same color tinged with purple; it passes most of its time in moist places, and is found

from Maine to South Carolina. In the species belonging to the last two genera of Rafinesque and Tschudi, there are no sphenoidal teeth, and the carpus and tarsus are ossified in the adults, and the tongue rudimentary in the former and large and fleshy in the latter; in the other subgenera sphenoidal teeth are sometimes present, and the tongue is generally protractile. Other genera and several other species of American salamanders are described by Baird in the above mentioned journal, in vol. x. of the Pacific railroad reports, and in vol. ii. of the Mexican boundary survey. They are all not only harmless, offering no resistance when captured, but are positively beneficial from the great numbers of noxious insects and larvæ which they devour.—The common salamander of Europe (*S. maculata*, Merrem) is black with more or less large yellow spots. It is found in central Europe, and in

Common European Salamander (*Salamandra maculata*).

the mountainous parts of S. Europe, in cool and moist places, and feeds on insects, worms, and small mollusks; it attains a length of 7 or 8 in.; it is viviparous, and produces 20 to 30 young at a birth.

SALAMIS (now *Kuluri*), an island of Greece, in the gulf of Ægina, of very irregular form, lying near Attica, from which it is separated by a narrow channel, and 10 m. W. of Athens; greatest length about 10 m., average width about 3 m.; area, about 30 sq. m; pop. 5,000. One small stream flows into the sea on the S. W. coast. The chief modern town is Kuluri, on the W. shore, at the head of the bay of the same name. The island is hilly, and mostly barren, but produces some olives, vines, and cotton. On the E. shore are the ruins of the ancient city of Salamis.—Salamis is said to have been made a kingdom by Telamon, father of Ajax. It continued independent till 620 B. C., when its possession was disputed by Attica and Megaris, and finally it became one of the Attic demi. It was celebrated as the birthplace of Solon and Euripides, but most of all for the great naval victory gained by the Greeks under Themistocles over the fleet of

Xerxes in 480 B. C., about the beginning of autumn. (See GREECE, vol. viii., p. 190.) Several times in modern wars the inhabitants of Attica have been forced to take refuge in Salamis.—Salamis was also the name of an ancient city of Cyprus, on the E. coast, the most important in that island, ruins of which are still visible at Old Famagusta.

SAL AMMONIAC. See AMMONIA.

SALDANHA OLIVEIRA E DAUN, João Carlos, duke of, a Portuguese statesman, born in Lisbon, Nov. 17, 1791, died Nov. 21, 1876. His mother was a daughter of Pombal. He studied at Coimbra, and at an early age was a member of the council for the colonies. In 1810 he was sent to England as a prisoner, and subsequently went to Brazil, where he served in the army and as a diplomatist. Having returned to Portugal, he was appointed minister of foreign affairs in 1825 by John VI., after whose death in 1826 he became governor of Oporto, and under the constitution of Dom Pedro minister of war, till June, 1827, when he resigned and went to England. Dom Miguel having usurped power, Saldanha raised troops against him, but they abandoned him. In 1832 he landed in Portugal with Dom Pedro, and became commandant of Oporto, and subsequently marshal and generalissimo. Aided by the duke of Terceira, he terminated the war by taking the capital, and compelling the capitulation of Dom Miguel at Evora. In 1835 he became minister of war and president of the council; but he resigned in November of the same year and lived abroad from 1836 to 1846, when he was recalled by the queen to form a ministry. In 1849 he was overthrown by Costa-Cabral, who offered him a place in his ministry, which he refused. In 1851 Saldanha effected a new revolution, and was again at the head of the government till the accession of Pedro V. in 1856. He was minister in Rome from 1862 to 1864, and again from 1866 to 1869. In May, 1870, he instigated a revolt in the army, which compelled the king to place him once more at the head of the cabinet; but the new elections went against him, and he was succeeded on Aug. 30 by Sa da Bandeira. At his death he was ambassador to England.

SALE, in law, a contract to give and transfer rights of property for money, which the buyer pays or promises to pay to the seller for the thing bought and sold. The word is often applied indifferently to the transfer, for a consideration, of both real and personal property; but in its proper and technical sense it applies only to that of personal property, the transfer of real property passing under the denomination of a grant or conveyance. The difference between a sale and an exchange is that in the former the price is paid in money, while in the latter it is paid in goods. Three things are necessary to constitute a valid sale at common law, viz.: the thing to be sold, the price to be paid for it, and the agreement or consent of the contracting parties that the property in the

subject matter should pass from the vendor to the vendee, for the stipulated price given or promised to be given by the vendee. If there is no evidence that the sale is on credit, an agreement for immediate payment is implied; and if the vendee leaves without paying, the vendor may rescind the sale and demand and recover his goods. But the actual delivery of a chattel, and the acceptance of earnest or part payment by the seller, is evidence of an implied agreement between them that something is left to be done in future, and the legal presumption of immediate payment is thereby rebutted. The buyer however cannot take the goods, notwithstanding earnest be given, without full payment, unless it is an express condition of the sale. If he does not come, in a reasonable time after request, and pay for and take the goods, the contract may be dissolved by the seller, and he is at liberty to sell the goods to another person. But where express terms are agreed upon whereby the delivery or the payment is postponed to a future time, the sale is complete, and the property in the chattel passes immediately to the buyer. The thing sold must be in actual existence at the time of the sale, otherwise the sale will be invalid. If one man sells to another a horse, and the horse is dead, or if he sells a house or other property which has been destroyed by fire, both parties being ignorant of the fact before sale, it is invalid. If a part only of the subject matter is non-existent or destroyed, and the remainder is capable of transfer or delivery, the buyer has the liberty, at his option, either to rescind or enforce the contract as to such remainder. The price to be paid must be ascertained and certain, or so referred to a definite standard that it may be made certain; and the thing sold must also be specific or capable of a certain identification. When made by letter, the contract is complete as soon as a distinct proposition contained in it is accepted *bona fide*, by letter written within a reasonable time, and mailed before the acceptor receives information of a withdrawal of the offer. If the thing is sold for cash, the vendor is entitled to hold possession of it until he receives his pay. He cannot sue for the price until the goods are delivered or tendered; but if they are accidentally destroyed while thus in his possession, and without any fault or carelessness on his part, he may then sue for the price. If the price is not paid, whether the goods are sold for cash or on credit, and they remain in the hands of the seller, he has a lien on them for the price. This lien is destroyed by either actual or constructive delivery of the goods; and if he takes a bill of exchange or promissory note as security for the price, he also loses his lien. After a sale of personal property and a fair and absolute delivery to the purchaser personally, the seller cannot reclaim or retake possession of the property (upon the ground of a lien), because the consideration which was to have been given at the time of the delivery has not been

paid, even though the purchaser shortly after becomes insolvent; for the seller's lien being once lost or waived by the delivery, it cannot reattach.—A sale without delivery is not valid, in general, against a third person who buys without notice; and if the goods are sold by the vendor to two different and innocent parties, by transfers equally valid, he who first obtains possession of the goods will hold them. But as between the seller and the purchaser, delivery is not necessary to complete the bargain; though as between the seller and his creditors a strong inference arises, in the absence of delivery, that the sale itself is colorable, and intended as a fraud upon the creditors. This inference is not conclusive, but is one of fact to be considered by the jury in connection with other circumstances. Symbolical delivery will in many cases be sufficient and equivalent in its legal effect to actual delivery. The delivery of the key of a warehouse in which the goods sold are deposited; or transferring them in the warehouseman's or wharfinger's books to the name of the buyer; or the delivery of a part as representative or as an instalment of the whole, is a delivery sufficient to transfer the property. When the goods sold are of such a nature or in such a situation that a personal possession of them is impracticable or inconvenient, the simple sale and an agreement of the parties will pass the property to the purchaser without actual delivery. If no particular time is appointed by the terms of the contract for delivery or payment, these must be made within a reasonable time; and the seller is bound to keep the things sold until time of delivery with ordinary care and good faith; otherwise he will be liable should they be injured or destroyed. If the contract is to deliver at the residence of the buyer or any other particular place, and this is not done, the seller is liable even though such a delivery becomes impossible, unless it becomes so through the act or fault of the purchaser. If the goods are to be delivered to the purchaser, but no place of delivery is named, they must be sent to him wherever he may happen to be, or to his house or place of business, unless they were bought to be used for any particular purpose, or at any particular place. When a time and place are expressed in the contract of sale, the buyer must receive and pay for them then and there, and also pay all reasonable charges for keeping after the sale and before delivery. If the goods are sold on credit, and the purchaser should become insolvent before delivery, the seller may demand security and refuse to deliver without.—Whenever, in a contract of sale, it is agreed that some particular act shall be done in relation to the thing sold, by either party, as that the goods shall be delivered on a particular day, or on request, or that a promissory note shall be given, this makes a conditional sale. So it is a condition precedent where some act remains to be done, such as

weighing or measuring; and if there is no evidence tending to show the intention of the parties to make an absolute and complete sale, the property does not pass wholly to the buyer until such condition is performed. If the buyer neglects or refuses to comply with a condition precedent, and the goods are therefore not delivered, the seller may, after due delay and precautions, resell them, and hold the buyer responsible for any deficiency in the price. In all of these cases the property in the thing sold passes to the buyer by the fact of sale, but he holds it subject to the lien or other reserved right of the seller. One class of sales on condition are those known as "contracts of sale or return," where possession of the goods is given to the purchaser with the privilege of keeping them or returning them within a specified time. If he returns them within this time, the contract is rescinded; but otherwise the sale becomes absolute and complete. When goods are sold by auction, the conditions of sale made known to the buyer by the advertisement, or communicated by the auctioneer at the time of sale, bind both parties, and regulate the transfer and possession of the property. When goods which are only a numerical proportion of an entire bulk are sold, no property passes and the sale is incomplete until such part has been separated and set apart from the remainder and actually delivered.—The seller of goods has not only a lien upon them for the price while they remain in his possession, but he may, in the event of the bankruptcy or insolvency of the purchaser, after he has parted with the possession of them, and while they are *in transitu* on their way to the purchaser, retake them, the price being unpaid. (See STOPPAGE IN TRANSITU.) A sale of goods with intent to delay, hinder, or defraud a creditor, though good as between the parties, is utterly void as against the creditor, even if the purchaser pays full value for them, unless the purchaser was ignorant of the fraud and purchased them in good faith, as well as for a good consideration.—Contracts of sale which have an immoral or illegal object in view are void at common law. Contracts with an enemy for the purchase or sale of goods, and contracts in contravention of statutory provisions, are illustrations of this rule. The obtaining goods upon false pretences, under color of purchasing them, does not change the property; but it has been held that a *bona fide* purchaser of goods for a valuable consideration, from a person who obtained them from the owner by false pretences, amounting even to a felony, will hold them against the first seller, if he (the first seller) voluntarily parted with the possession and intended to part with the title. The sale will never be valid in favor of the purchaser where he obtains the goods by fraud practised upon the seller under color of a purchase, whether on credit or otherwise. Thus, if an infant fraudulently represents him-

self to be of full age, and by such false representation succeeds in obtaining goods on credit, the sale will be void, and the seller may reclaim the goods from the buyer, or from any one who has not bought the goods of the buyer for value, and in ignorance of the fraud. If a person steals goods and sells them, the property is not thereby changed, but remains in the rightful owner, who may reclaim them wherever they may be found. In England there is an exception to this rule, which is where the goods are sold by the wrongful possessor in market overt, in which case the sale is binding upon the true owner, and the purchaser obtains a good title. But in this country no sale of goods by the wrongful possessor is valid. (For sale with warranty, see WARRANTY.) A conjectural estimate of the value is not a misrepresentation which might avoid the sale; and concealment, to be fraudulent and material, must be a concealment of something which the party was bound to disclose. A seller is unquestionably liable to an action for deceit if he fraudulently represents the quality of the thing sold to be other than it is, in some particulars which the buyer has not equal means with himself of knowing; and he is if he do so in such a manner as to induce the purchaser to abstain from making the inquiries which for his own security and advantage he would otherwise have made.

SALE, Salee, or Sla, a walled town of Morocco, on the Atlantic coast, in lat. $34^{\circ} 4' N.$, lon. $6^{\circ} 45' W.$, at the mouth of the river Bu Regreg, on its N. bank, opposite Rabat; pop. about 10,000, chiefly descended from Spanish Mohammedans. One half the area enclosed by the walls is now unoccupied. Carpets and combs of lentisk wood are manufactured; the exports consist principally of wool. The harbor will admit only brigs and schooners. Salé was a resort of pirates in the latter part of the 18th century, when it was substantially independent of Morocco. In 1851 it was bombarded and nearly destroyed by the French.

SALE, George, an English oriental scholar, born in Kent in 1680, died in London, Nov. 14, 1736. He was educated at King's school, Canterbury, and was a lawyer. For the "Universal History," edited by Swinton and others, he wrote the cosmogony and parts of oriental history. He was also one of the authors of the "General Dictionary" (10 vols. fol., London, 1734), and he translated the Koran into English from the original Arabic, with notes and comments. His translation was defective, but many editions have been published. After his death his Arabic, Persian, and Turkish manuscripts were purchased for the Radcliffe library at Oxford.

SALEM, a S. W. county of New Jersey, bordered W. by the Delaware river, drained by Salem, Alloway's, and other creeks, and traversed by several railroads; area, 540 sq. m.; pop. in 1870, 23,940. The surface is level and the soil a fertile sandy loam. Marl abounds,

and iron ore is found. The chief productions in 1870 were 259,777 bushels of wheat, 756,342 of Indian corn, 164,678 of oats, 350,955 of Irish and 220,574 of sweet potatoes, 67,496 of grass seed, 39,454 tons of hay, 11,658 lbs. of wool, and 373,849 of butter. There were 5,155 horses, 630 mules and asses, 7,352 milch cows, 9,946 other cattle, 6,668 sheep, and 9,836 swine; 5 manufactories of carriages and wagons, 3 of window glass, 4 of machinery, 2 of paper, 10 of saddlery and harness, 3 foundries, 5 brick yards, 4 tanneries, 14 flour mills, and 19 saw mills. Capital, Salem.

SALEM, a city, port of entry, and one of the shire towns of Essex co., Massachusetts, occupying a peninsula between two arms of the sea, called North and South rivers, and adjacent territory, 14 m. N. by E. of Boston; lat. $42^{\circ} 31' 18'' N.$, lon. $70^{\circ} 53' 53'' W.$; pop. in 1870, 24,117, of whom 6,084 were foreigners; in 1875, 26,068. The peninsula is about 2 m. long and $\frac{3}{4}$ m. broad. A small peninsula called the Neck is attached to it, and was first inhabited; a large portion of it belongs to the city, and is occupied as the almshouse farm. The site of that part of the city within the peninsula is flat, but healthy; in other parts the surface is more uneven. The streets are irregular, but well built. In the E. part of the city, toward the end of the peninsula, is a beautiful park or "common" of $8\frac{1}{2}$ acres, called Washington square. Harmony Grove cemetery, on the W. border, contains 65 acres. Salem is connected with Lowell by the Salem and Lowell railroad, and with Boston by the Eastern railroad, and there are branches to Marblehead and Lawrence. Horse cars run through the principal streets and to the adjoining towns.—Salem was formerly noted for its foreign commerce. In its very infancy its inhabitants not only engaged in the fisheries and the coasting trade, but in vessels of 40 to 60 tons traded with Spain, Italy, France, and the islands of the West Indies. In the revolutionary war 158 privateers, mounting at least 2,000 guns, and carrying not fewer than 6,000 men, were fitted out from the town of Salem. These vessels captured 445 prizes, and brought nine tenths of them into port in safety. In 1785 the first vessel ever sent from this country to the isle of France, Calcutta, and China, was despatched by Elias Haskett Derby of Salem; and for years Salem held almost the monopoly of that trade, and in 1818 had 54 vessels engaged in it. The trade to the other ports of the East Indies and Japan was also commenced by the merchants of Salem, as was that to Madagascar and Zanzibar, and the other gum and ivory ports of E. Africa, the legitimate trade to the ports of W. Africa, the commerce with Brazil and the Amazon, and especially the India-rubber trade, in which for many years she took the lead. The foreign commerce of Salem is now small, but the coasting trade is large and increasing, coal for shipment to the interior

manufacturing towns being the chief item. Recently the fisheries, which ceased as the East India trade grew up, have been resumed. The value of imports from foreign countries into the customs district, which includes also Beverly and Danvers, for the year ending June 30, 1874, was \$60,717; of exports to foreign countries, \$50,153; number of entrances, 84, tonnage 8,468; clearances, 100, tonnage 11,767; number of vessels belonging in the district on that date, 91, tonnage 9,409; engaged in the cod and mackerel fisheries, 55, tonnage 3,386. The number of entrances in the coastwise trade during the same year was 98, tonnage 10,443; clearances, 41, tonnage 5,461.—Manufacturing is a prominent interest, and is increasing. The manufacture of leather is the most important branch. Other articles are jute bagging, cordage, twine, machinery, foundry products, cars, chemicals, boots and shoes, white lead, leather belting, lead pipe and sheet lead, trunks and valises, furniture, and glue. The car shops of the Eastern railroad company are here. The Naumkeag steam cotton company has two large mills, with 1,438 looms and 73,594 spindles, and employs a capital of \$1,200,000. There are seven national banks, with an aggregate capital of \$2,015,000; two savings banks, with about \$3,000,000 deposits; and five insurance companies.—Salem is divided into six wards, and is governed by a mayor with a board of six aldermen and a common council of four members from each ward. It has an efficient police force and a good fire department. The streets are lighted with gas, and water is supplied by an aqueduct from Wenham lake, 4 m. distant. The assessed value of property in 1874 was \$25,845,675 50, viz.: real estate, \$14,121,000; personal estate, \$11,724,675 50. The taxation on property amounted to \$438,995 65, of which \$32,380 was for state purposes, and \$22,243 30 for county purposes. The net expenditures for the eleven months ending Dec. 1, 1874, were \$279,680 29; city debt, less cash assets on that date, \$1,358,753 07. Besides the almshouse and smallpox hospital, there are an orphan asylum, a dispensary, a reform school for boys, and several charitable societies. The public schools are under the general management of a school committee of 20 members, who appoint a superintendent. There are a high school, five grammar and twelve primary schools, two evening schools, two drawing schools, and a special school for factory operatives and others unable to pursue the regular course. The number of pupils enrolled in the public day schools in 1874 was 4,206; average attendance, 2,953; number of teachers, 80. The total expenditure for schools was \$71,180 55. One of the state normal schools (for females) is here. Among the principal public institutions is the East India marine society, organized in 1799, and formed of those who, as captains or supercargoes, have doubled Cape

Horn or the cape of Good Hope. The museum of this society is one of the most interesting and valuable in the country. Together with the scientific collections of the Essex institute, it has been placed in charge of the trustees of the Peabody academy of science, founded by George Peabody in 1869 by the gift of \$150,000. The joint collections, with those of the academy, are deposited in the East India marine hall, and are accessible to the public. The Essex institute, organized in 1848 by the union of the Essex historical society and the Essex county natural history society, besides its extensive cabinet of natural history, has a library of 30,000 volumes, a large collection of portraits, and many historical and other relics. The Salem Athenæum, formed in 1810 by the purchase of the social and philosophical libraries as a basis, has a library of 15,500 volumes. These two last named institutions occupy the fine building known as Plummer hall, erected in 1856 from funds bequeathed to the Salem Athenæum by Miss Caroline Plummer. In the same building are the libraries, each comprising about 1,000 volumes, of the Essex agricultural society, incorporated in 1818, and the Essex southern district medical society, formed in 1805. The office of the permanent secretary of the American association for the advancement of science, organized in 1848, is in the East India marine hall, and contains a small and select scientific library. The charitable mechanical association, organized in 1817, has a library of 4,000 volumes. Other important associations are the marine society, instituted in 1766; the lyceum, in 1830; the young men's union, in 1855; and the young men's Christian association, in 1858. Two semi-weekly and three weekly newspapers and two monthly periodicals are published. The number of churches is 20, viz.: 3 Baptist, 3 Congregational, 2 Episcopal, 1 Free Advent, 1 Friends', 2 Methodist, 1 New Jerusalem, 2 Roman Catholic, 4 Unitarian, and 1 Universalist.—Salem is the oldest town in Massachusetts except Plymouth, having been settled in 1628 by John Endicott, before whose arrival, however, a house had been built there by Roger Conant in 1626. In 1629 11 ships arrived here from England, bringing 406 immigrants, who settled in various localities in the vicinity. The first church organization effected in this country was at Salem in 1629, with the Rev. Francis Higginson as its pastor. In 1692 the famous witchcraft delusion made its appearance, and 19 persons from this and adjacent towns were executed on the eminence now known as Gallows hill. It had its origin in what is now the town of Danvers, and the persons connected with it belonged to several other towns also. (See WITCH.) The town was incorporated in 1630, and received city privileges in 1836. Its Indian name was Naumkeag.

SALEM, a city and the county seat of Salem co., New Jersey, on a creek of the same name, 3 m. from its mouth in the Delaware river,

32 m. in a direct line and 44 m. by rail S. S. W. of Philadelphia; pop. in 1850, 3,052; in 1860, 3,865; in 1870, 4,555; in 1875, 4,459. The creek is navigable to this point by vessels of 50 tons. There is regular communication with Philadelphia by steamer and by the West Jersey railroad. The city owes its prosperity chiefly to the rich agricultural resources of the surrounding country. It contains manufactories of glassware for druggists' use, oil cloth, carriages, &c., fruit-canning establishments, ship yards, a national bank, two building associations, seven public and six private schools, two weekly newspapers, and eleven churches.

SALEM, a town and the county seat of Roanoke co., Virginia, on the Roanoke river and the Atlantic, Mississippi, and Ohio railroad, 145 m. W. by S. of Richmond; pop. in 1870, 1,355, of whom 500 were colored; in 1875, about 2,000. It is at the head of the valley of Virginia, between the Blue Ridge and Alleghany mountains, and is celebrated for its healthfulness, mild climate, and fine scenery. It is a favorite summer resort. In the immediate vicinity are sulphur and chalybeate springs, and within a radius of 30 m. are seven of the most celebrated mineral springs in Virginia. The Valley railroad, in course of construction, is to terminate here. The town has several hotels, a national bank, two free schools (white and colored), two weekly newspapers, and Baptist, Episcopal, Lutheran, Methodist, and Presbyterian churches. It is the seat of Roanoke college, Lutheran, founded in 1853, which has beautiful grounds and three fine brick buildings. There are collegiate, normal, and preparatory departments; and select courses may be pursued. The library contains about 13,000 volumes. The college has extensive chemical and philosophical apparatus and a large cabinet of minerals. In 1874-'5 it had 9 instructors and 167 students (84 collegiate, 40 select and normal, and 43 preparatory). The number of alumni in 1875 was 133. The theological seminary of the Evangelical Lutheran church, founded at Lexington, S. C., in 1830, was removed to Salem in 1873.

SALEM, a city and the county seat of Marion co., Oregon, capital of the state, beautifully situated on the E. bank of the Willamette river, and on the Oregon and California railroad, 50 m. S. of Portland; pop. in 1870, 1,139; in 1875, about 6,000. The river is navigable to this point during three fourths of the year, and steamers run regularly to Portland. The city is surrounded by a fertile prairie. Mill creek enters the river at this point, and its rapid fall affords good water power. There are flouring mills, tanneries, machine shops, foundries, a woollen mill, a linseed oil mill, and other manufactories. The city has two private banks, one daily and three weekly newspapers, and eight churches. It is the seat of Willamette university and of three state institutions, the penitentiary, deaf-mute school, and institute for the blind. It was settled in 1834, incor-

porated in 1853, and became the state capital in 1860.

SALEM, a district of British India, in the province of Madras, bordering on Mysore, North and South Arcot, Trichinopoly, and Coimbatore; area, 7,617 sq. m.; pop. in 1871, 1,963,243. It includes the high table land of Barramah, which produces teak, sandal, and rose wood, and cedar in great abundance. The principal river is the Cavery. Artificial sheets of water or tanks for irrigation are numerous. Iron ore is abundant, and mines of chromate of iron have been extensively worked at the foot of the Sheevaroy hills. The district is the principal seat of the Indian steel manufacture. Cotton, tobacco, indigo, coffee, and rice are extensively cultivated. The capital is Salem, 170 m. S. W. of Madras; pop. about 25,000. Silk and cotton are manufactured here.

SALEP (Persian, *sahaleb*), a substance consisting of the dried bulbs of various species of *orchis*, and other plants of the same family. Any of the tuberous-rooted orchids afford it, and it is ascribed to more than a dozen species, natives of different countries from England to India. It is known in commerce by the country rather than by the plant producing it; it is chiefly supplied through Smyrna. Some species have roundish and others lobed tubers, which when taken up are stripped of their epidermis and plunged in boiling water or dried in an oven, after which they are strung together in bunches. In drying they form small, oval, irregular masses, hard, horny, semi-transparent, of a yellowish color, feeble

Orchis mascula, one of the plants furnishing Salep.

odor, and mild mucilaginous taste. It is used in a powdered state, in which it is also sometimes kept. Salep has long been in use in oriental countries, where it has for ages been regarded as able to restore virility; but at best it is only an article of diet of no special value.

It contains a small proportion of starch, and 48 per cent. of a peculiar mucilage more nearly allied to cellulose than to gum; it will convert 40 parts of water into a thick jelly; small amounts of sugar and albumen are also present. Salep is hardly known to Americans; druggists keep it to supply the wants of Europeans, who use it in a decoction flavored with spice, wine, and sugar.

SALERNO (anc. *Salernum*), a town of S. Italy, capital of the province of Principato Citeriore or Salerno (see *PRINCIPATO CITERIORE*), at the head of the gulf of Salerno in the Mediterranean, 30 m. S. E. of Naples; pop. in 1872, 27,759. The port, long nearly filled up with sand, has been improved since 1868. The cathedral, begun about 1080 on the site of an older edifice, contains the remains of Pope Gregory VII., and according to tradition also those of St. Matthew, to whom it is dedicated. The university of Salerno, especially celebrated in the middle ages for its school of medicine, was replaced in 1817 by a lyceum.—*Salernum* was originally founded by the Greeks or Tyrhenians, and received a Roman colony in 194 B. C. It was some time the residence of the Lombard duke of Benevento, in 840 became an independent principality, in 1077 was captured by Robert Guiscard and made the capital of the duchy of Apulia, and afterward passed to the kingdom of Naples.

SALES, Francis de. See *FRANCIS DE SALES*.

SALFORD. See *MANCHESTER*.

SALIANS, or Salic Franks, a tribe of Germans, who in the 5th century invaded Gaul, and by its conquest under Clovis founded the French monarchy. (See *FRANKS*.) Their code of law was called the *Salic*. (See *CODE*, vol. v., p. 7.)—*Salic land* (*terra Salica* or *dominicata*) was a name given to an estate subject to no burden, depending upon no superior, and upon which the manor house of the master was situated. Later the title was applied also to inherited landed property as distinct from acquired possessions, and by the *Salic law* females were excluded from inheriting this species of property. This last feature of their law has always prevailed in France with respect to the crown, as it did in Spain under the Bourbon line till 1830, when it was abolished in favor of Isabella. The German emperors of the house of Franconia, from Conrad II. to Henry V. (1024–1125), are designated as *Salians*.

SALICINE, a crystallizable bitter substance contained in the leaves and young bark of the willow (*salix*), poplar, and several other trees, discovered by Leroux in 1830. It was investigated by Piria, who discovered many of its derivatives, among them salicylic acid. It is prepared by boiling the bark in water, concentrating the decoction, digesting with oxide of lead, and precipitating the lead by sulphuretted hydrogen, when salicine crystallizes out on evaporating and cooling. By treatment with animal charcoal and recrystallizing it may be obtained pure in small white silky needles,

having an intensely bitter taste, but no alkaline reaction. Its formula is $C_{13}H_{10}O_7$. It is soluble in 5–6 parts of cold, and in much less boiling water. The addition of sulphuric acid produces a deep red color. Distilled with a mixture of bichromate of potash and sulphuric acid, among other products there is a yellow, sweet-scented oil, called salicylöl, $C_7H_6O_3$, identical with the volatile oil which was obtained from the flowers of *spiræa ulmaria* or common meadow-sweet by Löwig and Weidmann.

SALIC LAW. See *SALIANS*.

SALICYLATE OF SODIUM. See supplement.

SALICYLIC ACID, a product of salicine, carbolic acid, and other substances. (See *SALICINE*.) When salicylöl is acted on by chromic acid or potassium hydrate, it becomes oxidized, forming potassium salicylate, with evolution of hydrogen ($C_7H_6O_2 + HOK = C_7H_5KO_2 + H_2$). The potassium salicylate is decomposed by the action of hydrochloric acid, liberating salicylic acid, $C_7H_6O_3$, with production of potassium chloride ($C_7H_5KO_2 + HCl = C_7H_6O_3 + KCl$). Oil of wintergreen (*Gaultheria procumbens*) also yields, by distillation with potash, methyl alcohol and salicylic acid. The latter may also be formed by passing dry carbon dioxide into warm phenol (carbolic acid), to which at the same time are added small pieces of sodium. The reaction forms sodium salicylate, from which salicylic acid may be obtained by the action of hydrochloric acid. It is this manner of producing salicylic acid which gives it importance both in a scientific and commercial point of view. Two German chemists, Kolbe and Lautemann, chose carbolic acid to experiment upon, with a view to produce salicylic acid, and its discovery is therefore not an accident. Salicylic acid crystallizes from an alcoholic solution by spontaneous evaporation in large, monoclinic, four-sided prisms. From a hot aqueous solution it separates on cooling into slender needles, often an inch long. It melts at $266^\circ F.$, and gives off phenol at a higher temperature. It has a sweetish sour taste, and reddens litmus paper strongly. It does not act on polarized light. It is very slightly soluble in cold, quite soluble in hot water, and still more in alcohol; and boiling oil of turpentine dissolves about one fifth of its weight. The acid solution imparts a deep red color to ferric salts. Salicylic acid has recently attracted much attention as a powerful anti-ferment, taking the place of carbolic acid or phenol as a dressing to wounds and ulcers, and as a general antiseptic. When considerably diluted it is almost odorless and tasteless, and in moderate quantities it has no poisonous effects. It prevents the souring of worts and beer, and is used by glue manufacturers to arrest putrefaction.

SALIERI, Antonio, an Italian composer, born in Legnano, Aug. 19, 1750, died in Vienna, May 7, 1825. In 1766 he went to Vienna with Gassmann the contrapuntist, who instructed him, and whom he succeeded in 1775

as court chapelmaster and director of the theatre there. Here he became so intimate with Gluck as to compose for him an opera, produced in Paris, entitled *Les Danaïdes*, the real authorship of which Gluck did not announce till it had been performed several times. Salieri wrote 43 operas, and various compositions for instruments and for the church, including his *Passione di Gesù Cristo*, five masses, and a requiem.

SALINE, a river of Arkansas, rising in the N. part of Saline co., and flowing S. E., S., and S. W. into the Washita river. Its length is about 200 m. It is navigable at high water by boats of considerable size 70 or 80 m. from its mouth. It has a number of small tributaries.

SALINE, the name of five counties in the United States. **I.** A central county of Arkansas, drained by Saline river; area, about 800 sq. m.; pop. in 1870, 3,911, of whom 185 were colored. The surface is level in the S. part and hilly elsewhere, and the soil is productive. Marble, quartz, and soapstone are found in large quantities. The chief productions in 1870 were 10,890 bushels of wheat, 186,040 of Indian corn, 15,899 of sweet and 5,874 of Irish potatoes, 69,292 lbs. of butter, 11,457 of honey, 3,816 of tobacco, 3,438 of wool, and 603 bales of cotton. There were 779 horses, 259 mules and asses, 1,518 milch cows, 2,350 other cattle, 2,049 sheep, and 11,221 swine. Capital, Benton. **II.** A S. E. county of Illinois; area, 370 sq. m.; pop. in 1870, 12,714. The surface is generally level and well timbered, and the soil is fertile. It is traversed by the Cairo and Vincennes railroad and a branch of the St. Louis and Southeastern. The chief productions in 1870 were 83,211 bushels of wheat, 531,516 of Indian corn, 69,793 of oats, 24,247 of Irish and 11,600 of sweet potatoes, 3,149 tons of hay, 1,155,941 lbs. of tobacco, 29,274 of wool, 198,462 of butter, and 23,252 gallons of sorghum molasses. There were 3,467 horses, 1,109 mules and asses, 2,888 milch cows, 4,542 other cattle, 15,018 sheep, and 20,576 swine. Capital, Harrisburg. **III.** A central county of Missouri, bounded N. and E. by the Missouri river, and intersected by the Black and Salt forks of La Mine river; area, 750 sq. m.; pop. in 1870, 21,672, of whom 3,754 were colored. The surface is mostly prairie and the soil fertile. Bituminous coal, lead, limestone, and sandstone are found; and there are numerous salt springs. The chief productions in 1870 were 396,645 bushels of wheat, 2,106,043 of Indian corn, 323,806 of oats, 80,670 of potatoes, 10,424 tons of hay, 215,475 lbs. of tobacco, 47,018 of wool, 339,108 of butter, 28,528 of honey, and 10,566 gallons of sorghum molasses. There were 8,083 horses, 3,279 mules and asses, 7,171 milch cows, 14,202 other cattle, 16,310 sheep, and 46,231 swine; 10 flour mills, and 10 saw mills. Capital, Marshall. **IV.** A central county of Kansas, intersected by the Saline and Smoky Hill rivers; area, 720 sq. m.; pop. in

1870, 4,246. It is traversed by the Kansas Pacific railroad. The soil is fertile. Timber grows along the streams, and there are salt springs. The chief productions in 1870 were 67,586 bushels of wheat, 225,048 of Indian corn, 20,931 of oats, 30,220 of potatoes, 40,331 lbs. of butter, and 10,862 tons of hay. There were 1,425 horses, 1,867 milch cows, 3,824 other cattle, and 1,392 swine. Capital, Salina. **V.** A S. E. county of Nebraska, intersected by Big Blue river and watered by its affluents; area, 576 sq. m.; pop. in 1870, 3,106. It is intersected by the Burlington and Missouri River railroad and the Beatrice branch. The surface is undulating and the soil fertile. The chief productions in 1870 were 19,061 bushels of wheat, 33,570 of Indian corn, 5,809 of potatoes, 11,885 lbs. of butter, and 1,051 tons of hay. There were 340 horses, 257 milch cows, 414 other cattle, 696 sheep, and 384 swine. Capital, Pleasant Hill.

SALISBURY, or **New Sarum**, a city of England, capital of Wiltshire, at the junction of the Avon, Wily, and Bourne rivers, 78 m. W. S. W. of London; pop. in 1871, 12,903. The cathedral was built between 1220 and 1260, by the bishop and canons of Old Sarum, 2 m. N., which place was in consequence deserted by its inhabitants for the new site. Since 1868 the exterior and interior have been completely restored. The principal manufacture is cutlery. The woollen manufacture, once famous, has become extinct.

SALISBURY. I. Robert Cecil, earl of. See **CECIL**. **II. Robert Arthur Talbot Gascoyne Cecil**, third marquis and eighth earl of, an English statesman, born Feb. 13, 1830. He was educated at Eton and Oxford, and from 1853 to 1868 was member of parliament for Stamford, being at first called Lord Robert Cecil, and after the death of his elder brother in 1865 Viscount Cranborne. In 1866-'7 he was secretary of state and president of the council for India. He succeeded to the peerage April 12, 1868. On the death of the earl of Derby, Oct. 23, 1869, Salisbury succeeded him as chancellor of the university of Oxford. In February, 1874, he became a member of Disraeli's administration as secretary of state for India. He is one of the most influential representatives of the tory party.

SALIVA. See **DIGESTION**, and **SALIVARY GLANDS**.

SALIVARY GLANDS, those glands which secrete the saliva, the principal of which are the parotid, the submaxillary, and the sublingual, disposed in pairs. The parotid, the largest gland, weighing from half an ounce to an ounce, is immediately below and in front of the ear and the zygomatic arch, reaching down as low as the angle of the lower jaw. Its outer surface, slightly lobulated, is covered by the skin and fascia, and its inner surface extends deeply into the neck by two processes, one of which dips behind the styloid process and beneath the mastoid process of the temporal bone

and the sterno-mastoid muscle, and the other is situated in front of the styloid process. The external carotid artery passes through the substance of the gland. It is also traversed by the posterior auricular, transverse facial, temporal, and internal maxillary arteries, by a venous trunk formed by the union of the temporal and internal maxillary veins, and by a branch connecting this trunk with the jugular vein. The facial nerve and its branches and the great auricular nerve pass through it from before backward. The internal carotid artery and internal jugular vein lie close to its deep surface. The duct of the parotid gland (the duct of Steno) is about $2\frac{1}{2}$ in. long, opening on the inner surface of the cheek by a small orifice opposite the second molar tooth of the upper jaw; it is dense, of considerable thickness, and its canal is about the size of a crow quill, composed of an external fibrous and internal mucous coat, lined with columnar epithelium. The gland is supplied with blood by branches of the external carotid artery, and with nerves from the carotid plexus of the sympathetic, the facial, the superficial temporal, the auriculo-temporal, and great auricular nerves; and its lymphatics terminate in the superficial and deep cervical glands. The submaxillary gland is situated below the lower jaw, within and just in front of the angle, lying upon the mylo-hyoid, hyo-glossus, and stylo-glossus muscles, and is separated from the parotid by the stylo-maxillary ligament. It is irregular in form, and weighs about two drachms. It is relatively smaller in the herbivora than in the carnivora, being in the latter larger than the parotid. The facial artery lies imbedded in a groove in its posterior and upper border. Its duct (Wharton's) is about 2 in. long, much thinner than that of the parotid, and opens by a narrow orifice by the side of the frænum of the tongue. The gland is supplied with blood by branches of the facial and lingual arteries, and its nerves are derived from the submaxillary ganglion, from a branch of the inferior dental, and from the sympathetic. The sublingual gland is the smallest, weighing about a drachm. It is situated in the floor of the mouth at the side of the frænum linguae, in contact with the inner surface of the lower jaw, close to its symphysis. Its excretory ducts are from 8 to 20 in number, very short, and open on the crest or projection formed by the gland itself. One or more join to form a duct known as the duct of Bartholin, which opens into Wharton's duct. The gland is supplied with blood from the sublingual and submental arteries, and with nerves from the gustatory nerve.—These three pairs of glands are of the kind called conglomerate, consisting of numerous lobes composed of smaller lobules connected together by areolar tissue, vessels, and ducts. There are other small glands lying in and beneath the mucous membrane of the mouth, such as the labial and buccal glands, the follicular glands of the tongue,

and certain glandular bodies in the mucous membrane of the pharynx. (See PHARYNX.) Prof. Dalton obtained pure parotid saliva from the human mouth by introducing a silver tube into the duct, and arrived at many important facts regarding its functions. In one observation 480 grains of the secretion flowed from the tube in 20 minutes. The secretion takes place most rapidly during mastication, and on that side of the mouth where the mastication is performed, as has been shown by Colin and confirmed by Dalton. The flow is also active upon the sight or perception of the odor of food, and also from the influence of the imagination. Bernard has shown that galvanization of the small root of the fifth pair of nerves, and of the facial, immediately produces profuse secretion from the parotid. Parotid saliva is clear and limpid, and differs in composition somewhat from that of the submaxillary and sublingual glands. It contains organic matter, sulpho-cyanide of sodium, phosphate of lime, chlorides of potassium and sodium, and carbonate of soda. The function of parotid saliva is now generally regarded as chiefly to assist in mastication and deglutition. Pure submaxillary saliva was first studied as a distinct fluid by Bernard. It is more viscid than that from the parotid, but is perfectly clear, and on cooling becomes gelatinous. Its organic matter is not coagulated by heat. Bernard regards the function of submaxillary saliva as exclusively connected with gustation or tasting, and says its secretion only takes place under the stimulus of the gustatory nerves. The secretion of the sublingual is more viscid than that of the submaxillary, but does not gelatinize on cooling. Like the secretion from the other salivary glands, it is decidedly alkaline. Its organic matter is not coagulated by heat, acids, or metallic salts. The functions and properties of the mixed saliva of all the glands of the mouth are stated in the article DIGESTION.

SALLE, Jean Baptiste de la. See LA SALLE.

SALLET, Friedrich von, a German poet, born in Neisse, Silesia, April 20, 1812, died at Reichau, Feb. 21, 1843. He was descended from French Protestant refugees. After serving in the army, he published in 1830 a satirical novel on military life, and was sentenced to ten years' imprisonment, which the king reduced to two months. His principal work, *Laienevangelium* (Breslau, 1839; 6th ed., 1861), is a eulogy of pantheism. His complete works were published in 5 vols. (Breslau, 1845-'8; new ed., 1864).

SALLUST (CAIUS SALLUSTIUS CRISPUS), a Roman historian, born at Amiternum, in the country of the Sabines, in 86 B. C., died in 34. He belonged to a plebeian family, and about the age of 27 obtained the quaestorship. In politics he allied himself with the faction of Cæsar, was a tribune of the people in 52, and in 50 was expelled from the senate by the censors Appius Claudius and Piso on the ground of adultery with Fausta, the daughter of Sulla,

but in reality, probably, on account of his opposition to the aristocratic party. In 47 he was prætor, and in 46 he accompanied Cæsar in his expedition to Africa. He was appointed governor of Numidia, and, after acquiring an immense fortune by plundering the inhabitants, devoted the remainder of his life to literary pursuits and the embellishment of his splendid gardens on the Quirinal hill. Dion Cassius and other authors ascribe to him almost every species of profligacy and crime. He wrote *Bellum Catilinarium*, a history of the conspiracy of Catiline; *Bellum Jugurthinum*, a history of the war against Jugurtha; and *Historiarum Libri V.*, comprising the period between 78 B. C., the year of Sulla's death, and 66, and forming, with the other two works, a connected history of Roman affairs for 45 years. The last exists only in a few fragments. Of the numerous editions of the "Jugurthine War" and the "Conspiracy of Catiline," the first is that of Venice (fol., 1470), and one of the best that of Gerlach (3 vols. 4to, Basel, 1823-'31), the latter containing, in addition, the fragments of the lost books. There are numerous translations of Sallust into English, the oldest by Barclay (1511), and recent ones by Watson (1852), by Dr. Giles (1862), and by J. R. Mongan (1864).

SALMASIUS, Claudius (CLAUDE DE SAUMAISE), a French scholar, born at Semur-en-Auxois, April 15, 1588, died in Spa, Sept. 6, 1653. In his boyhood he wrote Greek and Latin verses. He completed his studies in Paris and Heidelberg, and became a Protestant. He was invited to Venice, Oxford, and Rome, but preferred in 1632 the university of Leyden, and returned there in 1640 after a visit to Paris, although offered a large pension if he would become Richelieu's biographer. At the instigation of Charles II., then a refugee in Holland, he wrote in 1649 *Defensio Regia pro Carolo Primo*, which led to Milton's celebrated reply, *Pro Populo Anglicano Defensio* (1650). In the same year he visited Queen Christina of Sweden, but returned in 1651 to Leyden. His most important work is *Plinianæ Exercitationes in Solinum* (2 vols. fol., Paris, 1629; new ed., Utrecht, 1689).

SALMON, the common name of the soft-rayed fishes of the genus *salmo* (Cuv.). The old genus *salmo* of Artedi and Linnæus has been subdivided into the three principal families of *salmonidæ*, *characini*, and *scopelidæ*, of which only the first concerns us here; this, besides the salmon and trout, includes the smelt, capelin (*mallothus*), grayling, whitefish, and others. The genus *salmo* has the cheeks or whole head covered with scaleless integument, and the rest of the body with cycloid, thin, small scales; there is an adipose fin on the back near the tail, over the anal, and the dorsal is over the ventrals; the branchiostegal rays vary from 12 to 19, and there is a false gill on the inner side of the operculum; the edge of the upper jaw is formed by the maxillaries as well as

the premaxillaries; the air bladder is always present, large and simple, opening into the pharynx; the intestinal canal is short, with numerous pyloric cæca; the ovaries form closed sacs without oviducts, and the eggs enter the cavity of the abdomen, whence they pass out by an opening behind the anus. The names salmon and trout have been applied in the most indefinite and contrary manner, by different authors and in both hemispheres, to the fishes of this genus; those by almost universal consent called salmon will be alluded to here, leaving for the article Trout the brighter spotted and usually smaller and fresh-water species. According to Prof. Rasch of Norway, many so-called species of the *salmonidæ* produce fertile offspring *inter se*; the spawn of the true salmon fecundated by the common trout has been known to produce 40 per cent. of a well shaped prolific brood; showing either that hybrids are not sterile, or that the limits of the species cannot be defined. Even the genus as restricted by Cuvier has been subdivided into three by Valenciennes according to the distribution of the vomerine teeth; in *salmo* (Val.) there are strong conical teeth in both jaws and a small group at the end of the vomer; the palate bones and the sides of the tongue are also armed with teeth; in *fario* (Val.), including the salmon trout, there is in addition a single mesial line of teeth on the vomer; and in *salar* (Val.) the vomer has two rows of teeth. Species called salmon and species called trout are found in each of these subdivisions, but the last two contain chiefly those called salmon trout and trout. The salmons are of great importance to man as an article of food, and are the most esteemed of any fresh-water fish; the number of men and the amount of capital employed in this fishery are very great; their flesh is eaten fresh, salted, smoked, dried, and pickled. The species, which are numerous, inhabit the sea and fresh waters, some migrating from the ocean to rivers at the breeding season; they spawn in shallow streams, both sexes assisting in forming the bed; they are found in the northern waters of Europe, Asia, and America, even in small streams, in the cold water of the arctic zone, and as high as the regions of perpetual snow; none have been found in South America, the East Indies, or Africa. They are unmistakably alluded to by Pliny and Ausonius.—At the head of the true salmons, or those having the body of the vomer smooth, stands the common salmon (*S. salmo*, Val.; *S. salar* of authors). In this the head is large, the gape wide and well furnished with teeth; the gill openings are very large, and consequently death very soon takes place out of the water; the abdominal outline is much more curved than the dorsal; the snout pointed, and the body rather slender and fusiform; the form is elegant, and the movements are rapid and vigorous. The color is slaty blue on the back, darkest on the head, duller and slightly silvery

on the sides, and beneath pearly silvery white; there are numerous black spots above the lateral line; the dorsal, pectorals, and caudal are

Common Salmon (*Salmo salar*).

dusky, the anal white, and the ventrals white externally and dusky internally; the gill covers are rounded posteriorly, and the tail is nearly square in the adult, but forked in the young; the scales are delicate, and sunk in the thick and fatty skin. As seen in the markets they are generally not more than 3 ft. long, though they attain a much greater size. From the northern seas they enter the rivers when swollen by the rains and more or less turbid and deep, remaining for a time in the brackish estuaries; they are probably able to detect the mixture of the waters through the nostrils, which are freely supplied with nervous filaments; they ascend during the flood, at the rate of 15 to 25 m. a day, resting in pools when the water is unfit for their progress; the females ascend before the males. Having attained the requisite height, as the cold weather comes on they take measures to deposit their spawn; at this time the female becomes very large, and her silvery tints dull gray; the male becomes thinner on the back, the nose longer, the under jaw turns up in a strong hook which enters a hollow in the nose, and the colors become brown and red. A furrow, 6 to 9 in. deep, is excavated in the bottom, principally by the female; in this the spawn is deposited, impregnated, and covered with gravel by the fish. The spawning process consumes from 8 to 12 days, and at the end of it the fish are very much emaciated, the scales are cast off, and they retire to some quiet place to regain their strength; in this condition they are called kelts, and are unfit for food. The eggs remain covered by the gravel all winter beneath the ice, and begin to be hatched by the end of March or commencement of April; experiments prove that the eggs are hatched in 114 days when the temperature of the water

Young Salmon.

is at 36° F., in 101 at 43°, and in 90 at 45°. The young come out from the gravel when about an inch long; these are called parr, and

remain a year in fresh water; when 4 to 6 in. long they receive the name of smolts, and are greenish gray above and silvery below, with very deciduous and delicate scales, in which state they descend to the sea; after about two months' sojourn there they ascend the rivers again, weighing 2½ to 4 lbs., and are then called grilse; they spawn during the winter, and then are entitled to the name of salmon; descending and returning the following season, they weigh 10 to 15 lbs., and may go on increasing to 60 or 70 lbs.; but now a salmon of 30 lbs. is considered very large, as from the injudicious methods of fishing both in Europe and this country most are caught in the condition of grilse or younger. According to Dr. Davy, the eggs retain their vitality for many hours in the air, if moist and cold (even to 32° F.), but not more than an hour if dry and at ordinary temperatures; both the ova and young fish will bear a heat of 80° or 85° in water for a short time, but die in water above 84° or 85°; they perish also in salt or brackish water. In their descent to the sea they generally remain for a time in brackish water, getting

Salmon One Year Old.

rid of their fresh-water parasites (crustaceans which attach themselves to their gills), and they do the same thing before they ascend the rivers, which frees them from marine parasites. This species is very extensively distributed in northern Europe and America, being found in Great Britain, the Orkneys, France, Belgium, Holland, Germany, Russia, Denmark, Sweden, Norway, and Iceland, getting access from the English channel and the northern seas by the Tweed, Tay, Severn, Loire, Rhine, Elbe, &c.; it does not occur in rivers falling into the Mediterranean, and does not come below the 45th parallel of latitude; in North America it frequents the rivers of Labrador, Canada, Newfoundland, Nova Scotia, New England, and those of New York communicating with the St. Lawrence, ascending even to Lake Ontario. Salmon can live without access to the sea, as is seen in Sebago and other landlocked lakes of Maine, but they are of inferior size and quality. It is well known that the salmon has the power of swimming with great velocity, of stemming rapid rivers, and of jumping over dams and waterfalls of considerable height; they have been known to spring 14 ft. out of water, and to describe a curve of at least 20 ft. in order to surmount a cascade; if not successful at first they persevere till they succeed, unless the obstruction be insurmountable; these efforts they

are able to make by their powerful and active muscles, and especially by the strong and fleshy tail. Ascending the rivers from June to September, their shoals are attended by porpoises, seals, and carnivorous fish, which find them an easy prey; it is popularly believed that they return to the river in which they were hatched, which in their immense numbers would be likely to happen to some, but more unlikely, as the fact proves, to the greater portion. The salmon is very voracious, and grows rapidly; in the sea it feeds principally on small fishes, especially the sand eel (*ammodytes*), crustaceans, the ova of echinoderms, &c.; it is believed that it eats very little while in fresh water from its thin appearance, but the emaciation would be sufficiently accounted for by the waste incidental to the breeding season. In the sea salmon very rarely bite at a hook, but in rivers and estuaries they will rise to artificial flies. For an interesting account of salmon fly fishing the reader is referred to Sir Humphry Davy's "Salmonia, or the Days of Fly Fishing." They are speared by the American Indians, and also in the Scottish rivers. Where salmon fishing is pursued as a business, they are taken in nets, usually in gill nets, stretched across the mouths of the rivers. Many hundred salmon of good size are often taken at a single haul of a seine, and some of the English fisheries furnish annually more than 200,000; the fisheries of Scotland and Norway are also very profitable. Rivers are let out to sportsmen with the exclusive right of fishing for salmon; the streams of the British provinces in America are frequently thus disposed of both to native and foreign anglers. The river Thames was once celebrated for its salmon, but its stream is now too impure to invite them to enter. The Merrimack river in Massachusetts formerly swarmed with salmon weighing from 9 to 12 lbs., but the numerous dams and manufacturing establishments have driven them away, and the northern markets are now supplied from the Kennebec river and the British provinces, and from the Pacific coast. The salmon enters the rivers of Nova Scotia in the latter part of April, the rivers emptying into the bay of Fundy a month later, and those emptying into the gulf of St. Lawrence in June; the females arrive first, and the males about a month after, and the grilse ascend during July and August. They spawn late in autumn, most of them returning to the sea before the rivers are frozen over, but some remaining in fresh water all winter and going to the sea in the spring; the ova are cast when the water is at most at 42° F., in shallow, pure, and rapid streams. Among the noted rivers for fly fishing are the Gold and St. Mary's in Nova Scotia, and the S. W. Miramichi and Nepisiguit in New Brunswick. The flesh is exceedingly delicate, and of a tint of pink which has received therefrom the name of salmon-colored; the delicacy of the flesh is no doubt due to the ova of echino-

derms and crustaceans which form their chief food, and the intensity of the red color seems to be in proportion to the quantity of the *gammarina* (minute amphipod crustaceans) which they devour. As with all fish which swim near the surface, it should be eaten when fresh, as the flavor is rapidly lost after death. The salmon is one of the fish to which the attention of pisciculturists has been directed, from the ease with which artificial fecundation is effected, the successful results obtained, and the value as food. In the Penobscot river in November, 1871, the Russian method of fecundation, that of carefully keeping the eggs and milt from water until they have come in contact, was practised with such success that 96 per cent. of the eggs were fecundated, a very much larger proportion than in the natural operation; 70,000 eggs from 10 females, thus fertilized, were sent in December to other parts of Maine, Massachusetts, and Connecticut. From the ninth annual report of the commissioners of fisheries of Massachusetts, for the year ending Jan. 1, 1875, it appears that their chief work consisted in hatching the eggs and planting the young of the California and Maine salmon; a few landlocked salmon from Sebec were also distributed to different parts of the state. Salmon eggs have also been carried from Scotland to New Zealand.—The *S. hamatus* (Cuv.), regarded by Bloch and other naturalists as the old male of the preceding species, has the back reddish gray, the sides brighter, and lower parts dull white; there are black spots above the lateral line, and some red markings, and the fins are bordered with blackish; the lower jaw in both sexes and in the young has a terminal hook turned upward and received in a depression near the union of the intermaxillaries; the mouth is very large from the elongation of the jaws, and is armed with strong teeth. The true salmon enters the rivers in summer, but this species ascends between October and the end of February, so that the two are not found together except at the end of the fishing season; the flesh is lighter colored and drier than in *S. salar*, and is hence less esteemed; it is found in the rivers of western Europe, but a specimen so named by Agassiz was caught in 1860 in the Merrimack river, showing that species which generally leave their arctic retreats for the European shore sometimes descend on the American coast. In the *S. hucho* (Val.), the salmon of the Danube, the body is longer and rounder than in the common salmon; it is grayish approaching to violet on the back, silvery white on the sides and below, the head and dorsals with a greenish tint, and the other fins yellowish; above the lateral line are black spots, smallest in the largest fish; as in other salmons, the young have seven or eight dark vertical bands on the body, which disappear with age; it attains a weight of 30 or 40 lbs., and is not found in the rivers opening into the Baltic; the flesh is white, but

softer and less agreeable than in the common species; the spawning season is in June. For other species of old world salmon, see Cuvier and Valenciennes's *Histoire naturelle des poissons*, vol. xxi. Among the American species the arctic salmon (*S. Rossii*, Rich.) deserves mention; it grows to a length of 2 or 3 ft., and has a more slender form than the common salmon; the color above is brownish green, the sides pearly gray with bright red dots near the lateral line, and red below; the under jaw is considerably the longer; the scales small, and separated from each other by smooth skin; it is found in the arctic seas and in the rivers therewith communicating so abundantly, that over 3,000 were taken at a single haul of a net during one of the expeditions of Sir John Richardson. Many other species of the arctic seas, on the E. and W. coasts of North America, are described and figured in Richardson's "Fauna Boreali-Americana," and many since his time have been described from the Columbia river and its tributaries, and from the rivers of the N. W. coast. (See "Report of United States Commission of Fish and Fisheries," by Prof. Baird, part ii., 1875.)

SALMON TROUT. See TROUT.

SALNAVE. See HAYTI, vol. viii., p. 553.

SALO, Gasparo da, an Italian violin maker, born at Salo, on the lake of Garda, about 1540, died in Brescia about 1614. He was a contemporary of the Amatis, and was one of the first to bring the instruments of the violin family to perfection. His instruments were large in their proportions and of great body and brilliancy of tone, double-purified, and having large sound holes. In general they were long, having the arch of the belly high and extending almost up to the sides. They resemble in their general characteristics those of Stradivarius rather than those of the Amatis and their imitators. He excelled in his varnish, which was of a rich brown. He left many violas and double basses. Dragonetti, the great contrabassist, played upon one of his instruments, presented to him by the convent of St. Mark in Venice, to which it was returned on his death. One of the best of his violins is owned by Ole Bull, having figures carved by Benvenuto Cellini. Salo worked at his trade in Brescia for 50 years. A violin of his is extant dated 1566, and another of 1613.

SALOMON ISLANDS. See SOLOMON ISLANDS.

SALONA, the Roman capital of Dalmatia, near the present Spalato (anc. *Spalatum*). (See SPALATO.)

SALONICA, or *Saloniki* (Turk. *Selanik*; anc. *Therma*, and afterward *Thessalonica*), a walled town of Turkey in Europe, capital of a vilayet of its own name (see MACEDONIA), at the head of the gulf of Salonica, anciently called the Thermaic gulf, 305 m. W. by S. of Constantinople; pop. about 70,000, including nearly 20,000 Jews and about as many Greeks. The town is on the slope of a steep hill. It is celebrated for the number and beauty of its

churches. Among them are the church of St. George, resembling the Roman Pantheon, which some consider to have been a temple of the Cabiri, and the former church of St. Sophia, now a mosque, in which St. Paul is said to have preached. A triumphal arch at the W. extremity of the Via Egnatia is believed to have been erected by the people of Thessalonica in honor of Augustus, and in memory of the battle of Philippi; it is 12 ft. wide and 18 ft. high, and is constructed of large blocks of marble. Another arch is of brick faced with marble, has camels sculptured on it, and is supposed to commemorate the victory of Constantine over the Sarmatians. The castle by which the town is defended is partly Greek and partly Venetian. Woollen and silk goods and hardware are manufactured. In 1872 the value of the exports was \$6,778,000, and of the imports \$7,294,000; and during the same year 642 vessels of an aggregate of 179,000 tons entered the port. Within a few years the trade has materially fallen off.—Salonica was first known in history as *Therma*, being so called from the hot springs near it. About 315 B. C. it was enlarged by Cassander of Macedon who named it Thessalonica after his wife, the daughter of Philip. Xerxes rested his army here. It was occupied by the Athenians about 432, and afterward became the chief Macedonian naval station. It surrendered to the Romans after the battle of Pydna, and under the empire it was the capital of the Illyrian provinces. Cicero took refuge here during his exile. The apostle Paul visited it about A. D. 52, and addressed epistles to its church. In consequence of a riot the city was subjected to a frightful massacre by the emperor Theodosius in 390. It took a prominent part in the Gothic and Slavic wars, but was captured by the Saracens in 904, when the population amounted to 220,000. The Normans from Sicily took it in 1185. It was held during the first half of the 13th century by Boniface of Montferrat, and afterward by the Venetians; and it was finally captured by the Turks in 1430. A butchery of Greeks took place here in 1822, in consequence of insurrectionary movements in the neighborhood.

SALOP. See SHROPSHIRE.

SALSETTE (native name, *Sashthi*), an island in the presidency of Bombay, 18 m. long and 10 m. wide; area, about 150 sq. m.; pop. estimated at 50,000. It is connected with the island of Bombay by an arched stone bridge and by a causeway built at the expense of Sir Jamsetjee Jejeebhoy, and with the mainland by the viaduct of the Peninsular railway. In the central hill of Keneri and elsewhere there are famous ancient rock-cut cave temples. The chief town is Thanah. Salsette came into the possession of the Portuguese in the 16th century, and was wrested from them in 1739 by the Mahrattas, who were dispossessed by the British in 1774.

SALSIFY. See OYSTER PLANT.

SALT, sodic chloride, sea salt, or common salt, the substance which is always denoted when the word "salt" is used in ordinary language. The word is derived from the Greek, in which $\alpha\lambda\varsigma$ in the feminine is used for the sea, and $\alpha\lambda\varsigma$ in the masculine for the solid product left when sea water evaporates. It is sometimes also called muriate of soda. It may be formed by burning sodium in chlorine gas, or by neutralizing hydrochloric acid with sodium carbonate, and evaporating. It occurs very abundantly in nature, both in the solid state, as rock salt, and in solution in sea water, salt lakes, and salt springs; also in smaller quantity in river water. Mines of rock salt have been recently explored in the Caucasus, in which the stone implements were found as they were left at a date so remote that no tradition exists of the time when they were worked. The mines of Wieliczka in Austrian Galicia have been worked for at least six, but probably for upward of eight centuries. The springs of Droitwich in England were worked by the Romans, and in Cheshire "the Wiches" were very productive in the reign of Edward the Confessor. Little is understood of the origin of rock salt. Some beds, as those of Cheshire, appear to have been produced by the drying up of bodies of sea water cut off from the ocean, while in other cases, as at Bex, where the salt forms a perpendicular vein or dike, its origin is altogether obscure. Salt lakes are derived either from the partial drying up of isolated bodies of sea water, as the Dead sea, or by the evaporation of lakes without outlets, and fed by streams which have passed over beds of salt, or plains impregnated with it, as Great Salt lake, Lake Urumiah in Persia, and many of the lakes of South America. Saline incrustations often overspread the surface of plains in Russia, India, the South American pampas, and the regions E. and W. of the Rocky mountains. The salt of the ocean has doubtless resulted from the chemical changes which have taken place between the elements that constitute the earth's crust during former geological epochs. The waters of the open ocean contain on an average 33.8 parts of salt in 1,000, of which 26.8 in 1,000 are common salt, equal to about 4 oz. in a gallon, or a bushel from 300 or 350 gallons. The entire quantity of salt in the ocean is estimated by Schaffhäutl at 3,000,000 cubic miles. The water of landlocked seas like the gulf of Mexico or the Mediterranean sea contains more salt than that of the open ocean, and it is also found that the water of the bottom of such seas is saltier than that upon the surface.—Salt crystallizes in colorless, transparent, anhydrous crystals, belonging to the isometric system, and has a very perfect cubic cleavage, which generally displays itself even in the great masses of rock salt, parts of which however are frequently massive and granular, and rarely fibrous or columnar. But the most characteristic peculiarity of the crystallization of salt is the for-

mation of the hopper-shaped crystals on the surface of a saline solution during evaporation. A single cube appears at first, which partially sinks in the liquid, and new cubes then form and attach themselves to its upper edge, till by a repetition of this process a hollow rectangular pyramid, sometimes of considerable dimensions, and with the apex downward, is finally produced. Crystals of this form occur in some salt mines, and casts of them in clay are found in the New York salt region and some other places. Salt has a specific gravity of 2.1 to 2.257, and a hardness between gypsum and calc spar. It is transparent to translucent, and its color varies from white to yellowish, reddish, bluish, and purplish. It is of all substances the most perfectly diathermanous or transparent to heat of every degree of refrangibility. (See DIATHERMANCY.) At 32° F. 100 parts of water dissolve 35.52 parts of pure salt; and at 229.5°, the boiling point of a saturated solution, only 40.35 parts are dissolved. This almost uniform solubility at all temperatures furnishes the means of separating it from many of the foreign salts with which it is associated in sea water and brine springs. Rock salt dissolves much more slowly, even in fine powder, than sea salt and that from springs, and the coarsely crystallized salt than the finer varieties. These differences are of economical importance, especially in curing provisions. For the principle of its curative properties see PRESERVATION OF FOOD. The freezing and boiling points of solutions rise with the degree of concentration. Salt is fusible at a red heat, and volatile at a still higher temperature. Its volatility is made use of in the process of "salt-glazing" common earthenware. (See POTTERY AND PORCELAIN, vol. xiii., p. 788.) Artificial crystals generally decrepitate when heated, from the presence of water mechanically enclosed between their layers. Some specimens of rock salt from Wieliczka decrepitate when dissolved in water, and disengage a gas, which is sometimes pure carburetted hydrogen, and sometimes a mixture of this with hydrogen and oxide of carbon.—Salt is a compound of one atom of chlorine combined with one atom of sodium; chemical symbol, NaCl; molecular weight, 58.5. When it is heated to redness with silica, silicate of sodium and hydrochloric acid are formed. A process for manufacturing soluble glass is based on this reaction. With oil of vitriol it gives sulphate of sodium and hydrochloric acid. This is the first step in Le Blanc's process for soda ash. Salt is rarely if ever obtained pure. The chief impurities in rock salt are sulphate of lime, oxide of iron, and clay; but besides these the chlorides of potassium, calcium, and magnesium, the sulphates of soda and magnesia, and bituminous matters are occasionally met with, and some varieties are even colored by the presence of infusoria. In salt made from sea water, the salts of magnesia with a little sulphate of lime are the principal

impurities. All the varieties of salt occasionally contain minute quantities of bromides and iodides. The following table exhibits the composition of salt from various sources:

VARIETIES OF SALT.	Chk ride of sodium.	Chloride of potassium.	Chloride of calcium.	Chloride of magnesium.	Sulphate of potash.	Sulphate of lime.	Sulphate of magnesia and soda.	Carbonates.*	Alumina and iron.	Residue.	Water.	Percentage of saline residue.	AUTHORITIES.

An examination of this table will show that the impurities differ both in kind and in quality. More or less sulphate of lime and chloride of magnesium are found in salt from whatever

locality or source it may be derived. The purest rock salt is the best of all; next to that is sea salt, and then the average quality from brine springs; but the table shows that the

* The carbonates are mainly of lime, except in the Holston rock salt, which contains magnesia only. The brines of Nauheim, Onondaga, Kanawha, and many others, as well as sea water and that of the Dead sea, contain traces of bromides

and iodides. The dry residue of sea water from the Mediterranean contains 1.47 per cent. of bromide of sodium.

† Sulphate of magnesia only.

‡ Sulphate of soda only.

§ Silicate of soda.

"Onondaga factory filled salt" is as pure as the rock salt of Cheshire, England, which is one of the purest known. An impurity of 3 per cent. renders salt unfit for domestic purposes, especially if the impurity consist of chlorides of calcium and magnesium, particularly the former.—Beds of rock salt and brine springs occur in geological formations of almost every period. The New York springs are in the upper Silurian, and most of those of western Pennsylvania and Virginia, of Michigan, Ohio, Indiana, Illinois, and Kentucky, in the lower coal measures; most of the Russian mines and springs are in the Permian; those of Cheshire in England, Ireland, eastern France, Würtemberg, and many other parts of Germany, in different members of the triassic group; those of the Austrian Alps in oolitic beds; those of the Pyrenees and of Cardona in cretaceous rocks; while those of Wieliczka in Galicia, of Tuscany, Sicily, and Petite Anse belong to tertiary strata. Its most invariable mineral associate is gypsum or hydrated sulphate of lime; in some places, as at Bex in Switzerland, this is replaced by anhydrite, or the same mineral without water; while polyhalite (a mineral consisting of sulphates of lime, magnesia, potash, and soda), bitumen, sulphur, and calc spar also frequently occur with it; and in many places, as in the wells in the coal formation, a copious discharge of carburetted hydrogen gas accompanies the flow of brine, and also jets of rock oil. (See *PETROLEUM*, vol. xiii., p. 370.)—Geographically salt is widely distributed. Excepting Norway, Denmark, and Holland, the European countries are all provided with salt to some extent from domestic sources, and even in some of these rock salt is imported and refined. The principal mines of rock salt are those of Wieliczka in Galicia; at Hall in the Tyrol, and along the mountain range through Aussee, in Styria, Ebensee, Ischl, and Hallstadt in Upper Austria, Hallein in Salzburg, and Reichenhall in Bavaria; in Hungary in the county of Mármaros; in Transylvania, Moldavia, and Wallachia; at Vic and Dieuze in German Lorraine; at Bex in Switzerland; in the valley of Cardona and elsewhere in Spain; in the region around Northwich in Cheshire, England; near Carrickfergus, Ireland; and in the government of Perm in Russia. The principal salt springs are in Cheshire, Worcestershire, and Staffordshire, England; in Würtemberg and Prussian Saxony; and in northern Italy. Russia is almost the only country which derives much from salt lakes. France, Spain, Portugal, and Italy, with a number of the islands of the Mediterranean, are the principal producers of sea salt. England, Austria, France, Spain, Portugal, and Italy, with some of the Mediterranean islands, are the principal exporters of salt.—In Russia the supplies from mines, springs, and lakes are inexhaustible. Over the vast area of the Permian group, covering upward of 300,000 sq. m., salt is found, and

in numerous localities is extensively and profitably worked. Ancient mines of rock salt have been explored in the Caucasus, supposed to be among the oldest in the world. In Sweden, Carlstad near the N. shore of Lake Wener produces some salt, but both Sweden and Norway import much, principally from England and Sardinia. Denmark is also a large importer. In Holland and Belgium refined salt is made from British rock salt, which is dissolved in fresh or sea water, and crystallized by artificial heat. Among the largest salt mines in the world are those of Stassfurt in Prussia, and the adjoining Anhalt mines.—In the Austrian empire, Upper Austria, Salzburg, Styria, and Tyrol on the west, and Croatia and Dalmatia on the south, have almost inexhaustible stores of rock salt and brine springs; while the province of Istria derives much wealth from the lagoons bordering the Adriatic. The salt mines of Wieliczka, 7 m. S. E. of Cracow, extend over a space of about 2 m. in length by nearly 1 m. in breadth, and are about 1,000 ft. in depth. The salt occurs in great lenticular masses, inclined at a high angle. It varies very much in quality; the so-called "green salt" contains 5 or 6 per cent. of clay, which destroys its transparency; a variety called *szpica* is crystalline and mixed with sand; while that known as *szymbik*, principally from the lower levels, is in largely crystallized masses, perfectly pure and transparent. The strata in which it occurs are compact tertiary clays, containing fossils; and the principal associated minerals, besides gypsum, are bitumen, anhydrous sulphate of lime, the sulphates of baryta and strontia, and sulphur. The mines are entered by numerous shafts, with galleries at seven different levels, leading to a labyrinth of passages and immense excavations extending to a total length of upward of 500 m. Some of the chambers formerly excavated were more than 150 ft. high, but those now made are much smaller. One of these is fitted up as a chapel dedicated to St. Anthony, in which the altar, statues, columns, pulpit, &c., are all of salt. In another part is a lake 650 ft. long and 40 ft. deep, formed by the water which trickles through the strata. The annual yield is now about 1,400,000 cwt. It is not known when these mines were discovered. They are believed by recent authorities to have been worked in the early part of the 11th century, when they belonged to Poland, and in the 14th Casimir the Great established regulations for their working, as they had then become very productive. They were pledged to Austria in 1656, but recovered by John Sobieski in 1683. In 1772, when the first dismemberment of Poland took place, Austria again obtained them, and, except from 1809 to 1815, has since held them. The kings of Poland drew considerable revenues from these mines, and depended upon them for the dowries of their queens and the endowments of their convents, to which last purpose their revenues were applied as early as the

14th century. At each royal election the nobles always stipulated that the salt of Wieliczka should be supplied to them at the mere cost of extraction. From Wieliczka a saliferous region extends on both sides of the Carpathians, through Galicia, Hungary, and Transylvania, into Wallachia and Moldavia. The richest mines of Hungary are in the county of Máramaros. In Transylvania the mines have been worked since the times of the ancient Romans, and there is also a large number of salt springs.—In Switzerland the brine springs of Bex have been worked since the middle of the 16th century. They formerly belonged to a family of Augsburg named Zobel, but are now the property of the government of the canton (Vaud). In 1823, in consequence of the gradual failure of the springs, the mountain was pierced by a gallery, which led into a vein or dike of salt, varying from 2 to 50 ft. in thickness. Springs are found in other parts of Switzerland.—In Italy the lagoons and springs, still highly productive, were worked in ancient times. Venice formerly owed her prosperity in great part to her salt lagoons and her control of the trade in salt in southern Europe. During the decline of her power her salines remained unproductive, until they were reestablished on a vast scale during the French rule. They are again largely worked in the artificial enclosures around the city connected with the sea. Salt is a strict government monopoly, and the springs and salines furnish one of the chief articles of export.—Spain has one of the most remarkable salt mines in Europe, at Cardona in Catalonia. Here is a hill 500 ft. high, covering an area of three quarters of a square mile, composed of nearly vertical beds of salt, gypsum, and clay belonging to the cretaceous series, the salt constituting about four fifths of the entire mass. The workings are in the form of long steps of one metre (39 in.) in height and width, cut in the salt, in the open air, by means of blasting and the pick. The salt is simply ground and washed to prepare it for sale. Salt springs are found in other parts of Catalonia and along the Pyrenees, in beds of the same age, as at Pamplona in Navarre. But most of the salt of Spain is obtained from sea water, especially in Valencia and Catalonia. Salt is a strict monopoly in Spain, and can be sold by individuals only for exportation.—In Portugal salt is manufactured principally from sea water, and the business is largely carried on, sustaining a considerable export and coasting trade. The St. Ubes salt, well known in commerce, and much esteemed for packing provisions, is a product of Portugal. The export, and that of the Cape Verd islands also, is principally to Brazil and the United States.—In France, which by the treaty of 1871 has lost its principal rock salt deposits of Vic and Dieuze, formerly comprised in the department of Meurthe, there are both important deposits and springs in the adjoining regions, along the Jura, and in

the central departments. Along the Pyrenees rock salt and springs are found in the cretaceous formation. But the greatest portion of the product of France is from the lagoons on the Atlantic and Mediterranean coasts.—England, which now produces more salt than any other country, obtains her supply almost exclusively from mines and springs in beds of the same geological age as those of Vic and Dieuze, principally in Cheshire and Worcestershire; there are also brine springs in Staffordshire, from which Hull is supplied. Northwich and Winsford in Cheshire, on the river Weaver, furnish six sevenths of the whole; and the beds of rock salt are chiefly limited to the region drained by this river. They occur in detached masses of limited area beneath the plains of this district, sometimes spreading out, as at Northwich, to a breadth of three fourths of a mile. The strata penetrated at this locality are gypsiferous clays and marls to the depth of 120 ft., below which are found beds of salt 60 to 90 ft. thick, resting on 30 to 40 ft. of indurated clays containing seams of rock salt, and below these rock salt about 100 ft. thick. The purest salt is in a portion of 4 ft. thickness about 10 or 12 ft. above the bottom of the upper bed, and in another of 20 ft. thickness 60 or 70 ft. below the top of the lower bed. Other portions of the beds are earthy. The salt is not stratified, but divided into vertical prisms sometimes 3 ft. in diameter. But the Cheshire salt, known in commerce as Liverpool salt, is mostly obtained from wells of 200 to 250 ft. depth, terminating in the lower bed of rock salt. In these the brine is pumped up and conveyed to the evaporating pans, which are 20 ft. wide, 30 to 80 ft. long, and 16 to 20 in. deep. In Scotland, before the abolition of the duty, much salt was made from sea water, but most of the salt works are now abandoned. In Ireland two beds of rock salt, making together a thickness of 120 ft., covered by 630 ft. of red marls, were discovered about 1853 at Carrickfergus near Belfast; since which time the annual product has gradually increased to many thousands of tons.—The total product of the mines and springs of Europe was estimated in 1821 at 1,250,000 to 1,500,000 tons. It is now certainly twice as great as the larger of these estimates; and with the addition of that from sea water and salt lakes, the total product is probably 5,000,000 tons.—In Asia salt is no less abundant than in Europe. In Siberia and Tartary plains are covered with saline incrustations. Extensive mines of rock salt have been worked from ancient times at Nakhitchevan in Armenia. This variety abounds in Persia, where are also many salt lakes with no outlets. Lake Urumiah, 90 m. long and 20 to 30 m. broad, and about 4,300 ft. above the sea, contains brine of extraordinary strength, the percentage of pure salt being 18.116 and of other salts 2.434. Its specific gravity is 1.155. In summer, over a breadth of 3 or 4 m. around parts of this lake, the incrustation of salt is

sometimes more than a foot thick. The resources of British India in salt are great, but comparatively unimportant from the monopoly of the government, and salt is largely imported from England. Still vast beds of rock salt are worked in the Punjab at the foot of the Himalaya, and great quantities are obtained from the incrustations over the plains near the mouth of the Indus, and from various other portions of the Indian peninsula. The salt wells of China are remarkable for their great depth and immense numbers. China and Java are wholly dependent upon their own resources for salt, admitting no importations.—Africa contains extensive tracts of salt lands and beds of rock salt in the desert of Sahara, particularly in the N. and W. portions, as in that part called Tanezruft, on the route between Tuat and Timbuctoo. The trade in salt with Soodan furnishes a support for many of the inhabitants of the desert. Near Biskra is a mountain of salt in the cretaceous formation; and another is found near the salt lake Zagrez. This lake is in some seasons covered with a glistening white crust of excellent salt, like ice, amounting to even one or two feet in thickness. Similar lakes are met with in this region, and also in Abyssinia. In central Africa, salt from salt lakes is perhaps the most important article of commerce.—In the Hawaiian islands salt is procured from the lakes near Honolulu, and is exported.—In South America, rock salt is found in Brazil, Peru, Colombia, and Venezuela; in the pampas of the south and the elevated plains of Peru, it occurs as an incrustation; in Patagonia and the Argentine Republic are productive salt lakes; in Colombia it is obtained from springs, and in Brazil from lagoons on the coast. The salines or salt lakes of the pampas extend from Port St. Julian in Patagonia, lat. 49° S., through the Argentine Republic, to lat. 25° S. They are generally shallow, and in the wet season the whole or a part of the salt is dissolved, and redeposited during the dry season, when the appearance of the snow-white expanse, crystallized in great cubes, is very striking. Patagonian salt is still a large article of commerce with other parts of South America. It is of the greatest purity, requiring no preparation, and containing only 0.26 per cent. of gypsum and 0.22 of earthy matter, without a trace of iodic salts. The beds of various salts in the elevated plains of Tarapaca in Peru, especially around Iquique, are among the most remarkable in the world. The porphyritic mountains on the coast rise abruptly to a height of between 1,900 and 3,000 ft.; between their summits and an inland plain, on which lies the celebrated deposit of nitrate of soda, is a high undulatory district, covered by a crust chiefly composed of common salt, either in white, hard, opaque nodules, or mingled with sand, forming a compact sandstone. This never attains a great thickness, though in the pampa of Tamarugal, in S. Peru, Mr. J. H. Blake

saw a considerable space covered with round masses of salt, 5 or 6 ft. in diameter, piled upon each other. In some places they were deep red, but in the vicinity of Pisco they were sufficiently pure for culinary purposes. The inhabitants employed them in building their houses. As rain falls here only at intervals of many years, the deposits are subjected to very little waste. Colombia has very rich mines of rock salt, especially in the district of Zipaquirá. The mineral extends many miles across a branch of the Cordillera. Salt springs are also found here. On the N. coast are lagoons of great capacity of production. The salt mines of Araya, in the peninsula N. of Cumaná in Venezuela, were discovered by the followers of Columbus in 1499; and as they offered an inexhaustible supply of the finest salt, they continued for years to attract adventurers of all nations. The Dutch islands of Curaçoa and Buen Ayre, N. of Venezuela, produce several hundred thousand barrels annually by natural evaporation and of the finest quality, much of which is exported to the United States.—A large number of the West India islands produce salt, especially the southern Bahamas, Cuba, Porto Rico, St. Martin, and St. Christopher or St. Kitts. Turk's island, S. E. of the Bahamas, was formerly the main source of sea salt for the United States, and even now most of the salt from any of the West India islands, or from Yucatan, is called Turk's island salt. Since 1833 the manufacture has fallen off here, while it has grown up in the Windward islands and some other British islands. Of the Dutch West Indies, besides Curaçoa and Buen Ayre, St. Martin, in the Leeward islands, produces a great deal from lagoons in the southern part, and it is the principal export of Philipsburg, the Dutch capital. On the N. coast of Cuba are extensive lagoons, from which in dry years large quantities are obtained. In Hayti there is a deposit of rock salt on the S. side of the island, said to form a mountain 6 m. long, $\frac{1}{2}$ m. broad, and 400 to 500 ft. high. The crude salt contains 96.79 per cent. of pure sodium chloride. In Porto Rico are two salines formerly worked by the government, which, as well as the monopoly of the introduction of either Spanish or foreign salt into the island, were sold to private parties in 1851. Cuba and Porto Rico, however, draw most of their supply from Spain, and some from England.—In Central America are many salt springs, and on the Pacific coast large quantities are made from sea water. In Mexico, the state of Oajaca has salines extending for 30 or 40 leagues along the Pacific, which are very valuable and supply the whole interior of the state. These formerly belonged to the government, but were sold by Santa Anna to the family of Echeverría for \$300,000. In Tamaulipas salt is produced from a chain of lagoons on the coast divided by the Rio Grande from the celebrated salt lake near Brownsville in Texas.

The lake of Tezcuco, near the city of Mexico, is so strongly impregnated as to leave a white deposit on its banks, and supplies a number of salt works. The island of Carmen, in the gulf of California, contains a large salt lake, with a solid crust several feet thick. Large quantities are sent to Mazatlan and San Francisco.—In British North America, Nova Scotia, New Brunswick, Cape Breton island, Newfoundland, and the Magdalen islands contain salt springs, which in nearly all these places are associated with gypsum. At Goderich on Lake Huron, in 1866, in boring for oil, a deposit of rock salt was struck at a depth of about 960 ft., and the brine was remarkably strong and of great purity. The manufacture of salt was commenced immediately, and developed rapidly, until now the production amounts to several millions of bushels annually, affording the principal source of supply for Canada, and also furnishing a large amount for export to the United States. On account of the strength and purity of the brines, salt is produced and sold at a price which after adding the duty enables the Goderich manufacturers to compete with those of the middle and western states. Canada was formerly principally supplied from England and the state of New York; she has been indeed our only customer of importance, the exports of American salt to other countries being small.—The United States is well supplied with salt, 23 of the states and territories having been returned by the different censuses since 1810 as producers, while seven others possess valuable springs or deposits. Rock salt has been found only in S. W. Virginia and in Louisiana. The principal springs are in central New York, near Syracuse, in West Virginia and Pennsylvania, in Michigan, and in the states bordering on the Ohio. Salt lakes occur in California, Utah, New Mexico, Texas, and Minnesota. Salt has been made from sea water in nearly every Atlantic state at some period. The New England states have at different times produced large quantities of sea salt, particularly during the revolution and the war of 1812, and about 1830; since which time but little has been made, though a few vats are still kept in operation at Cape Cod, Nahant, &c. Virginia had salt works at Cape Charles before 1620, and in 1633 exported salt to Massachusetts. In South Carolina, Nathaniel Johnson undertook the manufacture in 1689, and in 1725 the legislature passed two acts for the encouragement of salt making.—The salt springs of New York are principally in Onondaga co., in the towns of Syracuse, Salina, and Geddes, and issue from rocks of upper Silurian age. They were known to the Indians at a very early period, but Father Lalemant is believed to have been the first white man who visited them. About 1770 Onondaga salt was in common use among the Delawares, and was carried to Quebec for sale. The first made by the whites was in 1788, near Syracuse, by boiling. The salines

belong to the state, which supplies the brine to manufacturers and receives a royalty of one cent a bushel. Six cents was formerly charged, and the state thus derived a large revenue; but in 1846 the tax was reduced to its present amount, which suffices to defray the expenses of pumping, superintendence, &c. In 1789-'90, 500 or 600 bushels were made and sold at \$1 a bushel. In 1791 the capacity of the works was 8,000 bushels a year. In 1797, when the first leases of salt lots were made, the product was 25,474 bushels; in 1807, 165,448; in 1817, 448,665; in 1827, 983,410; in 1837, 2,161,287; in 1847, 3,951,351; and in 1858, 7,033,219 bushels. In 1862 the production reached the maximum of 9,053,874 bushels; since that year the average has been about 8,000,000 bushels, gradually declining since 1870. For 1874 the product was 6,594,191 bushels. The productive springs are in great part found in the marshy lands which surround Onondaga lake. A stratum of marl 3 to 12 ft. thick, underlaid by a marly clay, forms an impervious barrier between the water raised from the wells and that of the lake. Wells are sunk or bored in the low lands around the lake, from 200 to 300 ft., and from these the salt water is forced up by pumps into the reservoirs from which the evaporating works are supplied. The strata passed through near the surface are beds of fine sand, and then clay, sometimes more than 40 ft. thick, beneath which is gravel of pebbles and sand containing salt water. The brine is of variable strength in the different wells, as indicated by its specific gravity, which is from 1.045 to 1.147, and from 30 to 45 gallons are required for a bushel of dry salt weighing 56 lbs. The chief impurity is sulphate of lime, which was found by Dr. Lewis C. Beck to amount to from 4.04 to 5.69 per cent. Excepting the chloride of magnesium, the impurities found in these brines are also common to rock salt. From the deepest wells at Syracuse Dr. Beck obtained brines which afforded 173.50 parts of salt in 1,000 parts, and of which 33½ gallons were required to the bushel of ordinarily dry salt. The deepest wells now afford brines containing 17 to 20 per cent. of salt. Salt springs are found in other parts of central and also of western New York, especially over the area extending E. and W. 170 m. from Otsego co. to Orleans and Genesee, and N. and S. about 80 m. from Broome co. nearly to Lake Ontario.—In western Pennsylvania is an important salt region along the Alleghany, Kiskiminetas, and Beaver rivers, in the carboniferous series. In 1812 the first wells were bored 200 ft. deep on the Kiskiminetas river, and in 1829 there were extensive works there, using coal, and producing salt at 20 to 25 cts. a bushel, while in Kentucky, Ohio, and Illinois it was selling at 50 cts. The production of Pennsylvania in 1857 was estimated at 900,000 bushels; in 1860 it was 1,011,800 bushels, but it has since declined. West Virginia has very important

salines in the valley of the Great Kanawha, beginning at Charleston and extending about 20 m. above. They are situated in the lower coal measures. The first wells bored were only 30 ft. deep, but some have since been bored 1,500 ft.; 700 or 800 ft. is as great a depth as is generally profitable, as below this the water does not increase, while the discharge of carburetted hydrogen gas becomes much more copious. This gas was formerly employed for heating the kettles, but its use is now almost discontinued. The bitter or residual liquor contains a good deal of bromine. In 1829 these works produced 1,000,000 bushels. The product for 1870 was 4,633,750 bushels, but for 1875 it was expected to amount to hardly one fourth of that quantity. In S. W. Virginia there is a salt region, in Washington and Smyth counties, along the banks of the N. fork of the Holston river. The Holston springs and rock salt are on the line of an extensive dislocation of the strata, bringing the lower Silurian magnesian limestones into immediate contact with the lower carboniferous strata, the vertical displacement being calculated by Prof. Rogers at not less than 8,000 ft. The dislocation is at least 100 m. long, but no rock salt or workable brine is found except in the Preston valley, on the line of Smyth and Washington counties. Several productive wells have been bored to the depth of 200 to 300 ft. In one well over 300 ft. of rock salt divided by a little clay was passed through without tapping any brine. There appears to be no solid rock, but a deposit of clay and earth, imbedding in places large bodies of rock salt and gypsum, and saturated in its lower portions with highly concentrated brine. —The first attempts in Ohio were made in 1798 at the "old Scioto salt works" in Jackson co. The wells were only 30 ft. deep, and 600 to 800 gallons were required to make a bushel of dark and inferior salt, which however sold for \$3 or \$4, being carried, even as late as 1808, on pack horses to considerable distances. Until about 1845 the wells were sunk only 400 or 500 ft. in depth, but at Pomeroy they are now 1,200 ft. deep, yielding a copious supply of strong brine, and more than two thirds of the salt of Ohio is at present manufactured in that vicinity. From some of the springs issue large quantities of carburetted hydrogen gas, which has been used as fuel in evaporating. Rock oil is also a product of them. (See PETROLEUM.) In 1850 Ohio produced 550,350 bushels, and in 1873 4,154,187 bushels. Indiana has numerous salt springs, especially along the Wabash river in the coal measures. The Wabash saline in 1809 made 130,000 bushels, and the United States saline, about 1820, at least 150,000 bushels; but in 1870 the whole product of Illinois was only estimated at 54,000 bushels. In Kentucky salt springs or licks are very numerous, and even before 1795 much salt was made. The principal licks are: one on Salt Lick creek, near the Ohio; the upper and

lower Blue springs on Licking river; Drennon's lick, on the Kentucky river; Big Bone, Long, Bullett's, and Mann's licks. The principal works recently in operation are on Goose creek; they made in 1860 about 290,000 bushels, but the product in 1870 was only 64,000 bushels, and is now still less. In Michigan is a valuable salt region in Saginaw co. Many licks and springs have long been known, and in 1838 unsuccessful attempts were made by the state authorities to work some of them. In 1859 the legislature offered a bounty of 10 cts. a bushel for salt made in the state, and a company in E. Saginaw bored a well, and obtained at 669 ft. nearly saturated brine. Since 1860 the production of salt in Michigan has developed with great rapidity, until it has become next to New York the largest salt-producing state in the Union. The product in 1874 was 5,134,875 bushels. In 1862 a deposit of rock salt was discovered on the island of Petite Anse in Vermilion bay, off the coast of Louisiana. It is considered to be geologically more recent than the tertiary, or of quaternary age. It was worked extensively during the blockade of that coast in the civil war, and has since produced more than 100,000 bushels annually. In Kansas, the Indian territory, and western Arkansas, along the Arkansas and Washita rivers, in N. W. Texas, New Mexico, and Utah, is a vast expanse of sterile plains, principally occupied by cretaceous rocks, in nearly every part of which salt lakes and incrustations and vast masses of gypsum occur. But the most famous of these lakes is the Great Salt lake of Utah, about 75 m. long and 30 m. wide, whose waters are nearly saturated, containing 20·2 per cent. of common salt, and 2 per cent. of other salts. For several years the waters in this lake have gradually risen above their former level, and a proportionate diminution of salt has been observed. In California are numerous salt lakes, particularly in Tulare co., at the Canada de las Uvas, and in the Taheechaypah pass of the Sierra Nevada, near which is a dry lake from which a considerable quantity fit for table use has been taken.—At the present time (1875) the production of salt in the United States may be considered in reference to three different sections, viz.: the region east of the Mississippi river, the Rocky mountain region, and the Pacific coast region. Although during the past 100 years salt has been manufactured in nearly every state east of the Mississippi river, the business is now mainly restricted to three separate areas: the neighborhood of Syracuse, N. Y.; Saginaw valley, Mich.; and the Kanawha valley, including the wells at Pomeroy, near the junction of that river with the Ohio. These three localities produced in 1870, in about 200 establishments, nearly 16,000,000 bushels of salt, the total number of establishments in the country at that time being 282, and the total production 17,606,000 bushels. From 1850 to 1875 the salt industry has grown in Florida and Michigan, while in New York

and the Kanawha region it has gradually decreased since 1862, when the business appears to have been most flourishing. In Massachusetts, Pennsylvania, Kentucky, Indiana, and Illinois the business is rapidly becoming unproductive, while Missouri and Tennessee no longer report any saline in actual operation. But the total production for 1870 was greater than that for 1860 by about 5,000,000 bushels, an increase of 40 per cent. The salt industry is now very much depressed, especially in the Kanawha valley and at Syracuse, from the fact that the great strength of the Michigan and Goderich brines and the abundance of fuel in those localities enable these brands of salt to be successfully sold where Onondaga salt made from brines only half as strong, and Ohio and Kanawha salt made from brines still weaker, formerly commanded the market. In addition to these disadvantages, the Onondaga and Kanawha salt is driven from eastern markets by Liverpool salt, which is brought to our eastern seaports at a merely nominal charge by ships that load in return tobacco, cotton, and breadstuffs. Throughout the region lying on both flanks of the Rocky mountains the demand is rapidly increasing, and is mainly supplied from local sources, chiefly brine springs. In 1870 Utah produced 1,950 bushels, Idaho 13,400, Colorado 7,500, and Kansas 10,000. The production is rapidly increasing with the settlement of the country, and is almost without competition. On the Pacific coast salt has long been produced near Los Angeles and further north, and the production increased from 44,000 bushels in 1860 to 174,835 in 1870. The salt is obtained entirely by evaporation of sea water. Salt was formerly produced in Oregon, but is not now manufactured there.—*Manufacture of Salt.* The separation of salt from brines and sea water is conducted in three distinct ways: 1, by evaporation by the heat of the sun in shallow reservoirs, principally practised with sea water in the southern temperate or tropical regions; 2, by artificial heat, in very long shallow pans, as in Cheshire, or in kettles, as at the Onondaga salines; 3, by exposing sea water to intense cold, when the ice formed is nearly pure, and a concentrated brine remains, which is afterward subjected to one of the first two processes. Weak brines are frequently brought to a certain strength by solar evaporation, and then finished by boiling; or more frequently they are pumped up into elevated reservoirs, and suffered to trickle over the surface of bundles of brush or thorns built up into walls, sometimes 30 to 50 ft. high and 5,000 ft. long, fully exposed to the sun and wind; the great amount of surface thus obtained causes the evaporation to go on very rapidly, and a few repetitions of the process bring very weak brines to suitable strength for boiling. This process is known as "graduation;" and the same effect is sometimes obtained by allowing the water to trickle over ranges of cords suspended perpendicularly.

The third process is practised in northern Europe. In nearly every locality certain details are employed in the evaporation due to peculiarities in the brines, in the fuel employed, proximity to the sea, &c. As an illustration of the general methods employed when treating sea water, the operations at Berre near Marseilles are thus described by Dr. T. Sterry Hunt, in a paper published in the "Geological Survey of Canada" for the years 1853-'6. The waters of the Atlantic contain from 2.5 to 2.7 per cent. of common salt, and those of the Mediterranean about 3 per cent. While the latter therefore afford a stronger brine, the dry and hot summers of the southern shores are also more favorable for the evaporation (which is conducted without artificial heat) than the cooler and more rainy coasts of Brittany and La Vendée. The Mediterranean waters, moreover, contain about 0.8 per cent. of sulphates and chlorides of calcium, magnesium, and potassium; and from the residue, or mother liquors, after most of the common salt has been separated, it is found that salts of magnesia and potash and sulphate of soda may be obtained of almost equal value with the salt which is the primary object of the manufacture. The salines of Berre, however, where these operations are very successfully conducted upon a grand scale, do not use the strong sea water, but are supplied from a lake which, though connected with the tide, is freshened fully one half by streams from the interior. Other advantages afforded by the situation compensate for this weakness of the brine. The broad receiving basins of these salines must be so situated that they can be flooded at very high tides, and be protected by dikes against their incursions when supplies of salt water are not wanted. A clayey soil is important to prevent infiltration, and give strength to the dikes. The water being let into the great shallow basins, it is allowed to remain till it deposits its sediments and begins to evaporate by the warmth of the sun. It is thence conducted successively through other basins of 10 to 16 in. depth, in which the evaporation goes on, and the lime it contained is deposited as a sulphate. As its bulk decreases smaller shallow basins suffice for holding it after it is separated from the sediments and lime, and in these it is concentrated by continued evaporation to a saturated brine. When this marks 25° Baumé, it is transferred to the salting tables, upon which the crystalline crusts soon collect. Pure salt to the extent of 25 per cent. of the whole product separates between 25° and 26°, and may be kept by itself, the brine in this case being removed to another table. Upon this salt of second quality is deposited to the extent of 60 per cent. of the whole, between 26° and 28.5°; and upon other tables the remainder is collected between the last degree named and 32°. The last product, though somewhat impure and deliquescent from the magnesian salt it contains, is preferred

for salting fish on account of its property of attracting moisture. The mother liquors are run off to be treated for the other salts. From the salting tables the crystallized salt is taken and made up into pyramidal heaps, and during the summer season these are left exposed to the weather. The little rain that falls promotes the purification of the salt by removing the more soluble foreign matters. Nothing more is done to prepare the salt for the market. Its average price is one franc for 100 kilogrammes (220 lbs.). Steam or horse power is employed at these large salines to raise the water from the lower basins into the upper ones; the machines that take up the water are lifting wheels of 8 to 16 ft. diameter. The evaporating surfaces cover 815 acres, of which $\frac{1}{10}$ is devoted to the salting tables. The total annual product of salt is about 44,000,000 lbs. At Baynas, as M. Payen states, the same amount is made with strong sea water on 370 acres.—The relative strength of the various brines employed in the United States and Canada for the manufacture of salt is thus given by Dr. Beck, the figures representing the number of gallons required to the bushel of ordinary dryness:

Sea water, from.....	300 to 350	Montezuma, N. Y. (old wells).....	70
Boon's Lick, Mo.....	450	Muskingum, O.....	50
Conemaugh, Pa.....	300	Montezuma, N. Y. (new well).....	50
Jackson, O.....	213	Onondaga, N. Y. (old wells).....	45
Lockhart's, Miss.....	180	Onondaga, N. Y. (new wells at Syracuse).....	35
St. Catharine's, Ont.....	120		
Zanesville, O.....	95		
Grand river, Ark.....	80		
Kanawha, W. Va.....	75		

At Saginaw, Mich., the proportion is 25 to 30 gallons to a bushel, and at Goderich, Canada, 22. The following description of the methods employed in treating the brines of Onondaga, N. Y., will serve as an illustration of those generally employed elsewhere, especially in Michigan, Ohio, and West Virginia. These brines contain about one half of one per cent. of sulphate of lime, a very small percentage of the chlorides of calcium and magnesium, mere traces of carbonic acid and oxide of iron, and from 16 to 17 per cent. of salt. It is the object of the manufacturers to remove all of the iron, a part of the sulphate of lime, and as much as possible of the chlorides of lime and magnesium. The colorless and clear brine is first pumped into shallow vats, where it remains until the carbonic acid escapes and the iron is deposited as oxide. It is then either evaporated by the sun's heat for "solar salt," or by artificial heat for fine or boiled salt. The first process is conducted in wooden vats protected by movable covers, sheds with sectional movable roofs being generally used. The evaporation is conducted very slowly, and as a consequence the salt appears in very large crystals and is known as "coarse salt." The brine from which the iron has been separated is drawn into a lower set of vats, where it is left until crystals of salt appear on the surface. A considerable amount of sulphate of lime has meantime been deposited. The resulting satu-

rated brine, called "salt pickle," is drawn off from the precipitated gypsum into a third set of vats. Whenever a sufficient amount of salt crystals has accumulated, they are washed in fresh pickle and allowed to drain from perforated wooden troughs, and thence removed to the storehouse. Three crops are produced in a season, the middle crop being the best. This coarse salt is considered best for packing meats and fish, as it dissolves more slowly than fine salt and prevents the meats from being packed too closely. Boiled salt is produced by several methods, of which three are the most important, viz.: the kettle, the pan, and the steam processes. In the first, most frequently employed in this country, from 50 to 60 kettles, having a capacity of from 100 to 120 gallons each, are set in a row and heated by a common flue and fireplace. Two rows are attached to one chimney. The settling tanks and store rooms are arranged along the sides of the kettles, and the whole roofed over. The precipitation of the iron is sometimes hastened by the addition of a small quantity of milk of lime. The clear brine is then drawn into the kettles, when evaporation goes on rapidly and at a higher temperature; consequently a larger proportion of the sulphate of lime separates before saturation than in the solar process. The removal of this precipitate is effected by placing an iron pan upon the bottom of the kettle, provided with an upright handle. The motion of the boiling liquid causes the particles of solid matter to collect in the central portion of the bottom upon the pan. The pan is removed and emptied from time to time until crystals of salt appear, when it is not replaced. The salt which accumulates is well washed in the remaining pickle and placed in baskets suspended over the kettles, when after draining a few hours it is emptied into the store rooms. A state law in New York prescribes that the salt shall be stored two weeks; also that it shall be inspected before being stored, and again when ready for shipment. The pan process is used in this country to some extent, and largely in England. The brine is either saturated cold or in a pan called the "foreheater." It is then transferred to another pan and evaporated, either slowly or rapidly as a coarse or a fine salt is desired. If a very fine grain is desired, the pans are constantly stirred. The pans are of iron, set over flues, and vary in size from 60 to 20 ft. in length and 35 to 13 ft. in width, by 15 to 20 in. in depth. In these pans the evaporation is very rapid; the salt accumulates constantly, and requires to be withdrawn continually. In the steam process the brine freed from iron is drawn into the steam settlers, where it is brought to saturation. These are wooden cisterns about 100 ft. long, 8 ft. wide, and 6 ft. high. They are heated by several four-inch steam pipes, which pass through them from end to end. After the impurities have settled the brine is drawn into grainers, which are of about the same size as the settlers,

but only 12 to 15 in. deep; they are also heated by steam pipes. The salt forms very rapidly, and is lifted and drained and stored before inspection, as in the kettle process. The character of the salt, especially its fineness, depends less on the character of the brine than on the care and rapidity with which the evaporation has been conducted. The practice called "cutting the grain," *i. e.*, adding to the boiling brine traces of glue, resin, soap, &c., has been known and employed for generations; but its use is condemned by the best manufacturers, as it requires very great care to prevent the salt from being injured for dairy and other purposes for which fine salt is most used. Salt of the very finest quality is now manufactured at Onondaga, by the Ohio and Kanawha salt companies, and in Michigan.—*Uses and Statistics.* Salt is the only mineral substance universally employed as an article of food by man and the higher orders of animals. Besides its direct consumption as food, enormous quantities are needed for preserving meats and fish, much is consumed for agricultural purposes and given to cattle and sheep, and a very large amount is used in chemical operations, particularly in the manufacture of soda. This last process alone takes about 48,000 tons annually in France, and a single establishment near Glasgow has used 26,000 tons for the past 20 years. The proportionate consumption of salt in different countries is very variable. In the United States it is estimated at about 50 lbs. annually for each person, in Great Britain at 22, in France at 15 lbs. Animals and many plants will not thrive when totally deprived of salt, though too much acts as a poison. Certain plants which grow at the seaside depend upon it, and are also found inland in the neighborhood of salt mines and lakes. It is employed as a remedy for dyspepsia, and a spoonful of dry salt will sometimes check hæmorrhage of the lungs or hæmorrhage from other causes. In small doses it acts as a stimulant tonic, and in larger ones as a purgative and emetic. It has also been used with good effect in intermittent fever. It is a necessary stimulus in health, quickly passing into the blood and escaping by the kidneys. Its inordinate use induces plethora, increasing the weight and strength of the body. It is sometimes applied as a fomentation in sprains and bruises. Salt-water baths, natural or artificial, are considered stimulating and tonic. Salt is alluded to in many passages of the Bible. All sacrifices offered in the temple were seasoned with it; newborn children were rubbed with it; it is mentioned as one of the things most necessary to life; it is used as a symbol of perpetuity and incorruption, of hospitality (as it still is in the East), and finally of barrenness and sterility, as in sowing the site of a destroyed city with salt. From its necessity salt has in almost all countries been a favorite subject of taxation, and important political re-

sults have sometimes arisen from the extortions practised by the collectors, of which the histories of France and Hindostan furnish examples. In England the excise on salt has long been repealed. In the United States, the states most largely engaged in the manufacture of salt appoint an inspector whose duty is to inspect the salt and brand the packages as first or second quality, as it may have been carefully or carelessly prepared. To support this system of inspection a light tax is levied on all the salt produced. In Michigan the tax is three mills per bushel; in New York it is one cent a bushel, which however pays, in addition to inspectors' salary, the expenses incident to running the wells.—It would be impossible to gather trustworthy statistics of the consumption of salt throughout the world. In 1790 very little was produced in the United States, and 2,337,920 bushels were imported; in 1825 the value of the production was more than \$1,500,000, and the importation was 4,574,202 bushels; in 1850 the production was 9,763,840 bushels; in 1860, 12,717,193 bushels were produced and 14,094,227 bushels imported; in 1870 the production was 17,606,105 bushels. At present (1875), while our total production has fallen off to some extent, our imports have increased, particularly from Canada, and our total yearly consumption is probably not far from 30,000,000 bushels.

SALTA. I. A N. W. province of the Argentine Republic, bordering on Bolivia and the provinces of Jujuy, Santiago, Tucuman, and Catamarca; area, 50,000 sq. m.; pop. in 1869, 85,959. It is traversed in almost every direction by spurs of the Andes, the flattened crests of which form in the west and northwest a series of plateaus, some as high as 12,000 ft. above the sea, with peaks rising much higher. Among the numerous rivers are the Juramento, San Francisco, and Bermejo, the last forming the boundary with the Gran Chaco. The soil is fertile, and wheat, barley, maize, cotton, coca, coffee, yerba maté or Paraguay tea, and excellent wines are produced. The great forests yield many kinds of valuable wood. Gold, silver, copper, and iron are found, and porcelain clay is abundant. Wine, rum, sugar and molasses, dried and preserved fruits, and the wool and skins of the vicuña, llama, and alpaca are exported. Salta is divided into 21 departments. II. A city, capital of the province, in the low valley of Chicoana, between two mountain chains, about 820 m. N. W. of Buenos Ayres; pop. in 1869, 11,716. It is regularly laid out, with good streets and neat houses. The public schools were attended in 1869 by 2,885 pupils, of whom 1,231 were females. The climate here is less salubrious than almost anywhere else in the province.—This city was founded in 1582 by Abren, under the name of San Clemente de la Nueva Sevilla, in the valley of Siancas; in 1584 it was transferred to its present site, and at first called San Felipe de Lerma.

SALTILLO, a city of Mexico, capital of the state of Coahuila, on the Rio Tigre, 435 m. N. by W. of the city of Mexico; pop. about 15,000. It is well built, but the only edifices worthy of mention are the government house and the parish church. Some silver and gold mines were formerly worked in the vicinity, but none of importance are now in operation. The manufactures comprise cotton stuffs, and *zarapes* much prized for their fineness and brilliant colors. There is an annual fair lasting eight days, largely attended from all parts of the state.—Saltillo was founded in 1586, and incorporated as a city with the name of Leone Vicario, by decree of Nov. 5, 1827. Near it was fought the battle of Buena Vista, Feb. 22 and 23, 1847. (See BUENA VISTA.)

SALT LAKE, a N. county of Utah, bordering on Great Salt lake, and intersected by Jordan river; area, 1,200 sq. m.; pop. in 1870, 18,337. The Wahsatch mountains cross the E. part; the W. portion descends toward the valley of the lake. Along the base of the mountains the soil is productive when irrigated. There are four mining districts, producing gold, silver, and lead in 1874 to the value of more than \$4,000,000. There are smelting works, stamp mills, flouring mills, saw mills, breweries, tanneries, and various manufactories. The county has several railroads. The chief productions in 1870 were 26,838 bushels

of wheat, 6,838 of Indian corn, 4,584 of oats, 4,413 of barley, 16,216 of potatoes, 4,285 lbs. of wool, 16,207 of butter, and 1,172 tons of hay. There were (on farms) 455 horses, 611 milch cows, 1,058 other cattle, 3,184 sheep, and 243 swine. Capital, Salt Lake City.

SALT LAKE CITY, a city, capital of Utah territory and of Salt Lake co., situated at the W. base of a spur of the Wahsatch mountains, 4,320 ft. above the level of the sea, about 12 m. from the S. E. extremity of the Great Salt lake, 2 m. E. of the river Jordan, and 600 m. E. by N. of San Francisco; lat. 40° 46' N., lon. 112° 6' W.; pop. in 1860, 8,236; in 1870, 12,854, of whom 5,250 were foreigners; in 1875, about 20,000, of whom about one third are gentiles and apostate Mormons. It is connected with the Union and Central Pacific railroads at Ogden, 37 m. N., by the Utah Central railroad. The Utah Southern railroad is completed to York, 78 m. S., and the Utah Western 25 m. W. Camp Douglas, a United States military post, is about 3 m. distant. Great care was displayed in selecting the site and in laying out the city. The streets are 128 ft. wide, and cross each other at right angles. There are 260 blocks, each one eighth of a mile square and containing 10 acres. Each block is divided into 8 lots, 10 by 20 rods, and containing 1½ acre. Several of the blocks have been cut by cross streets laid out since the

Salt Lake City, showing the Tabernacle.

founding of the city. Shade trees and ditches filled with running water, brought from City creek for the purpose of irrigation, line both sides of every street, while almost every lot has an orchard of pear, apricot, plum, peach, and apple trees. The city is divided into 20

wards, nearly every one of which has a public square. The dwellings and business structures are built principally of adobe. The former are generally small and of one story, with separate entrances where the proprietor has a plurality of wives. Among the public build-

ings are the city hall, costing \$70,000, used as the territorial capitol; the tabernacle, capable of seating about 15,000 persons, covered by a self-supporting roof; and the Mormon temple, in course of construction, estimated to cost \$10,000,000. The theatre is very large. The government is vested in a mayor and common council, but they are really controlled by the president of the Mormon church. Recently 5 m. of street railroad have been built and gas works have been put in operation. The laying of about 5 m. of water pipes is in progress (1875). The city contains two national banks, a savings institution, and three private banks. There are no public schools, but many good private ones. The principal institutions of learning are the university of Deseret (Mormon), St. Mark's school (Episcopal), a Roman Catholic nunnery, and the Methodist and Presbyterian schools. There is a public library, under the auspices of the ladies of the city. Three daily (two Mormon and one gentile) and five weekly (two Scandinavian) newspapers and two monthly periodicals (devoted to religion and education) are published. A miners' hospital is supported mainly by the mining camp near the city. There are about 30 churches, of which all but 6 are Mormon. Salt Lake City was settled in 1847 by the Mormons, under the lead of Brigham Young.

SALTPETRE. See NITRATES.

SALTS. In the present state of chemical science a satisfactory definition of the term salt cannot be given. The older chemists regarded a salt as a product of the "union" of an acid with a base, as when (using the older notation, as well as atomic weights) nitric acid (NO_3) unites with potash (KO) to form nitrate of potash (KO, NO_3); and this definition is often used at the present time, but according to modern theory it is not strictly correct. To say that a salt is produced by the "action" of an acid on a base is correct as far as it goes, but salts are sometimes formed by the direct union of two elements, neither of which is an acid or a base. By the term base is meant a body composed of two or more elements (inorganic bases usually having only two), most frequently an oxide of a metal, which is capable of effecting a double decomposition with an acid, during which water and a salt are formed by the exchange of elements, as when oxide of silver is acted upon by nitric acid ($\text{Ag}_2\text{O} + 2\text{HNO}_3 = 2\text{AgNO}_3 + \text{H}_2\text{O}$), where the oxygen of the oxide of silver unites with the hydrogen of the nitric acid to form water, while the metallic basyle silver unites with the radical (NO_3) to form nitrate of silver. This is a different action from that formerly supposed to take place, that is, the direct union of the base and acid, without double decomposition; for instance, using the old notation and equivalent numbers, $\text{AgO} + \text{NO}_3 = \text{AgO}, \text{NO}_3$. That part of the base which unites with a portion of the acid to form the salt is usually called the basyle. In the formation of

nitrate of silver above described, the basyle Ag of the base Ag_2O displaces the hydrogen which in the nitric acid is united with the radical NO_3 . Lavoisier supposed that all true acids contained oxygen, and gave the name (meaning acid generator) to that element in accordance with that hypothesis. The term acid was applied to both the anhydrides and their compounds with water, which latter are now regarded as the only true acids. In course of time it was discovered that there were acids containing no oxygen, such as hydrochloric, hydriodic, and hydrobromic acids, which possessed all the other characteristics of Lavoisier's acids, as sourness to the taste and the power to redden vegetable blues. This led to the division into oxyacids and hydracids; but it was found that the constitution of common salt was simply binary, it being composed of the metallic basyle sodium united to the element chlorine, and having the formula NaCl . Berzelius then propounded the theory that a salt consisted of an electro-positive body united to an electro-negative body, each of which might be either simple or compound. When simple, as in common salt, they formed haloid salts, so named from their resemblance to common salt (Gr. $\alpha\lambda\varsigma$, sea salt), and consisted of an electro-positive metal united to an electro-negative radical or halogen. When these bodies were compound they formed amphide salts, and these amphide salts might contain oxygen in both base and acid, or they might contain sulphur in both; in one case being called oxy-salts, and in the other sulpho-salts. The haloid salts were strictly binary compounds, but the amphide salts were regarded as ternary. Davy and Dulong also introduced a theory by which the seeming difference between oxyacid and hydracid salts was reconciled. This was called the binary theory, and it regarded all hydrated acids as in reality salts, containing hydrogen in place of a metal, and acting the part of a basyle toward a single element or group of elements, and all salts as being built up on the type of chloride of sodium. Thus sulphuric acid, H_2SO_4 , may be regarded as a salt similar in constitution to potassic sulphate, K_2SO_4 , the only difference being the presence of the feeble basyle hydrogen in place of the powerful basyle potassium. By the action of sulphuric acid on zinc there is simply displacement of hydrogen by zinc ($\text{H}_2\text{SO}_4 + \text{Zn} = \text{ZnSO}_4 + 2\text{H}$), hydrogen being evolved in a gaseous state. According to the old ideas, using the old notation, sulphuric acid, $\text{H}_2\text{O}, \text{SO}_3$, acting on the zinc, caused electric polarization, by which the affinity of the metal for oxygen was so increased that it rapidly decomposed water, liberating the hydrogen, forming a base, ZnO , with the oxygen, and then uniting with the anhydride SO_3 , forming sulphate of zinc, ZnO, SO_3 . The binary theory, it will be observed, simplifies the reactions, at the same time that it admits of the agency of the electro-motive force; for in the composition of

sulphate of zinc, ZnSO_4 , the metal is regarded as an electro-positive basyle, while the body SO_4 is regarded as an electro-negative radical, composed of the anhydride of the acid plus oxygen, and called generically an oxion. When the oxygen is united to sulphur, as in sulphuric acid, the oxion is specifically called a sulphion, or sometimes an oxysulphion. In the case of sulphurous acid, instead of being a sulphion it is a sulphosion. When the radical contains nitrogen instead of sulphur, it is an oxion, which is specifically called a nitron or a nitrosion, according as it is a constituent of nitric or nitrous acid. The objections to the binary hypothesis are, that none of the compound radicals or oxions, SO_4 , NO_3 , or CO_3 , have ever been isolated; and it also appears improbable that a compound which is held together by such powerful attractions as in potash exist between potassium, the most highly electro-positive, and oxygen, the most highly electro-negative element, should be decomposed by the action of carbonic anhydride, CO_2 , parting with its oxygen, so that $\text{K}_2\text{O} + \text{CO}_2$ should become K_2CO_3 instead of $\text{K}_2\text{O} \cdot \text{CO}_2$. Chemists are now more inclined to regard a salt, when once formed, as a whole, and not as consisting of two distinct parts, although it is probable that during the act of combining the electro-chemical relations of the constituents are distinct and opposite. It is sometimes convenient, however, to regard salts as having the constitution of binary compounds, and as consisting of a basyle and a radical constantly held together by opposite electric polarities. It was formerly supposed that salts are formed only between acids and bases of the same class; that is, that both members must be oxides, sulphides, chlorides, &c.; and this was consistent with the ternary hypothesis, which regarded the salt as a combination of a compound base with an anhydride and not with its radical, as has been above illustrated. Upon this hypothesis it will be seen that sulphuret of potassium could not form a salt with sulphuric acid. It required decomposition to effect this, including the evolution of sulphuretted hydrogen gas, thus: $\text{K}_2\text{S} + \text{H}_2\text{SO}_4 = \text{K}_2\text{SO}_4 + \text{H}_2\text{S}$. But according to the binary theory a similar reaction takes place on the addition of sulphuric acid to oxide of potassium, water instead of sulphuretted hydrogen being formed: $\text{K}_2\text{O} + \text{H}_2\text{SO}_4 = \text{K}_2\text{SO}_4 + \text{H}_2\text{O}$.—There are three varieties of salts which depend upon the relative proportions of radical to basyle, or, in common language, of acid to base. They are called neutral or normal, acid, and basic or subsalts. 1. *Neutral Salts*. A salt is commonly said to be neutral when the characteristics of both acid and base have neutralized each other, and this condition is usually regarded as existing when the salt has neither the effects of acids nor alkalies upon certain vegetable colors. The blue color of litmus is changed to red by an acid, and again restored by an alkali, while a perfectly neutral

salt produces neither of these effects. The yellow of turmeric is turned brown by an alkali, and is restored by an acid. But there are some salts which are regarded as neutral in composition, or, to use a more appropriate term, normal, which have the power of changing vegetable blues to red, and *vice versa*. There are some acids (and they are all now regarded as salts of hydrogen) that contain only one atom of hydrogen which can be displaced by one atom of a monad metal. Such acids are said to be monobasic, and among them are hydrochloric, HCl , nitric, HNO_3 , and acetic, $\text{HC}_2\text{H}_3\text{O}_2$. When these acids unite with bases, they are capable of forming only monobasic salts, that is, salts containing one atom of basyle. Other acids contain two atoms of hydrogen, which may be replaced by two atoms of a monad metal like potassium, or one equivalent of a dyad like zinc. These acids are called dibasic, and among them are sulphuric, H_2SO_4 , and tartaric, $\text{H}_2\text{C}_4\text{H}_4\text{O}_6$. Other acids again contain three atoms of hydrogen, which may be replaced by three atoms of a monad metal, or one atom of a triad; and such acids are said to be tribasic, of which tribasic phosphoric acid, H_3PO_4 , and citric acid, $\text{H}_3\text{C}_6\text{H}_7\text{O}_7$, are examples. Acids and salts which contain more than one equivalent of basyle are said to be polybasic. In general it may be said that when all the atoms in the hydrogen basyle of the acid are, in the formation of the salt, replaced by an equivalent number of atoms of the metallic basyle, the salt as formed will be normal, or, in common language, neutral; although it must be remembered that some normal salts will change vegetable colors. 2. *Acid Salts*. When the atoms of the hydrogen basyle are only partially replaced by a metallic basyle, the salt so formed is an acid salt, the acid character of the hydrogen compound (acid or salt) not having been neutralized by an equivalent of metallic basyle. The formation of a true acid salt therefore requires a polybasic acid, for if the one basyle of hydrogen in an acid is replaced by one metallic basyle, the salt so formed will be normal. An example of an acid salt is bisulphate of potassium (hydric-potassic sulphate), KHSO_4 , where only half of the basyle hydrogen is displaced, and there is only one atom of potassium instead of the two which are required to replace the hydrogen in sulphuric acid, H_2SO_4 . Other examples are the organic salts, bitartrate of potassium (cream of tartar, hydric-potassic tartrate), $\text{KHC}_4\text{H}_4\text{O}_6$, and bicarbonate of potassium (hydric-potassic carbonate), KHCO_3 . The normal salts corresponding to these are: potassic sulphate, K_2SO_4 ; potassic tartrate, $\text{K}_2\text{C}_4\text{H}_4\text{O}_6$; and potassic carbonate, K_2CO_3 . 3. *Basic Salts*. These are such as contain a greater number of atoms of metallic basyle than there were atoms of hydrogen basyle in the acid. An example of such salts is basic mercuric sulphate (turpeth mineral), $\text{HgSO}_4 \cdot 2\text{HgO}$, which contains three atoms of mercury in

place of the two atoms of hydrogen that were contained in the sulphuric acid from which the salt was formed. The theory of the formation of basic salts is imperfect, and it will be observed that here there is not that complete replacement of basyle which exists in neutral and acid salts. The tendency to the formation of basic salts is limited to certain acids and bases. The monad basyles do not form basic salts. The dyad metals, such as copper, lead, and mercury, have a strong tendency to do so, while the triads, as antimony and bismuth, have a still stronger tendency. 4. *Double Salts*. In considering polybasic acids and salts, it was seen that one of the atoms of the hydrogen basyle of a dibasic acid might be replaced by an atom of a monad metallic basyle. Such an acid salt may be regarded as a true double salt of a metal and hydrogen. But a normal double salt may be formed by replacing one half of the hydrogen basyle with one monad metal, and the other half with another monad metal. Such are called double salts, of which Rochelle salt (tartrate of potash and soda), $\text{KNaC}_4\text{H}_4\text{O}_6 + 4\text{Aq}$, is an example. Most of the double salts have this constitution, but others have a different formation. A remarkable class of double salts was investigated by Graham. In many cases the water of crystallization may be expelled from a salt by the temperature of boiling water; in other cases all but one molecule will be thus expelled, which requires a considerably higher heat. It was found that this last molecule of water could be replaced by a molecule of certain anhydrous salts. The formation of a certain class of sulphates illustrates this action. All the sulphates of metals isomorphous with magnesium are capable of forming double salts of this character with some anhydrous sulphate not isomorphous with this class, as potassic sulphate. If magnesian sulphate, $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$, which parts with six of its molecules of water at 212° and crystallizes in right rhombic prisms, and potassic sulphate, K_2SO_4 , which crystallizes in six-sided prisms, or in four-sided right rhombic prisms, are separately dissolved in water in equivalent proportions and mingled while at a temperature a little above 212° , the solution will deposit on cooling a new double salt, $\text{MgSO}_4 \cdot \text{K}_2\text{SO}_4 + 6\text{H}_2\text{O}$, having the same crystalline form as magnesian sulphate, but containing six instead of seven molecules of water of crystallization, potassic sulphate occupying the place of the seventh molecule. This seventh molecule has been termed by Graham saline water. Another well known variety of double salts are the alums, of which common potash alum, $\text{K}_2\text{Cl}_2\text{SO}_4 + 24\text{H}_2\text{O}$ (or $\text{K}_2\text{SO}_4 \cdot \text{Al}_2(\text{SO}_4)_3 + 24\text{H}_2\text{O}$), is an example. (See ALUM.) Haloid salts unite with each other to form double salts, the most common of which are formed by the chlorides, iodides, and bromides of the less oxidizable metals, and the alkaline and earthy metals. Examples of such double haloid salts are the double chloride of potas-

sium and platinum, $2\text{KCl} \cdot \text{PtCl}_4$, and the double iodide of potassium and mercury, $2\text{KI} \cdot \text{HgI}_2$. There is a class of salts called oxychlorides, oxybromides, oxycyanides, &c., in which one molecule of the chloride, of the bromide, or of the cyanide is united with one or more molecules of the oxide of the same metal, as in Turner's yellow, $\text{PbCl}_2 \cdot 7\text{PbO}$.—When any acid is added to the solution of a salt the basyle of which is capable of forming a soluble salt with the radical of such added acid, a partial exchange between the basyle of the salt and the hydrogen basyle of the added acid is supposed to take place, probably in the proportion of the relative attractions of these basyles for each radical. But if the radical of the added acid is capable of forming an insoluble salt with the basyle of the salt, the latter will be entirely decomposed, and its radical appropriated by the radical of the added acid; for as fast as the basic sulphate is formed it is removed from the solution by precipitation, which necessitates a continual decomposition of the first salt: $\text{Ba}_2\text{NO}_3 + \text{H}_2\text{SO}_4 = \text{BaSO}_4 + 2\text{HNO}_3$. Similar reactions take place on adding a base to a saline solution. If both bases and the salts which they form with the radical of the salt are soluble, the solution will remain clear; but if the added base forms an insoluble salt with the radical of the salt, the latter will be decomposed, while the new salt will be precipitated; or if the base of the salt be insoluble while the added base is soluble, a soluble compound will be formed, and the base of the first salt will be precipitated. Most of the metallic salts, with the exception of those of the alkalis and the alkaline earths, are formed from bases which are insoluble in water; consequently the addition of a soluble base, as potash or soda, to such metallic salts causes the precipitation of the base or oxide, and upon this reaction depend many of the chemical tests for metallic substances. Oxide of zinc, or zinc white, although prepared for commerce by distilling zinc into chambers supplied with currents of air, may be formed by precipitation from solutions of its salts by an alkaline hydrate, for instance, from the sulphate by the action of potassic hydrate ($\text{ZnSO}_4 + \text{K}_2\text{O} = \text{ZnO} + \text{K}_2\text{SO}_4$), potassic sulphate being formed and remaining in solution. The nature of the double decomposition which takes place when two salts are brought together depends often upon the condition in which they are. For instance, if ammoniac sulphate and calcic carbonate are mixed together in a dry state and gently heated, decomposition takes place, and calcic sulphate and ammoniac carbonate are produced, the latter being expelled as a volatile product: $\text{CaCO}_3 + (\text{H}_4\text{N})_2\text{SO}_4 = (\text{H}_4\text{N})_2\text{CO}_3 + \text{CaSO}_4$. But if a solution of calcic sulphate and ammoniac carbonate are mixed, the effects will be reversed, and calcic carbonate and ammoniac sulphate will be formed, the former being precipitated, the latter held in solution.

SALTZBURG. See SALZBURG.

SALUTATION, words or signs of greeting.

Among the ancient Greeks the verbal form was *Χαίρε* ("Rejoice"); among the ancient Romans, *Salve, vale* ("Be healthy, be strong"), and *Quid agis?* ("What doest thou?"). The French say: *Comment vous portez vous?* ("How do you carry yourself?"); the Germans: *Wie befinden Sie sich?* ("How do you find yourself?"); the Italians: *Come sta ella?* ("How do you stand?"); the modern Greeks: *Τί κάμνετε* ("What do you do?"); the Dutch: *Hoe vaart gij?* ("How do you fare?"); the Swedes: *Huru mår Ni?* ("How can you?"). One form of salutation in the fevered country of Egypt is: "How goes the perspiration? do you sweat copiously?" In China a common salutation is: "Have you eaten your rice? is your stomach in good order?" and a similar one prevails in Holland in *Smakelijk eten?* ("Have you relished your meal?"). One Polish form is: *Czyś wesół?* ("Art thou gay?"); and another: *Jak się masz?* ("How hast thou thyself?"). Two common salutations in Russia are: *Zdrastvui* ("Be well"), and the peculiar *Kak pozhivayete?* ("How do you live on?"). A common exclamation in Russia, *Boh s toboi*, which means literally "God with thee," has now rather the signification of "Devil take you." The salutations of the Arabs and Turks are marked by a religious character. Among those of the Arabs are: "May your morning be good;" "God grant thee his favors;" "If God will, thou art well;" "If God will, all the members of thy family enjoy good health." The Turks say: "Be under the care of God;" "My prayers are for thee;" "Forget me not in thy prayers;" and "Thy visits are as rare as fine days," an expression evidently of very ancient origin, as it is in no way applicable to their present country. The Persian salutations are marked by extravagant compliment, such as: "Is thy exalted high condition good?" "Peace be upon thee;" "I make prayers for thy greatness;" "May thy shadow not be removed from our head;" and "May thy shadow never be less." An old English salutation in polite society was: "Save you, sir," evidently an abbreviation of "God save you, sir," just as "Good bye" is a contraction of "God be with you."—Of the many different methods of salutation, the custom of shaking hands is the one most common among civilized nations, though probably it comes from the remotest barbarism, when two men meeting gave each other their weapon hands as a security against treachery or sudden attack. On the European continent it is usual for men who are intimate friends to kiss one another; but this custom prevails in England and America only among women. In the greatest portion of Germany it is an act of politeness to kiss the hand of a lady; but this privilege is allowed in Italy only to near relatives, while in Russia it is extended to kissing the forehead. In the East and among the Slavic nations the salutations

partake of the character of self-abasement. The custom of throwing one's self upon the ground and kissing the feet of the monarch prevailed among the Persians. In China, an inferior upon horseback meeting a superior dismounts and waits till the latter has passed by. In Japan the inferior removes his sandals when meeting his superior, crosses his hands by placing the right hand in the left sleeve, and then suffering both to fall slowly on his knee, passes the other with a slow and rocking motion of the body, crying out: *Augh! augh!* ("Do not hurt me!"). In Siam, when the inferior throws himself upon the ground before his superior, the latter sends one of his dependants to examine whether the former has been eating anything or carries with him any smell at all offensive. If such be the case, he is immediately kicked out without ceremony; but if not, the attendant raises him up. In Ceylon the inferior on meeting a superior throws himself on the ground, repeating the name and dignity of the latter, who appears to take scarcely any notice of the prostrate form which he passes. In some countries the salutations are often made by the contact of other parts of the body besides the hands and the lips. In the Society and Friendly islands, two persons on meeting salute by rubbing the ends of their noses together, and the salutation is returned by each taking the hand of the other and rubbing it upon his own nose and mouth. The Moors of Morocco ride at full speed toward a stranger as if they intended to run him down, and as soon as they have approached near they stop suddenly and fire a pistol over his head. In one of the Pelew islands the inhabitants grasp either the hand or the foot of the one they wish to salute, and rub their faces against it. In Burmah, in order to kiss, they apply the mouth and nose closely to the person's cheek and draw in the breath strongly as if smelling a delightful perfume; hence, instead of saying: "Give me a kiss," they say: "Give me a smell." The Arab salutations are very ceremonious. If persons of distinction meet, they embrace several times, kiss each other's cheek, inquire several times about the health of each other, and also kiss their own hands. The Arabian dwellers in the desert shake hands six or eight times, and in Yemen persons of rank permit their fingers to be kissed after a long refusal. In Turkey it is the custom to cross the hands upon the breast and bow to the person saluted. Military salutations consist in the touching of the hat or cap, the lowering of swords or of colors, the presenting of arms, or the firing of cannon. Naval salutes are also made by the discharge of cannon, by the lowering or raising of the flag, and by the cheering of the sailors.

SALUZZO (Fr. *Saluces*), a town of Piedmont, Italy, capital of a circle in the province of Coni, 30 m. S. S. W. of Turin; pop. about 16,000. It contains a cathedral, a gymnasium, and a statue of Silvio Pellico, who was born here.

The old castle, where Griseldis is said to have been imprisoned, has been converted into a penitentiary. Wine, grain, cattle, and ice are dealt in, and there are silk looms, tanneries, and hat manufactories. In the middle ages Saluzzo formed a margraviate, which in the latter part of the 14th century became dependent upon Savoy. In the 16th century its possession was disputed by France and Savoy, but in 1601 Henry IV. gave it up to the latter, receiving a compensation in other territories.

SALVADOR, Joseph, a French historian of Spanish-Jewish extraction, born in Montpellier in 1796. He studied medicine, but did not practise. His principal works are: *Loi de Moïse, ou Système religieux et politique des Hébreux* (1822), a prelude to the *Histoire des institutions de Moïse et du peuple hébreu* (3 vols., 1828); *Jésus-Christ et sa doctrine* (2 vols., 1838); *Histoire de la domination romaine en Judée et de la ruine de Jérusalem* (2 vols., 1846); and *Paris, Rome, Jérusalem, ou la question religieuse au XIX^e siècle* (2 vols., 1859).

SALVAGE, in admiralty, and generally in the law merchant, the compensation earned by persons who voluntarily assist in saving a ship or her cargo from a maritime peril. This compensation is not a mere payment on the principle of a *quantum meruit*, or a remuneration *pro opere et labore*, but a reward for bravely encountering the perils of the seas, given in order that the general interests of navigation and the commerce of the country may be advanced. As to the amount of salvage which shall be decreed, or the proportion in which it shall be given to salvors, there is no fixed rule or practice in admiralty. In respect to derelict or abandoned property, the ancient rule gave one half to the salvor; but now the position seems to be well established that the reward in derelict cases should be governed by the same principles as in other salvage cases, namely, that it shall depend upon the danger to property, value, risk of life, skill, labor, and the duration of the service. The court has no power to decree salvage for saving life merely; but if the saving of life can be connected with the saving of property, then the court will take notice of it. Nevertheless, efforts to save life do not command a compensation so much higher than is given for the saving of property as might perhaps be expected. The reason is, that it is not a deviation when the vessel goes out of her way to save life, and therefore the insurance is not forfeited; whereas it is a deviation to vary from the course for the purpose of saving property, and compensation must be made for forfeiture of the insurance.—It is a cardinal rule that salvage services can be performed only by persons not bound by their legal duty to render them. A crew cannot claim as salvors of their own ship or cargo, not only because it is their duty to save her if possible, but because it would be most unwise to tempt them to let the ship and cargo get into

a position of extreme danger, that then, by extreme exertions, they might claim salvage. But to this general rule there is the exception that, where the contract of the seamen is at an end, or the service rendered is so entirely out of the line of their ordinary duty that it may be considered as not done under their contract, there may be a valid claim for compensation. A crew are bound to suppress a mutiny on board their own ship at all events and at every hazard, and cannot claim salvage therefor. If the crew of one ship suppress mutiny or revolt in another, or retake a captured ship from mutineers or revolters, this may well found a claim for salvage. If part of the crew leave their ship and go to save another, and thereby acquire a claim for salvage, the rest who remain share in the claim, yet not equally, for their right rests mainly on the increased labor, exposure, or peril which falls on them. For ordinary services rendered to the ship in time of distress, no salvage is due to a passenger; but in his case, as in that of a seaman, extraordinary services may give a salvage claim. A pilot, like a passenger, may become a salvor when his peculiar relation to the ship is dissolved; but most of our state pilotage laws make it part of the duty of a pilot to assist vessels in distress, and either give the rate of extra compensation to be awarded, or point out the tribunal which shall determine the amount due. Extra services are, therefore, generally considered in this country as such, and not as salvage services. The officers and crews of our national vessels are so far bound to rescue a vessel from mutineers that they are not entitled to claim any compensation in such a case, unless perhaps when they incur great personal danger, and use great exertions in the performance of the service. For an ordinary salvage service they are entitled to compensation. As a general rule, none can claim salvage who do not directly participate and aid in the salvage services, or at least promote those services by doing the work of those who render them. But an exception, and a liberal one, is usually made in favor of the owners of the saving vessel, who are not only entitled to claim compensation for stores and other supplies and outlays, but salvage compensation in addition.—A salvage service is possible when the peril encountered is something distinctly beyond ordinary danger, something which exposes the property to destruction unless extraordinary assistance be rendered. But if the master can, by proper use of the means in his possession, save the property, the law presumes that he will, and that the salvor's interference was unnecessary; yet even if the master could save the ship, the salvors may show that he would not have done so. It is not necessary that the distress should be actual or immediate, or that the danger should be imminent and absolute; it will be sufficient if, at the time the assistance is rendered, the ship has encountered any damage or

misfortune which might possibly expose her to destruction if the services were not rendered. That the property must be actually saved, and saved by those claiming to be salvors, in order to lay the foundation for salvage claims in admiralty, is quite certain; but if the party encounters the danger, and does all he can to save the vessel, and his services tend in some degree to preserve the vessel, compensation will be awarded to him, although the vessel is mainly preserved by other means. It is equally a salvage service, whether the service be rendered at sea or where the vessel is wrecked on the coast, and whether it be performed by seamen or landsmen. If a vessel at sea is short-handed by reason of sickness, and is navigated into port by a part of the crew of another vessel, that is to be treated as a salvage service. So compensation has been granted for keeping near a vessel in distress at the earnest request of her master and crew, although but little aid was rendered.—Salvage is generally decreed on all the property saved, whether ship, cargo, or freight. It is allowed on public property, and all goods of the government pay the same rate as if they were owned by individuals. The general rule is that our courts have jurisdiction over all property, to whomsoever it belongs, which comes within their territorial jurisdiction; but vessels of war belonging to a foreign neutral power cannot be arrested in our ports into which they have lawfully come, and the same is true of a private armed vessel sailing under a commission from a foreign government. The private property of a foreign sovereign, or the prize property which a vessel of war brings into our ports, comes within the general rule, and not within the exception.—If assistance is rendered to a vessel under circumstances which would generally constitute it a salvage service, it may yet not be such; as where the service is rendered under a custom to give assistance gratuitously in similar instances, or where the aid is given under a special contract. If two vessels sail as consorts and under an agreement to assist each other, neither can claim salvage for assistance rendered to the other. Even when vessels sailing together are not consorts, nor owned by the same party, it is possible that there may be a usage of mutual help which would defeat a claim of salvage. Thus it is said that if a steamer be stranded on a sand bank in the Mississippi, and another steamer draws her off, usage prohibits any salvage compensation. But a custom of one port that vessels shall assist each other gratuitously is not binding on vessels of other ports rendering assistance to vessels of the port where the custom exists. If, at the time of the service, the salvors make a bargain with the owners of the property in peril, or their servants, as to the amount of salvage, this is enforced by the court against the owners only so far as it seems equitable and conformable to the merits of the case.—Any gross misconduct on the part of the

salvors, and especially any embezzlement of the property saved, forfeits their whole claim. The responsibility of the salvors, respecting the preservation and protection of the property, continues as long as the property is subject to the decree of the court. Salvors in possession have a qualified property in the thing saved, whether ship or cargo, or both, and they cannot be divested of this interest until it is taken from them by adjudication. Yet it is not necessary that they should remain in actual possession, in order to maintain their rights or preserve their qualified property; nor should they do so to the detriment of the property or the inconvenience of the master and crew.—Military salvage is that which is earned by rescuing vessels or cargoes from pirates or the public enemy. In cases of recapture, it follows as an incident of prize. The amount of salvage is fixed by statute for most of these cases, and when not so determined must be governed by the general principles of law.

SALVANDY, Narcisse Achille de, count, a French author, born at Condom, June 11, 1795, died in Normandy, Dec. 15, 1856. He enlisted in the imperial guard in 1813, was wounded at the battle of Brienne, and rose to the rank of adjutant major. In 1819-'21 he was master of requests. In 1824 he became connected with the *Journal des Débats*, and assisted Chateaubriand in combating the ultra royalists. In 1835 he was admitted to the academy. He was minister of public instruction in 1837-'9, and again in 1845. In 1843 he was made count and ambassador to Turin. After the *coup d'état* of Dec. 2, 1851, he withdrew to private life. He published *Alonzo, ou l'Espagne* (4 vols., Paris, 1823-'4); *Isaor, ou le Barde chrétien* (1824); and *Histoire de Pologne avant et sous le roi Jean Sobieski* (3 vols., 1827-'9).

SALVATOR ROSA. See ROSA.

SALVI, Giambattista. See SASSOFERRATO.

SALVIA. See SAGE.

SALVINI, Tommaso, an Italian actor, born in Milan, Jan. 1, 1833. At the age of 14 he became a pupil of the actor Gustavo Modena, made his first appearance a year later at the royal theatre in Naples, and subsequently accompanied Ristori in a theatrical tour through Italy. In 1849 he served as a volunteer under Avezzana, and afterward went to Paris, where he appeared in the characters of Orosmane in *Zaire*, Oreste, Saul, and Othello. On his return to Italy, Giacometti wrote for him the drama *La morte civile*. In 1865 he took part in the celebration at Florence of Dante's 600th birthday, reciting portions of the *Divina Commedia*. After another tour through Italy, he played in the chief cities of Spain and Portugal, and in April, 1871, went to South America, filling engagements in Montevideo, Buenos Ayres, and Rio de Janeiro, whence he returned to Italy. In 1873 he came to the United States, making his first appearance Sept. 16, as Othello, in the academy of music in New York, and gave 128 representations, including

Hamlet, the Gladiator, Samson, David Garrick, &c., in the leading American cities, and 28 in Havana, closing with Othello in New York in June, 1874. In 1875 he gave a successful series of performances in London.

SALZACH, or *Salza*. See **SALZBURG**.

SALZBURG. **I.** A duchy and crownland of Austria, bordering on Upper Austria, Styria, Carinthia, Tyrol, and Bavaria; area, 2,767 sq. m.; pop. at the end of 1869, 153,159. It is almost entirely surrounded by Alpine mountains. The Noric Alps extend through the country under various names, and the Gross-Glockner, their highest peak (12,776 ft.), is on the southern border, on the confines of Carinthia and Tyrol. The principal river is the Salzach, an affluent of the Inn, which rises in the S. W. corner, flows E. by N. to the centre of the duchy, and then N. N. W. to the Bavarian frontier. Among other rivers are the Enns and the Mur. The Zeller lake is the largest of the numerous Alpine lakes. The Krimler Ache waterfall is the most imposing in Austria. The principal mineral springs are at Gastein. Hallein, on the Salzach, is noted for its production of salt. The climate is generally cold, but not unhealthful, although there are many cretins in the high mountain region. Salt, copper, iron, lead, and arsenic abound, but the production of precious metals has fallen off. Cattle and horses are plentiful. Hosiery is the principal article of manufacture.—The country formed a part of the Roman province of Noricum, and after the fall of the empire rapidly recovered from the invasion of the barbarians. The duchy owes its origin to a bishopric founded in the 6th century by the Bavarian duke Theodo, with St. Rupert as first incumbent. Considerably enlarged, it was raised in 798 to an archiepiscopal see. The archbishop Gebhard became in 1088 legate for all Germany. His successors were perpetually involved in hostilities with the emperors and other princes and their own subjects. In 1498 Archbishop Leonard II. expelled the Jews and all his enemies among the nobles. In 1731–'2 all the Protestants, numbering about 30,000, were expelled by Archbishop Leopold Anthony for refusing to abjure their faith. Most of them found a hospitable refuge in East Prussia, offered to them by Frederick William I. Previous to its secularization in 1802, the see had a population of nearly 200,000. It was then ceded with other territory to the grand duke Ferdinand of Tuscany, and in 1805 to Austria. By the peace of 1809 it was ceded to Napoleon, who in 1810 gave it to Bavaria. Most of the territory was restored to Austria in 1814. In 1849 it became a separate crownland, and the first Salzburg diet was held in 1861. **II.** A city (anc. *Juvavia* or *Juvavum*), capital of the duchy, on the Salzach, 156 m. W. by S. of Vienna; pop. in 1870, 20,336. The situation is one of the finest in Europe. On the left bank of the Salzach is the Mönchsberg, and on the right bank the Kapuzinerberg, and the

town stands within the narrow defile formed by these hills, the outlying houses in the suburbs being built around rocks. The Salzach is spanned by three bridges. The streets are generally crooked, but there are several large squares and many handsome edifices. The principal churches are the fine cathedral, St. Peter's with Haydn's monument, St. Sebastian's with that of Paracelsus, St. Margaret's, restored in 1864, and the university church; and there are 15 other places of worship, including one for Protestants, opened in 1865. The monument of Mozart, who was born here, adjoins a high fountain on a principal square; and that of the archbishop Sigismund stands near the new gate (*Neuthor*). The university, founded in 1620, was suppressed early in the present century. An archbishop resides here, and there is a theological faculty and seminary for priests. In 1818 Salzburg was partly destroyed by fire, but was soon rebuilt. The emperor of Austria and the king of Prussia met here, Aug. 19, 1865, to ratify the convention of Gastein with regard to Schleswig-Holstein and Lauenburg. In 1874 Roman golden ear rings and other relics, including a marble coffin and a milestone of the time of Septimius Severus, were dug up in the city.

SAMANA. See **SANTO DOMINGO**.

SAMARA. See **PHILIPPINE ISLANDS**.

SAMARA. **I.** An E. government of European Russia, bordering on Ufa, Orenburg, Astrakhan, Saratov, and Simbirsk; area, 60,197 sq. m.; pop. in 1870, 1,837,081. The river Volga forms its W. frontier, and it is drained by the Samara, the Irgis, and other affluents of the Volga. The government was erected in 1850.

II. A city, capital of the government, at the confluence of the Samara with the Volga, 518 m. E. S. E. of Moscow; pop. in 1867, 34,494. It is the seat of a Greek bishop, is the chief corn market on the Volga, and has a growing trade in cattle, sheep, fish, caviare, skins, leather, and tallow. Along the Volga are many German and Swiss settlements.

SAMARANG. **I.** A province on the N. coast of Java; area, about 1,500 sq. m.; pop. in 1868, 1,001,252, of whom 5,162 were Europeans. It has numerous rivers, navigable for boats within the limits of the tide. The S. W. boundary is formed by a volcanic range of mountains which rises to the height of 9,000 and 10,000 ft. Along the sea there is a low alluvial plain. The country is very fertile, producing coffee, sugar, cotton, indigo, tobacco, pepper, and rice, of which large quantities are exported. **II.** A city, capital of the province, near the mouth of the river Samarang, about 250 m. E. by S. of Batavia; pop. about 30,000. It is an important commercial centre; there are cotton and leather manufactories; and a railway built in 1868 connects it with the rich agricultural region of the interior.

SAMARCAND (anc. *Maracanda*), a walled city of central Asia, belonging to Russia, formerly in the khanate and 135 m. E. of the city of

Bokhara, about lat. 39° 40' N., lon. 67° 18' E.; pop. from 15,000 to 20,000, mostly Uzbeks. It is situated in the fertile valley of the Zerafshan, 4 m. S. of that river, and in site and surroundings is said to be the most beautiful city in Turkistan; but much of its interior aspect is miserable. It contains a citadel and a large public market place, and a considerable trade is carried on at the bazaars, especially in the products of leather manufacture. Samarcand stands on higher ground than Bokhara, and before the Russian conquest was a summer resort of the emir in consequence of its lower temperature. The principal buildings are the summer palace of Tamerlane, his mosque surmounted by a melon-shaped dome, his reception hall containing the celebrated *köktash*, or blue stone, on which his throne was placed, and his sepulchre in a domed chapel without the city. Three sacred colleges (*medreses*) border the market place.—Samarcand was known to the Chinese as Tshin prior to the times of Alexander the Great. In classical geography it appears as Maracanda, the capital of Sogdiana. Alexander, who occupied it in 328 B. C., slew there his friend Clitus. The Nestorian Christians early made their way thither, and according to Col. H. Yule the see of a Christian bishop was established there early in the 6th century. About the time of the Arab invasion of Turkistan, the city and territory appear to have been ruled by a Turkish prince bearing the title of *tarkhan*. About 710 they fell under the dominion of the Arabs, and subsequently became subject to the dynasty of the Samanides, after the fall of which the city was ruled by various contending chieftains until its capture and the destruction of its fortress by Genghis Khan about 1220. A century and a half later it reappears prominently in history as the capital of Tamerlane, who made it the most famous, luxurious, and magnificent city of central Asia, adorned with imperial palaces and surrounded by extensive and splendid gardens. Vámbéry declares that the reputed magnificence of the buildings is fully borne out by the existing ruins. At that time the city contained 150,000 inhabitants, and was not only the centre of important manufactures and a vast emporium of trade, but also a prominent seat of Mohammedan learning. It maintained 40 colleges, one of which accommodated 1,000 students, and is still even in ruins remarkable for the handsome specimens of fine earth mosaic work in its walls. With the fall of the Timour dynasty Samarcand began permanently to decline, and it is now politically and commercially inferior to Bokhara. It was captured by the Russians in May, 1868, in the course of the war against Bokhara, and was ceded to Russia a few months later. A Russian garrison occupies the citadel, and Samarcand is now the capital of the military district of Zerafshan in the Russian province of Turkistan.

SAMARIA (Heb. *Shomeron*), an ancient city in middle Palestine, in the tribe of Ephraim, so

called after the hill of Shomeron, upon which it was founded about 925 B. C. by Omri, the sixth king of Israel. Omri made Samaria the royal residence, and it remained so until the captivity of the ten tribes. In 721 it was conquered by the Assyrian king Shalmaneser, and peopled with colonists from the Assyrian provinces. In 109 it was besieged, conquered, and razed to the ground by the Asmonean John Hyrcanus; but it must have been soon rebuilt, for in 104 it is mentioned as a town belonging to the Jewish territory. Augustus gave it to Herod the Great, who embellished it with a temple of Augustus and other buildings, strongly fortified it, and called it, in honor of the emperor, Sebaste (the Greek word corresponding to Augusta). The ancient name of the city was also retained, and is mentioned in the New Testament. The later history of the town is unknown, but a little village, Sebus-tieh, with some ruins, still exists on its site, and contains about 60 houses, substantially built of old materials, which exhibit here and there traces of the splendor of ancient Sebaste. Under the Romans a whole division of Palestine was also called Samaria, forming a separate province between Judea and Galilee.

SAMARITANS (Heb. *Shomeronim*, later *Kuthim*, Cuthæans), a people commonly supposed to have sprung, after the conquest of Samaria by Shalmaneser, from the mixture of the natives with foreign colonists from Babylon, Cuthah, Ava, Hamath, and Sepharvaim. As they were a mixed race, their religion was also mixed. More strictly following the Biblical narrative (2 Kings xvii.), Hengstenberg (who has been followed by Hävernick, Robinson, and others) argues that the entire Hebrew population of Samaria had been carried away, that the Samaritan people were wholly of heathen origin, and that the Israelitish worship was established when the colonists obtained from the Assyrian king an Israelite priest, in order to appease the supposed wrath of the national deity by restoring his worship. After the return of the Jews from the Babylonish captivity the Samaritans asked permission to participate in the restoration of the temple, but it was refused; and from this event (535 B. C.) dates the hostility between Jews and Samaritans. It increased in the latter part of the 5th century B. C., when the Persian governor Sanballat erected for the Samaritans on Mt. Gerizim, near Shechem, a temple of Jehovah, and gave them an independent high priesthood, which was bestowed by him upon his son-in-law Manasses, son of the Jewish high priest. Alexander the Great took a Samaritan army with him to Egypt, and many settled in the Thebaid. The colony received reinforcements from Samaria under Ptolemy Soter, and again at the time of John Hyrcanus, who destroyed that city, crushing the power of the Samaritans in Palestine. Remnants of the Egyptian colony are extant, and form a congregation at Cairo. In Palestine a few families are found

at Nablus, the ancient Shechem. Attempts have been made by Europeans to maintain a correspondence with the remnants of the Samaritans; as by Joseph Scaliger in the latter part of the 16th century, by several learned men in England in 1675, by the Ethiopic scholar Ludolf in 1684, and by Sylvestre de Sacy and others. All the letters of the Samaritans written on these occasions, with an essay on their history by De Sacy, may be found in *Notices et extraits des manuscrits de la bibliothèque du roi* (vol. xii., Paris, 1831). The best modern accounts of them are by the Americans Fisk ("Missionary Herald," 1824) and Robinson ("Biblical Researches," vol. iii.), and Guérin, *Description géographique, historique et archéologique de la Palestine, deuxième part, Samarie* (Paris, 1875).—The Samaritans recognize, of the books of the Old Testament, only the Pentateuch, rejecting all the rest of the Hebrew canon, together with the traditions of the Pharisees. Of the Pentateuch they have a translation in the Samaritan language, an Aramaean dialect, mixed with many Hebrew forms and words. In the same language are written their rituals and liturgies, and a number of psalms. (See Gesenius, *Carmina Samaritana*, in his *Anecdota Orientalia*, Leipsic, 1824.) They have also preserved an ancient Hebrew text of the Pentateuch, first described in Europe by Morinus in 1628 (after a copy bought by Pietro della Valle from the Samaritans in Damascus), and shortly after published in the Paris polyglot. It is of considerable importance, agreeing with the Septuagint in a vast number of places where that differs from the ordinary Hebrew text, though Gesenius has proved the studied design of the Samaritan revisers to conform their text to their peculiar anti-Jewish tenets, and the blundering way in which they executed their emendations. It is written in the old Hebrew characters, closely resembling the Phœnician. When the Arabic became the conversational language of the Samaritans, all their works were translated into it; and they have also in Arabic a so-called book of Joshua. (See JOSHUA.) We know from the New Testament that the Samaritans, like the Jews, were waiting for a Messiah, who in their later writings is called Hashshahab or Hattahab, *i. e.*, the Restorer. Their later writings also prove their belief in spirits and angels, in the immortality of the soul, and in the resurrection. They observe the Mosaic ordinances concerning the sabbath, and many other prescriptions of the Mosaic law.—See Juynboll, *Commentarii Historiæ Gentis Samaritanæ* (Leyden, 1846), and John W. Nutt, "Fragments of a Samaritan Targum," edited from a Bodleian manuscript, and containing a sketch of Samaritan history (London, 1874).

SAME, or **SAMOS**. See CEPHALONIA.

SAMNIUM, a division of ancient Italy, bounded N. W. by the territories of the Marsi, Peligni, and Marrucini, N. E. by that of the Frentani, E. by Apulia, S. by Lucania, and S.

W. and W. by Campania and Latium, and comprising most of the present provinces of Campobasso and Benevento, with some surrounding districts. The country is occupied by some of the highest mountain groups of the central Apennines. It was watered by the upper courses of the Sagrus (now Sangro), Tifernus (Biferno), Frento (Fortore), Aufidus (Ofanto), and Volturnus (Volturno), all of which, except the last, flow into the Adriatic. The principal places were Beneventum (Benevento), Caudium (Airola)—near which were the narrow passes called Caudine Forks, where a defeated Roman army passed under the yoke in 321 B. C.—Aufidena (Alfidenza), Bovianum (Bojano), and Æsernia (Isernia). The Samnites were a warlike people of the Sabine race, who conquered the country from the Opicans before the foundation of Rome. With this republic they waged a series of wars, in which Valerius Corvus, Curius Dentatus, Papirius Cursor, Fabius Maximus Rullianus, and other Romans shine as heroes amid frequent calamities and humiliating defeats of their countrymen (343–290 B. C.). They were finally subdued, joined Pyrrhus in 280, but succumbed again, and in 216 took sides with Hannibal, but without any permanent result. They rose again together with other Italians in the social war (90), and were the last of the allies to yield. During the war of Sulla and Marius they tried to recover their independence; but their army was annihilated by Sulla in a battle at the Colline gate of Rome, and their country laid waste and distributed to Roman settlers, the inhabitants being sold into slavery (82).

SAMOAN ISLANDS, or **NAVIGATORS' ISLANDS**, a group in the S. Pacific, about 400 m. N. E. of the Feejee islands, between lat. 13° 27' and 14° 18' S., and lon. 169° 28' and 172° 48' W. They include nine inhabited islands, viz.: Manua, Olosinga, Ofu, Anuu, Tutuila, Upolu, Manono, Apolima, and Savaii; area, according to recent authorities, which reduce the figures of Com. Wilkes's survey of 1839, about 1,125 sq. m.; pop. in 1869, 35,107. Besides these, there are at the E. end of Upolu four islets, Nuulua, Nutali, Taputapu, and Namoa, and between Manono and Apolima an isolated islet called Niulapo. All the islands and islets are of volcanic formation, though the latter are separated from the former by coral reefs. There are extinct volcanoes on most of the islands, and the natives have no traditions of eruptions from any of them; but in 1867 a submarine volcano burst out of the ocean between Manua and Olosinga, and for two weeks shot up jets of mud and dense columns of sand and stones to a height of 2,000 ft. It left no permanent protrusion above the bed of the sea, and it is said to be difficult now to obtain soundings on its site. Manua, the most easterly island of the group, which has an area of about 20 sq. m., rises like a dome to the height of 2,500 ft. Olosinga is a narrow ledge of rocks with a double coral reef around it, the outer shelf

50 to 60 ft. wide, and the inner in some places 140 ft. It contains but 6 sq. m.; Ofu, next to it, is somewhat larger. Tutuila is high and mountainous, with precipices rising from the ocean to a height of from 1,200 to upward of 2,300 ft. Its W. end, which is lower, is covered with luxuriant vegetation and is thickly settled. On its N. coast are many good ports, but the best is Pango-Pango or Pago-Pago on the S. side. It is completely landlocked, has an entrance clear of rocks, and water enough for the largest vessels. It is one of the safest and best harbors in the Pacific, and, being on the direct steamship route between America and Australia, must become in time an important port. The area of the island is about 50 sq. m., and it contains, together with Anuu, an islet off its E. extremity, 3,500 inhabitants. Upolu, the most important island of the group, has an area of about 335 sq. m., and in 1869 had 16,610 inhabitants. A range of broken hills occupies its middle, the sides of which, covered with luxuriant vegetation, slope to the sea. Apia, on the N. side, the chief town, has a population of about 300, of whom 100 are whites. It is the official residence of the various consuls, of the members of the London missionary society, and of the Roman Catholic bishop of Oceania. Almost all the business of the port is in the hands of Hamburg firms. The harbor of Apia is sheltered by a natural breakwater, and is second only to that of Pango-Pango. Manono, which is enclosed within the sea reef of Upolu, has an area of only 3 sq. m. Apolima, about a mile distant, 2 sq. m. in area, is a natural fortress. It is the crater of an extinct volcano, and is a ring of perpendicular cliffs, with a single opening on the N. side, through which only one boat at a time can pass to the basin within. A few miles distant is Savaii, the westernmost and largest island of the group, containing about 700 sq. m. and a population in 1869 of 12,670. Its interior, which has not been explored, is occupied by a mountain chain, in parts nearly 5,000 ft. high, sloping gradually to the sea, and leaving but a strip of alluvial land a few miles wide along the shores. It has little timber and no running streams, and its shores are rocky and precipitous, with few harbors. On the N. side the bay of Mataatu affords good anchorage. A series of wonderful caves in the island have been explored for $2\frac{1}{2}$ m., but not to their full extent.—The climate is very equable, the mercury seldom rising higher than 88° or falling lower than 70° . From observations made in 1872 at Malua in Upolu, the mean temperature for the year was $78^{\circ}33'$. The difference of temperature between sun and shade is seldom more than 7° . Rains are distributed evenly throughout the year, excepting in January, February, and March, when heavy rain storms with northern winds prevail; but destructive storms are rare. The soil is a rich vegetable mould, with a slight proportion of decomposed lava impregnated with iron. Excepting the

shore line, the mountains, and a lava field on the E. end of Savaii, there is little naked land on any of the group. The interior is covered with dense forests of tropical luxuriance, containing many varieties of valuable timber trees. Among the trees and fruits are the banian, two varieties of pandanus, several species of palms, the anauli, bamboo, rattan, breadfruit, cocoanut, wild orange, lemon, lime, banana, plantain, yam, taro, paper mulberry, tacca (from which arrowroot is made), pineapple, vi apple, guava, mango, and citron. Wild sugar cane grows abundantly, and there are two varieties of sea-island cotton, one of longer staple than the other. Tobacco is grown in small quantities, and some coffee is raised. The *ava* (*macropiper methysticum*), which grows in clusters from 6 to 10 ft. in height, is a species of pepper. From its dried root is made an intoxicating beverage, which when taken in small doses is a delightful soporific. There are no traces of native mammalia except a species of bat (*pteropus ruficollis*), which often measures 4 ft. from tip to tip of wings. Horses, cattle, and swine have been introduced. Poultry is plentiful, and pigeons abound. A bird called the tooth-billed pigeon (*didunculus strigerostris*), allied to the dodo, is found in the lonely parts of the mountains.—Among the Polynesian islands the inhabitants of the Samoan group rank in personal appearance second only to the Tongese. The men average about 5 ft. 10 in. in height, are erect and proud in bearing, and have straight and well rounded limbs; the women are generally slight in figure, symmetrical, and easy and graceful in their movements. The skin of both sexes is dark olive, but the chiefs and better families are much lighter. The nose is usually straight and not flattened like that of the Malay, and the mouth is large, with thick lips. In some the eyes are oblique. The hair is black and straight. Beards are not so common as among Europeans, yet many have heavy beards. Polygamy is customary, but two wives seldom live in the same house. They are generally cleanly in their habits and social in disposition. Women are considered the equals of men, and both sexes join in the family labors. Great ingenuity is displayed in the construction of their houses, which are built of the wood of the breadfruit tree, thatched with wild sugar cane or pandanus leaves. The ancient religion of the islanders acknowledged one great God, but they paid less worship to him than to some of their war gods. They had a god of earthquakes, a god who supported the earth, and gods of lightning, rain, and hurricanes, and also many inferior gods who watched over certain districts; and they had carved blocks of wood and stone, erected in memory of certain chiefs, whom they worshipped. All are now nominally Christians; there are schools and a church in every village, and the missionaries have unbounded influence. Nearly all the children seven years of age can read their own

language, and most of the adult population can read and write. The Bible has been translated and printed, and hymn books and other works are published at the missionary printing office. According to a census taken in 1869 by the representatives of the London missionary society, the population was divided denominationally as follows: Independents and Presbyterians, 27,021; Wesleyans, 5,082; Roman Catholics, 3,004.—The commerce of the islands is small. The exports are *coppa*, or the dried meat of the cocoanut, from which oil is made, and a small quantity of cotton. Of the former about 10,000 tons are shipped annually, mainly to Hamburg. The imports are general merchandise and provisions, and some lumber from California and Oregon. Nearly all the trade is controlled by the Hamburg house of Godeffroy and co., who have buildings at Apia and several cotton plantations in the vicinity. In 1873 105 vessels, of 25,198 tons, entered the port of Apia, of which 47 were German, 47 English, and 4 from the United States.—The Samoan islands were named by Bougainville, who visited them in 1768, the *archipel des navigateurs*, from the skill of the natives in using their canoes. In 1787 La Pérouse touched at these islands, and De Langle, the commander of one of his vessels, and 11 men were killed by the natives. The first missionaries landed in Savaii in 1830, from the Society islands, and in 1836 they were joined by others from England. The first Roman Catholic missionaries arrived in 1846. The islands were surveyed by Com. Wilkes in 1839. In 1872 Com. Meade visited the group, and, by arrangement with the native chiefs, took the harbor of Pango-Pango under the protection of the United States. In 1873 a special agent, Mr. A. B. Steinberger, was sent by President Grant to the islands, who reported that the chiefs were desirous that the whole group should be protected by the United States; but in 1875 a native king was elected, and Steinberger became his prime minister.

SAMOS (called by the Turks *Susam-Adassi*), an island of the Grecian archipelago, belonging to Turkey, separated from the coast of Asia Minor by the strait of Little Bosphorus, and from the island of Nicaria (anc. *Icaria*) by the Great Bosphorus; length, from E. to W., 27 m., greatest breadth 12 m.; area, 213 sq. m.; pop. about 15,000, nearly all Greeks. The chief town is Chora. There are several good harbors on the coast. The interior is traversed by two mountain ranges, one of which attains the height of 4,725 ft. in Mt. Kerkis (anc. *Cercetius*). Samos was anciently celebrated for its fertility. The olive and vine are cultivated, and grain, silk, cotton, wine, figs, and oil are exported. The minerals include marble, iron, lead, silver, and emery, but are not worked.—The original inhabitants are supposed to have been Carians and Leleges. The Samians planted several colonies on the shores of the Propontis and Ægean, and early in the

6th century B. C. their navy was the most powerful in the Grecian waters. The capital, Samos, near the site of the present town of Chora, was one of the finest cities in the Hellenic world. Polycrates, who usurped the government about 535 B. C., enriched it with a temple of Juno, artificial moles enclosing the harbor, an aqueduct hewn in solid rock to convey water to the town, and a fortified palace. After his death in 522 the island was subject to Persia for 43 years, when it was liberated by the victory over the fleet of Xerxes at Mycale, and became a member of the Athenian league. It revolted, but was conquered by the Athenians in 439. The Romans made the capital a free city. In the middle ages the island was taken by the Saracens, who were expelled in the 13th century. During the Greek revolution the Samians expelled the Turks, but by the treaty which secured the independence of other parts of Greece Samos remained subject to Turkey, though enjoying special privileges. Since 1835 it has been governed by the Greek family Vogorides. The governor, styled "prince of Samos," pays an annual tribute of about \$18,000 to the sultan. The production and population of Samos have been much reduced within a few years. In February, 1873, an earthquake continuing four days destroyed many lives and much property.

SAMOTHRACE (modern Gr. *Samathraki*; Turk. *Semendrek*), an island of the Grecian archipelago, belonging to Turkey, between Lemnos and the coast of Thrace; area, about 32 sq. m.; pop. about 1,800. It is the highest land in the north of the archipelago. It is sterile and destitute of ports. In antiquity it was called Dardania, Electris, Melite, and Leucosia, and was renowned as a chief seat of the worship of the Cabiri. It was in early times independent, with possessions on the mainland, aided Xerxes in the battle of Salamis, and was afterward subject to Athens, Macedon, and Rome.

SAMOYEDS, a nomadic people in the northern parts of European and Asiatic Russia, forming a branch of the Uralo-Altaic division of mankind. The name, which signifies in Russian "persons who devour themselves," and occurs in early Russian chronicles, would seem to imply that the people had once been cannibals, if it were not more likely that in this instance it is a corruption of some word connected with the Finnic *Suomi* or Lapp *Sam* and *Sabme*. The Samoyeds were originally spread from the Altai mountains to the Arctic ocean, and from the White sea nearly to the river Lena. They are still met with in groups from the White sea to the river Khatanga, but the space between the Obi and the Yenisei is now their principal seat. Their whole number is estimated at less than 20,000, divided into three principal and several smaller tribes speaking different dialects. They are mostly idolaters, of small stature and repulsive features, but peaceably disposed. They dwell in tents of reindeer skin.—See "The Land of the

North Wind: Travels among the Laplanders and the Samoyedes," by Edward Rae (London, 1875).

SAMPHIRE (formerly written *sampire* and *sampetra*, from the old Fr. name *l'herbe de Saint Pierre*, Ital. *San Pietro*, from its grow-

Samphire (*Crithmum maritimum*).

ing on rocks), a very succulent plant of the parsley family or umbellifers, *crithmum maritimum*, with fleshy, dissected leaves, and compound umbels of small white flowers destitute of calyx teeth; the fruit oblong, dark green or purplish. It is a smooth perennial, about a foot high. Samphire is found on rocky cliffs by the seashores of Britain and southward to northern Africa, the roots penetrating deep into crevices by means of their numerous strong fibres. The leaves and young shoots have a pleasant aromatic taste, and the plant was held

Marsh Samphire (*Salicornia herbacea*).

in great esteem by the old herbalists as a stomachic, and used in salads and pickled. It is still used in England as a pickle, and on the

continent is sometimes cooked as a pot herb.

—The plant sometimes called samphire in this country, and marsh samphire in England, is *salicornia herbacea* (Lat. *sal*, salt, and *cornu*, horn, a saline plant with horn-like branches), more generally known as glasswort; it is one of the goosefoot family, or chenopods. Its annual stems are 6 to 12 in. high, leafless and long, succulent, jointed, and much branching; the minute flowers each in a hollow in the stems at the joints. It is very abundant along the coast and in saline marshes in the interior; it is much relished by cattle, and in Europe was formerly burned in large quantities for the soda contained in its ashes. It is said that much of the pickled samphire sold in England is really this plant, which is very abundant and more accessible than the true samphire, from which it differs not only in appearance but in the absence of aromatic flavor.

SAMPSON, a S. E. county of North Carolina, bordered W. by South river and drained by Black river and several tributaries of that stream; area, 940 sq. m.; pop. in 1870, 16,486, of whom 6,483 were colored. The surface is undulating and the soil sandy but fertile. There are extensive forests of pitch pine. The chief productions in 1870 were 281,381 bushels of wheat, 21,950 of peas and beans, 141,373 of sweet potatoes, 1,231 bales of cotton, 19,837 lbs. of rice, 7,523 of tobacco, 11,437 of wool, 35,554 of butter, and 22,664 of honey. There were 1,441 horses, 605 mules and asses, 3,378 milch cows, 1,149 working oxen, 5,267 other cattle, 6,732 sheep, and 22,524 swine. Capital, Clinton.

SAMSON (Heb. *Shimshon*), a judge of Israel, celebrated for his bodily strength. He was the son of Manoah, of the tribe of Dan, and was born about the middle of the 12th century B. C. He was devoted to the life of a Nazarite from his birth, and early began to exhibit superhuman strength. The great achievements recorded of him are connected with his love for his Philistine wife and for two women of loose character, one of whom, Delilah of Sorek, ascertained that the secret of his strength lay in his hair, which had never been shorn. Having entered into a plot against him with the Philistines, she called in a man to cut off his hair while he lay sleeping in her lap; he was then seized by his enemies, deprived of his sight, and made to grind in the prison. But when his hair grew long his strength came back. An immense multitude of Philistines having assembled in a temple to rejoice in his captivity, he was brought in to make them sport, and was placed, where all might see him, between the two central supports of the building. Persuading the lad who held him by the hand to let him feel the pillars and lean upon them, he grasped them both, and exerting all his strength overthrew them, and the building fell, burying the whole assembly, himself included, beneath the ruins. He was a judge of Israel for 20 years.

SAMSON, George Whitfield, an American clergyman, born at Harvard, Worcester co., Mass., Sept. 29, 1819. He graduated at Brown university in 1839, and at Newton theological institution in 1843, and was pastor of the 4½ street Baptist church, Washington, D. C., till October, 1849. He was president of Columbian college from 1859 to 1871, and of Rutgers female college in New York in 1872-'3. He has published a series of letters from Egypt, Palestine, and Italy (1848); *To Daimonion* (1852; enlarged under the title of "Spiritualism Tested," 1860); "Outlines of the History of Ethics" (1860); "Elements of Art Criticism" (1867); and "Physical Media in Spiritual Manifestations" (1869).

SAMSON, Joseph Isidore, a French actor, born in St. Denis, July 2, 1793, died in March, 1871. He was of humble origin, and was at first a lawyer's clerk and a copyist in a lottery bureau. In 1812 he began to study at the conservatory after performing at a minor theatre. From 1832 to 1863, when he retired, he was connected with the Théâtre Français, being especially distinguished in the comedies of Molière and Beaumarchais. He also wrote vaudevilles and dramas, and *L'Art théâtral*, a didactic poem, and lectured on dramatic art. He was professor of elocution at the conservatory for upward of 30 years.—See *Samson et ses élèves*, by Legouvé (Paris, 1875).

SAMUEL (Heb. *Shemuel*, "heard of God"), a Hebrew seer or prophet, the last judge of Israel. He was the son of Elkanah and Hannah, of the tribe of Levi, and was born in the latter part of the 12th century B. C., probably at Ramathaim Zophim in Mt. Ephraim. Even before his birth his mother had bound him to the obligations of a Nazarite, and he was set apart from his early youth to the service of the tabernacle at Shiloh, under the immediate tutelage of Eli. His first prophecy concerned the doom of Eli's house. Twenty years after the death of Eli Samuel assembled the people at Mizpah, urging them to remain faithful to the Lord, and promising them speedy deliverance from the Philistines. At this time he seems to have been acknowledged as judge, an office which he held for about 20 years, restoring everywhere the neglected national worship. The Philistines, the most dangerous foes of Israel, were routed, and did not recruit their strength during the remainder of his leadership. The Amorites, the eastern foes of Israel, remained in peace with him. His dwelling was at Ramah, and in his old age he appointed two of his sons deputy judges at Beersheba. The people became dissatisfied, and demanded a king. Samuel, with great reluctance, at length yielded by divine direction to this demand, and anointed Saul the first king of Israel. He rebuked Saul on several occasions, and at length, in the name of the Lord, anointed David as second king before the demise of Saul. He died before 1060 B. C. According to Jewish tradition, he was the au-

thor of the book of Judges and of a part of the books of Samuel.

SAMUEL, Books of, two canonical books of the Old Testament, reckoned by the Jews as one book. The present division into two books dates from the edition of the Hebrew Bible by Bomberg (1517-'18), and is derived from the Septuagint and Vulgate, in both which versions they are termed the 1st and 2d books of Kings. They consist of the connected biographies of Samuel, Saul, and David. The author of the books of Samuel is unknown. Grotius, Eichhorn, Jahn, Herbst, and Hävernick regard the prophet Jeremiah as the author. Most commentators agree that they were the work of one compiler, who used several older books; but as to the number and character of these they do not agree. The date of the work seems from internal evidences to have been between 975 and 622 B. C. Some writers, as Hobbes, Spinoza, Simon, Le Clerc, Eichhorn, Thenius, and De Wette, have maintained that the book contains contradictory statements; but their arguments have been disputed by Carpzovius, Davidson ("Biblical Hermeneutics"), Hengstenberg, Hävernick, Welte, Keil, and others. Among the most recent commentators are Thenius, *Die Bücher Samuels* (2d ed., Leipsic, 1864); Keil, *Die Bücher Samuels* (1864; English translation, 1866); Wordsworth, in his "Holy Bible, with Notes and Introductions" (1866); and Erdmann, in Lange's *Bibelwerk* (1873). For the latest critical view of the state of the text, see Wellhausen, *Der Text der Bücher Samuels* (Göttingen, 1871).

SANA, or **Sanaa**, a city of Yemen, Arabia, formerly capital of the imamate of Sana, 110 m. E. N. E. of Hodeida; pop. about 20,000. It lies in a fertile valley, about 4,000 ft. above the sea, and is surrounded by a ruinous wall of sun-baked brick, 5½ m. in circumference. It is divided into a Jewish quarter, on the W. side, and the city proper, with the citadel, at the E. end. The imam's palaces are built of cut stone, with extensive gardens, surrounded by separate walls and fortifications. The streets are wide and comparatively well kept, but a large part of the town is in ruins. The climate is subject to great variations; sometimes no rain falls for several years, and the drought produces famine and pestilence; but generally there are rains in January, June, and July. Sana is the centre of the coffee trade of Yemen, and is famous for its fruits, especially grapes. The rich merchants have summer houses at Raudhah, 5 m. N. of the city.—Sana was a city of the Sabæan kingdom, and is of great antiquity. It is probably the Tamna or Thomna of the ancient geographers. It is described by Pliny as a large commercial town, with 65 temples, to which caravans from Gaza resorted. About 930 it became the seat of the imams of Yemen, who ruled all S. W. Arabia. (See **YEMEN**.) In July, 1872, it was taken by the Turks, who have since held it with a garrison of 1,000 men.

SAN ANTONIO, a city and the county seat of Bexar co., Texas, on the San Antonio and San Pedro rivers, 75 m. S. W. of Austin and 250 m. N. by W. of Brownsville; pop. in 1850, 3,488; in 1860, 8,235; in 1870, 12,256, of whom 4,120 were foreigners and 1,957 colored; in 1875, about 16,000, of whom about a third are of German and a third of Mexican origin. It consists of three parts: the old town, or San Antonio proper, between the two streams; Alamo, E. of the San Antonio; and Chihuahua, W. of the San Pedro. The old town is the business quarter, and has in great part lost its Mexican character, having been almost entirely rebuilt since 1860. The two principal streets are Commerce and Market, running parallel to each other from the main plaza. The former is built up with handsome business structures, two and three stories high. Separated from the main plaza by a fine Catholic church is the *plaza de las armas*. From the two plazas run to the right and left a number of other streets, mostly with Spanish names, and still in part occupied by low, castellated Mexican houses, built of limestone, without windows. Chihuahua is almost exclusively Mexican in character and population. The houses are one story high, partly built of stone and partly of upright logs with cane roofs. Alamo is the largest quarter of the city, is considerably higher than the other two, and is mostly inhabited by Germans. It is divided into two parts by the Alameda, an extension of Commerce street. In the N. part is the Alamo plaza, with the fort of that name celebrated in Texan history. (See ALAMO.) The land immediately around the city is level. A mile distant rises a chain of limestone hills, which furnish an excellent building material. The sources of the San Pedro and the adjacent land belong to the city, and are set apart as a public park, which has long been the principal pleasure resort of the citizens.—San Antonio is the chief city of W. Texas, and has an extensive trade. Its most important manufactories are three large flouring mills, a soap and candle factory, a wood and stone cutting establishment, two ice factories, a meat extract factory, and three breweries. It has a national bank, with \$125,000 capital, and four private banks. The city is not yet reached by any railroad, but the Gulf, Western Texas, and Pacific, and the Galveston, Harrisburg, and San Antonio lines, in progress (1875), will connect it with Indianola and with Houston and Galveston respectively. The former is completed to Cuero, 75 m. S. E., and the latter to Kingsbury, 42 m. E. N. E. Regular lines of stage coaches run to these points and to Austin. San Antonio is divided into four wards, and is governed by a mayor, recorder, and a board of twelve aldermen. It has a good fire department. There are a hospital and a female orphan asylum, under the control of the Roman Catholics; a Roman Catholic college and convent; two German-American schools; five free public schools with about

1,000 pupils; two daily, a tri-weekly (German), and three weekly (one German) newspapers; and ten churches, viz.: 1 Episcopal, 1 Lutheran, 3 Methodist (2 colored), 1 Presbyterian, and 4 Roman Catholic.—San Antonio was founded in 1714 by the Spaniards, who established a fort on the right bank of the San Pedro, and called it San Fernando. Near this some monks in 1718 established the mission of the Alamo. On account of the Indians, both the fort and mission were removed to the left bank, where the *plaza de las armas* now is. The settlers established themselves around this, and called it San Antonio de Bexar, while a portion of the town E. of this was called San Antonio de Valero. The mission continued to be called San Antonio de Valero till 1783. San Antonio was the centre of important operations in the wars for Mexican and Texan independence. It was incorporated as a city in 1733. The German immigration commenced in 1845.

SAN ANTONIO RIVER, a river of Texas, rising in Bexar co., and following a general S. E. course of nearly 200 m. to Espiritu Santo bay. It unites with the Guadalupe about 12 m. from its mouth. Its largest tributaries are the Medina and Salado in Bexar co., and the Cibolo in Karnes co. The chief towns on its banks are San Antonio and Goliad.

SAN AUGUSTINE, an E. county of Texas, bordered W. by Angelina river and Attoyac bay, and drained by their branches; area, 680 sq. m.; pop. in 1870, 4,196, of whom 1,964 were colored. The soil is very rich and produces excellent cotton. The chief productions in 1870 were 110,007 bushels of Indian corn, 10,082 of sweet potatoes, 2,598 bales of cotton, and 1,135 lbs. of wool. There were 913 horses, 2,576 milch cows, 791 working oxen, 5,368 other cattle, 1,221 sheep, and 8,713 swine. Capital, San Augustine.

SAN BENITO, a W. county of California, bounded E. by the main range of the Coast mountains, and embracing the valley of the San Benito river. It was formed in 1874 from the E. portion of Monterey co. The raising of sheep and cattle is largely pursued, and agriculture is carried on to some extent. It is traversed by the Southern Pacific railroad. Capital, San Benito.

SAN BERNARDINO, a S. E. county of California, bounded N. E. by Nevada, and E. by Arizona, from which it is separated by the Colorado river; area, about 16,000 sq. m.; pop. in 1870, 3,988. About three fourths of the county, comprising the N. and E. portions, consists of dry desert valleys and volcanic mountains. This region has little vegetation, and is interspersed with hot springs and deposits of sulphur and soda. There are some streams that lose themselves in "sinks." Death valley, in which the Amargosa river disappears, is from 100 to 250 ft. below the level of the sea, is destitute of good water, and is extremely hot in summer. Gold and silver are found in the Sierra Nevada mountains in

the north. In the S. W. part of the county, here crossed by the Coast range, are extensive valleys having a delightful climate and a fertile soil. The mountains contain an abundance of pine, cedar, hemlock, maple, &c. In this district are found gold, copper, tin, marble, and alabaster, and silver mines are worked successfully. The largest stream is the Santa Ana, which flows into the Pacific. The chief productions in 1870 were 10,356 bushels of wheat, 12,250 of Indian corn, 51,906 of barley, 48,730 gallons of wine, 71,075 lbs. of wool, 21,780 of butter, 7,000 of cheese, and 1,808 tons of hay. There were 970 horses, 622 milch cows, 2,498 other cattle, 18,121 sheep, and 1,066 swine; 2 manufactories of saddlery and harness, 1 flour mill, and 5 saw mills.—**SAN BERNARDINO**, the capital, is situated in a fine valley, about 60 m. E. of Los Angeles; pop. in 1870, 3,064. The town is supplied with water by artesian wells, and the numerous fruit and ornamental trees give it a very beautiful appearance. The view of Mount San Bernardino, the loftiest peak of the Coast range, is exceedingly grand.

SANCHUNIATHON, or *Sanchoniathon*, the name prefixed, as that of the author, to a history of Phœnicia and Egypt published by Herennius Philo of Byblus as a Greek translation from the Phœnician. Philo, a grammarian who flourished early in the 2d century A. D., represents Sanchuniathon as a native of Berytus, and as having written in the time of Semiramis, dedicating his work to Abibalus, a national king of Berytus. Of this work a considerable fragment is preserved in Eusebius, who quoted Sanchuniathon in corroboration of certain Biblical statements which Porphyry had assailed. It is now, after much learned controversy, the belief of most critics that the so-called history of Sanchuniathon was originally written by Philo. Richard Cumberland, bishop of Peterborough, translated the fragment from Eusebius, with copious chronological and historical notes (8vo, London, 1720). The Greek fragments still extant have been published by Orelli (Leipsic, 1826), and in Cary's "Ancient Fragments" (London, 1832). In 1837 Friedrich Wagenfeld published at Bremen what purported to be the entire Greek text of Philo's Sanchuniathon, but it proved to be a fabrication of the editor.

SAN CRISTÓBAL, a city of Mexico, capital of the state of Chiapas, 450 m. S. E. of the city of Mexico; pop. in 1869, 7,649. It is situated in a fertile and well cultivated valley, on the E. slope of the central mountain range, and has good streets and houses, the latter mostly of one story. Lead and iron abound in the surrounding country. The chief industries are cattle rearing, and the manufacture of coarse woollen and cotton stuffs and common earthenware.—The town was founded in 1528 under the name of Villa Real, and was successively called San Cristóbal de los Llanos and Ciudad Real; it received its present name in 1829.

SANCROFT, William, an English prelate, born at Fresingfield, Suffolk, Jan. 13, 1616, died there, Nov. 24, 1693. He was educated at Emmanuel college, Cambridge, and became a fellow in 1642, but subsequently lost his fellowship by refusing to subscribe to the "Solemn League and Covenant." He was chosen one of the university preachers in 1660, was rector of Houghton-le-Spring, a prebendary of the cathedral of Durham, and in 1678 became archbishop of Canterbury. When James II. issued his declaration for liberty of conscience, and required the clergy to publish it, Sancroft refused, and with six other bishops presented a petition to the king against it. The seven prelates were committed to the tower on a charge of libel, but were acquitted. Sancroft refused to take the oath of allegiance to William and Mary, and was deposed. He published some sermons, and "Letters to Mr. North" (afterward Sir Henry). His "Modern Policies and Practices," from Machiavelli and others, was published in 1757.

SANCTUARY. See ASYLUM.

SAND, George. See DUDEVANT.

SAND, Karl, a German political fanatic, born at Wunsiedel, in Franconia, Oct. 5, 1795, executed near Mannheim, May 20, 1820. After studying theology at the universities of Tübingen and Erlangen, he went in 1817 to that of Jena, where he joined the Teutonic society, a precursor of the *Burschenschaften*. He was an enthusiast in the cause of liberty, and conceived it to be his duty to destroy Kotzebue, whose writings and connection with the Russian court had made him especially obnoxious to the German patriots. Having delivered a letter to him at his residence in Mannheim, March 23, 1819, while he was reading it Sand struck him thrice with a dagger, then went into the street, and kneeling down cried, "Long live my German fatherland," and stabbed himself. His wound was not mortal, and on May 5, 1820, he was condemned to death.

SANDAL WOOD (Sansk. *chandana*), the aromatic wood of several species of *santalum* (Pers. *sandul*), especially *S. album*, of the East Indies. The genus gives its name to a small family of apetalous, exogenous plants, comprising herbs, shrubs, and trees, most of which are parasitic by their roots, at least when young. Besides the above named species of *santalum*, others, in the Hawaiian and Feejee islands and Australia, furnish sandal wood, some of which finds its way into commerce. The Indian sandal wood is a tree 20 to 30 ft. high, with a trunk 6 to 12 in. through; it is rather local, being found most abundantly in Mysore, where the trees are a monopoly of the East India company, and can only be felled by the proper officers, and in Madras they are also under government control. Where there is no restriction the trees soon become exterminated, but in the localities referred to the supply is kept up by new plantations. The trees reach their full size in 20 or 30 years; after they are

felled and the branches removed, the trunks are allowed to remain on the ground for several months in order that the white ants may eat away the worthless sap wood; the trunk is cut into pieces 24 and 30 in. long, carefully trimmed, weighed, and assorted for shipment.

Sandal Wood (*Santalum album*).

The wood is very heavy, its density and aroma being greatest when it grows on dry and poor soil; the color is a pale brown, varying in different samples; it splits easily; has a persistent odor which is agreeable to most persons; its taste is strongly aromatic. The aroma of the wood depends upon a volatile oil, which is light yellow and thick, and begins to boil at 385° F.; a resin is also found in the wood. Sandal wood is mentioned in a Vedic work written as early as the 5th century B. C.; it was used in sacred buildings in India; the gates constructed for the temple of Somnath in Guzerat, and carried off on its destruction about 1025, are of carved sandal wood, and though over 1,000 years old are in good preservation. It was used in embalming princes. The great consumption of the wood is in China; in 1866 there were received at the various ports 5,197 tons. The oil is made at the localities where the trees grow; the roots are dug up for the purpose, and the chips and sawdust are also used; in 1872-'3, 10,348 lbs., valued at £8,374, were imported into Bombay, a large share of which was reexported. In the East the wood is used in religious ceremonies, and the wealthy Hindoos add sticks of it to the funeral pile to show their respect for the departed. In India it is the best substitute for box wood for engravers' use; it is used largely by the Chinese for cabinet work, as its odor repels insects, for small boxes, and the framework of fans; they also burn it as incense in their temples. Within a few years the oil has come into use as a substitute for copaiba in the treatment of gonorrhoea.—**RED SANDAL WOOD**, or **SAUNDERS WOOD**, is fur-

nished by *pterocarpus santalinus*, a tree of the *leguminosæ*, and a native of various localities in southern India. It is 20 to 30 ft. high, and seldom over 4 ft. in girth; like the true sandal wood, it is controlled by government, and is now raised in plantations; it is found in commerce in irregular logs consisting of the heart wood of the lower part of the trunks and the larger roots; it is of a deep red color and takes a fine polish. The natives of India use it in their temples, and for turned work. It was formerly supposed to be medicinal, but is now used only for coloring; the compound spirit of lavender, popularly called red lavender, owes its color to this, as does Stoughton's bitters. The coloring matter is santalic acid, or santaline, a resinoid, soluble in alcohol, ether, and alkaline solutions.

SAND BLAST. A method of engraving figures on glass or metal, or cutting away or boring holes in hard substances, by a rapid stream of sharp sand, invented by Mr. B. C. Tilghman of Philadelphia. The jet of sand may be driven by a blast of steam from a boiler, at high pressure (from 50 to 300 lbs. per square inch), or by an air blast produced by a fan blower revolving with great velocity (a 30-inch fan 1,500 to 2,000 times per minute). The sand is contained in a hopper, and is let down through a tube with a fine orifice, which may be inclined at any desired angle. Surrounding the sand tube is the blast pipe, the effect being to carry the stream of sand with nearly the velocity of the steam or air jet against the object to be operated on, which is placed in a box, and adjusted by means of slides so that it may be moved in front of the jet as the figures are being cut. The box must have openings for the exit of the air. In an experiment with this apparatus a hole an inch and a half in diameter and of the same depth was bored through a piece of corundum in a little less than half an hour, the sand being driven by a steam jet at 300 lbs. pressure per square inch. A diamond was easily reduced in weight and a topaz completely dissipated in one minute. Patterns of objects may be laid upon the glass in the manner of stencil plates, and engraved with great facility. An engraving of a photographed coating of gelatine upon glass may also be taken.

SAND CRAB. See **CRAB**.

SANDEAU, Léonard Sylvain Jules, a French author, born at Aubusson, department of Creuse, Feb. 19, 1811. He was a lover of George Sand, and published with her the celebrated novel *Rose et Blanche*. A complete collection of his novels appeared in 2 vols. in 1859. One of his most successful plays is *Mlle. de la Seiglière*, adapted from his novel of the same title. He is a member of the academy and a director of the Mazarin library.

SAND EEL. See **EEL**.

SANDEMANIANS, a sect of Christians who originally separated from the Presbyterian church of Scotland. Their actual founder was the

Rev. John Glass, a native of Dundee (1695-1773), and they were at first known as Glassites; but subsequently they were called Sandemanians, from the Rev. Robert Sandeman, the son-in-law of Glass, who reduced his opinions to a system. Sandeman was born in Perth about 1720, and in 1764 settled in Danbury, Conn., where he died in 1771. Under his influence churches were gathered in the principal cities of Scotland, in Newcastle, London, and other English cities, and in several towns of Connecticut and Massachusetts. But few of these remain; the most important are at Dundee, Edinburgh, and Danbury. The number of persons at present belonging to the sect is probably less than 2,000. The peculiarities of the Sandemanians are their construction of the word "faith," which they interpret as simple assent to the teaching and divinity of Christ; rejection of all mystical or double sense from the Scriptures; prohibition of all games of chance; weekly love feasts, being the dinner of all the church together on every Sunday; the kiss of brotherhood, which passes between all the members, male and female, at their solemn meetings; strict abstinence from all blood and "things strangled," according to the Jewish precept; plurality of elders, two at least being required for all acts of discipline and all administration of ritual; prohibition of college training; and the absence of prayer at their funerals. Their religious services are confined mostly to the reading and explanation of Scriptures; and where there is no special church, the meetings are held in the houses of the brethren. The custom of washing feet is now discontinued.—See the writings of John Glass (4 vols. 8vo, Edinburgh, 1762).

SANDERLING, a wading bird of the genus *calidris* (Cuv.), differing from the sandpipers

to 8 in. long, with an alar extent of 12½ in., the bill 1 in. and the tarsus the same, and the weight 1¼ oz. The plumage above is ashy gray with lighter edges, with spots of brownish black on the head and back, and with fine transverse lines on the rump and upper tail coverts; under parts pure white; shoulders brownish black without spots; quills with white shafts; the greater wing coverts widely tipped and the middle tail feathers edged with white; bill and legs greenish black; the bill is straight, a little widened at the end; the tail is doubly emarginated, the middle feathers the longest; both sexes are alike; in the spring the plumage is more or less tinged and edged with yellowish red. It is abundant from the Atlantic to the Pacific, in winter going to the southern states and to South America. The European bird presents no certain distinguishing marks from the American.

SAND GROUSE. See GROUSE.

SANDHURST (formerly BENDIGO), a city of Victoria, Australia, 82 m. N. N. W. of Melbourne; pop. about 25,000. The town is well lighted and supplied with water, and the principal streets are paved. The main street, Pall Mall, has many fine shops, and numerous imposing brick and stone buildings. The banks, the government and municipal offices, the hospital, benevolent asylum, mechanics' institute, and Lyceum theatre are among the principal buildings. Sandhurst is one of the chief railway stations of Victoria, and is the headquarters of a rich gold-mining region.

SAN DIEGO, the S. county of California, bounded E. by Arizona, from which it is separated by the Colorado river, S. by Lower California, and W. by the Pacific ocean; area, about 13,500 sq. m.; pop. in 1870, 4,951. Two branches of the Coast range cross it from N. to S., dividing it into three divisions differing much in climate, soil, and topography. The division along the coast is about 25 m. wide, and consists largely of level plains or gently sloping valleys, watered by the San Bernardo, San Diego, San Luis Rey, Margarita, Sweetwater, and other rivers; the greater portion is suitable for agriculture and grazing. The central or mountain division is very irregular in outline, averaging nearly 40 m. in width. Both ranges are covered with forests of oak, cedar, pine, and fir, and contain gold, silver, copper, and other minerals. Valuable gold mines have been opened within the past four years. Between them are a number of broad valleys or table lands, having a delightful climate and a fertile soil. They produce grapes, oranges, wheat, barley, &c. The E. division is occupied by the Colorado desert, which is for the most part treeless and barren, and part of it is below the level of the sea. It is very dry and hot, and contains many natural curiosities, among which is a lake of boiling mud, about half a mile long by 500 yards wide. The chief productions in 1870 were 32,947 bushels of wheat, 9,330 of Indian corn, 18,745 of bar-

Common Sanderling (*Calidris arenaria*).

(*tringa*, Linn.) chiefly in the absence of the hind toe. The common sanderling is the *C. arenaria* (Ill.), inhabiting the temperate regions of America and Europe; it is from 7¾

ley, 9,250 lbs. of wool, and 1,433 tons of hay. There were 5,687 horses, 1,268 milch cows, 20,347 other cattle, 16,443 sheep, and 1,683 swine. Capital, San Diego.

SAN DIEGO, a city, port of entry, and the capital of San Diego co., California, on the N. E. shore of a bay of the same name, about 460 m. S. E. of San Francisco, and 15 m. N. of the Mexican border; lat. $32^{\circ} 44' 41''$ N., lon. $117^{\circ} 8' W.$; pop. in 1870, 2,300; in 1874, about 4,000. It has one of the three good harbors on the Pacific coast of the United States, and has been fixed by act of congress as the western terminus of the Texas and Pacific railroad. Its climate is remarkably equable and salubrious, the thermometer rarely rising to $80^{\circ} F.$ or sinking to the freezing point. Many visit it as a health resort. The exports in 1874, consisting mainly of gold bullion, wool, wheat, flour, barley, hides, honey, wine, and olive oil, amounted to \$2,000,000. There are four churches, two academies, two daily and two weekly newspapers, two banks, a fine court house, and a steam flouring mill. The city was laid out in 1868.—North San Diego, a small hamlet 4 m. N. of the city proper, was the first place settled by white men in California. Father Junípero, a Jesuit priest, with a number of followers, landed there in May, 1768, and soon afterward founded the mission of San Diego.

SAND LAUNCE. See EEL.

SAND MARTIN. See SWALLOW.

SAN DOMINGO. See SANTO DOMINGO.

SANDOVAL, Prudencio de, a Spanish historian, born about 1560, died in Pamplona, March 17, 1621. He was a Benedictine monk, and was appointed by Philip III. historiographer of Spain, in 1608 bishop of Tuy, and in 1612 bishop of Pamplona. His principal works are: *Historia de la vida y hechos del emperador Carlos V.* (2 vols., 1604-'6), of which there are abridgments in English by James Wadsworth ("The Civil Wars of Spain," fol., London, 1652) and Capt. John Stevens ("History of Charles V.," 1703); *Historia de los reyes de Castilla y de Leon* (1615); and *Las crónicas de los quatro obispos*, an edition of the works of four chroniclers of the 12th century.

SANDPIPER, the common name of the *tringa*, an extensive subfamily of small wading birds of the snipe family. They have the bill as long as or longer than the head, slender, compressed on the sides, with the culmen slightly depressed and enlarged near the tip, and the greater portion covered with a soft, very sensitive skin; the nostrils are basal, in a groove extending for two thirds of the bill; the wings long and pointed, the tail moderate and nearly even, the tarsi usually long and slender, and the toes but slightly united at the base. In the typical genus *tringa* (Linn.) the first primary is longest, the tertiaries long, and the secondaries short; the tarsus is covered in front with transverse scales, the hind toe very small, the anterior toes margined with mem-

brane and free at the base. There are between 20 and 30 species, in all parts of the world, some widely diffused, and a few common to America and Europe; they are usually seen in flocks on the seashore or on the margin of lakes and rivers, and in marshes, probing the sand and mud with the bill in search of worms and minute crustaceans. They are generally migratory. The colors of the spring and autumn plumage are different in most species, which has created some confusion in specific descriptions; both sexes are much alike in color, but the females are frequently the largest.—Among the American species is the purple sandpiper (*T. maritima*, Brunn.; *argutella*, Baird), found on the shores of eastern North America, and in winter in tropical North and South America, and also in the temperate parts of Europe; gunners call it the rock snipe, from its frequenting rocky instead of sandy shores. The red-backed sandpiper

Least Sandpiper, or Peep (*Tringa Wilsonii*).

T. alpina, Linn.; *schœnichus*, Möhr.) is very abundant on the Atlantic shores in sandy and muddy places; it is found also in temperate Europe, where it is called dunlin and purre; Mr. Cassin thinks the American bird a distinct species, and gives it the name of *Americana*. The nest is a slight hollow in a dry place lined with grass; the young leave the nest as soon as hatched, as do all the species. The least sandpiper, or peep (*T. Wilsonii*, Nutt.), is the smallest of the group in this country, being only $5\frac{1}{2}$ to 6 in. long; it is abundant over the entire temperate regions of North America; it breeds in the far north, arriving in Massachusetts early in July. Its congener in Europe is the *T. minuta* (Leisler).—Among the European species of sandpipers, the ruff, the knot, and the sanderling have been noticed under these titles.

SANDRART, Joachim von, a German painter, born in Frankfort, May 12, 1606, died in Nuremberg, Oct. 14, 1688. He was a pupil of

Gerhard Honthorst, and was employed by the emperor Ferdinand III. and Maximilian of Bavaria. He published the *Academia Artis Pictoriae, Romæ Antiquæ et Novæ Theatrum*, and other works, which were translated into German (8 vols. fol., Nuremberg, 1769-'75).

SANDS, Robert Charles, an American author, born in Flatbush, Long Island, May 11, 1799, died in Hoboken, N. J., Dec. 17, 1832. He graduated at Columbia college in 1815, and in 1820 commenced the practice of law. With J. W. Eastburn he wrote the poem "Yamoyden" (New York, 1820), in 1824 edited for a time the "Atlantic Magazine," in 1825-'7, with William Cullen Bryant, the "New York Review," and from 1827 till his death was an editor of the daily "Commercial Advertiser." With Bryant and Verplanck he wrote the "Talisman," an annual (3 vols., 1828-'30, afterward republished as "Miscellanies"), in which appeared the "Dream of the Princess Papantzin," one of his longest poems; and he was associated with Bryant, Paulding, Leggett, and Miss Sedgwick in "Tales of Glauber Spa" (2 vols., 1832). He also published "Life and Correspondence of Paul Jones" (1831). His works were edited with a memoir by Gulian C. Verplanck (2 vols. 8vo, New York, 1834).

SANDSTONE, a rock formed of grains of sand, often intermixed with coarse pebbles, cemented together by the infiltration of calcareous, argillaceous, ferruginous, or silicious substances. This, with long continued pressure, has converted the collections of sand into solid rock. Sandstone strata occur through all the geological formations from the metamorphic group upward, and the hard quartz rocks of this group are now understood to be altered sandstones. Those formations of the stratified rocks in which layers of sandstone prevail are often specially designated by this name. Beds of very coarse pebbles are known as pudding-stones and conglomerates. (See CONGLOMERATE.) The Potsdam sandstone, near the base of the Silurian rocks, is extremely hard, close-grained, and quartzose, often occurring in broad sheets and little intermixed with other strata. Its beds in several places in New England, New York, and E. Pennsylvania attain a thickness of more than 300 ft.; and at Potsdam in St. Lawrence co., N. Y., a thickness of 70 ft. is exposed in the quarries. The rock is remarkable for its uniform thickness in broad sheets; masses are taken out 30 ft. square and 2 ft. or more thick, perfectly solid and smooth. Divisional planes are exposed by the hammer and wedges, and the thickness of the sheets may be reduced to an inch. The general color is yellowish brown, variously shaded in the different layers. (See POTSDAM.) Many other sandstones are extensively employed for building, some of which are easily quarried in sheets, of agreeable color, and well suited by their hardness and sharpness of grit for architectural ornaments. Such especially are the grits or harder sandstones of the coal measures, usually

brownish yellow or whitish. The formations known as the old red and new red sandstones afford quarries of superior building stones; but they also contain many layers of very inferior stone. The old portion of the capitol at Washington is built of an inferior variety of sandstone from the Potomac. In England sandstone is much more used for building than other rocks. Edifices of the 12th century, of the hard grits of the coal measures and underlying formations, as Melrose abbey and the cathedral of Glasgow, are in the finest state of preservation; and in some of those of the next century, as Ecclestone abbey near Barnard castle, the original sharp outlines of the delicate mouldings and other decorations are still finely retained; while other edifices, as Durham castle, and even the Hunterian museum in Glasgow, built in 1804, manifest decided symptoms of decay. The cause of these differences may be the imperfect consolidation of the grains in the poorer kinds, and a texture that admits the absorption of water, which, freezing and thawing within the mass, throws off successive portions from the outside; or it may be the original intermixture of foreign substances that are acted upon by atmospheric influences, as iron pyrites and carbonate of lime. Both of these together are particularly destructive from the sulphuric acid generated in the decomposition of the former attacking the carbonate and removing this from the stone.—The sandstones employed for architectural purposes in the United States are chiefly from quarries of the new red sandstone formation in the Connecticut river valley and in New Jersey; they are also imported from Nova Scotia and New Brunswick, and from Caen in France. The Nova Scotia and New Brunswick sandstones are chiefly from the vicinity of Shepody bay at the head of the bay of Fundy, and are known in the New York market as the Dorchester and Albert stone. The rock is yellowish brown, darker than the Caen stone, of even grain, and much of it very free from foreign substances. The quarries furnish very large blocks, and are directly on the shore of the bay, accessible to large vessels. For flagging stones several varieties of sandstone answer an excellent purpose, as for example the broad slabs of the Potsdam sandstone already referred to. New York city is chiefly supplied with them from Ulster, Greene, and Albany counties, and from the formation known as the Hamilton group. The principal shipping points are Kingston, Saugerties, Malden, New Baltimore, and Coxsackie on the Hudson river, and the quantities sent down annually amount to several million square feet. The stone is obtained in immense sheets of any desired thickness from nearly horizontal strata, and is regularly divided by perpendicular joints, which are as smooth as if cut by a saw.

SANDUSKY, a N. county of Ohio, bordered N. E. by Sandusky bay in Lake Erie, intersected by Sandusky river, and also drained by

Portage river and several smaller streams, and traversed by several railroads; area, about 425 sq. m.; pop. in 1870, 25,503. It has a low and level surface and fertile soil. In the W. part is the Black swamp, covered with forests, which has been reclaimed and is highly productive. The chief productions in 1873 were 405,116 bushels of wheat, 789,793 of Indian corn, 280,013 of oats, 121,575 of potatoes, 474,769 of apples, 21,131 tons of hay, 67,329 lbs. of cheese, and 141,879 of wool. In 1874 there were 8,726 horses, 18,301 cattle, 40,370 sheep, and 20,227 swine; in 1870, 5 manufacturing of brick, 11 of carriages and wagons, 1 of railroad cars, 6 of furniture, 4 of iron castings, 2 of engines and boilers, 7 of cooperage, 1 of woollens, 6 flour mills, 30 saw mills, and 6 tanneries. Capital, Fremont.

SANDUSKY, a city, port of entry, and the capital of Erie co., Ohio, finely situated on the S. shore of Sandusky bay, 3 m. from Lake Erie, and 105 m. N. by E. of Columbus; pop. in 1860, 8,408; in 1870, 13,000; in 1875, about 20,000. It has an excellent harbor, the bay being about 20 m. long by about 5 m. wide, with an average depth of 14 ft., easy of access, and secure in all weather. The city is built on an inexhaustible bed of excellent limestone, extensively employed for building purposes and in the manufacture of lime. The site rises gradually from the shore and commands a beautiful view of the bay. The city and neighboring islands are a favorite summer resort. The Lake Erie division of the Baltimore and Ohio railroad, and the Cincinnati, Sandusky, and Cleveland, and Lake Shore and Michigan Southern railroads, meet here. Sandusky is extensively engaged in exporting fresh and salted fish, ice, pine and hardwood lumber, shingles, and laths, and is the centre of one of the most important vine-growing districts in the United States. The value of imports from Canada for the year ending June 30, 1874, was \$26,240; of exports to Canada, \$264,914. The number of entrances was 136, tonnage 12,089; clearances, 155, tonnage 14,332. The number of entrances in the coastwise trade was 3,140, tonnage 479,897; clearances, 3,124, tonnage 474,602. The city is celebrated for its manufacture of articles in wood, of which handles, spokes and hubs, "bent work" for carriages, and carpenters' tools are the most important. It contains three national banks, several public schools, a daily, a semi-weekly, and three weekly newspapers, and 14 churches.

SAND WASP, the common name of a family of fossorial hymenopterous insects, the *sphégi-dæ* of Latreille. They have a long abdomen attached to the thorax by a long thin pedicel, filiform antennæ, and feet adapted for digging. There are numerous species, generally large, violet blue, sometimes banded with yellow; the females have a sting; there are no neuters, the female making her own nest in the sand. After laying an egg in a cell the mother places in it living insects, stinging them so as to pro-

duce stupefaction, and then closes the cell; the larva feeds upon the imprisoned insects, and grows rapidly; it then spins a silky cocoon in which it undergoes transformation. Some wasps of the family *crabronidæ* also make their nests in sand and earth.

SANDWICH, a town of Barnstable co., Massachusetts, extending across the peninsula of Cape Cod from Cape Cod bay to Buzzard's bay, 50 m. S. S. E. of Boston; pop. in 1870, 3,694; in 1875, 3,416. There are within the town eight stations on the Old Colony railroad and Wood's Hole branch, and nine post offices, viz.: Cohasset Narrows, East Sandwich, Monument, North Sandwich, Pocasset, Sandwich, South Sandwich, Spring Hill, and West Sandwich. The bays afford fine facilities for bathing and fishing. Many summer cottages have been erected in different parts of the town. The principal village is on the N. side, and is nearly surrounded by hills from which extensive views may be obtained. In clear weather Provincetown, 30 m. distant across the bay, is visible. The route of the projected ship canal, to connect the waters of Buzzard's bay with those of Cape Cod bay, lies through this town. The establishment of the Boston and Sandwich glass company is the largest of its kind in New England, and produces articles of superior quality. There are also a tack factory, a car factory, two iron foundries, a savings bank, 21 public schools, a weekly newspaper, a library of 1,100 volumes, and 10 churches.

SANDWICH ISLANDS. See HAWAIIAN ISLANDS.

SANDYS. I. Sir Edwin, an English statesman, born in Worcester in 1561, died at Northborne, Kent, in 1629. He was the son of Dr. Edwin Sandys, then bishop of Worcester, afterward archbishop of York. He studied at Oxford, where he was the pupil of Richard Hooker, and afterward travelled extensively on the continent, and published "Europæ Speculum, or a Survey of the State of Religion in the Western Part of the World" (best ed., 4to, 1637). Having supported the succession of James I., he was knighted by that monarch in 1603. He was an influential member of the second London company for Virginia, in which he took the lead in measures of reform, and introduced the vote by ballot. In 1619, having been elected treasurer of the company, as its chief officer was then called, he established in the colony representative government, and was indefatigable in promoting public security and prosperity. Spanish influence was exerted against him, and in 1620 King James, in violation of the charter, forbade his reelection; but his successor was his friend the earl of Southampton, who continued his policy. II. George, an English poet, brother of the preceding, born at Bishopsthorpe in 1577, died at Boxley abbey, Kent, in March, 1644. He was educated at Oxford, and published "A Relation of a Journey begun A. D. 1610, in Four Books, containing a Description of the Turk-

ish Empire, of Egypt, of the Holy Land, and of the Remote Parts of Italy and Islands adjoining" (fol., 1615; 7th ed., 1673), and a translation of the first five books of Ovid's "Metamorphoses" (2d ed., 1621). In 1621 he became colonial treasurer of Virginia, where he distinguished himself by his public zeal. He executed all orders concerning staple commodities; to him is due the building of the first water mill; he promoted the establishment of iron works in 1621, and in the following year introduced ship building. He translated the last ten books of the "Metamorphoses" while in Virginia. When the king broke up the Virginia company in 1624, he returned to England, where in 1626 he published the translation of the whole. He also wrote poetical versions of the Psalms (1636), of the book of Job, Ecclesiastes, Lamentations, &c. (1639), and of the Song of Solomon (1642). His life, by the Rev. H. J. Todd, is prefixed to "Selections from Sandys's Metrical Paraphrases" (London, 1839). A collective edition of his poetical works, with an introduction and notes, has been published by the Rev. R. Hooper (2 vols., London, 1872).

SANFORD, a N. W. county of Alabama, bordering on Mississippi, and drained by affluents of the Tombigbee river; area, about 600 sq. m.; pop. in 1870, 8,893, of whom 1,563 were colored. The surface is rolling and the soil is fertile. The chief productions in 1870 were 18,672 bushels of wheat, 219,437 of Indian corn, 14,128 of oats, 31,619 of sweet potatoes, 72,157 lbs. of butter, and 1,825 bales of cotton. There were 1,462 horses, 496 mules and asses, 2,518 milch cows, 4,470 other cattle, 6,784 sheep, and 11,463 swine. Capital, Vernon.

SAN FERNANDO, a city of Andalusia, Spain, 7 m. S. by E. of Cadiz, on the Isla de Leon; pop. about 18,000. It is joined to the mainland by an ancient Roman bridge, and between it and Cadiz extend vast salt marshes. Salt, rum, liqueurs, leather, and soap are manufactured. The town was founded about 1750, and in 1808 had 40,000 inhabitants. Two miles distant is the suburb of San Carlos, with the residence of the captain general and several public establishments.

SAN FRANCISCO, the chief city of California (in law, the city and county of San Francisco), the principal commercial emporium on the Pacific coast of America, in lat. 37° 46' N., lon. 122° 24' W. It is situated at the N. end of a peninsula, which is 30 m. long and 6 m. across at the city, and separates San Francisco bay from the Pacific ocean. The area within the political district is 42 sq. m., of which considerable portions are drifting sand and rocky hills, rising in several points to an elevation of 800 ft. Goat island, Alcatraz island, and Mission rock in the bay, and the Farallon islands in the ocean, 30 m. off, also belong to the city and county. The city stands on the E. slope and at the base of high hills. In 1846 these hills were steep and cut up by

numerous gullies, and the low ground at their base was narrow, save in what is now the S. part of the city, where there was a succession of hills of loose, barren sand, impassable for loaded wagons. In front of the town of Yerba Buena, as it was called previous to 1847, was a cove extending $\frac{1}{2}$ m. into the land and 1 m. wide between the projecting points of land known as Clark's point and Rincon point. Along the front line of this cove the water was 40 ft. deep, and around its edges there were mud flats which were bare at low tide. The sand ridges have been cut away, the gullies and hollows filled up, the hills cut down, and the cove filled in; and where large ships rode at anchor in 1849 are now paved streets. The country around the city is bare, with no trees and little fertile land within 20 m. The greater part of the peninsula is hilly and unfit for cultivation. There is but one road leading out of the city. The business streets are built up densely, but beyond that the houses are scattered at considerable intervals, and the settled part of the city may be said to cover an area of 9 sq. m. In the N. E. corner of the city is Telegraph hill, 294 ft. high; in the S. E. corner Rincon hill, 120 ft.; and on the W. side Russian hill, 360 ft. The densely settled streets are in the amphitheatre formed by the three hills. On account of the hills, some of which have been entirely cut down, the city has been laid off in different surveys not uniform with each other in the size of the blocks or the course of the streets; but in each survey, with rare exceptions, the streets are straight and cross each other at right angles. The principal retail shops are in Kearny, Market, and Montgomery streets, which are the most fashionable promenades; the banks and brokers' offices are in California street; the importers and jobbers are in Front, Sansome, and Battery streets; the principal fashionable residences are in Van Ness avenue, Pine street hill, and Taylor, Bush, Sutter, Post, Geary, and O'Farrell streets; and the Chinese quarter comprises portions of Sacramento, Commercial, Dupont, Pacific, and Jackson streets. The busiest streets are paved with Belgian block and cobble stones, and most of the residence streets are planked. The city is supplied with gas made from imported coal, and water is brought from Pilarcitos creek near the base of the peninsula, by a conduit 30 m. long; the supply at present is about 20,000,000 gallons a day. In February, 1875, there were in the city 23,700 buildings, of which 4,300 were of brick; the remainder were of wood, with the exception of perhaps half a dozen of adobe and as many of stone. The buildings erected in 1874 numbered 1,389, and cost \$9,344,000. The most notable buildings are the Palace hotel, Nevada bank, bank of California, merchants' exchange, Safe Deposit bank, Lick house, Occidental hotel, Grand hotel, Cosmopolitan hotel, custom house, mint, mercantile library, California theatre, grand opera house, a new

theatre not yet named, and the unfinished city hall. James Lick, a pioneer citizen, has given his property, valued at several million dollars, to trustees with instructions to erect various institutions that will contribute to science, art, and philanthropy, as well as ornament the city. The Palace hotel, the largest building of the kind in the world and the most complete in its appointments, is 275 by 350 ft. on the ground, nine stories high (counting two below the level of the street), can accommodate 1,200 guests, and cost with land and furniture \$3,250,000. The Occidental and Cosmopolitan hotels can each accommodate 400, the Lick house 350, and the Grand hotel 300. In the S. part of the city, 3 m. from the city hall, are the buildings of the old mission of San Francisco. The main structure is the church, built of adobe in 1778. Four miles W. of the city hall, and on the S. shore of the Golden Gate or entrance to the bay, is Fort

point, the chief defence of the entrance, which is there 1 m. wide. Alcatraz island, which contains another fortification, commanding both the entrance and the city, is 2 m. N. of the city hall. Although the city is on a sandy, rocky, treeless peninsula, with a site so ill fitted by nature for its present purposes that \$50,000,000 have been spent in grading, still it has much attractive scenery in its vicinity. The Golden Gate park contains 1,043 acres, and the Lone Mountain cemetery has in many respects no superior. Bridges each a mile long span Mission and Islais coves. The climate is peculiar. The mean temperature of January is 49°, and of July 57°. Furs are often seen in the streets in August, and snow is never seen in December. People go to San Francisco from the interior of the state to escape from the heat of summer, and the number of days so warm that the shade is necessary for comfort does not exceed a dozen in a year. As

New City Hall.

severe frost is unknown, tropical and subtropical plants need no shelter. The people are ruddier and stouter than Americans generally. —The growth of San Francisco has been unprecedented. In 1846 the population was 600; in the spring of 1848, when the gold fever broke out, it was 1,000; in 1852 a state census reported 34,870; the federal census in 1860 gave 56,802, but there were probably 70,000; according to the federal census of 1870 there were then 149,473; and in February, 1875, the number was estimated by local authorities at 230,000. Included in the last number were 83,956 white males over 21 years of age, 44,000 white females over 18, 43,573 white males under 21, 37,804 white females under 18, 19,000 Chinese, and 1,800 colored persons. In 1874, according to the city school census, there were 60,552 persons under 17 years of age, and of these 35,000 were between 6 and 17; 40,056 were born of foreign parents, 12,230 of native parents, and 5,956 of mixed

parentage. In 1870, according to the census, half the inhabitants were foreign, of whom 36 per cent. were Irish, 14 per cent. German, 13 per cent. Chinese, 9 per cent. English and Welsh, and 6 per cent. French, and the rest Scandinavians, Dalmatians, Spanish Americans, &c. Of the natives, 50 per cent., mostly children, were born in California, 16 per cent. in New York, 10 per cent. in Massachusetts, 3 per cent. in Maine, and some in every other state of the Union. There are German, French, Spanish, Italian, and Chinese newspapers, and Irish, German, French, Italian, Spanish American, Scandinavian, Dalmatian, Swiss, Dutch, and Chinese benevolent societies.—The only railroad terminating within the city limits is the Southern Pacific; the Central Pacific terminates at Oakland on the E. side of San Francisco bay, and the California Pacific and San Francisco and North Pacific lines terminate on San Pablo bay N. of the city. Ferry steamers ply to these points. There are eight

street railroads, with 45 m. of track. About 50 ocean steamers run from the port in regular lines to Japan, Australia, Panama, Mexico, Victoria, and domestic ports in Oregon and California, and a score of light steamers to various ports on the inland waters that have their outlet at the Golden Gate. In 1874 San Francisco exported \$30,000,000 of treasure, including \$20,000,000 to New York, \$8,000,000 to China, \$437,000 to Central America, \$400,000 to Peru, \$184,000 to England, and \$41,000 to Japan. The merchandise exports by sea in the same period were valued at \$27,000,000, including \$16,000,000 to Great Britain, \$1,668,000 to China, \$690,000 to Japan, \$1,000,000 to Mexico, \$453,000 to Central America, \$340,000 to Peru, \$450,000 to the Hawaiian islands, \$290,000 to the Society islands, \$382,000 to Australia, \$137,000 to New Zealand, \$693,000 to British Columbia, \$560,000 to France, \$339,000 to Germany, \$1,195,000 to Russian ports in Asia, and \$196,000 to the East Indies. The value of the principal articles of export was as follows: wheat (500,000 tons), \$14,000,000; flour, \$2,900,000; barley, \$289,000; oats, \$131,000; wines, \$600,000; quicksilver, \$711,000. There were also exported 18,000 tons of wool. The imports by sea included 261,000,000 ft. of lumber, 18,000 boxes of candles, 60,000 barrels of cement, 37,000 tons of English coal, 139,000 tons of Australian coal, 15,000 tons of Cumberland coal, 51,000 tons of Vancouver island coal, 11,000,000 lbs. of coffee, 34,000,000 lbs. of rice, 8,000,000 lbs. of tea, 71,000,000 lbs. of sugar, 355,000 fire brick, 28,000 boxes of fresh Oregon apples, 16,000 boxes of raisins, 214,000 kegs of nails, 305,000 cases of coal oil, and 34,000 cases, 8,000 baskets, and 15,000 casks (various sizes) of wine. The imports by rail were also large, and included some of the same classes of articles. The number of sea-going vessels that arrived was 4,204, with an aggregate measurement of 1,553,000 tons, of which nearly half came from Europe and New York. The sum of \$7,898,000 was paid for federal duties, and \$2,488,000 for internal revenue duties. The coinage was \$27,000,000. The sales of mining stock in the board of brokers amounted to \$260,000,000, and of real estate within the limits of the city to \$23,000,000. The site and some other circumstances of the city are unfavorable to manufacturing industry, but in the matter of climate and Chinese population, and in some other points, it has great advantages; and it has many important manufacturing establishments, including woollen and silk mills, and manufactories of watches, carriages, boots, furniture, candles, acids, soap, wire work, castings of iron and brass, and silver ware. San Francisco is the centre of great wealth and the home of many millionaires. Many of the mines of gold, silver, quicksilver, and coal, the deposits of borax and sulphur, the quarries of granite, marble, trap, slate, and steatite, the mining and irrigating ditches, the

railways and macadamized roads, the quartz mills and saw mills, the vineyards, farms, orchards, and ranchos, from Arizona to Idaho, and from the Pacific to the Rocky mountains, are owned here. The wealth of the city probably amounts to \$500,000,000; the assessed value of the property within its limits is about half that sum. The capital and deposits of the savings banks are \$55,000,000, and of the commercial banks \$25,000,000. The city owes much of its prosperity to the Comstock lode in Nevada, which pays about \$12,000,000 of annual dividends, and yields a considerable profit also upon the sales of mining stock, in which people from all parts of the coast speculate.—San Francisco is governed by a mayor and a board of supervisors of 12 members (one from each ward), elected for two years. The members of the board of education (one from each ward) are also elected biennially. The regular police force consists of 150 men. There is a paid fire department, with 11 steam engine companies, 5 hose companies, 3 hook and ladder companies, and a fire-alarm telegraph. The annual expenditures of the city government are \$3,500,000, including \$650,000 for schools, \$400,000 for interest and sinking fund of the debt, \$229,000 for street lights, \$224,000 for the fire department, \$190,000 for the police, and as much more for the hospital. The entire debt is \$4,162,000, less relatively than that of any other large American city. The taxation for city and state purposes in 1874 amounted to \$5,543,000. Among the charitable institutions are the United States marine hospital, the city hospital, the pest house, the almshouse (all government institutions), the woman's hospital, the lying-in hospital, and the hospitals of the sisters of mercy and of the French and German benevolent societies. There are 87 benevolent societies meeting openly, besides numerous secret societies that are at least partially benevolent in character. The public schools accommodate 30,000 pupils in regular attendance. The mercantile library has 40,000 volumes, the mechanics' institute library 30,000, the odd fellows' library 25,000, and the law library 15,000. There are an academy of sciences, a school of design, two medical colleges, and three academic institutions. The number of newspapers and periodicals is 75, viz.: 11 daily, 1 tri-weekly, 2 semi-weekly, 40 weekly, 1 bi-weekly, 2 semi-monthly, and 18 monthly. Of churches, the Methodists, Presbyterians, and Catholics have each 13; the Baptists, Episcopalians, and Lutherans each 7; the Congregationalists and Jews each 5; the Swedenborgians 2; and the Unitarians and Universalists each 1. In seven the German language is used, and the Russian, French, Spanish, and Swedish in one each.—The mission of San Francisco de Asis, frequently called the mission Dolores, was founded Oct. 9, 1776, by two Franciscan monks, Francisco Palou and Benito Cambon, natives of Spain. Their establishment grew, and in 1825 it had

76,000 head of neat cattle, 79,000 sheep, 3,000 horses, 18,000 bushels of wheat and barley, merchandise worth \$35,000, \$25,000 in cash, and about 1,800 Indians. For 58 years the missionaries had complete control of the mission, and it prospered without interruption until in 1834 the missions of California were secularized and given over to civil officers. Their downfall was then most rapid, and in a few years nothing remained save the adobe buildings. One of the first effects of the new policy of secularizing the missions, placing the country under the control of the civil powers, and encouraging colonization, was the establishment of the village of Yerba Buena, near the present site of the city hall. The first house was erected in 1835, and others followed slowly. The first survey of streets and town lots was made in 1839. A small trade was done in exporting hides, selling wheat to the Russians, furnishing supplies to whalers, and trading with the *rancheros* in the neighborhood. Very few vessels entered the harbor. In midsummer of 1846 an American man-of-war took possession of the place in the name of the United States. The town was known only as Yerba Buena until Jan. 30, 1847, when the *ayuntamiento* or town council changed it to San Francisco. On the discovery of gold in the spring of 1848 the town was deserted by many of its inhabitants from June to October; but the return of the adventurers in the autumn, the arrival of others from abroad, the increase of shipping, the abundance of money, and the profits of trade soon built up a city, and in 1849 San Francisco had become a great centre of commerce. But the houses were crowded together and built of combustible materials, and several great fires occurred; the first was on Dec. 24, 1849, when the estimated loss was \$1,000,000; the next on May 4, 1850, loss \$3,000,000; the third on June 14 of the same year, loss \$3,000,000; the fourth on May 2, 1851, loss \$7,000,000; the fifth on June 22, 1851, loss \$2,000,000. Yet these fires scarcely interrupted the prosperity of the place. It continued to grow rapidly until January, 1854, when, in consequence of over speculation in land, of a decline in the gold yield, and of the temporary decrease of shipping (the last the result of the home production instead of the importation of food), the business of the city became less profitable. The title to much of the land was in litigation; many houses were unoccupied; and the depression did not cease till August, 1858, when a new era of prosperity began, and the growth of the city has since been steady, notwithstanding a real estate panic, which, following immoderate expectations of the benefits to accrue from the Pacific railroad, began in May, 1869, and lasted four years. The city was incorporated in 1850, and the city and county were consolidated in 1856. In 1851 and 1856, in consequence of bad municipal government and corrupt administration of the criminal laws,

the people organized vigilance committees, and executed several criminals. (See CALIFORNIA.)

SAN FRANCISCO BAY, a sheet of water in California, connected with the Pacific ocean by a strait 5 m. long and 1 m. wide, called the Golden Gate, in lat. 37° 48' N., lon. 122° 30' W. It extends S. S. W. about 40 m., being separated from the Pacific by a peninsula from 6 to 15 m. wide, on the N. extremity of which is the city of San Francisco. The bay opposite the city is about 7 m. wide, and in its widest part 12 m. The shores of the Golden Gate are bold and rocky, rising on the north in some places nearly 2,000 ft., while on the south the hills are from 300 to 400 ft. high, many of them being covered with shifting white sand. On the bar there is 30 ft. of water at low tide; within there is a much greater depth and good anchorage. The principal islands are Alcatraz, in the middle of the channel, about 4 m. from the entrance; Angel, the largest, containing 800 acres; and Yerba Buena or Goat island, opposite the city. There is a fortification on Alcatraz island, and another at Fort point on the S. side of the Golden Gate. San Francisco bay is connected on the north by a strait 3 m. wide with San Pablo bay, which is nearly round and about 10 m. in diameter; and this receives from the east through Carquinez strait (1 m. wide) the waters of Suisun bay, which is about 8 m. long from E. to W. and 4 m. wide. San Pablo and Suisun bays are deep, but Carquinez strait has only 16 ft. of water at low tide. At the head of San Pablo bay is Napa or Mare island, on which is a United States navy yard. The Sacramento and San Joaquin rivers, which drain the great valley between the Sierra Nevada and Coast mountains, discharge into Suisun bay. The name San Francisco bay is often extended over San Pablo bay.

SANGAMON, a central county of Illinois, intersected by the Sangamon river, and traversed by several important railroads; area, 936 sq. m.; pop. in 1870, 46,352. The surface is mostly level prairie land diversified with forests of good timber. Bituminous coal is found in abundance. The chief productions in 1870 were 336,962 bushels of wheat, 4,388,763 of Indian corn, 397,718 of oats, 187,494 of potatoes, 50,682 tons of hay, 117,736 lbs. of wool, 554,196 of butter, and 58,487 of honey. There were 16,395 horses, 3,046 mules and asses, 8,897 milch cows, 26,219 other cattle, 29,749 sheep, and 76,429 swine; 5 manufactories of agricultural implements, 28 of carriages and wagons, 2 of iron castings, 2 of engines and boilers, 14 of saddlery and harness, 1 woollen mill, 15 flour mills, and 7 saw mills. Capital, Springfield, also the capital of the state.

SANGUINARIA. See BLOODROOT.

SANHEDRIM (accurately, *sanhedrin*, a Heb. word formed from the Gr. συνέδριον, assembly), the supreme council of the Jews in later times. Traditionally its origin is traced to the 70 elders appointed by Moses, but its Greek

name and the absence of earlier historic mention point to a time after the Macedonian supremacy. Its full development was under the earlier Asmoneans; and Herod, when procurator of Galilee, was summoned before the sanhedrim, charged with usurping its authority in sentencing men to death. Its members were chosen from the chief priests, elders, and scholars; and the tradition is that there were 70 besides the *nasi* or president. There was a vice president, who was called "father of the council." The usual meeting place was a hall called *lishkath haggazith* (hewn-stone chamber) within the temple enclosure. Before it Jesus was arraigned as a false prophet, and Peter, John, Stephen, and Paul as false teachers. Its power was nearly destroyed by Herod the Great, who put to death almost all its members. The Talmud also mentions a lesser sanhedrim of 23 members in every city of Palestine in which there were as many as 120 families.

SANILAC, an E. county of Michigan, bordering on Lake Huron and drained by the head streams of Black and Cass rivers; area, about 1,000 sq. m.; pop. in 1874, 16,292. It has an undulating and well timbered surface, and a moderately fertile soil. The chief productions in 1870 were 112,055 bushels of wheat, 49,782 of peas and beans, 145,396 of oats, 103,990 of potatoes, 14,901 tons of hay, 32,593 lbs. of wool, 250,832 of butter, and 32,999 of maple sugar. There were 1,941 horses, 3,265 milch cows, 1,419 working oxen, 3,700 other cattle, 9,182 sheep, and 3,760 swine; 4 flour mills, 16 saw mills, 5 manufactories of carriages and wagons, and 3 of furniture. Capital, Lexington.

SAN JACINTO, a river of Texas, rising in Walker co. and flowing S. S. E. into San Jacinto bay, an arm of Galveston bay; length about 120 m., of which 45 m. are navigable. It is deep and clear. Near its mouth, on April 21, 1836, was fought the decisive battle of San Jacinto. (See HOUSTON, SAM.)

SAN JACINTO, a S. E. county of Texas, bounded N. E. by Trinity river, and drained by small tributaries of the San Jacinto; area, about 500 sq. m. It has been formed since the census of 1870. The surface is undulating and the soil very productive. Capital, Cold Spring.

SAN JOAQUIN, a river of California, which rises in the Sierra Nevada mountains, in Fresno co., flows S. W. to the W. part of the county, and thence N. W. through Fresno, Merced, Stanislaus, and San Joaquin counties, and uniting with the Sacramento empties into Suisun bay, which through San Pablo and San Francisco bays communicates with the Pacific ocean. Tulare lake discharges into it at high water, and the river was formerly considered to rise in it. Its entire length is about 350 m. It is navigable at all seasons by vessels of from 150 to 250 tons to Stockton, about 50 m. above its mouth; in winter and spring steamers ascend nearly 200 m. further. It receives numerous tributaries from the Sierra Nevada, the chief

of which are the Fresno, Mariposa, Merced, Tuolumne, Stanislaus, and Calaveras. Its valley is noted for its fertility, producing great quantities of wheat and barley.

SAN JOAQUIN, a central county of California, intersected by the San Joaquin river, which here receives the Mokelumne, and bounded N. by the Calaveras and S. E. by the Stanislaus, tributaries of the San Joaquin; area, 1,452 sq. m.; pop. in 1870, 21,050, of whom 1,629 were Chinese. It lies between the foot hills of the Sierra Nevada and Coast ranges, but the surface is generally level, and a large portion of it treeless. Part of the extensive tract of tule marsh in the northwest has been reclaimed. The main line and Visalia division of the Central Pacific railroad and the Stockton and Copperopolis and Stockton and Visalia railroads traverse it. The chief productions in 1870 were 2,360,925 bushels of wheat, 37,350 of Indian corn, 1,027,016 of barley, 21,165 gallons of wine, 86,760 lbs. of wool, 292,060 of butter, 25,111 of cheese, and 41,214 tons of hay. There were 14,189 horses, 6,999 milch cows, 14,373 other cattle, 79,889 sheep, and 27,937 swine; 3 manufactories of agricultural implements, 6 of carriages and wagons, 2 of iron castings, 3 of machinery, 13 of saddlery and harness, 3 breweries, 1 tannery, and 2 flour mills. Capital, Stockton.

SAN JOSÉ, a city and the county seat of Santa Clara co., California, at the intersection of the Southern Pacific railroad with the San José branch of the Central Pacific line, 8 m. S. E. of San Francisco bay, and 40 m. S. E. of San Francisco; pop. in 1870, 9,089, of whom 3,755 were foreigners, including 714 Chinese; in 1875, estimated by local authorities at 15,000. The main portion of the city occupies a gently rising plateau, between the Coyote and Guadalupe rivers (small streams emptying into the bay), here $1\frac{1}{2}$ m. apart, with suburbs extending some distance beyond them. It is handsomely laid out, lighted with gas, and well supplied with water, and has a good fire department. Horse cars run through the main streets. The principal public buildings are the court house, a massive Corinthian structure costing \$200,000, with a dome commanding a fine view; the jail adjoining it, the finest in the state, costing \$80,000; the state normal school building, in the centre of Washington square, erected at a cost of more than \$200,000; the city hall; two markets, costing more than \$40,000 each; eight public school buildings; and ten churches, the largest and most expensive being an unfinished edifice belonging to the Roman Catholics. There are three public parks, containing 2, 8, and 30 acres respectively. The city owns a tract of 400 acres in Penitencia cañon, 7 m. E., reserved for a public park, containing a wild rocky gorge with a mountain stream and a variety of mineral springs. The climate is mild and equable, and the surrounding country yields grain and fruits abundantly. Slight earthquake shocks are not uncommon. The

city contains a woollen mill, three founderies and machine shops, three flouring mills, three planing mills, five or six carriage factories, three breweries, three distilleries, two large fruit-drying establishments, one fruit-canning establishment, three candy factories, two glove factories, a broom factory, a tannery, a starch factory, and a furniture factory. The banking institutions are a national gold bank and three banks of discount and deposit, with savings departments; aggregate capital, \$2,350,000. The public schools are graded. The college of Notre Dame (Roman Catholic), a day and boarding school for girls, founded in 1851 and incorporated in 1855, has a fine building and extensive grounds. The San José institute and business college, a day and boarding school for both sexes, founded in 1862, has commodious buildings. At Santa Clara, 3 m. W., is Santa Clara college, under the management of the Jesuits, founded in 1851 and incorporated in 1855. It occupies a number of elegant buildings in an enclosure of about 12 acres. Between Santa Clara and the city is the university of the Pacific (Methodist Episcopal), connected with which is a young ladies' seminary. The university was founded in 1852, and has been recently removed from Santa Clara. San José has an opera house seating 1,200, and an elegant and commodious music hall. The San José library association, incorporated in 1872, has 4,000 volumes. Three daily and three weekly newspapers and a monthly periodical are published. There are Baptist, Episcopal, Friends', Jewish, Methodist, Presbyterian, and Roman Catholic churches, and a Unitarian society.—San José was settled by the Spaniards before 1800, but remained merely a collection of adobe huts till after the cession of the country to the United States. The legislature of California held its first session here in the winter of 1849-'50, and assembled here again the following winter, but soon removed to Vallejo.

SAN JOSÉ, a city and the capital of the republic of Costa Rica, near the head waters of the Rio Grande, almost midway between the Atlantic and the Pacific; lat. $9^{\circ} 54' N.$, lon. $84^{\circ} 3' W.$; pop. about 26,000. It lies in a picturesque valley, 4,500 ft. above the sea, formed between the Herradura mountains on the south and those of Barba on the north. Its streets are laid out with great regularity, but the buildings are low and unimposing. Among the best of the latter are the cathedral, the episcopal palace, and the government buildings. A railway is in course of construction (1875) to connect it with Punta Arenas, its port on the Pacific, and with Limon on the Atlantic. The national bank of Costa Rica was established here in 1873, with a capital of \$2,000,000. San José became the seat of government after the destruction of Cartago, the former capital, by an earthquake, Sept. 2, 1841.

SAN JUAN, an island of Washington territory, in Washington sound, between the gulf

of Georgia on the north, the strait of Fuca on the south, Rosario strait on the east, and the canal de Haro on the west, about lat. $48^{\circ} 30' N.$, lon. $123^{\circ} W.$; length 15 m., greatest breadth 7 m.; area, about 60 sq. m.; pop. in 1870, 376, including the American garrison of 98 men, but exclusive of the British garrison. The N. part is mountainous and heavily timbered; the S. part has many beautiful and fertile prairies, and excellent pasturage. Coal and limestone are found. The adjacent waters abound in cod, halibut, salmon, and other fish. This and several smaller islands were included in Whatcom co. till 1873, when they were formed into the county of San Juan. The largest of the other islands are Orcas, about 60 sq. m., and Lopez, about 80 sq. m. The rest have an aggregate area of about 50 sq. m., the principal being Blakely, Decatur, Shaw, Waldron, Henry, Spieden, Stuart, and Sucia. Total area of the county, about 200 sq. m. The population of Orcas island in 1870 was 108; of Lopez, 48; of the others, except San Juan, 22; and of the entire group, 554, including 72 Indians; white population in 1874, 545.—San Juan derives its chief importance from the dispute respecting its possession between Great Britain and the United States. The treaty of June 15, 1846, for the settlement of the Oregon boundary, fixed upon the 49th parallel as the line to "the middle of the channel which separates the continent from Vancouver island, and thence southerly through the middle of said channel and of Fuca's straits to the Pacific ocean." Subsequently Great Britain claimed that Rosario strait was the channel intended, while the United States insisted upon the canal de Haro, leaving Washington sound with its numerous islands in dispute. In November, 1859, an arrangement was entered into between the two governments for a temporary joint military occupation, in pursuance of which a British garrison was established in the N. part and an American garrison in the S. By article 34 of the treaty of Washington, May 8, 1871, the question in dispute was referred to the arbitration of the emperor of Germany, who in October, 1872, decided in favor of the United States; and in the following month the British garrison was withdrawn.—See vol. v. of "Papers relating to the Treaty of Washington," published by the department of state (1872).

SAN JUAN DE NICARAGUA, *San Juan del Norte*, or *Greytown*, a port of Nicaragua, on a promontory near the mouth of the river San Juan, on the Caribbean sea, in lat. $10^{\circ} 56' N.$, lon., $83^{\circ} 45' W.$; pop. about 300. The houses, none of which have more than two stories, are now in a state of decay. San Juan derives its chief importance from being the principal port of Nicaragua on its E. coast. It was occupied by a British force in 1848 as belonging to the "Mosquito kingdom," became prominent as the terminus of the Nicaragua transit in 1853, when its inhabitants organized an independent

municipal government, and was secured to Nicaragua by treaty with Great Britain in 1860. It was bombarded in 1854 by a naval force of the United States, on a charge that its inhabitants had infringed upon the rights of the transit company. Since then its harbor has become nearly choked with sand.

SAN JUAN DE PUERTO RICO, a fortified city, capital of the island of Porto Rico, on a small island off the N. coast; lat. $18^{\circ} 29' N.$, lon. $66^{\circ} 7' W.$; pop. about 20,000. The streets are regularly laid out, well kept, and lighted with gas. The public buildings are the old government house, the royal military hospital, the bishop's palace and seminary, a large cathedral, an arsenal, custom house, city hall, and several fine castles, now used as barracks. There are a house of refuge and instruction for the indigent, an insane asylum, and other benevolent institutions. San Juan has several primary schools, a college in course of construction (1875), and a fine library. The port is difficult of access, but is considered one of the most important in the Antilles, and a direct trade has recently been established with Europe and the United States. It is regularly visited by the steamers of the British lines frequenting the West Indies. The principal exports are sugar, mostly to the United States, coffee to Germany, and some tobacco.

SAN JUAN RIVER. See NICARAGUA.

SAN LUCAR DE BARRAMEDA, a city of Andalusia, Spain, situated in a barren district at the mouth of the Guadalquivir, in the province and 18 m. N. by W. of the city of Cadiz; pop. about 16,000. It contains many churches and convents, and a hospital founded in 1517 by Henry VIII. of England for British sailors. Cotton and silk goods, leather, soap, and barrilla are manufactured. The chief export is wine. It serves as a seaport to Seville.

SAN LUIS. **I.** A central province of the Argentine Republic, bordering on La Rioja, Cordova, the pampas W. of Buenos Ayres, Mendoza, and San Juan; area, 20,000 sq. m.; pop. in 1869, 52,761. In the north it is mountainous, with several high peaks. The southern districts abound in excellent pasture lands, on which are reared large numbers of cattle. The Rio Quinto is the only river of importance. There are some lakes, the largest of which is the Bebedero, of considerable extent, and supplying salt for the whole province. Much rain falls. The soil is favorable for the cultivation of all the European products. Oranges and grapes are especially abundant, and large quantities of excellent wines are made. The chief articles of commerce are hides, sheep and guanaco wool, skins, leather, ostrich and condor feathers, gold, auriferous copper, precious stones, and salt. Of 14,576 children from 6 to 14 years of age, 2,600 attended school in 1869. The province is divided into eight departments. **II.** A city, the capital of the province, 460 m. W. N. W. of Buenos Ayres; pop. in 1869, 3,748. It is beautifully situated at

an elevation of about 2,500 ft., with a mild climate. The chief industries are agriculture and the manufacture of wines. The city, sometimes called San Luis de la Punta, was founded by Luis Loyola in 1596.

SAN LUIS OBISPO, a S. W. county of California, bounded W. by the Pacific, E. by the Coast range, and S. by the Guaymas or Santa Maria river, and drained by the head waters of Salinas or Buenaventura river; area, about 3,000 sq. m.; pop. in 1870, 4,772, of whom 59 were Chinese. The surface is partly mountainous, and the soil fertile. Gold, silver, coal, and limestone are found; there are bituminous springs, and a celebrated warm sulphur spring. The chief productions in 1870 were 38,864 bushels of wheat, 25,982 of Indian corn, 126,604 of barley, 16,519 of peas and beans, 903,863 lbs. of wool, 156,340 of butter, 341,259 of cheese, and 5,714 tons of hay. There were 4,485 horses, 4,813 milch cows, 15,899 other cattle, 191,909 sheep, and 3,319 swine. Capital, San Luis Obispo.

SAN LUIS POTOSI. **I.** An E. state of Mexico, bounded N. E. by Nuevo Leon, E. by Tamaulipas and Vera Cruz, S. by Hidalgo, Querétaro, and Guanajuato, and W. and N. W. by Zacatecas; area, 28,889 sq. m.; pop. in 1869, 476,500. In the southeast the surface is flat, but in other directions it becomes broken and hilly, terminating in mountains and a high table land in the west. The most important rivers are the Santander and Tampico. Large crops of wheat, maize, and barley are raised, and great numbers of cattle are reared. There are several copper mines. The manufactures include woollen and cotton goods, glass, leather, earthenware, and hardware. **II.** A city, capital of the state, upward of 6,000 ft. above the sea, 220 m. N. W. of Mexico, and 100 m. S. E. of Zacatecas; pop. in 1869, 31,389. It has six handsome churches, three convents, a hospital, a government house, and several schools, and manufactories of shoes, hats, and hardware.

SAN MARINO. **I.** A republic in N. E. Italy, the oldest and next to Monaco the smallest state in Europe; area, 22 sq. m.; pop. in 1874, 7,816. It is surrounded by the provinces of Forli and Pesaro ed Urbino, is mountainous, and has four or five villages. Wine, silk, and fruits are the principal products. It was settled, according to tradition, in the 4th century by Marinus, a Dalmatian hermit, and has ever since the establishment of its government remained independent. The legislature consists of a council of 60, taken equally from the ranks of nobles, burgesses, and small proprietors, and appointed for life by the councillors themselves. An executive body of 12 is selected from this number; two presidents (*capitani reggenti*) are chosen every six months, and justice is administered by two foreign magistrates appointed for three years. The annual revenue is about \$14,000. In 1874 the harboring in San Marino of fugitives from justice led to complications with the Italian gov-

ernment. **II.** A city, capital of the republic, 8 m. S. W. of Rimini; pop. about 6,000. It is situated on the summit of a rugged mountain, and contains a remarkable cabinet of medals, a theatre, five churches, two convents, a town house, and a statue of Marinus.

SAN MARTIN, José de, an Argentine general, born at Yapeyú, Feb. 25, 1778, died in Boulogne, France, Aug. 17, 1850. He received a military education in Spain, served with distinction at Baylen, and became a colonel in the Spanish army. He returned to South America on the outbreak of the war of independence, and organized the Argentine forces. After repeated victories over the royalists, he was made in 1814 commander-in-chief of the ill-fated expedition to Upper Peru against the troops of the viceroy of Lima. Withdrawing to the province of Cuyo, he soon raised an army, with which he crossed the Chilian Andes, and defeated the royalists under Osorio in the battle of Chacabuco, Feb. 12, 1817. Declining the presidency of Chili, he defeated the Spaniards again at Maypu, April 5, 1818, and Chilian independence was secured. In 1820 he marched into Peru, accompanied by Bernard O'Higgins, president of Chili, entered Lima, drove the Spaniards into the interior, declared Peru independent (1821), and assumed the dignity of protector, which he was forced to resign in 1822. Having retired to private life, he went to Europe, and lived in England, the Netherlands, and France.

SAN MATEO, a W. county of California, bordering on the Pacific, and bounded N. E. by the bay of San Francisco; area, 432 sq. m.; pop. in 1870, 6,635, of whom 519 were Chinese. The surface is hilly and well timbered, and the soil fertile. Excellent coal is found, and there are mineral springs of sulphur and iron. It is traversed by the Southern Pacific railroad. The chief productions in 1870 were 107,049 bushels of wheat, 294,318 of oats, 171,207 of barley, 329,875 of potatoes, 285,460 lbs. of butter, 469,295 of cheese, and 19,065 tons of hay. There were 3,238 horses, 5,140 milch cows, 4,688 other cattle, 6,535 sheep, and 5,829 swine; 2 flour mills, 1 tannery, and 11 saw mills. Capital, Redwood City.

SAN MIGUEL, an E. county of New Mexico, bordering on Texas, intersected by the Rio Pecos and Canadian river, and watered by their tributaries; area, about 10,800 sq. m.; pop. in 1870, 16,058. A S. projection of this county divides Bernalillo and Valencia counties into two parts. The N. W. portion is mountainous. The chief productions in 1870 were 13,321 bushels of wheat, 83,145 of Indian corn, 186,626 lbs. of wool, 18,650 of cheese, and 1,747 tons of hay. There were 649 horses, 979 mules and asses, 4,834 milch cows, 3,236 working oxen, 4,571 other cattle, 194,309 sheep, and 549 swine; 4 flour mills, and 3 saw mills. Capital, Las Vegas.

SAN MIGUEL, a city of San Salvador, capital of a department of the same name, in a broad

and fertile plain, about 90 m. E. S. E. of the city of San Salvador; pop. about 12,000. It is the most important trading town in Central America. The great fair of La Paz is held here every year. About 5 m. W. of the city is a volcano of the same name, 6,680 ft. high, rising abruptly from the plain, which sends out great volumes of smoke, and occasional eruptions open vast fissures in its sides.

SAN MIGUEL, Evariste, a Spanish general, born in Gijon in 1780, died in Madrid, May 29, 1862. He entered the army in 1808, became a lieutenant colonel, and was elected to the cortes. After the restoration of Ferdinand VII. he edited a liberal paper. In 1820 he served under Riego in the Andalusian expedition, and composed the "Hymn of Riego." He was banished to Zamora in 1821, but recalled in 1822, and made minister of foreign affairs. On the French invasion in 1823 he rejoined the army, was taken prisoner and exiled, and resided in England till 1834. Under the proclamation of a general amnesty he returned, and was for ten years a member of the cortes. In 1854 he became president of the revolutionary junta of Madrid, minister of war, field marshal, and provisional president of the cortes. He wrote several works on the history of his country.

SANNAZARO, or **San Nazaro, Jacopo**, an Italian poet, born in Naples in 1458, died there in 1530. His first poetical compositions obtained him the patronage of Frederick III. of Naples, whom he afterward followed into exile, returning to Naples only after the death of his benefactor, and declining the protection of Gonsalvo de Cordova. His chief works are: the *Arcadia* (4to, Venice, 1502; Naples, 1504; Milan, 1808), a pastoral romance, which had upward of 60 editions in the 16th century; his six *Elogæ* (published with the following), according to Paolo Giovio his most perfect work, in which the coast populations of Italy replace the shepherds of Virgil; and *De Partu Virginis Libri III.* (fol., Naples, 1526; Venice, 1528, 1535; Amsterdam, 1679, 1728), of which Hallam says: "It would be difficult to find its equal for purity, elegance, and harmony of versification."

SAN PATRICIO, a S. county of Texas, bounded N. E. by the Aransas river, S. W. by the Nueces, and S. by the gulf of Mexico; area, 625 sq. m.; pop. in 1870, 602, of whom 64 were colored. It has considerable good land, but is subject to summer droughts. Stock raising is the chief business. Nearly half the county is covered with mezquite and other trees. The chief productions in 1870 were 21,325 bushels of Indian corn, 9,010 of sweet potatoes, and 7,325 lbs. of wool. There were 4,973 horses, 30,828 cattle, 2,845 sheep, and 1,281 swine. Capital, San Patricio.

SAN PETE, an E. county of Utah, bordering on Colorado, and intersected by Green river; area, about 7,000 sq. m.; pop. in 1870, 6,786. The W. part is crossed by the Wahsatch moun-

tains, watered by the Sevier river, and has abundant timber and considerable land adapted to agriculture. In the east are numerous large but generally unoccupied valleys. The chief productions in 1870 were 91,443 bushels of wheat, 3,867 of Indian corn, 9,197 of oats, 5,256 of peas and beans, 58,655 of potatoes, 12,509 lbs. of wool, 61,887 of butter, and 4,084 tons of hay. There were 805 horses, 1,794 milch cows, 1,908 other cattle, 7,407 sheep, and 361 swine; 7 manufactories of furniture, 2 wool-carding establishments, 1 flour mill, and 11 saw mills. Capital, Manti.

SAN REMO, a town of Italy, in the province of Porto Maurizio, on the coast, 25 m. E. N. E. of Nice; pop. about 10,000. It is picturesquely situated on a declivity descending to the seashore, which is covered by a dense growth of olive trees. The streets are narrow and steep, and there are several ancient churches. The palazzo Garbarino contains Raphael's *Madonna della Rovere*. San Remo has become a rival of Nice and Mentone as a residence for invalids.

SAN ROQUE, a city of Andalusia, Spain, in the province and 57 m. S. E. of the city of Cadiz, near the head of the bay of Gibraltar; pop. about 8,000. There is trade in grain and provisions. Owing to its healthful situation on a rocky eminence, and the low price of living, it is frequented by summer visitors.

SAN SABA, a W. county of Texas, bounded N. and E. by the Colorado and intersected by the San Saba river; area, 1,100 sq. m.; pop. in 1870, 1,425, of whom 144 were colored. The surface is partly mountainous. There are sulphur springs in the S. E. part. The chief productions in 1870 were 49,710 bushels of wheat, 3,187 of sweet potatoes, 3,518 lbs. of wool, 3,090 of honey, and 1,870 gallons of molasses. There were 16,343 cattle, 1,465 sheep, and 5,394 swine. Capital, San Saba.

SAN SALVADOR. **I**. The smallest but most populous of the five republics of Central America, comprised between lat. 13° and 14° 30' N., and lon. 87° 30' and 90° 20' W., bounded N. and E. by Honduras, S. E. by Fonseca bay, S. by the Pacific, and N. W. by Guatemala; area, according to Squier, 9,600 sq. m., though most recent authorities give it at not more than 7,500 sq. m.; pop. estimated at 600,000, of whom 9,000 are whites, 300,000 Indians, 290,000 mestizoes, and 1,000 negroes. Except the extensive and safe port of La Union, on the W. shore of the bay of Fonseca, the harbors (Acajutla, La Libertad, and Jiquilisco) are merely open roadsteads. A narrow tract of low, rich, alluvial land, 20 m. wide, extends along the shore as far as La Libertad; further N. the coast is rising and broken. Several short mountain ranges of moderate height traverse the interior. About 12 to 15 m. from the coast are the volcanoes of Apaneca, 5,826 ft. high; Isalco, which is unceasingly active, 4,060 ft.; San Salvador, 7,376 ft.; San Vicente, 7,500 ft.; San Miguel, 6,680 ft.; Santa Ana, 6,615 ft.; Cojutepeque, 5,700 ft.; Tecapa, 5,200 ft.; Usu-

lutan, 4,250 ft.; Chinameca, 4,750 ft.; and Conchagua, 4,800 ft. The chief river is the Lempa, deep but rapid, about 150 m. long, principally fed by the lake of Guija, near the N. W. boundary of the state. Lake Ilopango, nearly in the centre of the state, is about 9 m. long and 3 m. wide. The soil is generally good, in some parts remarkably rich; but the frequent political dissensions have materially retarded agriculture. Considerable maize is planted; oranges, lemons, pineapples, and plantains are extensively grown; sugar, cacao, coffee, cotton, and tobacco yield bountiful crops. But indigo is by far the most important source of wealth, though the quantity raised has considerably diminished since the era of independence. The Balsam coast, where the balsam of Peru is collected, is W. of Point Libertad; the Indians collect annually about 20,000 lbs. Numerous fine cattle are raised. The hills are crossed by innumerable metallic veins, but the mineral wealth of the country is imperfectly developed, and the rich silver mines are almost entirely neglected; excellent iron ore is obtained near Metapa. The manufactures consist of coarse cotton goods, cutlery, and iron ware. Although warmer than Guatemala, the country is generally healthful, excepting the low tract along the coast. The republic is divided into the departments of San Miguel, San Vicente, La Paz (capital, Sacatecoluca), Chalatenango, Cuscatlan (capital, Suchitoto), San Salvador, Sonsonate, and Santa Ana, with capitals of the same names except in the two cases noted. San Salvador is the capital of the republic; and, besides it and the department capitals, there are 140 smaller towns and 62 villages. Fairs have been established by the government in different parts of the state; the principal one is held at San Miguel. The main article sold is indigo. In 1872 the imports amounted to \$3,000,000, and the exports to \$3,800,000. The public debt in 1869 was \$705,800, at 6 per cent. The president, whose term was formerly six years, is now elected every four years. The legislature consists of a senate with 12 members, and a house of representatives with 24 members, all elected for two years, half of the members being replaced by new ones every year. Every male citizen over 21 years old is entitled to vote, except domestic servants and those who are without a legal occupation, contract debts fraudulently, owe money past due to the state, enter the service of a foreign power, or are notoriously of bad character; foreigners may become naturalized after five years' residence. Ecclesiastics and soldiers in active service are debarred from civil government offices. The president as well as the representatives and senators must possess property of a specified value. Each department governor is elected for two years. The standing army consists of 1,000 men, and the militia of 5,000. Though the Roman Catholic church is recognized by the state, all other denominations are protected in

their worship. In education this republic excels the other states of Central America, and has a very well endowed university in the capital. Duties on imports, stamped paper, and the monopolies of tobacco and rum furnish the revenues.—When Pedro de Alvarado, the lieutenant of Cortes, invaded this region in 1524, it had a dense population and large, well built cities. In 1528 the city of San Salvador rose on the site of the ancient Cuscatlan, and under the Spanish rule the province became a flourishing portion of the kingdom of Guatemala. The independence of this part of the Spanish dominion was accomplished in 1821 almost without bloodshed. The present five republics constituted themselves as the confederated republic of Central America. When a violent effort was made to incorporate it with Mexico (under the emperor Iturbide), San Salvador decreed its annexation to the United States, but the fall of the Mexican empire re-established the Central American republic (1823), of which the city of San Salvador was made the capital. It became an independent commonwealth in 1839, and in 1856 assumed the title of republic. In all the revolutions of Central America, San Salvador, owing to its geographical position, has been compelled to take an active part. In 1862 a war broke out with Guatemala, which aimed at a supremacy over all Central America; but the troops of the latter state were repulsed, and a peace was effected in February, 1863. A second attempt at invasion by Guatemala in April, 1863, proved unsuccessful in the beginning, but ended with the capture of San Salvador by Carrera, president of Guatemala, in October. Barrios, president of San Salvador, was recalled from Panama in May, 1865, by the revolutionary party; but he was defeated and shot, after a trial by court martial. Duenas, provisionally elected in 1863, was reelected for four years in 1865, and continued in office till 1869. Under him the government endeavored to open the country, to construct and improve roads, and to build bridges and wharves. Gonzalez succeeded him as provisional president, and was reelected for four years in 1872, when a treaty of friendship and alliance was made between this republic and Guatemala.

II. A city, capital of the republic, on the Aselhuate, in lat. 13° 40' N., lon. 89° 5' W.; pop. about 16,000. It is situated in a delightful valley more than 2,000 ft. above the sea, about 3 m. S. E. of the volcano of San Salvador, famous for its numerous and disastrous eruptions. The streets are regularly laid out, and generally well kept. In the centre is a spacious plaza, on which before the late earthquake stood the cathedral, very large but of little architectural beauty, and three rows of handsome arcades. The other principal public buildings were eight churches, the university, a female seminary, a hospital, and two aqueducts. Fine sugar and indigo plantations abound in the vicinity, and there are numerous hot springs.

The chief industry is agriculture, the once extensive hardware and cotton manufactures having dwindled to comparative insignificance.—San Salvador was founded in 1528 by Jorge de Alvarado. It has frequently suffered from earthquakes, the most disastrous of which were that of April 16, 1854, when the city was almost completely destroyed, and a large number of the inhabitants (then numbering some 30,000) perished; and that of March 19, 1872, by which most of the public edifices and dwelling houses were thrown down, 50 persons killed, and more than 500 seriously injured. It was, however, resolved to rebuild the city on the same site, for the eighth time since its foundation. A new university and several public schools have been organized of late.

SAN SALVADOR, or **Cat Island**, an island of the Bahama group, 28 m. E. S. E. of Eleuthera; length nearly 50 m., breadth from 3 to 7 m.; pop. about 1,000. This island has generally been supposed to be Guanahani, the first land seen by Columbus in the new world (Oct. 12, 1492), and named by him San Salvador. Humboldt and Irving have defended this view, but Navarrete combats it and advocates the claims of Grand Turk island; and Watling island and Mayagana, of the same group, have been identified with Guanahani respectively by A. B. Becher ("Journal of the Royal Geographical Society," 1856) and F. A. de Varnhagen (*La verdadera Guanahani de Colon*, 1864). Becher's view has been adopted by Daniel, Petermann, and other eminent geographers.

SAN SALVADOR, a city of Brazil. See **BAHIA**.

SAN SEBASTIAN. See **SAINT SEBASTIAN**.

SANSKRIT, the literary language of the Hindoos, the Aryan inhabitants of India. Originally a vernacular dialect in Hindostan, it has for nearly or quite 2,000 years past been kept artificially in use, like the Latin in Europe, by the labors of grammarians and lexicographers, and the transmitted usages of an educated caste, to serve as the means of learned intercourse and composition. Its name (*saṁskṛta*, completed, perfected) denotes it as "the cultivated, elaborated, or perfected form of speech," in distinction from the uncultivated dialects, called Prakrit (*prakṛti*, nature), which sprang from or were contemporaneous with it. The importance and interest of the Sanskrit is twofold. Considered in its relation to Indian history, it contains an immense literature, laying open from a very remote epoch nearly to the present day the inward and outward life of a numerous and highly endowed branch of the human family (India still contains a seventh part of our race); and it is the most ancient and original of the Indo-European languages, and, by reason of its better conservation of the features of their common parent, throws vastly more light than any other upon the history and relations of all. The latter is the more widely appreciated side of its usefulness, and the one which has most contributed to give currency to its study. Its cultivation by Europeans dates less

than a century back, to the establishment of English supremacy in India, nor did it gain a foothold on European ground till after the beginning of the present century. The earliest translations of Sanskrit works were of the *Bhagavad-Gītā* in 1785, the *Hitopadesa* in 1787, and the *Sakuntalā* in 1789. Sir William Jones, and later Colebrooke and Wilson, were the Englishmen who did most in India to foster and advance the study; the Schlegels in Germany and Chézy in France were the first who introduced it upon the continent. Bopp (from 1830 onward) founded upon it the new science of the comparative grammar of the Indo-European languages, of which others before him had given but hints or fragments. Within 30 years the introduction of the Vedas to the knowledge of the world has made a new era in Sanskrit study. Hundreds of Sanskrit texts have been published in the East and in the West; translations from them, with grammars, glossaries, and other apparatus for the learner, are to be found in every cultivated language of Europe; all the considerable universities have instructors in Sanskrit, and its students are everywhere numerous.—The Sanskrit is ordinarily written in a character called *dēvanāgarī*, “divine city,” which, in its present fully developed form, is of a date several centuries later than the Christian era. The ancient alphabet from which it is descended was derived, according to the best opinion, from a Semitic source. Respecting the origin of writing there are not even any traditions in the Hindoo literature, as regards either its period or its place of derivation; and scholars are still at variance as to whether whole departments of the literature were composed before or after the knowledge of a written character. The earliest dated monuments known are those of the Buddhist monarch Priyadarsi, of the 3d century B. C.; their language is already Prakrit. The *dēvanāgarī* is written from left to right; it is a complete mode of writing, representing every analyzable sound by a separate sign; it is syllabic, each consonant implying a short *a*, if the sign of no other vowel is attached to it; if more consonants than one are to be spoken with one vowel, their signs are united into a single compound character. (See INDIA, RACES AND LANGUAGES OF, vol. ix., p. 217; and for the method employed in transcribing the sounds, see WRITING.) The completeness of this system of written signs, and its nice adaptation of sign to sound, are very evident. Not less evident is the richness of the system of sounds, and the harmony and proportion of its development. The spoken alphabet has the proper characteristics of an ancient and primitive system, lacking many of the later intermediate vowels, spirants, and the like, and the written alphabet, of course, is correspondingly defective; the English has at least five vowels (or nine, if long and short be counted as separate) and six consonants for which the Sanskrit alphabet has no signs. A peculiar

and striking feature of the external form of the Sanskrit is presented by its highly elaborate system of euphonic rules, which have play both in the formation and inflection of words, and also, in a yet more searching and extended manner, in the combination of words into a sentence. The ends sought are chiefly the avoidance of the hiatus and of the concurrence of surd and sonant letters, the assimilation of nearly kindred sounds, and the modification of combinations difficult of utterance; and the physical theory of most of the rules is readily traceable. As an illustration of the euphonic combination of the phrase, we take the words *indras apabharan apām garbhān charati apsu antar*; they form the sentence *indro 'pabharann apāṅ garbhāṅ charaty apsu antaḥ*. That there is something artificial and arbitrary in the strict application of the system of euphonic changes to the sentence is in itself highly probable, since we can hardly conceive that any people, in its ordinary use of language, should so sacrifice the independence of individual words to an exaggerated sense of euphony; and the probability becomes a certainty when we observe that in the Vedic poetry, the earliest and least artificial literature of the language, the euphonic rules, as is shown by the metre, are in great part unobserved. The accents are the acute and the circumflex, corresponding in value to those of the Greek. Neither is limited to any particular part of the word, like those of the Latin and Greek; it may stand, in a word of whatever length, on whatever syllable the rules of derivation or composition may direct. The circumflex but seldom rests on a simple long vowel; it belongs chiefly to a syllable whose vowel is preceded by a semi-vowel convertible into a vowel, as *krāḍ*, *nadyās*.—As regards the etymological part of grammar, the distinguishing characteristic of the Sanskrit is (besides the great affluence of forms, and the unlimited facility of forming new derivatives and new compounds) its remarkable preservation of original materials and processes, the great regularity and consequent transparency of its formative methods. In most words there is no difficulty in distinguishing root, affix, and termination, and in recognizing the original form and signification of each. For analyzing words, retracing their history, and referring them to their ultimate roots, the utmost facilities are afforded. This character of the language has determined that of the native science of grammar, on which our own grammatical treatment of it is mainly based. The Hindoo grammar is essentially analytical and etymological, dissecting out roots, affixes, themes, and terminations, and laying down the rules which govern their combination into vocables. About 2,000 roots are catalogued by the native authorities, but the greater part are of no account, being either slightly varied forms of others, or mere grammatical artificialities. The Indo-European roots are far more numerous and faithfully pre-

served, in form and signification, by the Sanskrit than by any other member of the family. It is this remarkable conservation of materials and processes which gives prominent importance to the Sanskrit in Indo-European philology, making its introduction the inauguration of a new era in etymologizing, and so in the science of language, which is based on etymology, or the history of individual words.—The whole system of inflection in Sanskrit is most nearly accordant with that of Greek; it is decidedly richer in declension, but vastly poorer in conjugation. In declension, it distinguishes three genders, the masculine and neuter agreeing in theme, and usually in inflection, the feminine having long terminal vowels and fuller endings. The cases are eight: the nominative, with which in most instances the next case, the vocative, agrees in form; two other cases of relation, the dative expressing for, the genitive of; and four cases of position or direction: the accusative, expressing to, direct approach, immediate action; the ablative, expressing from; the locative, in; the instrumental, by the side of, along with, with, by. Each occurs in three numbers, singular, dual, and plural, and the usual terminations are as follows: sing. nom. *s* (neut. *m* or wanting), acc. *m*, inst. *ā*, dat. *ē*, abl. *as* (or *t*), gen. *as* (*asya*), loc. *i*; dual, nom., acc., and voc. *āu* (neut. *ī*), inst., dat., and abl. *bhīdām*, gen. and loc. *os*; pl. nom. *as* (neut. *āni*, *ī*), acc. *as* (masc. *n*), inst. *bhis*, dat. and abl. *bhyas*, loc. *su*. Adjectives are declined like substantives; as comparative and superlative suffixes they add *tara* and or *īyans* and *ishtha*. The numerals closely accord with those in the related languages. (See GERMANIC RACES AND LANGUAGES, vol. vii., p. 740.) The pronouns, excepting the first and second personal, distinguish three genders. They derive themselves from roots of their own, which play also an important part in the development of forms and form-words. Their many irregularities of declension agree nearly with those of the pronouns in the other Indo-European dialects, nor are their roots peculiar. The verb has two voices, an active and a middle or reflexive, which latter, in a part of its forms, serves also as a passive, as in Greek. It distinguishes throughout, like the noun, three numbers, with the usual three persons in each, and the personal terminations are evidently reducible to forms of pronouns, indicating in each case the subject; they are of two classes, corresponding to those of the principal and historical tenses in Greek. In their normal form they are as follows: active: princ. sing. *mī*, *sī*, *tī*; dual, *vas*, *thas*, *tas*; pl. *mas*, *tha*, *anti*; hist. sing. *m*, *s*, *t*; du. *va*, *tam*, *tām*; pl. *ma*, *ta*, *an*;—middle: princ. sing. *ē*, *sē*, *tē*; du. *vahē*, *āthē*, *ātē*; pl. *mahē*, *dhvē*, *antē*; hist. sing. *i*, *thās*, *ta*; du. *vahī*, *āthām*, *ātām*; pl. *mahī*, *dhvam*, *anta*. The present and imperfect tenses exhibit various modifications of the verbal root into a special stem, on which is founded a division of the verbs

into ten conjugational classes; all are analogous with changes which the Greek verbs more irregularly undergo in the same tenses, and with scattered phenomena in the other related languages. The present has an imperative, distinguished by special terminations, and a potential, corresponding to the Greek optative, having for its characteristic the vowel *i*, or the syllable *ya*, inserted between the root and the personal ending. Of a subjunctive, made, as in Greek, by an *a* between root and ending, only fragments remain, in the antiquated dialect of the Vedas. The characteristic of the imperfect is an augment, a prefixed *a*. Of other tenses, we have an augmented aorist, of double formation, as in Greek; a “second aorist,” which is the imperfect of the unmodified root, and a “first aorist,” in several varieties, having *s* as its sign; a perfect, reduplicated, and with peculiar terminations; a periphrastic future, of late growth; a future of compounded origin, the same with the Greek in *σω*; an imperfect of this future, or a conditional, of very rare occurrence; and finally a precativ, or optative of compound formation, belonging to the aorists, also not common. Fragments of imperative, optative, and subjunctive forms, belonging to the aorist, perfect, and future tenses, are found in the oldest literature, but they are obsolete in the classical Sanskrit. The present, perfect, and future tenses, active, passive, and middle, have participles. Of verbal nouns there is an accusative case (the Latin supine in *um*), used as an infinitive; also an instrumental case, forming a gerund, or a kind of indeclinable past participle (as *bhūtvā*, having been), which is of excessively frequent employment. The derivative forms of the verb, formed at pleasure from any root, are the passive, having a special form only in the present and imperfect, the causative, the desiderative, and the intensive or frequentative. The affluence of verbal forms is thus seen to be great, yet the language is far from making full use of them, and the Sanskrit verb is not to be compared for power of expression with the Greek, or even with the Latin; there is a strong tendency, especially in the later styles of writing, to slight the finite forms, and to construct loose and awkward sentences with the participle and gerund. Prepositions, in our sense, are almost absent, the prepositions of the other Indo-European tongues having here still their original value as adverbs, directing the action of the verb, but not directly governing nouns; as prefixes to verbs they are of constant application, and play a great part in the formation of derivatives. Conjunctions and adverbs are in part derived from pronominal roots, in part from nouns.—Syntax is a branch of the grammar of very inferior interest, and is even left out in most of our Sanskrit grammars. Whatever expressiveness and rhetorical charm the language has lie chiefly in its boundless wealth of epithets, and not at all in the construction of its sen-

tences and periods; indeed, a period in Sanskrit is next to an impossibility; the formation and connection of its clauses is of the baldest simplicity. The excessive use of cumbrous compounds is also a very general fault in Sanskrit construction, appearing in all styles of composition, but especially the more artificial; to say, for instance, "water-play-delighted-maiden-bathing-fragrant (river-breezes)" for "made fragrant by the bathing of maidens delighted with sporting in the water," is a virtual abnegation of the privileges of an inflected language, and a partial retrogradation to the stiff inexpressiveness of the Chinese.—The construction of Sanskrit metre is based entirely upon quantity, as in Greek, with total disregard of accent. The most ancient metres are very simple and almost wholly iambic; much of the later versification is remarkable for its extreme complexity, elaborateness, and artificiality.—LITERATURE. The most ancient literature of India, that of the Vedas, as forming a body of works of separate and peculiar interest, has been treated under INDIA, RELIGIONS AND RELIGIOUS LITERATURE OF; and, with the Vedas, the whole mass also of Vedic literature, the oldest religious literature of the country, and also the two long epics or Itihāsas, the *Mahābhārata* and the *Rāmāyana*. The proper Sanskrit literature counts by thousands its works still in existence, while titles and quoted fragments of hosts of others, not known to be preserved in their entirety, are on record. Most of these works are still in manuscript, and the largest collections of manuscripts out of India itself are those of the India office in London, the royal library at Berlin, and the Bodleian at Oxford. The period it covers stretches, if the Vedas be included, from at least 1500 B. C. to our own day. Nearly all of it was composed after the language had ceased to be in the fullest sense a spoken vernacular; hence a tinge of artificiality, growing deeper as more modern times are approached, rests upon it all. With insignificant exceptions, it is all composed in metre, even works of law, of morality, of science; and, in great part, in the so-called *śloka*, a two-line stanza, each line made up of two eight-syllable feet, the movement being rudely iambic. Every department of knowledge and branch of inquiry is represented in it, with the single exception of history; and the want of the historical element is perhaps the most striking general characteristic of the literature. The Hindoo mind, in utter opposition to the Egyptian and Chinese, has ever been little regardless of objective truth, careless of facts, disinclined to observe and record, laying no stress on the events of outward life, heedless of their connection and succession; hence the absence of a chronology in the literary as well as the political history of India, and the uncertainty of centuries resting upon the date of almost every work. Much of this mass of literary productions is of a character which has com-

manded high and general admiration; but it exhibits the characteristic faults and deficiencies of the oriental mind in no light degree. The want of history robs it of one great source of worth and interest; much of it is trivial and tedious; and to place even its masterpieces on a par with those of the classical languages would be highly presumptuous. Its interest as a record of the life of a great and highly endowed people, of our own blood, whose influence and institutions have affected all eastern Asia, is not easily overestimated. Of other epic or quasi-epic poems besides the *Mahābhārata* and the *Rāmāyana*, we may mention the *Raghuvansa* ("Race of Raghu"), *Kumāra-Sambhāva* ("Birth of the War God"), and *Nalodaya* ("Rise of Nala"), all by Kālidāsa; Magha's "Death of Sisupāla;" and Harsha's *Naishadhīya*. In the lighter style of lyric and erotic poetry, which is abundantly represented, and by works of greatly differing merit, are the *Ritusanhāra* ("Seasons") and *Meghadūta* ("Cloud Messenger") of Kālidāsa, and the *Gīta-Govinda* of Jayadeva, describing the adventures of the god Krishna among the shepherdesses, the companions of his youth, a favorite theme of Hindoo song. The "Centuries" of Bhartrihari, and other like works, are aphorismic, pearls of thought and style, intended for edification and instruction. The same ends are served by the collections of fables, of which the most accepted have found their way all over the world; the *Panchatantra*, through Persian and Arabic translations, has entered almost every western literature, as the fables of Bidpai or Pilpay. A somewhat later collection of the same materials, the *Hitopadesa* ("Salutary Instruction"), is one of the most popular books of the Sanskrit literature. The Sanskrit fable is much longer drawn than the western, and depends for its interest more on discourse, and less on situation and action. The Hindoo tales, in verse and in prose, are of comparatively small consequence in the literature; the most noted collection is the *Kathāsaritsāgara* ("Ocean of Streams of Narration"); through the medium of Persian versions, they are regarded as forming the groundwork of the Arabic literature of like class, represented to us chiefly by the "Arabian Nights' Entertainments." The drama is a most interesting branch of Hindoo literature; no other ancient people, excepting the Greek, has brought forth independently anything so admirable in this department. The most celebrated dramas are the *Mrichhakatī* ("Toy Cart") of Sudraka, and the different works of Kālidāsa, as the *Sakuntalā*, the *Urvashī*, and "Malavika and Agnimitra," all of which have been edited and translated. The *Sakuntalā* is one of the most perfect flowers of the Indian genius; and its selection by the enlightened taste of Sir William Jones and his translation of it into English (1789), whence it passed at once into every language of Europe, was an important epoch in the early history

of Sanskrit study. The subjects of the drama are mainly legendary, their catastrophes always happy. They are written in mixed prose and verse, and likewise in mixed Sanskrit and Prakrit; only the higher male characters speaking the cultivated or learned tongue, while the lower, and all the females, talk the vernacular dialect. The machinery of the Hindoo stage is not well understood, but it is believed to have been very simple. The grounds on which Kālidāsa has been usually assigned to the 1st century B. C. are now acknowledged to be entirely futile, and the time of the bloom of dramatic composition is as uncertain as other such matters in Hindoo history; more probably it is at least two or three centuries after Christ, or even, as many scholars believe, as late as the 11th century. (See KALIDASA.) The Purāṇas form a separate class of works, being the religious literature of the middle period, later than the Vedic, preceding the modern and comparatively insignificant tantras and śāstras, all of which have been described in INDIA, RELIGIONS AND RELIGIOUS LITERATURE OF. The law books attach themselves to, and are a development of, a part of the Vedic literature, viz.: treatises prescribing the religious observances and rules of life of the orthodox Hindoo; domestic and civil duties, offences and penalties, purification and penance, are their subjects. The oldest and most famous among them is the code ascribed to the mythical sage Manu; it has been often translated, and is a chief source of authentic knowledge respecting the elaborated system of Brahmanic polity.—In treating of the scientific literature, the grammar, for its antiquity, originality, and profundity, is entitled to the first place. In its inception and method it is entirely peculiar, and it has carried phonetic and etymological analysis further than any but the best modern European science. Here, as more than once in other departments, the early works containing the beginnings of the science are lost; the most ancient extant authority, Pāṇini, is the supreme one; the immense grammatical literature is made up almost solely of commentaries and continuations of his work. Its age is uncertain, but it is usually assigned to the 3d or 4th century B. C. Its form is very peculiar; it carries brevity to the utmost extreme, far beyond the limits of orderly arrangement and intelligibility, availing itself of a technical terminology almost mathematical; the 4,000 concise rules which compose it are often compared to so many algebraic formulas. The same style is characteristic of some other departments of the literature, and especially of the text books of the schools of philosophy. Philosophy is another highly important branch of Indian science, and has its roots in the very earliest literature. There are six chief systems: the *Mīmāṃsa* of Jaimini and *Vedānta* of Bādarāyana, founding themselves more directly on the Vedas, and so especially ortho-

dox; the *Nyāya* of Gautama and *Vaiśeṣika* of Kanāda, wearing an especially logical character; and the *Sāṅkhya* of Kapila and *Yoga* of Patanjali, atheistic and theistic branches of a school named from the precision affected in the enunciation of its principles. The general character of these systems has been described in connection with the religions of India. The Buddhist Sanskrit literature is immense, and has been carried by the spread of the religion to many other countries of Asia, into whose languages it has been translated. The astronomical literature is later by some centuries than the Christian era, and nearly all there is of true science in the astronomy of the Hindoos was learned by them from the Greeks. They have made in arithmetic and algebra remarkable original progress; and the Hindoo system of decimal notation has made its way, through the Arabs, to the exclusive use of modern enlightened nations, our usual figures being by origin letters of the Sanskrit alphabet. The acquirements of the Hindoos as regards the interpretation of the symptoms of disease, and the application of medical and surgical remedies, are not insignificant, and their medical literature, which is as yet little known, is regarded as well deserving study; the most esteemed author whose works are preserved is Susruta. Rhetoric, versification, and music are each represented in a department of the literature. Respecting the arts, whether the fine arts or the practical, little of value is known to exist.—The best Sanskrit grammars are, in English, Williams's (3d ed., Oxford, 1864) and Max Müller's (1870); in French, Oppert's (Berlin, 1859); in German, Bopp's (4th ed., 1868), and, as a manual of reference for the advanced student, Benfey's (Leipsic, 1852). Wilson's lexicon (two editions, Calcutta, 1819 and 1832), an inferior work, but long indispensable to the student, is out of print and very dear; a third edition was begun by Goldstücker, but never finished. Westergaard's *Radices Linguae Sanscritae* is very valuable, and a necessary accompaniment of Wilson. Benfey has published a brief hand dictionary (London, 1866), and Monier Williams a very full and valuable lexicon in a single 4to volume (London, 1872). The great Sanskrit-German lexicon of Böhtlingk and Roth (St. Petersburg), an immense and admirable work, was completed in 1875. Bopp's *Glossarium Sanscritum* (Berlin, 1847) serves the beginner in connection with the texts published by the same author, and contains all the roots and much linguistic information. A good and useful chrestomathy is still a desideratum; of Lassen's (Sanskrit and Latin, Bonn, 1838) a new edition has been issued by Gildemeister (Bonn, 1865); Böhtlingk's (St. Petersburg, 1845) lacks a glossary; Benfey's (Leipsic, 1853-'4) is of small service to an unpractised scholar. Texts to be recommended to the beginner are Bopp's selections from the *Mahābhārata*, especially his *Nalus* (Berlin, 1832), or Williams's *Nala* (Oxford,

1860); the *Hitopadesa* of Schlegel and Lassen (Bonn, 1829), or Johnson (Hertford, new ed., 1864), or Müller (London, 1854-'65); the *Bhagavad-Gitā* of Schlegel and Lassen (Bonn, 1846) or Thomson (Hertford, 1855); the *Sakuntalā* of Böhlingk (Bonn, 1842), or Williams (Hertford, 1853), or Burkhard (Breslau, 1872); Böhlen's *Bhartrihari* (Berlin, 1833); and Johnson's *Meghadūta* (London, 1867).

SANSON, Nicolas, a French geographer, born in Abbeville, Dec. 20, 1600, died in Paris in July, 1667. He produced a map of Gaul at the age of 16, and about 1640 was named geographer to the king. His maps are very numerous, and more correct than those of Ortelius and Mercator, although he adhered to the Ptolemaic longitudes. He published works on the geography of ancient Gaul, Greece, the Roman empire, sacred geography, &c. His three sons were all geographers.

SANT, James. See supplement.

SANTA ANA, a N. W. county of New Mexico, bordering on Arizona, and intersected in the S. E. by the Rio Grande; area, about 7,000 sq. m.; pop. in 1870, 2,599. It is watered in the east by tributaries of the Rio Grande, and in the west by affluents of the San Juan and Colorado Chiquito. The surface is mountainous. The chief productions in 1870 were 2,975 bushels of wheat, 9,521 of Indian corn, and 26,334 lbs. of wool. They were 155 horses, 269 mules and asses, 1,477 cattle, 32,630 sheep, and 112 swine. Capital, Jemez.

SANTA ANNA, Antonio Lopez de, a Mexican general, born in Jalapa, Feb. 21, 1798, died in Mexico, June 20, 1876. He fought in 1821 against the royalists, gained some success, and received the command of Vera Cruz (1822); but insubordination led to his dismissal, and he took revenge by aiding in the downfall of the emperor Iturbide. Becoming chief of the federal party in the succeeding contest, he was signalily defeated, and retired to his home. At the end of 1828 he secured the overthrow of the Pedraza administration, and shortly after the elevation of Guerrero, who made him minister of war and commander-in-chief of the army, after Santa Anna had repelled the Spanish invasion under Barradas, in September, 1829. He subsequently headed two successful insurrections, one to replace Guerrero in the executive functions by Bustamante, and the other to overthrow the latter in favor of Pedraza (January, 1832). In March, 1833, he was elected president; but, though a favorite with the army, he was unpopular with the nation, being suspected of aiming at the imperial crown. Several insurrections broke out, the last and most formidable of which was crushed by Santa Anna on May 11, 1835, when the insurgents sustained severe losses, and the republican party received a fatal blow. A complete administrative reorganization was now effected, and the governors of the several states were henceforth dependent upon the supreme power. A revolutionary feeling long

existing in Texas now broke out into open insurrection. Early in 1836 Santa Anna took the field in person. By the middle of February he reached the Rio Grande at the head of 6,000 troops, stormed the Alamo at San Antonio on March 6, after several days' siege, and massacred its defenders, but with great loss to himself, and after the massacre at Goliad, done under his express orders, marched toward Gonzales. At San Jacinto he was totally routed by the Texan army under Houston, April 21. The next day he was taken prisoner, and his functions were at once suspended by the Mexican government. In 1837 he returned to his native country by way of the United States, but was coldly received, and at the presidential election of that year he had only 2 out of 69 electoral votes, after which he retired to his estates at Jalapa. The same year he took part in the defence of Vera Cruz, bombarded by the French, and there sustained an injury which necessitated the amputation of a leg. In the long contention between the centralists and federalists he was one of the leaders of the former; and from Oct. 10, 1841, to June 4, 1844, he was virtual dictator, under the title of provisional president. He was again constitutional president, under the instrument of June 12, 1843, from June 4 to Sept. 20, 1844, when he was deposed by a new revolution, taken prisoner near Tlaxolula on Jan. 15, 1845, and banished for ten years, and took up his residence in Cuba. In 1846 he was recalled, appointed generalissimo, and in December made provisional president. Immediately after, at the head of 20,000 men, he advanced northward, and on Feb. 22, 1847, attacked the American troops at Buena Vista, 5,000 strong, under Gen. Taylor, by whom he was effectually repulsed on the following day. Having raised a new army, he took up a position at Cerro Gordo, where he was again defeated by the Americans, under Gen. Scott, on April 18. Collecting 3,000 men from the fragments of his army, he retreated toward the city of Mexico. Late in April he was informed of his appointment to the presidency by congress; but finding subsequently that the election for president which the states had held on May 15 was unfavorable to his pretensions, he prevailed on congress to postpone the counting of votes until January, 1848, and in the mean time banished or imprisoned all who opposed his schemes, and established a severe censorship of the press. He had organized an army 30,000 strong for the defence of the capital; but Molino del Rey was stormed by Gen. Scott on Sept. 8, 1847, and Chapultepec on the 13th, and on the 14th the city of Mexico fell. Santa Anna now resigned the presidency, and made a last effort to retrieve his reputation by the siege of Puebla; but he was attacked by Gen. Lane at Huamantla, and forced to retire from the place, which was now relieved. Having received permission from the American commander-in-chief, he sailed for Jamaica on April 5, 1848.

In 1853 he returned to Mexico, and was received with great enthusiasm. He was appointed president for one year, after which time he was to call a constituent congress; but he fomented a new revolution by which he was declared president for life, with power to appoint his successor, and with the title of most serene highness. He began to rule with despotic authority, and the revolution of Ayutla followed, led by Gen. Alvarez. After a struggle of two years, Santa Anna signed his unconditional abdication, and sailed on Aug. 16, 1855, for Havana. He afterward spent two years in Venezuela, and thence went to St. Thomas. During the French invasion he reappeared in Mexico, and pledged himself to strict neutrality; but a manifesto tending to excite disturbance in his favor led Gen. Bazaine to order him to quit the country in May, 1864. Maximilian, however, appointed him grand marshal of the empire; but in 1865, having been implicated in a conspiracy against the emperor, he again withdrew to St. Thomas. In 1867 he made a last attempt to gain ascendancy in Mexico, but was taken prisoner at Vera Cruz and condemned to death. Juarez pardoned him, on condition of his quitting Mexican soil for ever, and he came to the United States. After the death of Juarez he was permitted to return, and he subsequently lived in seclusion in the city of Mexico.

SANTA BARBARA, a S. W. county of California, bounded S. and W. by the Pacific ocean, N. by the Guaymas or Santa Maria river, and drained by Santa Inez and other rivers; area, about 2,800 sq. m.; pop. in 1870, 7,784, of whom 109 were Chinese, since which a portion has been taken to form Ventura county. The eastern portion is mountainous, the western undulating. The soil near the coast is generally fertile, and in the valleys bountiful crops are produced. Formerly stock raising was the principal business; but latterly much attention has been devoted to the culture of grapes, oranges, and almonds. Gold, iron, copper, salt, asphalt, and petroleum are found. The chief productions in 1870 were 20,200 bushels of wheat, 158,374 of Indian corn, 187,871 of barley, 41,934 of peas and beans, 26,539 of potatoes, 996,200 lbs. of wool, 81,088 of butter, 34,500 of cheese, and 8,655 tons of hay. There were 3,777 horses, 2,166 milch cows, 7,993 other cattle, 189,358 sheep, and 3,947 swine.—**SANTA BARBARA**, the capital (pop. about 6,500), in a sheltered nook on the shore of the Pacific, 275 m. S. S. E. of San Francisco, has several hotels, two banks, a college, good public schools, three daily and two weekly newspapers, and seven churches. It is noted as a health resort on account of its mild and equable climate, and is growing rapidly. It occupies the site of a mission founded in 1780.

SANTA CATHARINA, a S. E. province of Brazil, bounded N. W. and N. by Paraná, E. by the Atlantic, and S. and S. W. by São Pedro; area, 28,220 sq. m.; pop. about 140,000. The

island of Santa Catharina, separated from the mainland by a strait varying in width from $\frac{1}{2}$ m. to 7 m., is about 30 m. long from N. to S., and about 10 m. wide. The strait is divided into two good harbors, the northern being one of the best in South America. The island is mostly covered with fine woods and abounds with water; its climate is temperate and salubrious. The coast of the mainland is level, but the interior is traversed by the Serra do Mar. The Uruguay has its source in this province. The climate is temperate. The province is one of the most fertile in Brazil, but not well settled. Beds of good bituminous coal have been discovered. Considerable oil is prepared from whales taken in the strait, and timber and cordage are exported. There are flourishing German colonies in the province. Capital, Desterro.

SANTA CLARA, a W. county of California, bounded N. by San Francisco bay, watered by the Coyote and Guadalupe rivers and other small streams; area, 1,332 sq. m.; pop. in 1870, 26,246, of whom 1,525 were Chinese. It occupies the fertile valley between the Coast and Santa Cruz mountains, extending to the summits of the ranges on either side. The hillsides are heavily wooded with redwood, oak, madrone, spruce, &c. There are mineral and hot springs. The New Almaden and Guadalupe quicksilver mines are in this county. It is traversed by the Southern Pacific railroad, and by the San José branch of the Central Pacific. The chief productions in 1870 were 1,188,187 bushels of wheat, 405,575 of barley, 31,764 of potatoes, 85,150 gallons of wine, 179,465 lbs. of wool, 179,675 of butter, 525,290 of cheese, 94,000 of hops, and 45,779 tons of hay. There were 7,926 horses, 7,553 milch cows, 14,569 other cattle, 49,085 sheep, and 8,135 swine; 3 manufactories of carriages and wagons, 2 of iron, 2 of machinery, 1 of paper, 12 of saddlery and harness, 6 of tin, copper, and sheet-iron ware, 1 of woollens, 2 establishments for smelting quicksilver, 2 planing mills, 6 saw mills, 2 tanneries, 2 currying establishments, and 8 flour mills. Capital, San José.

SANTA CLARA COLLEGE. See SAN JOSÉ.

SANTA CRUZ, a W. county of California, lying between the summit of the Santa Cruz mountains and the Pacific ocean, and bounded S. by the Pajaro river; area, 432 sq. m.; pop. in 1870, 8,743, of whom 156 were Chinese. There is considerable fertile land, but the greater portion consists of mountain ranges densely timbered with redwood, oak, and pine, and adapted to grazing. There is abundant water power. Copper, coal, gold, and sand for glass making are found. The chief productions in 1870 were 115,687 bushels of wheat, 22,795 of Indian corn, 56,690 of oats, 72,155 of barley, 34,253 of potatoes, 14,550 gallons of wine, 120,955 lbs. of butter, 120,225 of cheese, and 8,664 tons of hay. There were 1,729 horses, 2,168 milch cows, 2,745 other cattle, 819 sheep, and 3,408 swine; 1 manufactory of gunpowder, 4 of

lime, 2 of cooperage, 1 of engines and boilers, 5 of saddlery and harness, 3 of tin, copper, and sheet-iron ware, 5 tanneries, 4 currying establishments, 1 flour mill, 2 planing mills, and 22 saw mills. Capital, Santa Cruz.

SANTA CRUZ, or *Saint Croix*, an island of the West Indies, 65 m. E. S. E. of Porto Rico, the largest and southernmost of the Virgin group, forming with St. Thomas and St. John the Danish government of the West Indies; length about 25 m., greatest breadth 5 m.; area, 84 sq. m.; pop. in 1870, 22,760. The surface is level, with a range of low hills in the north. There are numerous streams, and the soil is fertile. Nearly the whole island is cultivated, about half being planted with sugar cane. Santa Cruz was discovered by Columbus on his second voyage, and has been in the hands of the Dutch, British, Spanish, and French, the last of whom ceded it to Denmark in 1733. The British took it in 1807, but restored it to the Danes by the treaty of Paris. English is the language generally spoken. Capital, Christiansted.

SANTA CRUZ, a fortified town, capital of the Canary islands, on the N. E. coast of the island of Teneriffe; pop. about 11,000. The harbor is good, and has a fine long mole. In 1871, 150 vessels entered, with an aggregate of 94,067 tons. The exports include cochineal, wine, almonds, raw silk, barilla, and archil.

SANTA FÉ, a S. E. province of the Argentine Republic, bordering on the Gran Chaco and the provinces of Corrientes and Entre-Ríos (from which it is separated by the Paraná), Buenos Ayres, Cordova, and Santiago; area, 20,000 sq. m.; pop. in 1869, 75,178. It is flat in the south and centre, and hilly in the north. Besides the Paraná, the principal rivers are the Tercero and the Salado; there are many small streams. There are numerous lakes, some of which are salt, and extensive forests. Wheat, maize, and tobacco are cultivated, and, with wax, honey, oranges, and other fruits, and skins, are exported in large quantities. The colonies established in this province are the most numerous and prosperous in the republic. The chief industries are agriculture and cattle rearing. (See ARGENTINE REPUBLIC.) Of 20,002 children between the ages of 6 and 14 in 1869, 4,303 attended school. The province is divided into the departments of Santa Fé, San José, San Gerónimo, and Rosario. The capital is Santa Fé, a prosperous town with 10,670 inhabitants in 1869; and the chief town is Rosario, the second city in the republic.

SANTA FÉ, a N. central county of New Mexico, drained by the Rio Grande and small tributaries of that river, and by the head waters of the Rio Pecos; area, about 1,800 sq. m.; pop. in 1870, 9,699. The surface is mountainous, and the soil, except in the valleys, poor and sandy. There are gold mines. The chief productions in 1870 were 6,314 bushels of wheat, 20,262 of Indian corn, 1,389 of peas and beans, 28,918 lbs. of wool, and 490 tons

of hay. There were (on farms) 416 horses, 840 mules and asses, 2,116 milch cows, 1,388 working oxen, 630 other cattle, 23,843 sheep, and 656 swine; 2 manufactories of jewelry, 2 breweries, 1 saw mill, and 2 quartz mills. Capital, Santa Fé.

SANTA FÉ, the capital of New Mexico and of Santa Fé co., situated on both banks of Santa Fé creek, which flows W. 14 m. into the Rio Grande, at an elevation of 6,862 ft. above the sea, about 275 m. S. by W. of Denver, Colorado, and nearly 900 m. W. by S. of St. Louis, Mo.; lat. 35° 41' N., lon. 106° 10' W.; pop. in 1870, 4,765; in 1875, about 6,000, of whom about 5,000 are of Spanish and Mexican origin and speak the Spanish language. Stage coaches run daily to Pueblo, Col., about 190 m. N. N. E., the terminus of the Denver and Rio Grande railroad, and to Las Animas, Col., about 230 m. N. E., the terminus of a branch of the Kansas Pacific railroad and of the Atchison, Topeka, and Santa Fé railroad. There is telegraphic communication with Denver. Santa Fé is the centre of supplies for the surrounding country, and is constantly filled with freight wagons and carrying animals, the latter being the *burros* or donkeys commonly used in the territory. The valley in which it is situated is irrigated from Santa Fé creek and is surrounded by high mountains. The climate is very agreeable, the temperature never reaching either extreme, while the atmosphere is rare and pure. The town is irregularly laid out, and the unpaved streets are very narrow, crooked, and ancient-looking. The public square or plaza, containing about 2½ acres, is bordered on three sides by the principal business houses and on the fourth by the old "palace," one story high, containing the governor's mansion, legislative hall, and court room. In the centre is a beautiful park of trees, chiefly cottonwoods, and here a soldiers' monument of native marble has been erected by the territorial legislature. The buildings are almost without exception of adobe and one story high. In the N. portion are the ruins of two unfinished stone buildings, the territorial capitol and penitentiary, congress having failed since 1855 to appropriate funds for their completion. Near these are the masonic and odd fellows' cemetery and the military and private cemeteries. Within the town is the military reservation of Fort Marcy. Santa Fé was incorporated as a city in 1852, but the succeeding legislature in 1853 repealed the charter. It has, however, municipal regulations and a police, under the prefect of the county. It contains two national banks, each having a capital of \$150,000. The Roman Catholics have a college for boys and a conventual academy for girls, each attended by about 150 pupils. One newspaper, the daily and weekly "New Mexican," is published in English and Spanish. There are four Roman Catholic churches and a Presbyterian mission church. The Episcopalians also have a resi-

dent missionary, but no church edifice. A new Roman Catholic cathedral is in course of construction around the old one, which is still used.—Santa Fé is known in the old church records and is often mentioned in the archives of the former governments of the country as

Marta, 455 m. N. of Bogotá; pop. about 4,000. It is situated in the midst of sand marshes, near the mouth of the Manzanares. The houses are chiefly of one story, roofed with straw or tiles, and there is a fine cathedral. The port, which is spacious and commodious,

and defended by three forts, is well frequented by shipping, chiefly engaged in coasting and the West Indian trade. Steamers ply monthly between Santa Marta and New York. The principal exports are Peruvian bark, hides, skins, coffee, hats, fustic and other dyes, and medicinal plants. The value of the exports to New York in 1872 was \$290,182.

SANTA MAURA (modern Gr. *Leccada*; anc. *Leucadia* or *Leucas*), an island and eparchy of Greece, one of the Ionian islands, in the Ionian sea, separated by a strait 1 m. wide from the W. coast of Acarnania; area, 111 sq. m.; pop. in 1870, 20,892. It is 22 m. long by from 5 to 9 m. wide, and is traversed N. and S. by a limestone ridge, terminating S. W. in Cape Ducato (the ancient Leucas, famous for Sappho's leap), and culminating

Street Scene in Santa Fé.

the city of "Santa Fé de San Francisco de Asis," St. Francis being the patron saint. St. Francis's day (Oct. 4) is still celebrated with much ceremony. When first visited by the Spaniards, about 1542, the town was a populous Indian pueblo. It is not known when it was first settled by the Spaniards, but it has been the capital of New Mexico since 1640. It was captured in 1680 and the principal buildings were burned by the Indians, who drove the whites from the country. It was recaptured by a Spanish force in 1694, when the inhabitants returned. The most formidable subsequent attack by the Indians was in 1837, when they were defeated by Manuel Armijo. It was occupied by the United States troops on Aug. 18, 1846. It was entered by the confederate forces from Texas on March 10, 1862, who were forced to evacuate it on April 8.

SANTA FÉ DE BOGOTÁ. See Bogotá.

SANTA MARIA (Sp. *Puerto de Santa María*), a city of Andalusia, Spain, in the province and 6 m. E. N. E. of the city of Cadiz, on the right bank of the Guadalete, where it falls into the bay of Cadiz; pop. about 21,000. It is second to Cadiz in exporting wine of excellent quality, and to Jerez in the extent of its wine cellars. Brandy, liqueurs, oil, hats, soap, leather, and wax are manufactured.

SANTA MARTA, a city of the United States of Colombia, capital of the state of Magdalena, on the E. shore of the bay of Santa

near the centre of the island in Mount St. Elias, about 3,750 ft. high. The whole surface is more or less broken; only a small portion is cultivated, and the crop of grain is insufficient for home consumption. The principal exports are oil, wine, and salt, the last procured by evaporation in the lagoon. Capital, Amaxichi, also sometimes called Santa Maura.—The ancient Leucas (Gr. *λεῦκος*, white) derived its name from the limestone cliffs. In the time of Homer it was united to the mainland at the N. E. extremity by an isthmus, which was cut through by the Corinthians about the middle of the 7th century B. C. The town of Leucas, which was founded near the isthmus by the Corinthians, became the headquarters of the Acarnanian league, and was taken and plundered by the Romans in 197 B. C. On the promontory of Leucas was a temple to Apollo, and at the annual festival of the god it was customary to cast a criminal from the rock into the sea. Birds of all kinds were tied to him to break his fall, and if he survived boats were ready to save him; but in that case he was banished for ever. This expiatory rite gave rise to the story that lovers leaped from this cliff to escape the pangs of love.

SANTANDER. 1. A province of Spain, in Old Castile, bordering on the bay of Biscay and the provinces of Biscay, Burgos, Palencia, Leon, and Asturias; area, 2,112 sq. m.; pop. in 1870, 241,581. The Cantabrian mountains, on its S. limit, abound in forests and valuable

timber, and are intersected by fertile valleys. It has productive fisheries, iron, lead, and copper mines, and limestone, marble, gypsum, and potter's clay. The trade is greatly hindered by the want of good roads. **II.** A city (anc. *Portus Blendium*), capital of the province, on the bay of Biscay, 215 m. N. of Madrid; pop. about 35,000. The houses are narrow and poor in the old quarter, but handsomely built in the new. It is the seat of a bishop, and has a commercial school, a school of navigation, an excellent institute for higher studies, and other literary and scientific institutions. There are a Gothic cathedral and an old convent, now an immense tobacco manufactory, tanneries, and sugar refineries. The harbor is of easy access, and has a lighthouse and excellent anchorage. There are regular steamship lines to Bayonne, Bilbao, Havana, Liverpool, London, and Hamburg.—The city was sacked by Soult in 1808, was stormed by the Spaniards but retaken by the French in 1809, and evacuated by them in 1812.

SANTAREM, a town of Portugal, in the province of Estremadura, on the right bank of the Tagus, 45 m. N. N. E. of Lisbon; pop. about 8,000. It occupies the summit and two sides of a hill, and the houses are mostly in decay. It has two colleges and a seminary, and a large trade in grain, olive oil, and wine. Santarem was taken from the Moors by Alfonso I. in 1146; and it was the last stronghold of the Miguelites in 1833-'4.

SANTA ROSA, a W. county of Florida, bordering on Alabama, watered by the Yellow and Blackwater rivers, and washed on the S. W. by Pensacola bay and Escambia river; area, 1,440 sq. m.; pop. in 1870, 3,312, of whom 562 were colored. The surface is flat and the soil poor. Santa Rosa island is off the S. shore. The chief productions in 1870 were 6,872 bushels of Indian corn, 1,887 of sweet potatoes, 27,845 lbs. of rice, and 1,328 gallons of molasses. There were 1,976 cattle and 1,291 swine. Capital, Milton.

SANTEE, a river of South Carolina, formed by the Congaree and Wateree, which unite near the middle of the state, at the junction of Sumter, Richland, Orangeburg, and Clarendon counties, whence it flows S. E. into the Atlantic by two mouths in lat. 33° 6' N. The main stream is about 150 m. long, and steamboats ascend to Columbia on the Congaree, and Camden on the Wateree. Its lower part is skirted by rice swamps and pitch pine forests.

SANTERRE, Antoine Joseph, a French revolutionist, born in Paris, March 16, 1752, died there, Feb. 6, 1809. He inherited from his father a large brewery in the faubourg St. Antoine. In 1789 he was an elector and a commander in the national guard, and took part in the attack on the Bastille, and subsequently in the disturbances on the Champ de Mars (1791), after which he fled to escape arrest. The amnesty granted after the king's adoption of the constitution enabled him to renew his

agitation, and he led the populace to the Tuileries on June 20, 1792, played a conspicuous part in the insurrection of Aug. 10, and became chief commander of the national guard of Paris, with the rank of general of division. In this capacity he escorted Louis XVI. to the Temple and to the guillotine, and ordered the drums to beat to drown the king's voice, which gave him an unfounded reputation for cruelty. Subsequently he commanded a division in Vendée, where he showed great incapacity, and was signally routed at Coron, near Chollet, Sept. 18, 1793. Returning to Paris in disgrace, he was imprisoned as an Orleanist, but released after the fall of Robespierre. Owing to his influence with the mob, he was confirmed in his rank by Napoleon, but was not actively employed. He ended his life in comparative poverty.—See *Santerre, sa vie publique et privée*, by Carro (Paris, 1847).

SANTIAGO. **I.** A central province of Chili, bordering on the Pacific and the Argentine Republic, and the provinces of Aconcagua, Colchagua, and Valparaíso; area, 7,800 sq. m.; pop. in 1872, 380,419. It is extremely mountainous, the Andes here including some of the most elevated peaks in America. The chief river is the Mapu. Silver and copper abound, and many mines are in operation. There are many mineral springs. In the lower regions the climate is mild and the soil extremely fertile, and agriculture is here in a higher state of perfection than elsewhere in South America. Cattle rearing is an important industry, and jerked beef is exported. The culture of tobacco, for which the soil is well adapted, is prohibited, its importation being a government monopoly. The province is divided into the departments of Santiago, Melipilla, Rancagua, and Victoria; the chief towns, besides the capital, are Rancagua and Melipilla. **II.** A city, capital of the province and of Chili, on the Rio Mapocho, about 70 m. S. E. of Valparaíso; lat. 33° 27' S., lon. 70° 40' W.; pop. given in 1865 at 115,377, but by Asta-Burruaga, in his *Diccionario de Chile* (1867), at 150,000. It lies between two cordilleras, about 1,800 ft. above the sea, 8 m. W. of the foot of the Andes. The streets are spacious and regular, well paved, and lighted with gas. The houses are of brick, with ornamented courtyards. The public squares and several of the avenues are profusely embellished with fountains and statues. The river is crossed by handsome bridges. The cathedral, founded in 1750, on the W. side of the Plaza Mayor, is 351 ft. long by 92 ft. wide, with a superb frontispiece. On the same square are the post office and treasury (formerly the *casa de la audiencia*), the city hall, criminal courts, the former residence of the presidents, now converted into a barrack, and the archiepiscopal palace, in the Moorish style. The mint is a beautiful edifice 460 ft. long by 350 ft. wide, a portion of which serves as the president's palace and for the offices of the ministry. The congress building was erected

in 1858, contiguous to the old church of the Jesuits, destroyed by fire Dec. 8, 1863, when 1,600 persons, chiefly women, perished in the flames. The hill of Santa Lucia rises in the centre of the city to a height of 254 ft., and on its N. and S. flanks stand two fortresses. The theatre ranks among the finest in America. The city has a powder magazine, a vast artillery barrack, a penitentiary, a house of correction for children, a military and two fine general hospitals, an insane asylum, a house of refuge, and many other benevolent institutions. The educational establishments include the academy of science, the university or national institute with 1,200 students, a military academy, schools of design, a school of agriculture with a model farm, two normal schools, the *seminario conciliar*, and about 40 primary and grammar schools, public and private, the former being gratuitous. The national library contains 40,000 volumes and many rare manuscripts. The mean temperature is 68° F. in summer and 49° in winter, when rains are frequent and heavy. Santiago is the commercial centre for the province. There are tanneries, flour mills, silver refineries, three banks, and a fire insurance and a life insurance company. The city is connected by telegraph with the principal ports of the republic, and by rail with Valparaiso and Talca; and a transandine railway to Buenos Ayres was projected in 1874. —Santiago was founded in 1541 by Pedro de Valdivia, under the name of Santiago del Nuevo Extremo, and erected into a bishopric in 1561. It was visited by disastrous earthquakes in 1570, 1647, 1657, 1688, 1730, 1751, and 1822, and has frequently suffered from inundations. An international exhibition was opened here on Sept. 16, 1875.

SANTIAGO, or **Santiago del Estero**, a central province of the Argentine Republic, bordering on Santa Fé, Cordova, Catamarca, Tucuman, Salta, and the Gran Chaco; area, 35,000 sq. m.; pop. in 1869, 132,763. The face of the country, somewhat mountainous in the west, consists mainly of an undulating plain, sloping toward the southeast. The province is watered by the Dulce, Salado, and many smaller streams, which are dried up during the summer. There are many lagoons and lakes, mostly salt, the chief of which is the Laguna de los Porongos on the southern border, fed by the waters of the Dulce. The climate is hot, but not insalubrious; and the soil is fertile, much of the land being devoted to pasturage. The chief productions are wheat, maize, the sugar cane, and fruits. There are large forests. The most important manufactures are those of ponchos and other articles of wool, with laces, some of which are not inferior to the finest imported from Europe. Carbonate and nitrate of soda and carbonate of potash from the salines are exported. Of 33,375 children from 6 to 14 years of age in 1869, 3,684 attended school. The province is divided into 18 departments. The capital is the city of the same name, with

7,775 inhabitants in 1869, founded about the middle of the 16th century.

SANTIAGO DE COMPOSTELA (Lat. *Campus Stellæ*), a city of Galicia, Spain, in the province and 32 m. S. by W. of the city of Corunna; pop. about 29,000. It is surrounded by hills, and has broad paved streets and well built houses. It is the seat of an archbishop. In the cathedral, founded in 1082, the body of St. James the Elder is popularly believed to be buried, and formerly there were frequent pilgrimages to the shrine. The city has a university with about 1,000 students, a public library, a hospital, and a mint. It was sacked in 997 by the Moors, from whom Ferdinand III. took it in 1235, and in 1809–14 it was held by the French.

SANTIAGO DE CUBA (locally called *CUBA*), a city of Cuba, capital of the Eastern department, and of a province of its own name, at the head of a fine bayou on the S. E. coast, 160 m. S. E. of Puerto Principe; lat. 19° 53' N., lon. 75° 53' W.; pop. about 45,000, of whom not more than 10,000 are whites. It is on the side of a hill 160 ft. above the bay. The streets are bad and many of them very steep, but all lighted with gas and lined with stone houses. The cathedral, completed in 1819, is the largest on the island, and there are several other churches, a theatre, a custom house, barracks, and three hospitals. The city is supplied with bad water through an aqueduct, and as it is shut in from the northern breezes, the suffocating heat and the miasmatic effluvia from adjacent marshes render it the most unhealthful abode in the Antilles. The harbor, although one of the best in America, is difficult of access, owing to the narrowness of the entrance. It is defended by four forts. W. of the city, 12 m. distant, are the extensive copper mines of El Cobre, which export annually more than 25,000 tons. The other exports are coffee, sugar, and molasses.—Santiago, founded by Diego Velasquez in 1514, is after Baracoa the oldest town in Cuba. In 1522 it was incorporated as a city, and for a time was the capital of the island. In 1553 it was seized by the French, who surrendered it for a ransom of \$80,000; and in the same century it suffered much from pirates. In November, 1873, the captain (Fry) and several of the crew and passengers of the ship *Virginus* were shot by order of the Cuban authorities at Santiago. This vessel, sailing under the United States flag, had been captured by the Spanish steamer *Tornado* off Jamaica, on the ground that it intended to land men and arms in Cuba for the insurgents. The affair created great excitement in the United States, but was settled by the payment of indemnities by Spain.

SANTIAGO DE LOS CABALLEROS, a city of Santo Domingo, capital of a province of the same name, on the right bank of the Yaqui river, in a savanna nearly surrounded by mountains, 20 m. S. of Puerto Plata; pop. about 8,000. It is built around a large plaza, in which is held the

market; the houses in the main part of the town are mostly of stone. Its climate is healthful, and its district very productive, both in minerals and plants. The tobacco of the Vega Real is sent thither for transportation to Puerto Plata.—Santiago was founded in 1504, in the region called Cibao. It suffered many reverses from the French and buccaneers, and was destroyed by Dessalines, and again by the Spaniards on evacuating the island in 1865.

SANTILLANA, Marquis de. See MENDOZA.

SANTLEY, Charles. See supplement.

SANTO DOMINGO (sometimes improperly called San Domingo), a republic comprising the eastern and larger portion of the island of Hayti, in the West Indies, otherwise called the Dominican republic. (For its physical characteristics, see HAYTI.) It includes all the territory E. of the boundary line fixed by treaty between Spain and France in 1777, which extends from the mouth of the river Pedernales on the S. coast to that of the river Massacre, which flows into the bay of Manzanillo on the N. coast. Its greatest length, from Cape Engaño to the Haytian frontier, is about 260 m., and its greatest breadth, from Cape Isabella to Cape Beata, 165 m.; area estimated at 18,000 sq. m. The republic is divided into five provinces: Santo Domingo, Azua de Compostela, Concepcion de la Vega, Santiago de los Caballeros, and Santa Cruz del Seybo, the capitals of which have the same names respectively. The principal harbors are Santo Domingo, Puerto Plata, and the bay of Samana. The last, which is formed by the peninsula of Samana on the N. E. end of the island, is about 35 m. long and 10 m. wide. Its entrance is made difficult by extensive banks and a reef. Samana bay proper, or the port of Santa Barbara, on the N. side of the large bay, is formed by a line of reefs and islets parallel with the shore. It is $\frac{1}{2}$ m. wide, and, though difficult of access, is deep enough for large vessels.—The soil of Santo Domingo is of extraordinary fertility. Tobacco, sugar cane, cotton, maize, coffee, cacao, and the plantain are the staple productions. The coffee is left in many places to grow wild; and the tobacco, from want of cultivation, is inferior, though with proper care it might equal that of Cuba. The cotton is of fine staple and good length, and might be made as good as any in the world. The forests contain great varieties of valuable trees, among which are mahogany, lignum vitæ, ebony, fustic, a species of logwood, and many other cabinet and dye woods. The plains furnish fine pasturage for the cattle of hundreds of owners, who annually collect and count the animals, and brand the young. The horses are in general small, but graceful and well adapted to the indifferent roads. Mules are numerous, as are also the other domestic animals; and swine raising forms an important industry. In the forests are large numbers of coati-mundis and agoutis. The rivers are infested with alligators. Various spe-

cies of lizards are found, and the iguana, whose flesh is by some regarded as a delicacy, attains a large size. Among the venomous insects are the scorpion, centipede, and tarantula, the stings of which, although causing much pain and inconvenience, are by no means fatal, as is commonly supposed. Gold, silver, iron, and copper are the chief minerals; the first two are said to be extremely abundant in all parts of the republic. The gold mines of La Vega and Buenaventura alone furnished Ovando with the half million of dollars which he sent home annually to the king of Spain, besides what he expended on improvements in the colony. As many as 240,000 crowns of gold were coined in the mint of La Vega in 1502, when the mines were not worked so thoroughly as in later times, and the city of Santiago de los Caballeros was chiefly inhabited by goldsmiths. No mines are now in operation, but considerable grain gold is still extracted. Silver was also mined in large quantities in the 16th century; but the mines were closed by a royal decree from Spain, and they have not been reopened, nor is their precise situation generally known. Mines of tin, lead, quicksilver, sulphur, and rock salt are also mentioned by the Spanish writers; and considerable salt is still produced.—The climate is much more salubrious than that of any of the other West India islands; and the average health and longevity is said to be equal to that of the United States. In the highlands the temperature is equable and agreeable; in the lowlands the thermometer ranges from 84° to 91° F. The intensity of the heat is tempered by the sea breeze, which blows nearly all day long, and by the land breeze, which begins two or three hours after sunset and continues until sunrise. From May to October heavy rains fall, frequently accompanied by thunder and lightning. From February to April it is uniformly dry. Yellow fever and cholera have made considerable ravages on several occasions in the island, but have never been epidemic there.—The population, which is set down by some authorities at 200,000, is said by the United States commissioners, who visited the republic in 1871, not to exceed 150,000. About nine tenths are native Dominicans, springing for the most part from the union of Spaniards, Indians, and negroes, though some are of pure African blood. The whites, about one tenth of the whole, are Spaniards of unmixed race, mainly descendants of the early settlers, and other Europeans, who reside mostly in the seaports and larger towns, and have almost exclusively under their control the foreign commerce of the country. The Dominicans are sober, courteous, affable, and hospitable, and in their intercourse with each other make little distinction of class, race, or color. Very little absolute poverty exists, and mendicancy is almost unknown. Cock fighting is the chief amusement, and gaming is largely practised both in public and in private. High

crimes are rare, and one may safely travel with money and valuables, alone and unarmed, in any part of the country. Few genuine representatives of the indigenous race of the island are now to be found. As they decreased with great rapidity, the colonists brought slaves from Africa. By 1522 so many Africans had been introduced that they rose in insurrection on account of cruel treatment. A colony of blacks emigrated from the United States to Santo Domingo in 1824, and their descendants are still to be traced among the population.—The prevailing religion is the Roman Catholic, but all other sects are tolerated; and there are some Methodist and Baptist churches, supported mainly by the colored emigrants from the United States. The archbishop of Santo Domingo still preserves the title of primate of the Indies, bestowed on him in the Spanish colonial days. There is a so-called university in the capital, and there are several schools there and in the other towns; but public education is little attended to, even in its primary branches.—The commerce of Santo Domingo is small, owing partly to anarchy and partly to customs duties so excessive as to be almost prohibitory. In 1863 the total imports amounted to about \$1,500,000; exports, \$2,500,000. In 1870 the imports were estimated at \$560,000; exports, \$700,000. In 1873 the imports at the chief port, Puerto Plata, amounted to \$871,116; exports, \$1,093,753. The number of vessels that entered that port in the same year was 201, of 12,191 tons. The principal exports are tobacco, coffee, cotton, sugar, cacao, ginger, hides, wax, mahogany, and dye woods. Inland commerce is cramped by the want of good roads, all highways being neglected, and transportation being confined almost entirely to the backs of horses and mules. Steamers run regularly from Puerto Plata and Santo Domingo city to the other West India islands and to New York.—The government is a republic, founded on a constitution adopted in 1844, and proclaimed anew on the departure of the Spaniards in 1865. The president and vice president are elected for six years, with a difference of three years in the time of their election. The president appoints a council of state consisting of four ministers, on one of whom, at his will, devolve the duties of minister of foreign relations. The legislative branch consists of a senate (*senado consultor*) elected for six years, and composed of nine members, two each for the cities of Santo Domingo and Santiago, and one for each of the five provinces. Each province and district has a government, and each parish and military post a commandant nominated by the executive. The towns are governed by councils elected for three years. The judiciary consists of a supreme court which sits in the capital, and a court of first instance in each province and district, sitting in the respective capitals. Each town and parish has also an alcalde or justice of the peace. The revenue is derived

from customs duties, which average 40 per cent., direct and indirect taxation, and sales of public property. There are no recent official returns of the receipts and disbursements of the government; but the United States commission reported the total income for 1870 to be \$772,684 75, of which \$728,605 58 was derived from customs, \$35,466 55 from direct and indirect taxes, and the remainder from sales, rents, &c. The total debt of the republic in 1870 was reported by the commission to amount to \$1,565,831, wholly internal. Besides this, a foreign debt of £757,700 was contracted in London in 1869, which at the close of 1872 had been reduced by a sinking fund to £722,700. The army consists of 4,000 men in time of peace, and on a war footing of 15,000 men. The navy comprises three corvettes and five schooners, with 44 guns.—For the history of Santo Domingo previous to 1844, see HAYTI. On Feb. 27 of that year the inhabitants of the Spanish part of the island declared their independence, and proclaimed the Dominican republic, under the lead of Pedro Santana. The Haytians invaded their territory with 20,000 (according to some authorities, 15,000) men, but were defeated by Santana on March 19. In November a constitution was formed, and Santana was elected president. He resigned in 1848, and was succeeded by Jimenes, who conspired with Soulouque, president of Hayti, and induced the latter to invade Dominica; but Santana, called to command the troops, defeated 5,000 Haytians with but 400 men at Ocoa, April 22, 1849. Santana received the title of liberator of his country, and, having deposed Jimenes, ruled as dictator until the election to the presidency of Buenaventura Baez in the autumn of 1849. Baez secured the recognition of the republic by Great Britain, France, and Denmark. About 1850 the question of annexation to the United States was mooted, but Baez did not favor it, on account of the existence of slavery there. This together with his alliance with the clerical party made him unpopular, and in 1853 Santana was elected president. He banished Baez, and compelled the archbishop to take the oath of allegiance to him as a power greater than the church; but he in turn became unpopular, and Baez was recalled in 1856. In the following year a rebellion broke out, and in 1858 Baez was driven from the island, Santana and liberalism again coming into power. In 1861 Santana, disheartened with affairs and despairing of his ability to preserve peace, suddenly invited Spain to resume her authority over the republic. Geffrard, president of Hayti, protested against the cession to Spain, and gave refuge to many prominent Dominicans who were opposed to it. The Spaniards sent troops into the island, but discontent prevailed everywhere, particularly among the negroes, who feared a return to slavery. In 1863 a serious rebellion broke out, and after two years of fighting, in which every atrocity

was perpetrated, Spain was at last forced to retire, and by an act of cortes, March 3, 1865, declared the independence of Santo Domingo. Large numbers of troops were sent to the island, a great proportion of whom perished in the struggle. Anarchy prevailed on the withdrawal of the Spaniards. Toward the close of 1865 Baez was recalled to the presidency, but in 1866 a conspiracy secured his overthrow, and a triumvirate consisting of Pimentel, Garcia, and Luperon came into power. These were succeeded by José Maria Cabral as president, who attempted to lease Samana bay to the United States, but the offer was declined. In 1868 Baez again became president. In 1871 three commissioners were sent by President Grant to examine into the condition of the Dominican republic, whose inhabitants had voted almost unanimously for annexation to the United States; their report was favorable to annexation, but congress took no action upon it. On Jan. 10, 1873, the bay and peninsula of Samana were ceded to a company formed in the United States; but on March 25, 1874, all the rights of the company were confiscated for non-payment of the stipulated annual rent. Baez was succeeded as president by Ignacio Gonzales, elected Dec. 20, 1873.

SANTO DOMINGO, a city, capital of a province of the same name and of the republic of Santo Domingo, on the right bank of the mouth of the river Ozama, lat. $18^{\circ} 28' N.$, lon. $69^{\circ} 55' W.$; pop. said to be 10,000, but estimated by the United States commission in 1871 at about 6,000. The town is built on a solid limestone formation, with a perceptible incline toward the river, and is surrounded by a wall, 8 ft.

other. Many of the ancient houses and buildings are still standing, but are only remarkable for their solidity. Few of the many churches which once graced the city now remain. The most noteworthy is the cathedral, in which the remains of Columbus and of his brother Bartholomew reposed for two and a half centuries. It was begun in 1512 and finished in 1540, and was modelled after a church in Rome. On the bank of the river are the ruins of the so-called castle of Columbus, a fortified stone house built by Diego Columbus. There are in the city a seminary, a college, and a primary school, all under the care of the church, with about 300 pupils. In the college are a school of medicine and a night school for gratuitous instruction. The climate is healthful. The trade is principally in cabinet and dye woods, which are brought down from the interior. The port is deep enough for large vessels, the river being 24 ft. deep for three miles, but there is only 18 ft. of water at the entrance.—Santo Domingo city, the oldest existing settlement by white men in the new world, was founded by Bartholomew Columbus in 1494 on the left bank of the Ozama, and was originally called Nueva Isabella. In 1502 it was destroyed by a hurricane, when its location was changed to the opposite side of the river. The walls were built in 1506. In 1586 Sir Francis Drake captured the city, but ransomed it for 25,000 ducats. In 1655 the English under Admiral Penn and Gen. Venables were defeated here.

SANTORIN. See THERA.

SANTORINI, Giovanni Domenico, an Italian anatomist, born in Venice about 1680, died there,

May 7, 1736. He studied medicine at Pisa, and practised in Venice, where he was professor and professor of anatomy. He discovered and described two small cartilages, attached to the apices of the arytenoid cartilages of the larynx, now known as the cartilages of Santorini. His works are: *Opuscula Medica de Structura et Motu Fibrae; De Nutritione Animalis; De Hemorrhoidibus; De Catamenis*, &c. (Venice, 1705); *Observationes Anatomicae* (1724); *Istoria d'un feto estratto delle parti de-*

Cathedral of Santo Domingo.

thick and 10 ft. high, built of *mamposteria*, a composition of earth, powdered stone, and lime; it is 4,500 yards in circumference, and is strengthened with bastions. The streets are straight, wide, and at right angles to each

retane (1727); *Istruzione alle febbre* (1784); and *Anatomica Septemdecim Tabulae*, &c. (Parma, 1775).

SÃO FRANCISCO, a river of Brazil. See BRAZIL, vol. iii., p. 220.

SAÔNE (anc. *Arar*; in the middle ages, *Se-gona* or *Saucona*), a river of France, which has its source at Vioménil, in the S. W. part of the department of Vosges, flows generally S. through the departments of Haute-Saône, Côte d'Or, and Saône-et-Loire, forms the boundary between those of Rhône and Ain, and unites with the Rhône at Lyons. Its length is 280 m., of which 190 m. are navigable for steamboats. The town of Gray is the head of navigation at the ordinary height of the river, but during an overflow large rafts, loaded with staves, iron, and other heavy produce, descend from the department of Vosges to Gray. Its principal affluents are the Oignon, Doubs, and Seille from the left, and the Ouche and Grône from the right. The Burgundian, Central, and Rhône and Rhine canals connect it with the Rhine and the Seine. Though usually a gentle stream, it has at times been subject to destructive floods; several of these are on record, including one in 1840 which produced great loss of property and life at Lyons.

SAÔNE-ET-LOIRE, a S. E. department of France, in Burgundy, bordering on Côte-d'Or, Jura, Ain, Rhône, Loire, Allier, and Nièvre; area, 3,302 sq. m.; pop. in 1872, 598,344. It is crossed from N. to S. by a mountain range, and is watered W. of this ridge by the Loire, and E. by the Saône. The surface is diversified and the soil moderately fertile. Fair wines, coal, iron, manganese, leather, glass, and linen, cotton, and woollen goods are produced. The great iron works of Le Creuzot are in this department. It is divided into the arrondissements of Charolles, Châlon-sur-Saône, Louhans, Mâcon, and Autun. Capital, Mâcon.

SAÔNE, Haute. See HAUTE-SAÔNE.

SÃO PAULO. **I.** A S. province of Brazil, bounded N. by Minas Geraes, E. by Rio de Janeiro and the Atlantic, S. by Paraná, and W. by Matto Grosso; area, 93,547 sq. m.; pop. in 1871, 835,000. The coast, 250 m. long, is fringed by numerous islands, the largest being that of São Sebastião. The best harbor is that of Santos. The Serra do Mar, forming the edge of the great Brazilian plateau, skirts the coast; its average height is 2,750 ft. On the W. side the country declines gently toward the plains of the Paraná basin. This region is watered by large rivers, mostly navigable for several hundred miles; the principal are the Grande and the Tieté, tributaries of the Paraná, which forms the W. boundary line of the province. The gold mines of Jaraguá were long famous. Pompeio sets down the yield of all the gold mines up to 1800 at 116,250 lbs. Silver, copper, and iron also occur, and diamonds, rubies, and other precious stones have been found. Valuable coal mines have recently been discovered. The climate in the west is mild, but on the coast it is hot. The soil is very rich, and the chief articles of cultivation are coffee, cotton, tobacco, sugar cane, maize, sweet potatoes, mandioca, and black beans. The value of the coffee exported in

1870-'71 was \$5,600,000, one fifth of which was to the United States; of the cotton, \$1,800,000, half of which went to England. In 1873 there were 624 public schools, with 16,264 pupils. **II.** A city, capital of the province, 40 m. N. N. W. of Santos, its port, and 225 m. W. by S. of Rio de Janeiro; pop. about 20,000. It stands on high ground, almost surrounded by a low plain. The streets are narrow and irregular, but well paved and lighted with gas; the houses are of adobe. The cathedral, a parish church, and several other churches attached to convents or nunneries, the bishop's and the president's palaces, the city hall, prison, three hospitals, and three stone bridges are noteworthy structures. São Paulo was founded by Jesuits in 1552; in 1712 it was incorporated as a city, and in 1746 was erected into a bishopric.

SÃO PEDRO DO RIO GRANDE DO SUL (formerly abbreviated to Rio Grande do Sul, now to São Pedro). **I.** The southernmost province of Brazil, bounded N. by Paraná, N. E. by Santa Catharina, S. E. by the Atlantic, S. W. by Uruguay, and N. W. by the Argentine Republic; area, 73,836 sq. m.; pop. in 1872 (estimated), 455,000, including several thousand Germans and about 84,000 slaves. The Serra do Mar traverses the province near the coast from N. to S., and the Serra Geral runs E. to W., none of the peaks rising more than 3,200 ft. above the sea. The S. and W. parts are level, and the coast is low and sandy. Parallel to the coast in nearly its whole extent are Lake Merim, 115 m. long and 15 m. wide, and the lagoa dos Patos, 150 m. long and 40 m. wide, united by a natural canal, São Gonzalo, 50 m. long, and communicating with the ocean through the estuary called Rio Grande do Sul, which extends from the S. end of the lagoa dos Patos and empties into the Atlantic over a dangerous bar. Besides the Uruguay, which flows on its N. and W. border, the principal rivers are the Ibicuy, 350 m. long, a tributary of the Uruguay; the Jacuy, navigable for 250 m., emptying into the lagoa dos Patos; and the Jaguarão, 175 m. long, falling into Lake Merim. The W. shores of the lakes are verdant plains intersected by small streams, and producing all the cereals and fruits of the temperate and tropic zones, with flax, hemp, sugar cane, cotton, and tobacco. Ipecacuanha, sarsaparilla, turpeth, camomile, and indigo abound. The forests afford abundant timber and a great variety of cabinet woods. The province is rich in gold, silver, iron, copper, marbles, and particularly coal. Lead, granite, kaolin and other clays, ochres, and many varieties of precious stones are found. Cattle raising is an important industry. Mining is still limited. Railway and telegraph lines are now (1875) in course of construction through the province. Education is encouraged; in 1873 there were 446 public schools, with an aggregate attendance of 14,696 pupils. The chief towns are São Pedro, Pelotas, Pardo, and Porto Alegre, the

capital. **II.** A city of the preceding province, near the mouth of the Rio Grande do Sul, 159 m. S. S. W. of Porto Alegre; pop. about 18,000. The streets are irregular, but well paved. The harbor is the only good one in the province, nearly the entire trade of which, conducted mainly by English and Germans, centres here. Three lines of steamers run to Porto Alegre. The exports in 1872-'3 were valued as follows: hides, \$5,037,312; horse-hair, \$247,200; wool, \$149,544; maté or Paraguay tea, \$93,658; rum, sugar, coffee, and timber, \$6,897; total, \$5,534,611. The imports amounted to \$1,826,587. The arrivals from foreign ports were 929 vessels, tonnage 198,029; departures 698, tonnage 212,936; arrivals from Brazilian ports 840, tonnage 221,213; departures 890, tonnage 185,060.

SAP. See **PLANT**, vol. xiii., p. 582.

SAPAJOU. See **MONKEY**, vol. xi., p. 751.

SAPAN WOOD (Malay, *sapang*), a dyewood afforded by *Cesalpinia sapan*, imported from the East Indies and used to dye red on cotton. The genus, named in honor of the naturalist Cesalpinus, is also found in Central and South America and the West Indies, where some species afford Brazil, peach or Nicaragua, and other dyewoods (see **BRAZIL WOOD**), and another species the divi-divi pods used in tanning (see **DIVI-DIVI**).

SAPOR. See **PERSIA**, vol. xiii., p. 322.

SAPPHIRE (Heb. *sappir*; Ar. *safir*), a precious stone, next in value and hardness to the diamond. It is a transparent variety of corundum, composed of nearly pure alumina. It receives different names according to the color, the red sapphire being the oriental ruby; the amethystine, the oriental amethyst; the yellow, the oriental topaz; the green, the oriental emerald; while the term sapphire alone is commonly applied to the blue variety. The Greek sapphire (*ἀσπερος*) was not the gem here described, but the lapis lazuli, as appears from the description given by Theophrastus and Pliny. The blue sapphire is the *δάκρυδος* of the Greeks and the *hyacinthus* of Pliny. The ruby was probably included in the *anthrax* of Theophrastus and the *carbunculus* and *lychnis* of Pliny. The chemical formula of sapphire is Al_2O_3 , with a small quantity of oxide of chromium, upon the varying proportions of which the color of the different varieties depends. The coarser kinds of corundum contain several other oxides. (See **CORUNDUM**, and **EMERY**.) The sapphire crystallizes in the rhombohedral system, has a vitreous lustre, often pearly in the basal planes, and sometimes, when viewed in the direction of the vertical axis, exhibits a bright opalescent star. All sapphires, or pure varieties of corundum, are exceedingly tough and hard, being rated 9 on the scale of hardness, the diamond being 10. The gem is found in various parts of the world, and in different geological formations, as in the granite of Siberia, in the ripidolite of North Carolina, and in the granular lime-

stone of New Jersey. The finest ruby sapphires come from Pegu, Burmah, and Siam. Smaller ones have been found at Hohenstein in Saxony, Bilin in Bohemia, and Le Puy in France. The finest blue sapphires come from Ceylon.—The blue sapphire has been known from the earliest times, and was regarded by the ancients as a sacred stone. It is the fifth stone in the breastplate of the Hebrew high priest. A good blue sapphire of 10 carats is worth about 50 guineas, and one of 20 carats 200 guineas. An ordinary rule for estimating the value is to multiply the square of the weight in carats by half a guinea. Fine gems, for special reasons, often bring a much higher price; thus a sapphire of a barbel blue, weighing 6 carats only, brought at a public sale in Paris \$350. Notwithstanding its excessive hardness, the ancients executed fine engravings upon the sapphire. A remarkable intaglio by Cneius, cut in a sapphire, is in the Strozzi cabinet at Rome; it is a profile of the young Hercules.—The red sapphire, or ruby, is the most precious variety, a perfect one weighing more than $3\frac{1}{2}$ carats being more valuable than a diamond of the same weight; a perfect one of 5 carats is worth twice as much as a diamond of the same weight; and when they weigh 10 carats each, the ruby, if very fine, has three times the value of the diamond. According to Harry Emanuel ("Diamonds and Precious Stones," London, 1873), the finest and purest rubies have the following value: 1 carat, from £14 to £20; 2 carats, £70 to £80; 3 carats, £200 to £250; 4 carats, £400 to £450. The tint of the ruby is as fine by artificial light as by the light of day, and when of the finest tint it has the color of the centre of the red band of the solar spectrum, or that particular shade known by jewellers as "pigeon's blood;" but it varies from the lightest rose tint to the deepest carmine. A deep-colored ruby exceeding 20 carats is usually called a carbuncle. The largest fine ruby known in the world was brought from China to Prince Gagarin, governor of Siberia; it afterward came into the possession of Prince Menshikoff, and is now in the imperial crown of Russia. The mines of Burmah are a royal monopoly, and the finest stones can be carried out of the country only by smuggling. When a particularly large and fine stone is found, it is customary to send out a procession of grantees with soldiers and elephants to meet it. One of the titles of the king is "lord of the rubies." The yellow sapphire, called the oriental topaz, is very rare, but never reaches the value of a ruby or blue sapphire, or even an emerald of equal dimensions. It was the second stone in the breastplate of Aaron. It was for a long time supposed that the ancients did not engrave upon the topaz, but Caire describes one in his possession weighing 29 carats, engraved with the motto in Arabic, "No one accomplishes but God." The ordinary occidental topaz is a compound of alumina, silica, and fluoric acid.

(See **TOPAZ**.)—The violet sapphire is the oriental amethyst, a very rare gem of a magnificent lustre. It is the ninth stone in the breastplate of the Hebrew high priest, and is the sacred stone which ornaments the cross and the pastoral ring of Catholic bishops. It was often cut both in relief and in intaglio by the ancients. In the national library of France there is a splendidly wrought profile in amethyst, supposed to be Mæcenas in old age, engraved by Dioscorides, one of the four celebrated engravers mentioned by Pliny. The greater part of the amethysts of commerce are occidental amethysts, quartz crystals colored a fine violet by certain metallic oxides. (See **AMETHYST**.) The oriental emerald, the green variety of precious corundum, when of a beautiful green and perfectly transparent, is the rarest of gems. Specimens have been found in Montana territory. (See **EMERALD**.) When the sapphire is colorless it is called the white sapphire, and when properly cut and polished it has been mistaken for the diamond; but it is inferior in brilliancy, and may be distinguished by its somewhat less specific gravity, and by its being readily scratched by the diamond.—Specimens of sapphire have been found in the ripidolite of North Carolina by Col. C. W. Jenks, in large crystals of several hundred pounds weight. They occur in the native rock *in situ*, of different colors, possessing much beauty as mineralogical specimens, and some of them have been cut; but as they are traversed by cleavage planes, they do not possess the perfection of the eastern gems.—Artificial sapphires have been formed by Deville and Caron in small crystals by subjecting fluoride of aluminum to the action of boracic acid at a white heat, and adding various quantities of fluoride of chromium. A certain quantity yields the blue sapphire, somewhat more the ruby, and still more the emerald. Daubrée formed pure crystals by the action of chloride of aluminum on lime; Ebelmann by exposing to a high heat four parts of borax and one of alumina; and Gaudin by decomposing potash alum with charcoal.

SAPPHO, a Greek poetess, born at Mytilene or Eresus in the island of Lesbos, flourished about 600 B. C. She lived in friendly intercourse with her countryman Alcæus, and was married to Cercolas of Andros, by whom she had a daughter, Cleis. From Mytilene, where she lived, she was compelled by persecution to flee to Sicily, but whether she remained there until her death is not known. The common story that, being in love with a youth named Phaon, she leaped in despair from the Leucadian rock, probably originated in the myth of the love of Aphrodite for Adonis, who is called Phaon by the Greeks, while the leap from the rock is a metaphor used by many poets besides Sappho. Her poems are principally erotic compositions for the single voice, but she also wrote on a variety of other subjects, serious as well as satirical, and is

said to have first employed the Mixolydian mode in music. The Attic comic poets delighted in introducing her into their dramas as a courtesan; but Welcker, K. O. Müller, Neue, and other commentators have attempted to vindicate her character. The poems of Sappho were arranged by the later literary Greeks in nine books according to their metres; but only one complete ode, that to Aphrodite, and a number of short fragments, remain. She wrote in the Æolic dialect, and is said to have invented the metre which bears her name. It was formerly the custom to print her literary remains in editions of the pseudo-Anacreon, and it was not till 1733 that a separate edition of any portion of them appeared. Numerous collections and critical editions have since been published, the best being by Volger (1810), Neue (1827), Schneidewin (1838), and Bergk (1843). There are numerous translations.

SARACENS, originally the name of an Arab tribe, then applied to the Bedouins, afterward to the followers of Mohammed, and later to all the Moorish or Mohammedan people who invaded Europe, and against whom the crusaders fought. The classical writers do not clearly indicate the locality occupied by the tribe. Decius, it is said, let loose among them a number of lions, to punish them for their predatory habits. In regard to the origin of the name, some suppose that an Arab tribe claimed Sarah as their ancestress in order to escape the stigma of being descendants of Hagar; others, that the name was given to them in consequence of their roving and plundering life, from the Arabic *sarak*, to plunder; and others, that the word is a derivative of *sharak*, to rise, and hence signifies merely "an eastern people."

SARAGOSSA (Sp. *Zaragoza*). **I.** A N. E. province of Spain, in Aragon, bordering on Navarre, Huesca, Lérida, Tarragona, Teruel, Gualajara, Soria, and Logroño; area, 6,607 sq. m.; pop. in 1870 (estimated), 401,894. The surface is generally hilly. The valley of Caspe in the southeast is remarkably fertile. The Ebro flows S. E. through the province; other rivers are the Jalon, Gallego, and Jiloca. Lead, copper, tin, and sulphur are found, but few mines are in operation. Wheat, flax, hemp, silk, wine, and oil are produced. Little attention is paid to manufactures. The chief towns, besides the capital, are Tarazona, Calatayud, Daroca, Mequinenza, and Caspe. **II.** A city (anc. *Cæsarea Augusta*), capital of the province, on the right bank of the Ebro, at the junction of the Huerba and nearly opposite the mouth of the Gallego, and on the canal of Aragon, 170 m. N. E. of Madrid; pop. about 65,000. Although one of the most important cities in Spain, it is gloomy and antiquated, with narrow, irregular, and ill-paved streets. The canal and the crossing of two main railway lines have lately given the city an increased activity. There are two cathedrals, several churches, an academy of fine arts, a

large hospital, and a university established in 1474. The bridge over the Ebro was built in 1487.—Saragossa was founded by Augustus in 27 B. C., taken by the Goths about 470, by the Moors in 712, and by Alfonso I. of Aragon in 1118. It is famous for the two sieges it sustained in 1808, the first from June 16 to Aug. 14, when the French were repulsed with great loss, and the second from Dec. 20, 1808, to Feb. 21, 1809, when the city surrendered after one of the most desperate defences in history, and was held by the French till July, 1813. During the siege 54,000 persons in the city perished, of whom only 6,000 were killed by the enemy, the rest dying from an epidemic which broke out and which compelled the surrender.

SARAGOSSA, Maid of. See AGUSTINA.

SARATOGA, an E. county of New York, bounded E. and partly N. by the Hudson river, and S. by the Mohawk; area, 780 sq. m.; pop. in 1870, 51,529. The surface is mountainous in the northwest. Iron ore, sandstone, and limestone are abundant. The central portion abounds in mineral springs, principally at Saratoga and Ballston Spa. The Champlain canal passes along the E. and the Erie along the S. border, and it is traversed by several railroads. The chief productions in 1870 were 15,913 bushels of wheat, 173,599 of rye, 381,541 of Indian corn, 581,674 of oats, 144,985 of buckwheat, 1,236,915 of potatoes, 83,399 tons of hay, 194,792 lbs. of wool, 1,426,308 of butter, 83,277 of cheese, 52,296 of hops, and 38,316 of honey. There were 9,200 horses, 15,779 milch cows, 11,041 other cattle, 40,513 sheep, and 7,675 swine; 6 manufactories of boats, 8 of brick, 32 of carriages and wagons, 3 of cotton goods, 4 of woollen goods, 1 of linen, 1 of window glass, 1 of edge tools and axes, 3 of hardware, 6 of iron castings, 6 of machinery, 2 of engines and boilers, 12 of paper, 20 of saddlery and harness, 8 of sash, doors, and blinds, 4 of wooden ware, 10 tanneries, 16 flour mills, and 80 saw mills. Capital, Ballston Spa.

SARATOGA, Battle of. On Sept. 14, 1777, the expedition of Burgoyne crossed the Hudson by a bridge of boats and encamped on the heights and plains of Saratoga, near Fish creek, within a few miles of the northern division of the continentals under Gen. Gates at Stillwater. Kosciuszko had fortified Bemus's heights; the right wing occupied a hill nearest the river, and Arnold commanded the left wing about three fourths of a mile further removed. Next day the right wing of the British advanced to within 4 m. of the American lines, and on the 19th made a further forward movement of 2 m. It was led by Burgoyne, and consisted of Canadians and Indians, supported by a body of grenadiers and light infantry under Gen. Fraser. Gen. Morgan, who had been detached about noon with his sharpshooters to observe Burgoyne's movements, drove back the advanced guard, but coming upon the main column was compelled to retreat. Reinforcements coming up under

Arnold, a severe conflict ensued, commencing about 4 o'clock and continuing until dark. The loss of the Americans was within 400, that of their adversaries about 500. This contest is variously called the battle of Saratoga, Stillwater, and Bemus's heights. Frustrated in this attempt, his communications with Canada cut off by the seizure of the posts at the outlet of Lake George, and his supplies intercepted by the capture of a large fleet of boats with provisions and 800 men, Burgoyne's only hope was in Sir Henry Clinton, who had promised to attempt the ascent of the Hudson for his relief. He fortified his camp, but after waiting two weeks had no alternative but to hazard a battle. On Oct. 7, seconded by Major General Phillips and Riedesel, and Brigadier General Fraser, he advanced with 1,500 picked troops, two 12-pounders, two 6-pounders, and two howitzers, and offered battle to the American army. Scouts were sent out with orders to make a diversion in the rear, but they were discovered by the advanced guard of the Americans. Two detachments went forward, one under Gen. Poor against the British left and one under Morgan against their right. On the left the Americans advanced against the British grenadiers and artillery, and, having been joined by Arnold (who had rushed without orders to the head of the detachment, and assumed the command), took and lost the batteries again and again, until the enemy had been driven off and their own guns turned upon them. Morgan in the mean while had attacked the enemy's right under Fraser, who was fatally wounded by a sharpshooter. This, followed by a reinforcement of the Americans, threw the British into confusion, and Burgoyne, abandoning his artillery, retreated to his camp in good order. Here he was again desperately assailed, and the Americans carried a portion of the camp and drove off the Hessian reserve. Arnold, who led the last charge, was severely wounded in the leg. Night closed the contest; the victors lay on their arms near the battle field, and Burgoyne abandoned a portion of his camp and moved to the river. On the 9th he retreated to Saratoga, and on the 10th the whole British force occupied their former camp, which they proceeded to strengthen in the hope of succor from Sir Henry Clinton, should they not be able to effect a retreat. An American battery under Gen. Fellows commanded the passage across the river, the bridges on the road to Fort Edward were destroyed, and Gates with about 12,000 men appeared on the S. side of Fish creek prepared for battle. Without an avenue of retreat, continually exposed to the fire of Gates's and Fellows's batteries and the riflemen of Morgan, without provisions for more than a few days, and despairing of relief, Burgoyne, after consultation, on Oct. 13 proposed a cessation of hostilities until terms of capitulation could be agreed upon. Gates demanded an unconditional surrender, which

was rejected; and he finally agreed on the 15th to more moderate terms, influenced by the possibility of Clinton's arrival, which after some hesitation Burgoyne signed on the 17th. They provided that the British were to march out with the honors of war, and to be furnished a free passage to England under promise of not again serving against the Americans. These terms were not carried out by congress, and most of the captured army, with the exception of Gens. Burgoyne, Riedesel, Phillips, and Hamilton, were retained as prisoners while the war lasted. The Americans obtained by this victory, at a very critical period, an excellent train of brass artillery, consisting of 42 guns of various calibre, 4,647 muskets, and a large supply of ammunition. The prisoners numbered 5,804, and the entire American force at the time of the surrender was 10,817 effective men. A plan has been formed for the erection of a monument on the site of the surrender (Schuylerville), to be higher than that of Bunker Hill, with niches for bronze statues of the principal actors in the battle. The cost is estimated at \$450,000, toward which the state of New York has appropriated \$50,000.

SARATOGA SPRINGS, a town and village of Saratoga co., New York, on the Adirondack and the Rensselaer and Saratoga railroads, 32 m. N. by W. of Albany; pop. of the town in 1870, 8,537; of the village, 7,516; in 1875, 10,765. The mineral springs, which have given this place its celebrity, and its large elms, are almost the only natural attractions. Saratoga lake, 6 m. long by 2 m. wide, fed by Kayaderosseras creek and connected with the Hudson by Fish creek, is $3\frac{1}{2}$ m. E. of the village. On the S. E. shore is a valuable white sulphur spring. There are in all at Saratoga 28 springs (including 6 spouting), some chalybeate, others impregnated with iodine, sulphur, and magnesia, and all powerfully charged with carbonic acid gas. The most celebrated are the Congress, Empire, Hathorn, High Rock, Washington, Geyser (spouting), and Pavilion springs. High Rock spring, composed of calcareous tufa, narrows rapidly as it rises above the surface, and terminates $3\frac{1}{2}$ ft. above the ground in a rounded top, in the centre of which is a circular opening a foot in diameter 4 in. below the surface; the depth of the spring from the top of the rock is 32 ft. In 1789 the rock was entire, the water occasionally overflowing and increasing its size by deposits. Two years afterward a large tree fell upon and cracked it, since which time the water has kept on a general level 5 or 6 in. below the top. The waters of these springs are regarded as valuable aids in cutaneous and liver diseases, in some cases of confirmed dyspepsia, and in chronic affections of the bowels. They are generally tonic and greatly cathartic. At an early period the waters were evaporated in potash kettles, and the precipitated salts sold in small packages; but it was soon found that these salts did not reproduce the original wa-

ters on being dissolved. Large quantities of the waters, especially of the Congress, Empire, and Hathorn springs, are bottled and exported. (For analyses, see MINERAL SPRINGS, vol. xi., p. 593.) The village contains 7 large and 25 small hotels, 49 boarding houses, four banks, a large town hall, two assembly rooms, a female seminary, a water cure, five printing offices, a daily and three weekly newspapers, and eight churches. The number of visitors during the season, which lasts from June 15 to Sept. 15, ranges from 30,000 to 45,000.—The medicinal properties of the High Rock spring, or the "Round Rock," as it was called by the early settlers, were known to the Iroquois confederacy at the period of Jacques Cartier's visit to the St. Lawrence in 1535. In 1767 Sir William Johnson was carried hither on a litter by the Mohawks, and it is believed he was the first white man to visit the spring. The first log cabin was built in 1773 by Derick Scowton, and the first framed house in 1784 by Gen. Schuyler, who in the same year cut a road through the forest to the High Rock from Schuylerville. In 1693 a sanguinary battle was fought near the site of the present village between the French under De Manteth and the English led by Major Peter Schuyler, in which the latter were victorious. The name Saratoga (Indian, *Saraghoga*) signifies the "place of the herrings," which formerly passed up the Hudson into Saratoga lake.—See R. L. Allen, "Analysis of the principal Mineral Fountains at Saratoga," &c. (New York, 1858), and W. L. Stone, "Reminiscences of Saratoga" (New York, 1875).

SARATOV. I. A S. E. government of European Russia, bordering on Penza, Simbirsk, Samara, Astrakhan, the country of the Don Cossacks, and Tambov; area, 32,622 sq. m.; pop. in 1870, 1,751,268, of whom 120,000 were Germans. It is watered by affluents of the Don and of the Volga, which bounds it in the east. It formerly included a large territory E. of the Volga, which is now comprised in the governments of Samara and Astrakhan. The country is generally level, but skirted by hills along the Volga. II. A city, capital of the government, on the right bank of the Volga, 450 m. S. E. of Moscow; pop. in 1867, 93,218. It contains 12 Greek and several other churches, and a gymnasium. It is an important centre of trade and industry, and the population has lately much increased. A Greek bishop resides here, as well as a Protestant consistory with an extensive jurisdiction.

SARAWAK. I. An independent state in Borneo, under English control, extending about 300 m. along the N. W. coast from Cape Datu to Kidorong point, between lat. $0^{\circ} 30'$ and $3^{\circ} 20'$ N., and lon. $109^{\circ} 40'$ and $111^{\circ} 40'$ E., and inland at the furthest point about 100 m. The interior boundary, bordered by the Krimbang mountains, forms a curve which terminates in the capes mentioned. The surface varies from the lofty mountains scattered throughout the

interior, some of which are at least 6,000 ft. high, to the low, forest-covered, and fertile plains in the valleys of the numerous rivers, separated from each other by mountainous ridges. A few isolated mountains occur near the coast. The largest and deepest river is the Rejang, which flows into the sea N. E. of the capital, over a bar having five fathoms of water at high tide. The Sarawak river has a depth of $3\frac{1}{2}$ fathoms at its principal entrance, at low water. Between it and the Rejang is the Batang-Lupar, a third long river, which enters the sea with a width of 4 m. Of the secondary rivers the more important are the Samarahan, Sadong, Seribas, and Kalaka, in W. Sarawak; the Egan, a branch of the Rejang; and the Bintulu, near the E. frontier, on which stands a settlement of the same name. In the mountains nearest the coast limestone is the prevailing formation. The soil along the rivers is a rich alluvium, but clayey in the higher districts. Gold washing is carried on by the Chinese on many of the streams, and yields some profit. The chief metal product, however, is antimony, which occurs of the best quality, in exceeding abundance, and in many localities. Excellent coal deposits have been discovered, but as yet are only partially developed. Iron was formerly manufactured by the inhabitants from native ores, and arsenic and manganese are found, and small quantities of silver; but none of these metals are now worked. Forests over-spread the greater part of the country, yielding valuable timber, ebony, ironwood, sandal wood, gutta percha, caoutchouc, camphor, rattan, and bamboo. Agriculture is in a comparatively primitive state. Rice is cultivated in the lowlands, and cotton, pepper, tapioca, and tobacco in the more elevated districts. Maize, sugar cane, arrowroot, and nearly all the insular products of the archipelago are also raised. The climate is hot, with much rain from September to March, but not unhealthy.—The population of Sarawak is estimated at 300,000, composed of about 40,000 Malays, the Land and Sea Dyaks, a tribe in the east known as the Milanaus, some tattooed tribes of the interior, and about 3,000 Chinese. There are settlements on all the larger rivers. The founder of the present government was Sir James Brooke (see BROOKE), to whom in 1841 the sultan of Borneo proper ceded the town of Kuching, with the title of rajah. An additional cession was subsequently made, enlarging Sarawak to its present boundaries. Under his enlightened rule the country steadily advanced, from the complete anarchy in which he found it, toward peace and prosperity, notwithstanding a formidable Chinese insurrection in 1857, which was successfully suppressed after the slaughter or expulsion of about 2,000 Chinamen. When Sir James Brooke died in 1868, he was succeeded as rajah by his nephew Charles Brooke, under whom Sarawak has continued to prosper. A

system of associating the native chiefs with Europeans in the government was adopted at the outset, and has been maintained. Justice is simply and effectively administered through native local courts, where the Mohammedan code is applied under European supervision, and through the supreme court of the rajah at the capital. Complete religious toleration prevails; the English bishop of Labuan exercises spiritual jurisdiction in Sarawak, and there are several Protestant missionary stations in the country. A few regular troops are maintained. The revenue is derived through the sale of antimony, duties on opium, tobacco, and spirits, and a family tax of four shillings sterling. The total value of the foreign trade is over £300,000 annually, the principal exports being gutta percha, antimony, sago meal, camphor, wax, edible birds' nests, and rattans.

II. A town, capital of the state, on the Sarawak river, 17 m. from the sea, in lat. $1^{\circ} 28'$ N., lon. $110^{\circ} 8' E.$; pop. about 25,000, mostly Malays and Chinese, with a few English officials. It was formerly known as Kuching. The buildings extend along the bank, none of them at any very great distance from the river, and include the government house, an English Protestant church and mission house, and a mosque. Large vessels can enter the river, but cannot ascend to the town, the approach to which is commanded by a small fort. Sarawak is a free port, and carries on a large trade, chiefly with Singapore.

SARBER, a W. county of Arkansas, bounded N. E. by the Arkansas river, and drained by small tributaries of that stream; area, about 625 sq. m. It has been formed since the census of 1870. The surface is generally broken and hilly, but there are some prairies, which with the river bottom and valleys are fertile. There is some fine timber. Grain, grass, cotton, and tobacco grow well. Capital, Anderson.

SARCODE. See ANIMALCULES, and PROTOPLASM.

SARD, and **Sardonix**, precious stones, varieties of carnelian or chalcedony, named either from Sardis in Lydia, where they were originally found, or from the Greek *σάρξ*, flesh, in allusion to the flesh-like colors they sometimes exhibit. The sard is marked by concentric zones or small nebulosities in the middle of its ground, which distinguish it from red carnelian. Its color by reflected light is a dark reddish brown, almost black, and by transmitted light a deep red inclining to blood red. When it alternates in bands with white chalcedony, it is called sardonix (sard and onyx). The name was indefinitely applied by the Romans to the various agates and carnelians. Dufrénoy designates true flesh-colored agates as sards, those with alternating white stripes as sardonix, and the deep reddish brown or orange red agates as sardoines.

SARDANAPALUS, the last king of the Assyrian empire of Ninus, according to the ancient historian Ctesias. His effeminacy and licentious-

ness excited a rebellion, headed by Arbaces, satrap of Media, and Beleys, the noblest of the Chaldean priests. He defeated the insurgents in several battles, and, when at last forced to retreat to Nineveh, sustained a siege of two years. When it became evident that the city could be held no longer, he collected all his treasures and his women, and placing them on an immense pyre perished with them in the flames. The date of the event has been variously assigned to 876, 789, 710, 625, and 606 B. C. The utter impossibility of reconciling the chronology of this account with that given by other authorities, has led many writers to distrust the whole narrative, and to consider Sardanapalus a myth. K. O. Müller sought in an ingenious and elaborate essay to prove the identity of the god Sandon with Sardanapalus. Rawlinson is of opinion that the Sardanapalus of Otesias represents both Asshurbani-pal, in whose reign the Assyrian empire reached its greatest extent, and his successor Asshur-emit-ilin (according to him the Saracus of Abydenus), in whose time Assyria fell into the hands of the Medes. (See ASSYRIA.) Lenormant identifies him with the predecessor of Tiglath-pileser II., whose name Rawlinson gives the form of Asshur-lukh-khush or Asshur-lush, George Smith of Assur-nirari, and Oppert of Asshur-likhish; but Lenormant, assuming that there was in Assyrian a peculiar *itanaphal* form of conjugation, reads the name Asshur-tanagbal, whence, by a softening of the consonants, the Greek form Sardanapalus might easily have arisen. The first destruction of Nineveh, thus placed in the reign of Asshur-tanagbal (789 B. C.) by Lenormant, Oppert, and Dr. Hincks, is not believed to be historical by Rawlinson and many other scholars.

SARDES, or **Sardis**, an ancient city of Asia Minor, capital of Lydia, in the plain N. of Mount Tmolus, on the river Pactolus near its junction with the Hermus, about 45 m. E. of Smyrna. Ancient writers say the town was named after the god of the sun, and it is conjectured that it is identical with the Homeric Hyde. The early history and traditions of Sardes have been given in the article **LYDIA**. There are but few remains of the magnificent residence of Croesus, in whose time Sardes was one of the richest cities in the world. At the side of a steep hill, on which the walls of the acropolis are still standing, are the ruins of a theatre and other buildings. In the valley are the remains of a gymnasium, or perhaps a basilica, and on the acropolis stand two enormous columns, besides several others lying on the ground, supposed to belong to a temple of Cybele, which Herodotus mentions as having been burned by the revolted Ionians when they took the city in 500 B. C. On the other side of the valley is the necropolis of the Lydian kings. Prominent among the tumuli, and the largest of all, is that of Alyattes, which is circular and about 1,140 ft. in diameter. It was discovered that the tomb had been open-

ed years ago, and the excavations made here in 1868 by G. Dennis showed that most of the tombs in the necropolis had been rifled. A few mud huts in the midst of the ruins constitute the Turkish village of Sart. In the reign of Tiberius Sardes was visited by an earthquake which convulsed the whole face of the country, and reduced it, together with other important cities, to a heap of ruins. It was rebuilt by the aid of Roman benefactions, and it is supposed that either St. Paul or St. John preached here, and founded the church mentioned in the Apocalypse as one of the seven churches of Asia. The Seljuks captured Sardes in the 11th century, and in 1402 it was almost entirely destroyed by Tamerlane.

SARDINE, a small and well known fish of the herring family, and genus *alosa* (Cuv.). It is regarded by Valenciennes and most ichthyologists as identical with the fish called pilchard on the coasts of Great Britain, though Cuvier made it distinct, giving it the specific name of *sardina*. Its flesh is very delicate. The fishery employs a great number of men and women on the coasts of Brittany, and to a less extent of Portugal. Sardines are salted, or preserved in olive oil and butter and put up in tin cases for exportation. The larger fish are called *celans* in France, and pilchards in England; their shoals are preyed upon by codfish, and especially by porpoises. Fish of many other genera of the herring family are called sardines. In the East Indies species of *clupeonia*, *spratella*, *kovala*, and *Dussumiera* (the last named belonging to the *erythrinidae*) are placed on the table as sardines; in the West Indies *harengula clupeola* (Val.) is called the Spanish sardine, and *pellona Orbignyana* (Val.) in South America. The menhaden (*A. menhaden*) is called the American sardine, and is caught on the coast of New Jersey, put up in oil, and exported in large quantities.

SARDINIA (Ital. *Sardegna*; anc. *Ichnusa* and *Sardinia*), next to Sicily, the largest and most important island in the Mediterranean sea, lying N. of Africa, N. W. of Sicily, W. of southern Italy, E. of Spain and the Balearic islands, and S. of Corsica, and extending from lat. 38° 52' to 41° 16' N., and from lon. 8° 8' to 9° 50' E. On the west and south it is washed by the Mediterranean proper, and on the east by the Tyrrhenian sea, and it is separated from Corsica by a narrow strait called Bocche di Bonifacio; length 169 m., greatest breadth 96 m.; area, including several small adjacent islands, 9,399 sq. m.; pop. in 1872, 636,660. Its shape is oblong, and its coasts are generally steep and rugged, with deep indentations especially on the west and south. On the E. side are Capes Figari, Co da Cavallo, Comino, Monte Santo, Bellavista, Ferrato, and Carbonara, and the bays of Terranova, Orosei, and Tortoli. The gulf of Cagliari cuts a wide semicircular opening on the south between Capes Carbonara and Spartivento, beyond which are Cape Teulada and the bay of Teulada or of Isola Rossa. On the

W. shore, going northward, are the bays of Palmas and Oristano, the latter having at its entrance the promontories La Frasca and San Marco, and Capes Mannu, Marargiu, Caccia, Argentiera, Negretto, and Falcone. East of this last point the N. coast, after forming the gulf of Asinara, makes a semicircular sweep to Punta la Testa at the N. extremity of the island. The principal small islands lying off the coast are the group of Madalena, among which is Caprera, near the E. mouth of the strait of Bonifacio; the island of Tavolara, S. E. of Cape Figari; Aguilastro, S. of Cape Monte Santo; Serpentara and Costelazzo, near Cape Carbonara; San Antioco and San Pietro, W. and N. W. of the bay of Palmas; Mal di Ventre, opposite Cape Mannu; and Asinara, N. of Cape Falcone.—More than four fifths of the surface is occupied by mountains. The main chain, which runs N. and S. across the island, as well as its offshoots, belongs chiefly to the palæozoic formation; the N. range, called Monti di Limbara, is mostly granitic; while the hills extending through the centre from Porto Torres to Cagliari are of tertiary calcareous formation. In many parts of the island, and especially in the northeast, there are extinct volcanoes. The highest summit is the Punta Bruncu-Spina, in the Genargentu or central range, 6,290 ft. above the sea. In the opinion of geologists Sardinia was once united to Corsica, from which it has been severed by some volcanic convulsion. The rivers are numerous, but small; the most important are the Tirso, which flows S. W., drains the centre of the island, and falls into the gulf of Oristano, and the Orosei, Flumendosa, Mannu, and Coghinas. The principal lakes are those of Cagliari, Sarno, and St. Giusta. The island abounds in mineral resources, which are very imperfectly developed. Its ancient silver mines are abandoned, but there are many lead mines in operation. Iron, copper, mercury, antimony, granite, marble, porphyry, jasper, amethyst, gypsum, and alabaster are found, and large beds of coal have been discovered near Iglesias. Salt is obtained on the coast, and there are numerous mineral springs. The coral fishery is an important branch of industry.—The soil is peculiarly rich. Wheat and barley are produced nearly everywhere; maize is supposed to occupy about one fifth of the cultivated land. In the vicinity of Milis, near Cape Mannu on the W. coast, there is an orange forest, the trees in which are far larger than the finest seen in Portugal. Other fruits are also produced in abundance; and the wines are remarkable for spirit and flavor. Tobacco is raised near Sassari; cotton thrives near Cagliari; flax, hemp, and saffron are produced; and in recent times white mulberries have been extensively planted. The cork oak, pine, chestnut, and other trees clothe the slopes of the mountains almost to their summits. Skins of hares, rabbits, foxes, and martens are largely exported. The moufflon, an animal of the

sheep kind, which is believed to be indigenous to the island, frequents the highest and most secluded woods. An enormous quantity of cheese is made from sheep and goat's milk. The coasts abound in tunny, anchovies, pilchards, &c. The climate is agreeable, especially in the high grounds; the summer heat is not so overpowering as on the continent, and winter is comparatively mild, there being little snow except on the higher mountains. The low lands, which are mostly marshy, are subject in the autumn to deadly malaria, here called *intemperie*. Sardinia was anciently one of the granaries of Rome; but its prosperity has been seriously checked by a long period of misgovernment. It was not till 1836 that feudal tenure and feudal jurisdiction were entirely abolished. Besides the royal manufactories of gunpowder, salt, and tobacco (the last two being crown monopolies), there are a few of cotton, woollen, and silk goods, and some coarse pottery and glass works. The island is divided into the provinces of Cagliari and Sassari.—Sardinia was originally settled by the Phœnicians and Etruscans, and temporarily also by Greeks in the 6th century B. C. Its inhabitants, a mixed race called Sardi, were despised as rude and thievish. It was early conquered by the Carthaginians, and occupied by the Romans shortly after the first Punic war. In the 5th century A. D. it was seized by the Vandals, and in the 6th annexed to the Byzantine empire by Belisarius. The Saracens invaded the coasts in the 8th century, and subsequently established there a kingdom. They were finally expelled in 1022 by the Pisans and Genoese, who disputed its possession for nearly 150 years. In 1164 Frederick Barbarossa made the Genoese Barisone king of Sardinia, but in the following year he granted the island to Pisa. The old contest was renewed and carried on till 1175, when the emperor, as umpire, divided Sardinia about equally between the Pisans and the Genoese. In 1238 Enzo, natural son of Frederick II., became king, and in 1296 the crown was given by Pope Boniface VIII. to King James II. of Aragon as a vassal of the Roman see. After overcoming the Pisans, he became in 1326 the sole and uncontested ruler, and Sardinia remained subject to Spain till 1713, when by the treaty of Utrecht it was surrendered to the emperor Charles VI. of Germany. In 1720 he gave it in exchange for Sicily to Duke Victor Amadeus II. of Savoy, who assumed the title of king of Sardinia. (See SARDINIAN STATES.)

SARDINIAN STATES, or Kingdom of Sardinia, formerly a government of Italy, comprising the island of Sardinia, Piedmont (in the wider sense, including Saluzzo, Montferrat, and the W. part of the duchy of Milan), Genoa, Savoy, and Nice. The last two portions have been annexed to France, while all the other states, as well as Lombardy, which was united with Sardinia in 1859, are now embraced in the kingdom of Italy. Previous to the annexation of Lombardy and the cession of Savoy

and Nice, the Sardinian states extended over an area of nearly 30,000 sq. m., with a population of about 5,000,000. The origin of the kingdom dates from the negotiations which followed the treaties of Utrecht and Rastadt, and resulted in the quadruple alliance of Aug. 2, 1718. Victor Amadeus II. of Savoy, who assumed the title of king of Sardinia in 1720, resigned in 1730 in favor of his son Charles Emanuel III., but soon made an ineffectual attempt to recover the crown, and died a prisoner in 1732. Sardinia received numerous additions under Charles Emanuel III. His son Victor Amadeus III., who succeeded him in 1773, was finally overpowered by Napoleon in 1796, shortly before his death, and obliged to surrender Savoy and Nice to France. His son Charles Emanuel IV. was forced in 1798 to retire to the island of Sardinia; Piedmont was annexed to France, Sept. 11, 1802, and until 1814 continental Sardinia remained part of that empire. On his abdication in June, 1802, he was succeeded by his brother Victor Emanuel I., who was restored in 1814, and reestablished absolutism. Savoy was reannexed to Sardinia, and Genoa was added to it by the congress of Vienna. Victor Emanuel I., during a military insurrection headed by Santa Rosa and others, abdicated in 1821 in favor of his brother Charles Felix, in whose absence Charles Albert, of the younger line of Savoy-Carignan, assumed the regency, proclaimed the Spanish constitution of 1820, and established a provisional junta. Charles Felix, aided by Russia and Austria, was restored and undid his relative's work; but as the elder branch of the house of Savoy became extinct in his person, April 27, 1831, Charles Albert ascended the throne. In 1848 he promulgated the *statuto fondamentale*, which is the basis of the present constitution of Italy. He was involved in the same year in a war with Austria, was vanquished by Radetzky, renewed the war in 1849, and was utterly defeated at Novara, March 23. (See CHARLES ALBERT, vol. v., p. 300.) He abdicated, and was succeeded by his son Victor Emanuel II., who, after a war with Austria in 1859, in which he was aided by Napoleon III., annexed Lombardy and other states, and finally became master of all Italy. (See ITALY, SAVOY, and VICTOR EMANUEL.)

SARDIS. See SADEES.

SARDOU, Victorien, a French dramatist, born in Paris, Sept. 7, 1831. His early life was passed in penury, as a teacher and writer, and his first play (1854) was a failure. After his marriage in 1858 with Mlle. de Brécourt, an actress, he formed the acquaintance of Mlle. Déjazet, who brought out at her theatre several of his plays; but his reputation was not fully established until after the performances in 1861 of *Nos intimes*. Among his best known later plays are: *Candide* and *Les premières armes de Figaro* (1862); *Don Quichotte* (1864); *Les vieux garçons* (1865); *La famille Benoiton* (1865); *Patrie* (1869); *Fernande* (1870); and

L'Oncle Sam, a satire on American society (1872). His *La Haine* (1874) failed. He has made an immense fortune from his plays, in which striking plagiarisms have been detected.

SARI, or **Saree**, a city of Persia, capital of the province of Mazanderan, in lat. 36° 35' N., lon. 53° 6' E., about 15 m. from the S. shore of the Caspian sea; pop. about 20,000. It is surrounded by a dilapidated wall and ditch, has dirty unpaved streets, and contains many houses of burnt brick neatly tiled, several mosques and the remains of Parsee temples, a remarkable brick tower 100 ft. high with a conical roof, public baths, and five colleges.

SARGASSO SEA. See ATLANTIC OCEAN, vol. ii., p. 79.

SARGENT, Epes, an American author, born in Gloucester, Mass., Sept. 27, 1812. He studied in Harvard college, became connected successively with the Boston "Daily Advertiser" and "Atlas," and about 1839 removed to New York to take charge of the "Mirror." He next edited the Boston "Evening Transcript," but in a few years retired from journalism, and prepared popular "Speakers," "Readers," and other school books, and works for the young. He has written several very successful plays, including "The Bride of Genoa" (produced in 1836); "Velasco," a tragedy (1837); "Change makes Change," a comedy; and "The Priestess," a tragedy founded on the story of Norma. Among his other works are: "Life of Henry Clay" (1840); "Fleetwood, or Stain of Birth" (1845); "Songs of the Sea, and other Poems" (1847); "Arctic Adventures by Sea and Land" (1857); "Peculiar," a slave story (1863); "Planchette," a work on spiritualism (1869); and "The Woman who Dared," a poem (1869). He is now (1875) preparing a new work on spiritualism.

SARGON. See ASSYRIA, vol. ii., p. 35.

SARMATIA, in classical geography, the name of a vast region of eastern Europe and western Asia (according to ancient divisions). Ptolemy the geographer distinguishes between European and Asiatic Sarmatia. He describes the former as bounded W. by the Vistula and the Sarmatian mountains (N. W. Carpathians); S. by a line running from the Sarmatian mountains to the mouth of the Borysthenes (Dnieper), and thence along the coast of the Euxine to the isthmus of the Tauric Chersonesus (Crimea); E. by the Mæotis (sea of Azov), the Tanais (Don), and further N. by the meridian drawn from the source of the Tanais; and N. apparently from the gulf of Finland to the mouth of the Vistula, the regions beyond being unknown at the time. The boundaries of Asiatic Sarmatia he draws from the Cimmerian Bosphorus (strait of Yenikale) along the N. E. shore of the Euxine to the mouth of the Corax, a little above Dioscurias in Colchis; thence along Iberia and Albania to the Caspian sea, which forms the E. boundary as far as the river Rha (Volga), which completes the E. limit unto the un-

known north. The eastern part was inhabited by the Sarmatæ or Sarmatians proper, probably the Sauromatæ of Herodotus, according to him an Asiatic people derived from the intercourse of Scythians with the Amazons. The larger western division, corresponding to the Scythia of Herodotus, was peopled by the Venedi, Alani, Hamaxobii, Roxolani, Jazyges, and numerous other tribes of various race.

SARMIENTO, Domingo Faustino, an Argentine statesman, born in San Juan de la Frontera, Feb. 15, 1811. In 1826 he became director of a school in the province of San Luis, and from 1831 to 1836 he resided in Chili. In 1836 he founded a female school at San Juan, but in 1840 again went to Chili, where he greatly promoted education, publishing many school books and establishing numerous schools and colleges, including the normal school of Santiago, and editing several periodicals, mostly educational. He was the first to publish a daily paper in Santiago. In 1845 the Chilean government sent him to Europe and the United States, to observe the primary school systems of those countries, and on his return he published a work entitled *De la Educacion popular*. Returning to the Argentine Republic, he became successively minister of the interior, colonel of the Argentine forces, governor of the province of San Juan, and minister of public instruction. He was minister plenipotentiary to the United States from 1864 to 1868, when he was elected president of the Argentine Republic, assuming office Oct. 12. During his administration the war against Paraguay was brought to a successful termination, numerous insurrections were put down, railways and telegraphs were constructed, immigration was promoted, foreign commerce encouraged and extended, schools were multiplied, a national college was established in each of the provinces, and the national observatory was founded under the supervision of Prof. B. A. Gould. Many important institutions were introduced, mainly modelled after those of the United States. His term expired in October, 1874. His most important works are: *Manual de la historia de los pueblos antiguos; Arjirópolis, ó la capital de los Estados Confederados; Civilizacion i barbarie* (translated into French); *Viajes por Europa, Africa i América; Vida de Abrahán Lincoln; and Las escuelas*. The last two were published in New York.

SARNIA, or **Port Sarnia**, a town, port of entry, and the capital of Lambton co., Ontario, Canada, on the St. Clair river near Lake Huron, and on the Grand Trunk and Great Western railways, 168 m. W. S. W. of Toronto; pop. in 1871, 2,929. It is connected by ferry with Port Huron, Mich., on the opposite side of the river. It contains manufactories of iron castings, machinery, wooden ware, woollens, and leather, saw, grist, and shingle mills, a brewery, two branch banks, two telegraph offices, several schools, two weekly newspapers, and

Baptist, Episcopal, Methodist, Presbyterian, and Roman Catholic churches. The value of imports for the year ending June 30, 1874, was \$864,616; of exports, \$819,517.

SARNO, a town of S. Italy, on the Sarno (anc. *Sarnus*), in the province and 13 m. N. W. of the city of Salerno; pop. about 15,000. It is of great antiquity, and contains the remains of a once powerful castle, a fine cathedral, mineral springs, and manufactories of paper and silk, and is the seat of a bishop. In 553 the Goths under Teias were defeated in this vicinity, on the banks of the Sarno, by the Byzantine general Narses.

SÁROS, a N. county of Hungary, in the Cistibiscan circle, bordering on Galicia, Zemplén, Abauj, and Zips; area, 1,463 sq. m.; pop. in 1870, 175,292, chiefly Slovaks and Ruthenians. The Carpathians extend over the whole N. frontier, and their branches cover a large portion of the county. The Tarcza, Topla, and other rivers form fine valleys, which produce flax, hemp, grain, and fruit. In the mountains, where the climate is severe, oats only thrive, but they abound with timber, and with iron and other minerals and precious stones, of which the beautiful varieties of opal in Mt. Lillbánya are most celebrated. Linens and other goods are manufactured. There are great salt works at Sóvár, near Eperies, the capital, and mineral springs at Bartfeld and other places.

SARPI, Paolo (commonly known as Fra Paolo), an Italian historian, born in Venice, Aug. 14, 1552, died there, Jan. 14, 1623. He studied for 12 years in a convent of Servites, became a member of that order in 1565 (exchanging his baptismal name of Pietro for that of Paolo on his solemn profession in 1572), completed his course of philosophy and theology at Mantua in 1570, was appointed professor of theology in the university there, and afterward at Venice. He became provincial of his order in 1579, and went to Rome to draw up new constitutions for the Servites. In 1585 he was sent again to Rome as procurator general, and was taken into favor by Sixtus V. He studied natural science, and when recalled to Venice in 1589 he drew up an account of his discoveries in physics. According to Grissellini, Sarpi had discovered the circulation of the blood, and had been the first to observe the dilatation and contraction of the pupil of the eye, the effect of pure air injected into the lungs in case of asphyxia, and the various phenomena of the inclination of the magnetic needle. Although noted for austerity of life, the independence with which he expressed his opinions on religious matters caused him to be suspected by the Venetian inquisitors, and to be refused two episcopal sees which he had solicited. Pope Paul V., having vainly requested the abrogation of a law of Venice which he deemed contrary to the freedom of the church, threatened to lay the republic under an interdict. Sarpi thereupon published a pamphlet in which he assailed the papal pre-

tensions. On Jan. 28, 1605, he was appointed state canonist, and in 1606 issued a *Trattato dell' interdetto*, in which he exhorted the Venetians to disregard the threatened interdict. Consulted by the Venetian government on the most important matters of public policy, and allowed the free use of the state archives, Sarpi published elaborate answers, and *Come debba governarsi la repubblica veneziana per avere il perpetuo dominio*. These works have been condemned as advocating an odious system of duplicity and oppression. At the same time their author strenuously promoted an alliance between Venice and the new Dutch republic, while stimulating his fellow citizens to hostility toward the court of Rome. He was denounced as a schismatic and a Protestant, and an attempt was made upon his life, Oct. 5, 1607. He is now best known by his "History of the Council of Trent" (*Istoria del concilio tridentino*, fol., London, 1619; 4 vols. 8vo, Florence, 1858; Latin translation, London, 1620; English translation, 1629 and 1676). Another principal work of Sarpi was his *Istoria dell' interdetto* (4to, Venice, 1624; translated into French and Latin). The best complete edition of his writings was published in Naples (24 vols., 1789). His life has been written by the Italian liberal A. A. Bianchi-Giovini (2 vols., Zürich, 1836), and by A. G. Campbell, from original manuscripts (Florence, Turin, and Rome, 1875). An account of the controversy of Sarpi with the pope and the Jesuits is given by T. Adolphus Trollope in his "Paul the Pope and Paul the Friar" (London, 1860).

SARPY, an E. county of Nebraska, separated from Iowa on the east by the Missouri river, and bounded S. and W. by the Platte; area, about 275 sq. m.; pop. in 1875, 3,385. It is traversed by the Union Pacific and the Omaha and Southwestern railroads. The surface is diversified and the soil very fertile. Cottonwood abounds along the streams. The chief productions in 1870 were 95,233 bushels of wheat, 231,075 of Indian corn, 91,387 of oats, 12,135 of barley, 39,578 of potatoes, 107,655 lbs. of butter, and 7,465 tons of hay. There were 1,531 horses, 1,422 milch cows, 1,888 other cattle, and 1,927 swine. Capital, Bellevue.

SARRACENIA. See PITCHER PLANTS.

SARSAPARILLA (Span. *zarza*, a bramble, and *parilla*, a vine; i. e., a thorny vine), a drug consisting of the roots of various species of *smilax*. (See SMILAX.) There is no article of materia medica surrounded by so much uncertainty as sarsaparilla. Little is definitely known as to the plants which produce the varieties of commerce, and there is no agreement among medical men as to its remedial value. Sarsaparilla is collected in western Mexico, Central America, and the northern countries of South America, and the varieties are known by the names of the countries producing them, or those of the ports of shipment. Among the species to which it has been referred are *smilax officinalis* of Colombia and Jamaica,

S. medica of Mexico, *S. papyracea*, *S. syphilitica*, and others. The base of the stem in the different plants is enlarged to form a short, thick, woody, and knotted rhizome, from which proceed several long slender roots which run near to the surface, often as much as 9 ft. in length. These roots are collected, in some countries with and in others without the rhizome, dried, and made into parcels; the dried roots average about the size of a quill, are furnished with more or less rootlets or "beard," and longitudinally furrowed; they have an earthy smell and flavor. Examined with the microscope in cross section, the varieties present characteristic differences in the proportion and arrangement of the cortical, woody, and medullary tissues; in some kinds the cells abound in starch granules, on which account the commercial varieties are grouped as mealy and non-mealy sarsaparillas; the Honduras, Guatemala, and Brazilian belong to the first, and the Jamaica, Mexican, and Guayaquil to the other class. A crystalline neutral principle may be separated from the root, which has been called smilacine, salseparine, and parilline; the last, being the oldest, is the generally accepted name; it appears to be related to saponine, and like that froths remarkably when a solution of it is shaken. Sarsaparilla was introduced into Spain as early as 1545, and has since been at times a very popular medicine. Those physicians who regard it as of value class it as an alterative, and use it in inveterate venereal cases, chronic rheumatism, obstinate skin diseases, and in a generally depraved condition of the system. It is given in the form of decoction and sirups; the sirups contain guaiacum and aromatics, and are much used as a vehicle for medicines of positive efficacy, such as iodide of potassium and corrosive sublimate. The drug has a popular reputation as a "purifier of the blood," and a few years ago immense quantities of quack medicines were sold bearing the name, but containing not a particle of sarsaparilla. The sirup called sarsaparilla, so much drunk in soda water under the impression that it is healthful, rarely contains any of the drug.—Indian sarsaparilla is *hemidesmus Indicus*, of the milkweed family, the root of which is employed in India and sometimes in England for the same purposes. American or false sarsaparilla is *aralia nudicaulis*. (See SPIKENARD.)

SARTHE, a N. W. department of France, formed from the old provinces of Maine and Anjou, bordering on Orne, Eure-et-Loir, Loir-et-Cher, Indre-et-Loire, Maine-et-Loire, and Mayenne; area, 2,397 sq. m.; pop. in 1872, 446,603. The Loir, flowing through the S. part, and its tributary the Sarthe, through the W. part, are navigable, and there are many smaller streams. The productions include iron, coal, hemp, wine, cloth, gloves, candles, paper, and glass. It is divided into the arrondissements of Le Mans, Mamers, La Flèche, and St. Calais. Capital, Le Mans.

SARTI, Giuseppe, an Italian composer, born in Faenza, Dec. 28, 1729, died in Berlin, July 28, 1802. He studied counterpoint under Padre Martini, and his first opera, *Pompeo in Armenia*, was produced at Faenza in 1752. He was for a short time chapelmaster at Copenhagen, and in 1779 at Milan. About 1785 he became imperial chapelmaster and director of the conservatory in St. Petersburg. He remained in Russia till 1801, when he went to Berlin for his health. He composed operas and church music, and invented a machine to measure the vibrations of tones.

SARTO, Andrea Vannucci del, commonly called Andrea del Sarto, an Italian painter, born in Florence about 1488, died there in 1530. After passing some time in the workshop of a goldsmith, he took lessons in drawing from one Giovanni Barile, and subsequently studied under Pietro di Cosimo. But his real instructors were the cartoons and frescoes of Michel Angelo, Leonardo da Vinci, Masaccio, and Ghirlandaio. Having executed some oil and fresco paintings in conjunction with his friend Francesco Bigio in Florence, he painted in 1509, for the convent of the Servites, a series of frescoes from the life of St. Filippo Benizzi, and in 1514 the pictures of the "Epiphany" and the "Birth of the Virgin," which exhibit delicacy of sentiment and masterly execution, but lack dignity and grandeur of conception. His coloring is distinguished by sweetness and freshness of tone. His reliefs are singularly bold, and he was a thorough master of chiaroscuro. His illustrations of the life of St. John, which he began in 1514 for the *Compagnia dello Scalzo*, are in chiaroscuro, and were not completed before 1526. For Francis I. of France he executed the *Pietà*, or "Dead Christ," with the Virgin, St. John, and Mary Magdalen. The king invited him to Paris, and the picture of "Charity," which he painted there, is now at the Louvre. In 1525 he painted in the cloisters of the Servites one of his most celebrated frescoes, the *Madonna del Sacco*, so called from the sack of grain on which St. Joseph leans, which was admirably engraved by Raphael Morghen as a companion to Raphael's "Transfiguration." His principal picture of 1528, the "Madonna with the Saints," in the Berlin museum, has been injured by a clumsy attempt to restore it; and his "Sacrifice of Abraham," painted in 1529, is at Dresden. He possessed also an extraordinary talent for copying the works of other masters, and his copy of Raphael's Leo X. in the museum of Naples is invariably taken for the original. He was not always well paid for his pictures, but might have been prosperous, as he had many powerful and rich patrons, had he not yielded to the caprices of an extravagant wife. He returned from Paris with a considerable amount of money given him by the king to be invested on the royal account in rare works of art. Instead of appropriating this money to the prescribed use, Andrea squan-

dered it in riotous living; and thenceforth, says Vasari, "from an eminent position he sank to the very lowest, merely working for a livelihood, and passing his time as best he could."

SARUM, Old, an extinct city of Wiltshire, England, 2 m. N. of Salisbury. It was an important settlement of the early Britons, afterward a Roman station, and the residence of the West Saxon kings. It was fortified by Alfred, and was made a bishop's see in the 11th century; but the cathedral having been removed to the present site of Salisbury or New Sarum in the reign of Henry III., in consequence of a local quarrel, the place was deserted, and has not now a single habitation, though traces remain of its walls, castle, and cathedral. It was endowed by Edward III. with the privilege of sending two members to the house of commons; the franchise accompanied the estate, and the proprietor, after it had lost all its inhabitants, continued to return the two members regularly until the passing of the reform act in 1832.

SASKATCHEWAN, a river of British North America, in the Northwest territories, the upper course consisting of two branches. The North branch, issuing from Glacier lake on the E. slope of the Rocky mountains, in lat. 51° 54' N., lon. 117° 30' W., flows E. past the base of Mt. Murchison, and then generally E. N. E. to its junction with the South branch near lon. 105°, 12 m. above Fort à la Corne. The latter branch, formed by the junction of the Bow and Belly rivers from the Rocky mountains in lat. 49° 40', lon. 111° 40', flows N. E. to Chesterfield, where it receives the Red Deer river, then E. N. E. to the junction with the North branch. The main river thus formed, called by the Crees Kisiskatchewan (swift current), flows N. E. to the bend on the parallel of 54°, then S. E. to Cedar lake, from which it flows E. to the N. W. extremity of Lake Winnipeg. The area of the entire basin is 240,000 sq. m. From the source of the North branch to the junction the distance is about 550 m., and the length of the main river is about 200 m. The basins of both branches are generally too wild and mountainous, and the climate is too rigorous, to admit of much cultivation; but S. of the North branch is a fertile belt, to portions of which the Hudson Bay company reserves its rights since its surrender of territorial and governmental privileges in 1869. The mountains are heavily timbered. On both branches coal and iron are found. Bisons, rapidly disappearing in the Northwest territories, are now chiefly found on the North branch. The valley of the main river, except along its lower course, presents the best agricultural region with good grazing land. The river is frozen from the middle of November to the middle of April, and in summer is navigable by the Hudson Bay company's boats, though the North branch has a rapid current and shallow channel obstructed by bowlders. The settlements and

stations are distant from the river and near the lakes on account of the fish, which are there abundant. Nelson river, which issues from the N. extremity of Lake Winnipeg, is treated by some authorities as a continuation of the Saskatchewan, adding 350 m. to its length. (See NELSON RIVER.)

SASSAFRAS, a North American tree of the laurel family (*lauraceæ*), formerly called *laurus sassafras*, but separated from *laurus* on account of differences in structure by Nees von Esenbeck, who took the popular name for that of the new genus, and it is now *sassafras officinale*; the name is said to be of Spanish origin. The tree rarely exceeds 50 ft. in height, and in northern localities is much smaller; it extends from Canada to Louisiana, and is found beyond the Mississippi. In a young and vigorous tree the head is broad and round, with its branches in regular whorls, and the long and irregular spray curves upward, forming a

Sassafras officinale—Leaves, Flowers, and Fruit.

sharp angle with the branches. The bark on young branches is reddish green, and on old trunks reddish ash color with deep and irregular cracks. The leaves vary remarkably, some being ovate and entire, and others broad and three-lobed, and various intermediate forms occur on the same branch. The greenish yellow flowers are dioecious and apetalous, in umbel-like racemes, the calyx being six-parted; the sterile flowers have nine stamens, the anthers four-celled and opening by four valves; the fertile flowers have six rudiments of stamens, and a roundish ovary, which ripens into an ovoid, one-seeded drupe, the size of a large pea, of a deep blue color, and supported upon pedicels, which when the fruit is ripe become thickened and dark red. The sassafras deserves attention as an ornamental tree, for which it is much more used in England (where it was introduced in 1597) than here. All parts of it are more or less aromatic, from a volatile oil, which is more abundant in the

bark of the root than elsewhere; the wood, which is brittle in the growing tree, becomes when seasoned remarkably tough and light, and is used for fishing rods; the trunks are sometimes sawn into boards, which are used for trunks and drawers; it is said that no insects will be harbored by a bedstead made of the wood; sassafras poles have long been used for roosts in poultry houses, as their odor is disagreeable to hen lice. The young shoots and leaves are highly mucilaginous; the pith, obtained from the twigs, is kept in the shops, in slender cylindrical pieces, remarkably light and spongy and very mucilaginous when chewed; a dram to a pint of boiling water forms a demulcent drink in inflammatory diseases, and is used as a soothing eye wash; the mucilage differs from ordinary gum in not being precipitated by alcohol. The leaves when chewed are not only mucilaginous, but have a peculiar flavor unlike that of the bark; in Louisiana these are dried and pulverized, the fibrous portions being removed, and kept for thickening soups, and making gumbo when okra is not at hand. (See OKRA.) The fruit is strongly and unpleasantly aromatic, but is greatly eaten by birds. When the Europeans first visited this country they found the sassafras in use by the Indians, and the sick of Monardes's expedition (1562) having been cured by it, its reputation spread to Europe, and early in the 17th century it was regarded as one of the important articles to be derived from the colonies. The wood, which is much less aromatic than the bark, is still used in England, where it is imported in logs 6 to 12 in. thick with the bark on; these are cut into chips or shavings, which are used with guaiacum and sarsaparilla to make a sudorific drink used in skin diseases; a tea made of these chips, mixed with milk and sugar, called sallow, is sold in the streets of London to laborers as they go to their work in early morning. In this country the bark of the root is the only portion valued for its aromatic qualities; it is kept in the shops in the dried state in small fragments, which are used for flavoring official preparations; an infusion sweetened with molasses and fermented with yeast is used in the southern states as beer.—The oil of sassafras is yielded abundantly by the bark of the root; the roots are used in distillation, and the amount of oil varies with the proportion of the bark from 2 to 4½ per cent.; it is colorless or reddish brown, of specific gravity about 1.09, and when cooled by a freezing mixture deposits crystals of sassafras camphor. Baltimore is the headquarters for this oil, and the annual product is from 15,000 to 20,000 lbs.—In localities where the sassafras tree is abundant it is difficult to clear the lands, as it is very tenacious of life, and every piece of root left in the ground will throw up shoots; the most successful manner of eradicating it is by means of sheep, which will eat off the shoots as fast as they start up.

SASSANIDÆ, a dynasty of Persian kings founded by Ardeshir, called by the Greeks Artaxerxes, and considered the son of Babek and the grandson of Sassan, who overthrew the rule of the Arsacidæ, in A. D. 226. (See ARDESHIR, and PERSIA.) Under the Sassanian kings, and especially under Sapor (Shapur) I., Sapor II., Chosroes (Khosru) I., and Chosroes II., long and successful wars were carried on against the Roman and Byzantine emperors, the Persian empire was extended and consolidated, and the Zoroastrian religion was restored and maintained. The dynasty closed with Yezdegerd III., who in 641 was beaten by the caliph Omar in the battle of Nehavend, into which the Persians went 150,000 strong; he was murdered in 651 while asleep, for the sake of his splendid garments, by a miller in whose mill he had hidden. From the coins of this dynasty, of which an almost complete series has been gathered, it appears that the kings were men of extraordinary personal beauty, with large eyes, prominent well formed nose, and firm chiselled mouth. On some of the coins an eldest son or a queen is associated with the monarch. On the reverses are fire altars, which were apparently carried before the kings in processions.—See Thomas, "Early Sassanian Inscriptions, Seals, and Coins" (London, 1868).

SASSARI. **I.** A province of the kingdom of Italy, forming the N. portion of the island of Sardinia, bounded S. by Cagliari, and on all other sides by the sea; area, 4,142 sq. m.; pop. in 1872, 243,452. It is mountainous throughout. It is watered by the Tirso, Coghinas, Posada, and other small rivers. Wheat, barley, and cattle abound, and cheese and butter are largely exported. The province is divided into the districts of Alghero, Nuoro, Ozieri, Sassari, and Tempio Pausania. **II.** A city, capital of the province, on the Turritano, 10 m. from its mouth in the gulf of Sassari and 102 m. N. N. W. of Cagliari; pop. in 1872, 32,674. It is the seat of an archbishop, and contains an old fortified castle, a cathedral, a small university, which in 1875 had 66 students, a theological seminary, and other schools, the Vallombrosa and other palaces, and fine gardens. Oil is the chief article of trade. Its seaport is the neighboring Porto Torres.

SASSOFERRATO (GIOVANNI BATTISTA SALVI), an Italian painter, born in the castle of Sassoferrato, near Urbino, July 11, 1605, died in Rome, Aug. 8, 1685. He is frequently confounded with an earlier artist of the same name, who imitated Raphael. In style he followed the Carracci, with sweetness and delicacy. He painted landscapes, sacred portraits, and more rarely historical pieces. The Berlin museum contains many of his best pictures.

SATAN. See DEVIL.

SATIN BOWER BIRD. See BOWER BIRD.

SATIN SPAR, a name applied to two distinct minerals, which have a similar fibrous structure. The most common is a variety of gyp-

sum, the other a carbonate of lime. The gypsum mineral, softer than the other, is found in the counties of Nottingham, Derby, and Gloucester, England, near Carrickfergus in Ireland, and in gypsum beds in other localities. It is sometimes made into beads which have some resemblance to "cat's eye," but the latter is a hard quartz mineral. (See CAT'S EYE.) Beautiful specimens of carbonate of lime satin spar, of snowy whiteness, are found in Cumberland, Devonshire, and Buckinghamshire, England, and at Lead Hills in Scotland.

SATIN WOOD, a name for several woods of commerce, which when polished present a peculiar lustre; the principal kinds are the Indian and West Indian, or Bahaman. The Indian satin wood is produced by *chloroxylon Swietenia*, of the *meliceæ*, and related to the mahogany tree; it is 50 or 60 ft. high, found along the Coromandel coast and other parts of India; the wood is hard and yellow, somewhat resembling box wood, but darker. The West Indian wood is superior to the other, being of a light canary yellow; though considerable quantities are exported from the Bahamas, the tree which furnishes it is still uncertain; it has been conjectured that it is the wood of a species of *maba*, one of the ebony family. In some cases the wood is handsomely curled and mottled, and such pieces are cut into veneers for choice cabinet work; the ordinary kinds are chiefly used for the backs of brushes.

SATSUMA, the name of a province in the S. part of Kiushiu, Japan, and of the most noted of all the feudal clans in the empire. The fief of the daimio of Satsuma comprised Satsuma proper, Osumi, Hiuga, and the Loo Choo islands. Satsuma now forms the Kagoshima *ken* or district; pop., 1,183,000. The surface is mountainous, and the soil indifferent. Commerce, mineral wealth, and manufactures, especially of porcelain, have made this one of the richest provinces of Japan. The history of the clan dates from 1571, when Shimadzu Yoshihisa became daimio. After the battle of Sekigahara, the daimio of Satsuma was allowed by Iyeyasu to retain his territory. In 1609 Iyehisa, one of the Shimadzu family, conquered the Loo Choo islands, which the shogun allowed him to retain as part of his fief. The Satsuma clan has long been pre-eminent for the ability of its leaders, and for military ardor and prowess. During the Tokugawa shogunate they were the most restive under its rule, rendering only nominal obedience. The last but one of the daimios of Satsuma, who died in 1858, was the first to develop the impulse toward occidental civilization. He introduced foreign learning and measures when the shogun endeavored to repress such tendencies, and diligently prepared the way for the revolution of 1868. On Sept. 12, 1862, Shimadzu Saburo, his younger brother, having left Yedo with a grudge against the shogun, and cherishing a desire to embroil him with foreigners, was met on the

highway between Yedo and Yokohama by a party of English gentlemen and a lady, who were attacked by his procession, and Mr. C. L. Richardson, a merchant from Hong Kong, was killed. The British government demanded and obtained from the shogunate an indemnity of £100,000, and after the bombardment of Kagoshima, Aug. 13, 1863, the Satsuma men paid to the British an indemnity of £25,000. In 1868 the clan led the coalition that overthrew the shogunate, restored the mikado, organized the new government, and led the van at the battle of Fushimi. Satsuma has sent more students to foreign countries and furnished more able men than any other province. The clan also led the way in the abolition of the feudal system in 1872.

SATTARA, or Satara. I. A collectorate in the southern division of the province of Bombay, British India, separated by the Western Ghats from the Indian ocean, and situated S. of the district of Poonah; area, about 11,000 sq. m.; pop. in 1871, 1,028,520. The country forms part of the table land of the Deccan, and the surface is generally much broken and rugged. It is drained by the head waters of the Kistnah and its tributaries. The soil is generally barren, and in the western or more elevated part of the country the climate is cool and excessively moist. The Mahratta race predominates, and it was here that the great chieftain Sevajee rose to power in the middle of the 17th century. The state passed from his successors to the peishwa, whose territory was occupied by the British at the close of the Mahratta war of 1817-18. In 1819 they replaced the rajah, a descendant of Sevajee, upon the throne of his ancestors, under British protection. In consequence of certain intrigues he was deposed by his protectors in 1839, and his brother elevated in his place. The new rajah governed with great wisdom, and died in 1848 without issue, but adopted a boy distantly related to him a few hours before his death. It was decided by the British authorities that a dependent principality could not pass to an adopted heir without the consent of the paramount power; and Sattara was annexed to British India. Within its limits is the political agency of Sattara, superintending four native principalities, each governed by a descendant of a Mahratta chief or courtier, viz.: the Pant Pratinidhi, the Pant Sacheo, the Minbalkar of Phalkan, and the Daflekar, with areas respectively of 350, 500, 400, and 700 sq. m. **II.** A town, capital of the district, 115 m. S. E. of Bombay, in lat. $17^{\circ} 41' N.$, lon. $74^{\circ} 1' E.$, among the hills of the Deccan, E. of the ridge of the Ghats. The fort is on the summit of a steep mountain, E. of the town, about 800 ft. high. Sattara was taken from the Mussulmans by Sevajee in 1673, blockaded and captured by Aurungzebe in person in 1700, and retaken by the Mahrattas five years later. It was the residence of the rajah after his restoration by the British.

SATURDAY (Saturn's day), the seventh and last day of the week, and the Roman *dies Saturni*. It is the Jewish sabbath, and in the Catholic breviary is called *dies sabbati*.

SATURN (SATURNUS), an ancient mythical king or deity of Italy, to whom was ascribed the introduction of agriculture and civilization. According to tradition, he reigned on the Capitoline hill, hence also called the Saturnian hill, and after his death was translated to the abodes of the gods. His reign was called the golden age of Italy. With his wife, Ops, the representative of plenty, he was regarded as the protector of agriculture and of all vegetation which tended to the benefit of man, and he carried in his hand a crooked pruning knife. The Greek deity Cronus, with whom he was frequently identified, was the youngest son of Heaven and Earth, and the father of Jupiter, Juno, Neptune, and Pluto. He usurped the sovereignty of Heaven (Uranus), and instituted a reign of peace and plenty, called by the poets the golden age, to which succeeded the rule of Jupiter, who deposed and imprisoned his father. In later times his name was identified with χρόνος, time, and in the character of the destroyer he was represented as bearing a scythe, and as devouring his own offspring.

SATURN, the sixth planet in order of distance from the sun, the third of the superior planets, and in ancient systems of astronomy the outermost member of the planetary system, but now known to travel within the orbits of two planets at least, Uranus and Neptune. Saturn moves at a mean distance from the sun amounting to 872,137,000 m. The eccentricity of his orbit being considerable, his greatest and least distances are respectively 920,973,000 m. and 823,301,000 m., the difference, 97,672,000 m., exceeding by fully 6,000,000 m. the earth's mean distance from the sun. The eccentricity of the orbit is 0.055996. Since the earth's mean distance from the sun is 91,430,000 m., it follows that when in opposition to the sun Saturn is at a distance from the earth of about 732,000,000 m. when nearest to the sun, and of about 829,500,000 m. when furthest from the sun. It appears therefore that notwithstanding his relatively enormous distance, which necessarily operates to diminish the changes of his apparent dimensions on account of the earth's motions, Saturn is seen under very different conditions in different oppositions. For, remembering the difference of solar illumination when Saturn is in aphelion and perihelion, as well as the variation in the apparent size of his disk on account of his varying distance from the earth, we perceive that he must be more favorably placed for observation in a perihelion than in an aphelion opposition, in the ratio of $(829,500,000)^2 \times (920,973,000)^2$ to $(732,000,000)^2 \times (823,301,000)^2$; that is, approximately as 8 to 5. This ratio would also represent the range of varying brightness of Saturn in different oppositions were it not for the rings, which greatly modify

the apparent brightness of the planet. As the rings attain their greatest opening very nearly at the aphelion and perihelion of Saturn's orbit, the ratio just obtained fairly represents the relative brightness when he is in those parts of his orbit; but he appears much less bright relatively when at his mean distance than would be the case if he had no rings, for the rings then turn their edge almost exactly toward the earth. Saturn completes the circuit of his orbit in 10,759.2198 days, or 29 years 167.2 days, in an orbit inclined about $2^{\circ} 29' 58''$ to the plane of the ecliptic.—Saturn comes next to Jupiter in volume and mass. In fact, he surpasses all the remaining planets taken together nearly three times. His mean diameter is about 70,150 m., his polar diameter about 3,500 m. less, his equatorial diameter about 3,500 m. greater. His compression is about $\frac{1}{10}$. He exceeds the earth 697 times in volume; but his density is only 0.13 of that of the earth, so that his mass only exceeds hers about 89.7 times. He rotates on his axis in about $10\frac{1}{2}$ hours, and his equator is inclined about 27° to the plane of his orbit.—Saturn when first observed with the telescope by Galileo presented a triple appearance, as if two smaller orbs were symmetrically placed on either side of a larger one. Afterward Galileo supposed the planet had two appendages resembling handles (*ansæ*) in shape and position. Sometimes the *ansæ* appeared so large as to form a continuous ring; at other times they disappeared altogether. After they had been for some time invisible, they reappeared, and gradually increased in magnitude. Galileo and Hevelius were able to detect a dark space apparently enclosed within the rounded curve of the *ansæ*. Huygens explained these appearances as caused by an opaque, flat, thin, and circular ring surrounding the equator of Saturn, but nowhere touching the planet's globe. This ring being inclined to the ecliptic and moving always parallel to itself, it follows that for half the Saturnian year one side of the ring is illuminated, and for the other half the other side. When the ring is turned edge-wise either to the sun or to the earth, or when the earth is on the darkened side of the ring, it is invisible except in telescopes of great power. As the distance of the earth from the sun is very small compared with that of Saturn, it follows that the invisibility caused either by the ring's plane passing through the earth, or by the earth and sun being on different sides of the plane, must always occur when the planet is near one or other of the two points on its orbit where the plane passes through the sun. Later observations by Cassini, Bell, Sir W. Herschel, and others, but more particularly the recent observations of the Bonds at Harvard college and Dawes and Lassell in England, have added greatly to our knowledge of Saturn's ring system. The ring is found to consist of two chief bright rings separated by a circular gap; but each of the bright rings is probably divided

into several subordinate rings. But perhaps the most remarkable part of this remarkable system is a dark ring within the bright system of rings. This dark ring is so obvious with very moderate telescopic power that the idea is naturally suggested that it is a recent formation; and therefore the history of its discovery and of observations prior thereto deserves to be carefully noted. It appears from a paper by Galle of Berlin in the *Nachrichten*, No. 756, that a dark ring was seen with the large Berlin refractor in 1838. An account of Galle's observations, accompanied by drawings exhibiting the part of the ring seen across the body of the planet, was read by Encke before the Berlin academy in the same year. But little notice seems to have been attracted by this remarkable announcement; so that the actual discovery of the ring (made in such a way as to secure general recognition) must be attributed to Prof. G. P. Bond of Harvard and the Rev. W. R. Dawes in England, in November, 1850; Bond, who discovered the ring on Nov. 15, having the priority by a few days. Dawes at this time, and Bond somewhat later, called attention to the darkening of the inner bright ring toward the inside, where it adjoins on the dark ring. Dawes's account, when he announced the discovery of the dark ring, was as follows: "The exterior portion of the inner bright ring to about one fourth of its whole breadth was very bright; but interior to this the shading off did not appear, as under ordinary circumstances, to become deeper toward the inner edge without any distinct or sudden gradations of shade; on the contrary, it was clearly seen to be arranged in a series of narrow concentric bands, each of which was darker than the next exterior one. Four such were distinctly made out; they looked like steps, leading down to the black chasm between the ring and the ball. The impression I received was that they were separate rings, but too close together for the divisions to be seen in black lines." Later Capt. Jacobs at Madras recognized the fact that the dusky ring is semi-transparent, the outline of the globe of the planet being distinctly visible through the ring. On this account, and because of the peculiar aspect of the dark ring when it crosses the body of the planet, the name "crape ring" has been assigned to it. Otto Struve has shown that the inner or dusky ring is not a modern appendage to the planet, as might be suggested by the fact that it remained so long undiscovered; but that at the beginning of the 18th century the dark band thrown across the planet was distinguished from the shadow of the bright rings, and was called by observers the equatorial belt. Another curious result of Struve's researches was to show, by comparisons of measures made by Huygens, Cassini, Bradley, Sir W. Herschel, W. Struve, Encke, and himself, that "the inner edge of the inferior bright ring is gradually approaching the body of the planet, while at the same time the total breadth of

the two bright rings is constantly increasing." The theory now generally accepted respecting the rings is that they are composed of minute satellites, like sand on the seashore for multitude. The following table shows the position of the ring system and the proportions of the ring and globe:

Longitude of ring's rising node.....	167° 44'
Inclination of ring to the ecliptic.....	2° 10'
Annual precession of rising node.....	8.145"
Exterior diameter of outer ring in miles.....	166,920
Interior " " " ".....	147,670
Exterior diameter of inner ring.....	144,310
Interior " " " ".....	109,100
Inferior diameter of the dark ring.....	91,750
Breadth of outer bright ring.....	9,625
" of inner bright ring.....	17,605
" of division between rings.....	1,680
" of dark ring.....	8,660
" of system of bright rings.....	28,910
" of entire system of rings.....	87,570
Space between planet and dark ring.....	10,322

—Saturn is attended by eight satellites, the largest of which, Titan, sixth in order of distance from the planet, is the largest satellite of the solar system, and probably is as large as the planet Mercury. Much confusion prevails, as Sir John Herschel complains, in the nomenclature of the Saturnian satellites, owing to the order of distances not coinciding with that of discovery. The elements of the satellites, and the names of their discoverers, are as follows, counting from within outward:

No.	Sidereal revolution.	Distance in radii of ♄.	Diameter in miles.	Discoverer.
1....	Od. 22h. 37m.	3.3607	1,000?	Sir W. Herschel.
2....	1 8 53	4.3125	do.
3....	1 21 18	5.3396	500?	G. D. Cassini.
4....	2 17 41	6.8398	500?	do.
5....	4 12 25	9.5528	1,200	do.
6....	15 22 41	22.1450	3,000	C. Huygens.
7....	21 7 8	26.7584	?	W. Bond.
8....	79 7 54	64.3590	1,800	G. D. Cassini.

Saturn's surface is marked by belts, somewhat similar to Jupiter's. Owing to the inclination of Saturn's equator, his belts afforded an opportunity, wanting in Jupiter's case, for testing the question whether the sun is the chief agent in causing the belts. It is clear that if this were so the belts would follow the sun, the equatorial zone, a well marked band of whitish color, remaining no longer equatorial when the sun was far to the north or south of the Saturnian celestial equator. And as the sun viewed from Saturn takes more than 29 years in completing the circuit of the star sphere, being half that time north of the Saturnian equator and the remaining half south of that circle, it is clear that there would be ample time for the sun to draw the cloud zone north of Saturn's equator during the summer of Saturn's northern hemisphere, and south of the equator during the summer of Saturn's southern hemisphere. This would happen if the sun caused and therefore ruled the Saturnian cloud belts, as he causes and rules the great cloud belt of the zone of calms. But in Saturn's case nothing of this kind is observed. His great

equatorial cloud zone remains equatorial all the year round. No clearer evidence could be desired of the fact that this cloud zone is neither sun-raised nor sun-ruled, but is due to some cause in the Saturnian globe itself. This cause can be no other, it would seem, than an intense heat pervading the whole globe of the planet. For other reasons, drawn from a consideration of the condition of Jupiter and Saturn on the nebular hypothesis, Prof. Peirce has recently adopted the opinion that these two great planets are thus instinct with their primeval fires.—Measurements of Saturn have led to the singular result that the planet appears to vary in shape. The disk is usually elliptical, but sometimes shows a figure in which the two diameters from 45° Saturnian latitude N. to 45° S. appear the greatest, the equatorial diameter less, and the polar diameter the least. This appearance has been called Saturn's "square-shouldered" aspect. It was first noticed by Sir W. Herschel, and as he recognized it with different telescopes he was satisfied that it was not a mere optical delusion. It has since been noticed by other observers, as the Bonds, Airy, and Coolidge, who possessed far too great skill in observing to be readily deceived in a matter so simple. It has been ascribed to optical illusion, but probably without sufficient ground. In fact it has never been shown why the illusion should be noticed at one time and not at others, or how it can be occasioned. It appears to the writer that a sufficient, a reasonable, and a probable interpretation is afforded by the theory that the atmosphere of Saturn is subject to changes, either by the formation and precipitation of cloud masses at an enormous elevation, or in some other way, which cause the apparent figure of the disk to alter while the real globe of Saturn, far within the visible boundary, remains unchanged in shape. This theory corresponds well with results to which the study of the planet Jupiter seems to lead us, as already shown. (See JUPITER.)

SATURNALIA, the festival of Saturn, celebrated originally by the rural population of ancient Italy in December, as a sort of harvest home, and in later ages converted into a season of almost absolute relaxation and merrymaking. Its origin was ascribed to Janus, Hercules, and others. Tullus Hostilius is said to have revived games of the Saturnalia and Opalia at Rome, in honor of Saturn and Ops, to commemorate a victory over the Sabines. During the republic a single day in the middle of December was set apart for its celebration, although the whole month was considered as dedicated to Saturn; but under the emperor Augustus the term was made to embrace Dec. 17, 18, and 19, to which a fourth day, and under Caligula a fifth, was added. It would seem, however, that under the emperors the festivities in reality lasted seven days, and included three separate festivals, the Saturnalia proper, the Opalia, and the Sigillaria, so called from the little

earthenware figures given to children as presents. During the Saturnalia no business of any kind was transacted, the distinctions of rank were forgotten, the utmost freedom of speech was permitted, and crowds perambulated the streets, wearing the *pileus*, the emblem of liberty, and shouting *Io Saturnalia*, much in the same spirit as in the modern carnival time; while within doors feasting and revelry were indulged to an inordinate degree.

SATYRS, in Greek mythology, a class of rustic divinities under the government of Bacchus, and forming part of his retinue. They are represented as robust and rough in appearance, with the heads and bodies of men, but with ears pointed like those of animals, and short horns and tails. They were frolicsome and addicted to various kinds of sensual enjoyment. Hesiod describes them as a good-for-nothing race. They were represented as the sons of Hermes and Iphthima. The older ones were called Sileni. The satyrs are sometimes confounded by the Latin poets with the Italian fauns, although originally distinct beings, and in ancient pictures and bass reliefs so represented. One of the most celebrated statues of antiquity was the satyr of Praxiteles at Athens. The word is used by Pliny to indicate a kind of ape.

SAUK, a S. W. county of Wisconsin, drained by the Barraboo river, and traversed by the Chicago and Northwestern railroad; area, about 900 sq. m.; pop. in 1870, 23,860. The Wisconsin river crosses the N. E. corner and borders the county S. E. and S. The surface is hilly and well timbered, and the soil fertile. The chief productions in 1870 were 487,416 bushels of wheat, 410,710 of Indian corn, 510,125 of oats, 210,518 of potatoes, 29,573 tons of hay, 61,081 lbs. of wool, 513,080 of butter, and 1,250,269 of hops. There were 6,030 horses, 7,250 milch cows, 8,601 other cattle, 18,766 sheep, and 13,374 swine; 7 manufacturing establishments of carriages and wagons, 3 of furniture, 2 of machinery, 2 of woollen goods, 1 blast furnace, 2 iron foundries, 5 flour mills, 10 saw mills, and 6 breweries. Capital, Barraboo.

SAUL (Heb. *Shaul*), the first king of Israel, son of Kish, of the tribe of Benjamin. He had four, or according to some six sons, three of whom, including Jonathan, the intimate friend of David, fell with their father in the battle against the Philistines at Mount Gilboa (about 1055 B. C.), and one of whom, Ishbosheth, for two years maintained himself as king of all the tribes except Judah. He had also two daughters, Merab, the first born, and Michal, the wife of David. (For the history of his reign see *HEBREWS*, vol. viii., p. 582.)

SAULCY, Louis Félix Joseph Caignart de, a French antiquary, born in Lille, March 19, 1807. He was an officer of artillery, and afterward keeper of the museum of artillery in Paris. In 1836 the French institute awarded him a prize for his *Essai de classification des suites monétaires byzantines*; and in 1842 he

became a resident member of the academy of inscriptions. He studied the Celtiberian, Phœnician, Egyptian, and cuneiform inscriptions; and in 1850 he explored the Dead sea and announced that he had found the ruins of Sodom, and had identified the "tombs of the kings" at Jerusalem as the royal sepulchres of Judah. He has published *Voyage autour de la mer Morte et dans les terres bibliques* (2 vols, 4to, with maps and drawings, Paris, 1852-'4); *Etudes sur la numismatique judaïque*, and *Histoire de l'art judaïque, tirée des textes sacrés et profanes* (1858); *Les expéditions de César en Grande-Bretagne* (1860); *Voyage en Terre-Sainte* (2 vols., 1865); *Les derniers jours de Jérusalem* (1866); *Histoire d'Hérode, roi des Juifs* (1867); *Étude chronologique des livres d'Esdras et de Néhémie* (1868); *Sept siècles de l'histoire judaïque depuis la prise de Jérusalem par Nebuchodonosor jusqu'à la prise de Bétir par les Romains* (1874); and *Numismatique de la Terre-Sainte* (1874).

SAULT STE. MARIE. See SAINT MARY'S STRAIT.

SAULT STE. MARIE, or *Sault de Ste. Marie*. **I.** A village and the county seat of Chippewa co., Michigan, on St. Mary's strait, at the foot of the rapids, and on the ship canal connecting the navigation of Lakes Huron and Superior, 290 m. N. by W. of Detroit, and 145 m. E. of Marquette; pop. in 1870, 1,213. The village is pleasantly situated on the site of an ancient French fort and missionary station. Fort Brady was built here in 1822 by the United States government, but it is now abandoned. The inhabitants are mostly French Canadians and Indians, and they subsist by exchanging furs, fish, and maple sugar with the vessels that touch here, for provisions and manufactured goods. The village contains three hotels and two churches, Presbyterian and Roman Catholic. **II.** A port of entry and the capital of Algoma district, Ontario, Canada, opposite the preceding; pop. in 1871, 879. It is pleasantly situated, and contains Episcopal, Roman Catholic, and Wesleyan Methodist churches. Many of the inhabitants are engaged in the fur trade and fisheries.

SAUMAISE. See SALMASIUS.

SAUMUR, a town of France, in the department of Maine-et-Loire, on the left bank of the Loire, 25 m. S. E. of Angers; pop. in 1872, 12,552. It is built partly on a steep hill surmounted by an old castle, now used as a town hall. A handsome bridge connects the lower town with a suburb on the opposite bank. Some of the churches are of great antiquity. Saumur has a celebrated school of cavalry, and manufactories of linen, glass, enamelled articles, leather, and saltpetre. It was formerly a stronghold of the Protestants, who had here an academy and a theological seminary, which were suppressed in 1685. In June, 1793, it was taken by the Vendéans, after a battle, and retaken by the republicans.

SAUNDERS, an E. county of Nebraska, bounded N. and E. by the Platte river, and drained by Cottonwood creek and other streams; area, about 750 sq. m.; pop. in 1875, 10,382. The Burlington and Missouri River railroad touches the S. E. corner. The surface consists of rolling prairies, and the soil is very fertile. The chief productions in 1870 were 55,652 bushels of wheat, 86,545 of Indian corn, 28,827 of oats, 15,273 of potatoes, 4,630 lbs. of wool, 41,525 of butter, and 5,730 tons of hay. There were 800 horses, 583 milch cows, 1,842 cattle, 1,351 sheep, and 1,335 swine. Capital, Ashland.

SAUNDERS, Prince, a Haytian lawyer, born in Thetford, Vt., about 1775, died in Hayti, Feb. 12, 1839. He was a negro, taught colored schools in Colchester, Conn., and Boston, Mass., and in 1807 went to Hayti. Christophe sent him to England to procure teachers, books, and school apparatus. The result not being satisfactory, Saunders returned to the United States, where he studied divinity, and preached for some time to a congregation in Philadelphia. He then returned to Hayti, and was appointed attorney general of the republic. He was the author of the criminal code of Hayti, and published several small works, including "Haytian Papers" (London, 1816).

SAUNDERSON, Nicholas, an English mathematician, born at Thurleston, Yorkshire, in 1682, died April 19, 1739. Before he was a year old he lost his sight by the smallpox. He became acquainted with Greek and Latin while young, and was instructed by his father in the rudiments of mathematics, afterward received instruction in algebra and geometry, and attended an academy near Sheffield. In 1707 he established himself as a teacher of mathematics and optics at Cambridge, and in 1711 was appointed on the recommendation of Sir Isaac Newton Lucasian professor of mathematics in Christ's college. He wrote "Elements of Algebra" (2 vols. 4to, 1740), and "The Method of Fluxions," including a commentary on some parts of Newton's *Principia* (8vo, 1756). He invented a method of performing arithmetical operations by touch.

SAUPPE, Hermann, a German philologist, born at Wesenstein, Saxony, Dec. 9, 1809. He studied in the universities of Leipsic and Zürich, and became professor in the latter in 1838. In 1845 he went to Weimar as director of the gymnasium, and in 1856 to Göttingen as professor of philology. He has edited many classical works, and in conjunction with Haupt a collection of Latin and Greek authors with German notes. He also edited *Don Carlos* in the great edition of Schiller (1867 *et seq.*).

SAURIANS, an order of scaly reptiles, including such as are popularly called lizards, skinks, monitors, geckos, iguanas, agamas, chameleons, &c., and the extinct iguanodon, ichthyosaurus, pterodactyl, and plesiosaurus. The ophisaurians, like the blindworm and amphibæna, have no limbs, and form the connecting

links between lizards and serpents. The saurians are all air-breathers, and the two lungs are about equally developed; the young undergo no metamorphosis, and the eggs are covered by a hard skin or shell; a few are viviparous. (See LIZARD.) The anal aperture is transverse, and the dermal or external skeleton is not bony like that of the *loricata* or crocodilians; the older writers, and some of the modern, place the crocodilians among saurians. This order is very numerous in genera and species, distributed most abundantly in tropical regions, where they are largest and most active. In their movements they come near the mammals, among them being found those which creep, others which walk, or run, or climb, or swim, or dive, or burrow, or fly. Their important subdivisions are treated under the popular names.

SAURIN, Jacques, a French Protestant clergyman, born in Nîmes, Jan. 6, 1677, died at the Hague, Dec. 30, 1730. His family went to Geneva after the revocation of the edict of Nantes. In 1694 he made a campaign in the English service as a cadet under Lord Galway, afterward served in Piedmont, and then returned to Geneva and studied theology. In 1701 he became pastor of the Walloon church in London. He remained there four years, and passed the rest of his life at the Hague, acquiring a great reputation as a preacher. His sermons, in several volumes, have appeared in many editions; a nearly complete translation of them has been published in German, and an abridged translation in English. Among his other works is *Discours sur les événements les plus mémorables du Vieux et du Nouveau Testament*, called "Saurin's Bible" (2 vols. fol., illustrated, 1720, to which Roques and Beaussobre added 4 vols.).

SAUROPSIDA, one of Huxley's three divisions of the vertebrates, embracing the birds and reptiles, characterized by absence of gills at any time of life, by skull jointed to spine by a single condyle, and by lower jaw of several pieces, united to the skull by an *os quadratum*, as distinguished from his division of *ichthyopsida*, including fishes and batrachians which have either permanent or deciduous gills. The affinities which justify the union of birds with reptiles are well seen in the fossil archæopteryx. (See ARCHÆOPTERYX.)

SAUSSURE, Horace Bénédict de, a Swiss naturalist, born at Conches, near Geneva, Feb. 17, 1740, died in Geneva, Jan. 22, 1799. He studied botany under his father and his uncle Charles Bonnet, and under Haller, and became familiar with many sciences. From 1762 to 1786 he was professor of philosophy at Geneva, and in 1798, after the incorporation of that city with France, of natural history at the central school of the department of Léman; and he founded the society of arts in Geneva. He made important researches in the Alps and other mountains, contrived the best kind of hygrometer or rather hygroscope, and perfect-

ed and invented other instruments, the best known being the cyanometer. In 1787 he ascended the summit of Mont Blanc, in 1788 of the Col du Géant, and in 1789 Monte Rosa. Cuvier regarded his *Essai sur l'hygrométrie* (Neufchâtel, 1783) as a remarkable scientific work, and attached the highest importance to his geological and mineralogical labors. His *Voyages dans les Alpes* (4 vols., 1779-'96), comprising also his exploration of other mountains, gave him the title of the "first painter of the Alps."—His son NICOLAS THÉODORE (1767–1845) became eminent in vegetable chemistry. His daughter ALBERTINE ADRIENNE (1766–1841), who married Jacques Necker, a cousin of Mme. de Staël, translated Schlegel's "Course of Dramatic Literature" (1814), and wrote *Notice sur le caractère et les écrits de Mme. de Staël* (1820), and *L'Éducation progressive* (3 vols., 1828-'32; 4th ed., 2 vols., 1864.)

SAUVEUR, Joseph, a French mathematician, born at La Flèche, March 24, 1653, died in Paris, July 9, 1716. He was mute until the age of seven, and his voice and hearing long remained imperfect, yet he made a new science of musical acoustics. He gained an introduction at court through Prince Eugene, and in 1686 became professor of mathematics at the collège de France. He determined the number of vibrations corresponding to each determinate sound, whether of an organ pipe or of a sonorous chord. His discoveries are described in numerous papers in the *Mémoires* of the academy of sciences.

SAVAGE, Marmion W., an Irish novelist, died in Torquay, May 1, 1872. After holding for many years a public office in Dublin, he settled in London in 1856, and for several years edited the "Examiner." His "Bachelor of the Albany," "My Uncle the Curate," "Reuben Medlicott," and "The Falcon Family" were originally published under an assumed name, to avoid compromising his official position, as they were strongly imbued with the spirit of young Ireland. He also edited with notes Richard Lalor Sheil's "Sketches, Legal and Political" (2 vols., London, 1855).

SAVAGE, Richard, an English poet, born in London, Jan. 10, 1698, died in Bristol, July 31, 1743. According to his own story, he was the illegitimate offspring of Anne, countess of Macclesfield, and Richard Savage, Earl Rivers, and at the age of 14 months was consigned by his mother to the care of a poor woman. The countess early disowned him, but her mother, Lady Mason, caused him to be placed in a school at St. Albans, after leaving which he was apprenticed to a shoemaker. Hearing by accident the secret of his birth, he assumed his father's name. Steele, Wilks the actor, and Mrs. Oldfield befriended him, and in 1723 he produced a successful tragedy, "Sir Thomas Overbury," in which he played the principal character. The publication of a volume of miscellanies soon after increased his reputation. In 1727, having killed a man in a drunken brawl, he was

tried and condemned to death. The countess of Hertford interceded with Queen Caroline in his behalf, and, despite the exertions of his mother to have the sentence carried into effect, on the ground that he had once attempted her own life, he received the royal pardon. On leaving prison he published his poem, "The Bastard." With a view of putting an end to scandal, Lord Tyrconnel, a relative of his mother, took him into his own house, where he was allowed an annual income of £200. For several years he led a life of excitement; but having quarrelled with his protector, he was again cast adrift. By the death of Queen Caroline soon after he was deprived of a pension of £50, and left to the charity of his friends, whom he gradually alienated. He was finally induced to retire to Swansea in Wales, and an annual stipend was contributed to his support by Pope and others. After the lapse of a year he started for London with a tragedy, and while passing through Bristol was arrested for a debt of £8, and died in the debtors' prison of that place. He also wrote "The Wanderer" (1729), a poem esteemed by him as his masterpiece, and a number of minor pieces. His works, with an account of his life and writings by Dr. Samuel Johnson, were published in 1775 (2 vols. 8vo).

SAVANNAH, the largest city and the commercial metropolis of Georgia, capital of Chatham co., on the right bank of the Savannah river, 18 m. from its mouth, and at the terminus of the Central, Atlantic, and Gulf, and the Savannah and Charleston railroads, 82 m. in a direct line and 104 m. by rail S. W. of Charleston, S. C.; lat. 32° 5' N., lon. 81° 5' W.; pop. in 1850, 15,312; in 1860, 22,292; in 1870, 28,235, of whom 13,068 were colored and 3,671 foreigners. The city is on a sandy plain about 40 ft. above the river, with one narrow street below the steep bluff, the warehouses upon which open below on the level of the piers, and from the uppermost story on the other side upon a wide sandy area called Bay street, which is divided by numerous carriageways and rows of trees. The whole city is regularly laid out with broad shaded streets, and at many of the principal crossings are open squares with trees. The corporate limits extend about 1½ m. back from the river, and include an area of 3½ sq. m. The water front extends in the form of an elongated crescent about 2½ m. Suburban settlements are fast springing up S. of the city limits. In this district a public park of 30 acres, called Forsyth place, has been laid out. Bonaventure cemetery, about 4 m. from the city, is reached by a fine drive. The principal other cemetery is Laurel Grove, belonging to the municipality. The residences are mostly surrounded with flower gardens, which bloom all the year. The most noticeable public edifices are the city exchange, court house, state arsenal, barracks, artillery armory, theatre, St. Andrew's hall, lyceum, Oglethorpe hall, Chatham academy,

custom house, market house, hospitals, and asylums. The custom house is of granite, 110 ft. long, 52 ft. deep, and 52 ft. high, and contains also the post office and United States court rooms. St. John's and Christ churches (Episcopal) are respectively Gothic and Ionic

edifices. Several other churches are very handsome and commodious, among which is the independent Presbyterian church, of granite, costing about \$130,000. The Georgia historical society has a large and beautiful hall. The reservoir is on a circular tower 80 ft. high;

Savannah.

new pumping works have recently been erected. There is a monument to Gen. Greene in Johnson square, and one to the memory of Pulaski in Monterey square, on the spot where he fell in the attack on the city in 1779. The harbor is one of the best on the southern coast. The depth of water on the bar is 19 ft. at mean low water, and 26 ft. at mean high water; within, at the Tybee roads anchorage, the depth is 31 ft. and 38 ft. respectively. Only 12 ft., however, at mean low water and 18 ft. at mean high water can be carried up to the city, and much dredging is required to keep the channel open in certain places to this extent. The river flows between marshy lands, which are intersected by numerous creeks and artificial channels, and are cultivated chiefly for rice. Long narrow islands and spits almost level with the water occupy a large portion of the space between the opposite banks, and reduce the main channel for a considerable part of the way between the city and the mouth to a width of a quarter of a mile and even less. From the city to Hutchinson's island, which extends about 6 m., is only about 600 ft. The chief defences of the river are Fort Pulaski, a strong fortification on Cockspur island, at the mouth of the river, built by the United States at a cost of \$988,859, and Fort Jackson on the right bank, 4 m. below the city, built at a cost of \$182,000. Steamers run regularly up the river to Augusta, and to New York, Boston, Philadelphia, Florida, and southern ports.—The chief business of Savannah is the receipt and shipment of cotton, though the trade in lumber is also

considerable. As a cotton port it ranks second in the United States. It recovered rapidly from the effects of the civil war, and the value of its commerce has since about doubled. The following table exhibits the shipments of cotton and the value of exports for ten years:

YEARS ENDING JUNE 30.	To foreign ports.		To coastwise ports.		Entire value of exports to for- eign ports.
	Bales.	Value.	Bales.	Bales.	
1866....	64,085	\$12,595,500	162,946	226,981	\$12,890,653
1867....	109,874	16,298,527	147,096	256,970	16,742,511
1868....	275,188	24,174,980	289,629	514,767	24,644,100
1869....	168,008	20,438,619	187,988	355,991	21,049,656
1870....	266,854	29,258,208	204,729	470,588	29,749,088
1871....	481,509	32,504,368	252,750	784,259	32,984,768
1872....	290,091	27,829,917	155,641	445,732	28,262,115
1873....	376,198	27,125,070	229,355	605,553	27,592,150
1874*....	178,479	12,277,160	189,110	817,589	12,440,283
1875†....	459,249	31,809,365	206,056	665,805	32,424,495

The value of imports from foreign countries in 1874 was \$788,220; of exports to coastwise ports, \$18,076,451; of all exports, \$50,500,946; tonnage entered in the foreign trade 297,619, cleared 189,399; entered in the coastwise trade 342,673, cleared 377,459. The number of vessels belonging to the port on June 30, 1874, was 80, with an aggregate tonnage of 22,170. The chief manufacturing establishments are several planing mills, founderies, and flouring and grist mills. There are a national bank, with a capital of \$750,000; three state banks, with an aggregate capital of \$9,000,000; and several building and loan associations.—The

* Six months ending Jan. 1.

† Year ending Jan. 1.

city is governed by a mayor and 12 aldermen, elected biennially. It has a good police force and an efficient fire department with a fire-alarm telegraph. The amount of taxable real estate and improvements is about \$14,000,000. The receipts into the city treasury during 1874 were \$988,320 65, of which \$362,869 65 were from loans; expenditures, \$975,991 61, of which \$353,505 were to pay floating debt and bonds. The funded debt on Jan. 1, 1875, amounted to \$3,600,140, on which the annual interest is \$251,052 90. The principal charitable institutions are the poorhouse and hospital, an orphans' home, a dispensary, and an infirmary. The public schools of the city and of the county of Chatham are under the management of a board of education of 12 members. The schools for white and colored children are separate. In the year 1874-'5 there were in the city 6,919 children of school age (3,853 white and 3,066 colored), and 13 public schools (10 white and 3 colored), all graded, with 61 teachers; average daily attendance, 2,453. The white schools include two Catholic institutions. Outside of the city there were 13 ungraded schools (4 white and 9 colored). The expenditures during the year for all the schools amounted to \$48,350 94, of which \$42,927 96 were for teachers' wages. The schools are free, being supported mainly by city and county appropriations. There are several private schools, and a medical college with 14 professors. Two daily (one German), one tri-weekly, and four weekly (one German) newspapers are published. There are 30 churches, viz.: 9 Baptist (7 colored), 1 Congregational (colored), 4 Episcopal (1 colored), 2 Jewish, 1 Lutheran, 4 Methodist (2 colored), 4 Presbyterian, 4 Roman Catholic, and 1 undenominational.—Savannah was founded in February, 1733, by Gen. Oglethorpe. The British attacked it on March 3, 1776, and were repulsed; but on Dec. 29, 1778, they took possession of the city. In October, 1779, the French and American army under Count D'Estaing and Gen. Lincoln attempted to recapture it, but were unsuccessful. In this engagement Count Pulaski fell, and the French lost 537 in killed and wounded, and the Americans 241. Savannah received a city charter in December, 1789. In November, 1796, a fire destroyed property to the value of \$1,000,000; and in January, 1820, another conflagration occurred, involving a loss of \$4,000,000. On Jan. 3, 1861, two weeks prior to the passage of the ordinance of secession by the convention of Georgia, Forts Jackson and Pulaski were seized by the state troops by order of the governor. During the war the place was occupied as a confederate military post and depot. It was the point on the sea to which Sherman's march from Atlanta was directed, and the first serious opposition which he encountered was about 15 m. N. W. of the city, the roads to which were obstructed by felled timber, earthworks, and artillery; but these

obstructions were turned, and on Dec. 10, 1864, the city was fairly invested. The entrance of the Ogeechee river into Ossibaw sound was guarded by Fort McAllister, a work of no great strength, having 23 guns mounted *en barbette*, a mortar, and a garrison of about 200 men. This fort was captured Dec. 13, with a Union loss of 90 men, and on the 17th Gen. Hardee, who had about 10,000 men at Savannah, mostly militia, was summoned to surrender by Sherman. Hardee refused on the ground that he still maintained his line of defence, and was in communication with his superior officers. Sherman then prepared to assault, but before his arrangements were completed Hardee abandoned the city and retreated to Charleston. The Union army entered Savannah on Dec. 21. Among the captures were 25,000 bales of cotton.

SAVANNAH RIVER. See GEORGIA, vol. vii., p. 716.

SAVARY, Anne Jean Marie René, duke of Rovigo, a French soldier, born at Marq, near Vouziers, April 26, 1774, died in Paris, June 2, 1833. He entered the army in 1790, superintended in 1804 the execution of the duke d'Enghien, became general of division in 1805, achieved in 1807 a victory at Ostrolenka, and received a large pension and the title of duke of Rovigo. Napoleon, after employing him in missions to Russia, sent him to Madrid, where he prevailed upon King Charles IV. and Prince Ferdinand to meet Napoleon at Bayonne, preliminary to their deposition. After the establishment of Joseph Bonaparte as king of Spain, he joined Napoleon at Erfurt, and remained his companion till 1810, when he succeeded Fouché as minister of police. In 1814 he accompanied Maria Louisa to Blois, and went on board the Bellerophon to accompany the emperor to St. Helena; but the English took him to Malta, whence he escaped to Smyrna. There he lost most of his fortune in commerce, and in 1819 he returned to Paris and obtained the reversal of the sentence of death which had been pronounced upon him in 1816. In 1823 he published an extract from his memoirs, in which he threw the blame of executing the duke d'Enghien on Talleyrand. The court was displeased at this, and he went to Rome, but was recalled to active service in 1831 as commander of the army in Algeria. His *Mémoires pour servir à l'histoire de l'empereur Napoléon* (8 vols., 1828) is one of the most valuable works on the first empire.

SAVE (anc. *Savus*; Ger. *Sau*; Hun. *Száva*), a river of Austria and Turkey, rises in the Carnic Alps, in the N. W. corner of Carniola, flows mostly E. S. E. through Carniola and Croatia, passing Laybach and Agram, and along the southern boundary of Slavonia, separating it from Bosnia and Serbia, and empties into the Danube between Belgrade and Semlin. It is about 550 m. long, and for most of its course winds sluggishly through an open country, often overflowing. Below the confluence of

the Kulpa it is navigable for vessels of 150 tons. Its principal affluents, all from the south, are the Kulpa, Unna, Verbas, Bosna, and Drina.

SAVIGNY, Friedrich Karl von, a German jurist, born in Frankfurt, Feb. 21, 1779, died in Berlin, Oct. 25, 1861. He studied at Marburg, where he lectured on the civil law from 1801 to 1804. In 1808 he was appointed professor of law at Landshut, and in 1810 at Berlin. In 1842 he was appointed minister of justice for the revision of the law, and in 1848 retired from political life. He published *Das Recht des Besitzes* (1803; 7th ed., 1865; English translation, "Treatise on Possession," &c., 6th ed., 8vo, London, 1848); *Geschichte des römischen Rechts im Mittelalter* (6 vols., 1815-'31); and *System des heutigen römischen Rechts* (8 vols., 1840-'49), to which *Das Obligationsrecht* (2 vols., 1851-'53) is an appendix.

SAVILLE, or Saville, George, marquis of Halifax, an English statesman, born in Yorkshire in 1630, died in London, April 20, 1695. He was the son of a baronet, and for his zeal in bringing about the restoration was created in 1668 Baron Savile and Viscount Halifax; in 1679 he was made earl, and in 1682 marquis of Halifax. In 1672 he was made a privy councillor, and in 1679 was admitted into the council of 30, and subsequently became one of Charles II.'s four confidential advisers. It was owing almost entirely to his oratory that the house of lords rejected the exclusion bill in 1680. He however defended Lord Russell, and denounced the withdrawal of the Massachusetts charter. On the accession of James II. he was obliged to give up his post as lord privy seal and accept the presidency of the council; but as he refused to support the king in the repeal of the test and habeas corpus acts, he was dismissed from office. He was appointed by James one of the commissioners to treat with William of Orange, but the flight of the king put an end to his mission. When parliament met he was appointed speaker of the house of lords, and supported the claim of William as king regnant, presented the crown to William and Mary on their accession, and was made lord privy seal. But he soon went into opposition, and acted for a short time with the Jacobites. He was the chief of the party contemptuously called trimmers, a name which he accepted and defended. He wrote "Character of a Trimmer," "Anatomy of an Equivalent," "Letters to a Dissenter," and "Maxims of State," all of which were printed in 1 vol. 8vo after his death. Several historical essays were published under his name. Two manuscript copies of his memoirs were both destroyed. The poet Henry Carey, ancestor of Edmund Kean, was his natural son.

SAVIN. See JUNIPER.

SAVINGS BANK, an institution for the deposit and safe keeping of small sums of money. Savings banks were originally established by benevolent individuals with a view to enable the poor to find places in which small savings

could be deposited on interest, and thus to offer inducements to make such savings. Unlike ordinary banks, savings banks do not usually lend money on personal security, but upon mortgage of real estate, stocks, and bonds of governments and incorporated companies. In some countries these banks are only permitted by law to invest in the national securities. The earliest savings bank of which there is any record was founded in Hamburg in 1778; but little is known of its history or operations. The next was in Bern, Switzerland, in 1787. In that country recently existed at Zürich the oldest savings bank in Europe, it having been founded in 1805. Francis Maseres in 1771 published in England a proposal that the rate payers of any parish should be incorporated for the purpose of receiving the savings of the people and of investing the same, and granting deferred annuities to the owners thereof. A bill based on this proposal passed the house of commons, but failed in the house of lords. In 1797 Jeremy Bentham suggested the plan of what he called "frugality banks" in connection with the management of paupers. In 1798 a "Friendly Society for the Benefit of Women and Children" was established at Tottenham High Cross, Middlesex, by Mrs. Priscilla Wakefield, and in or before 1801 there were combined with it a fund for loans and a bank for savings. In 1804 this bank was regularly organized with Mr. Eardley Wilmot, M. P., and Mr. Spurling as its first trustees. In 1799 the Rev. Joseph Smith of Wendover, Bucks, circulated in his parish proposals to receive sums on deposit during the summer, and to return them at Christmas with an addition of one third as a bounty on the economy of the depositors. The peasantry of the parish readily embraced this offer. In 1806 the "Provident Institution" of London was established. A savings bank was at first attached to it, but was soon discontinued, and the institution became simply a life insurance company. In 1807 the Rev. John Muckersy established in Scotland the "West Calder Friendly Bank for the Savings of the Poor." In 1808 a society was opened in Bath, chiefly through the instrumentality of ladies, for receiving the deposits of female servants. In 1810 the Rev. Henry Duncan, D. D., minister of Ruthwell, Dumfriesshire, Scotland, established a parish bank in that town, and at the end of four years had therein accumulated £1,160, at 5 per cent. interest. His attention had been directed to this subject by reading the writings of John Bone on social economy. He himself also wrote various essays, including "An Essay on Parish Banks." The institution established by him served as a model for various others. In gratitude to Dr. Duncan, a savings bank house was erected to his memory in the town of Dumfries soon after his death in 1846. In December, 1813, the Edinburgh savings bank was founded, mainly through the instrumentality of J. H. Forbes, who was connected with the

banking house of Sir William Forbes and co., and within three years he had received deposits amounting to £8,316 from 1,837 depositors. At first the rate of interest was 4 per cent., but after the first year it was fixed at 5 per cent. In January, 1815, the "Provident Institution of Bath," afterward called the Bath savings bank, was established. Southampton followed with a savings bank in November of the same year, Exeter in February, 1816, and Hertford in March. The bank of Exeter established agencies for receiving deposits throughout Devonshire, and within two years held deposits to the amount of £14,525. The Hertford bank had been preceded by the "Sunday Bank" established in the same place by the Rev. Thomas Lloyd. The first savings bank in Ireland was established at Stillorgan, county Dublin, in March, 1815. By the end of 1816 there were 74 in England and Wales, and 4 in Ireland. The first legislation by parliament for the regulation of these banks was "An act to encourage the establishment of banks for savings in England" and "An act to encourage the establishment of savings banks in Ireland," both passed in 1817. Among other provisions of these acts were those by which the trustees and managers of the banks were empowered to pay over the money received from the depositors to the bank of England or the bank of Ireland for the account of the commissioners for the reduction of the national debt, and as "the fund of the banks for savings," and the commissioners were to invest them in 3*d.* per cent. bank annuities and issue debentures bearing interest at the rate of 3*d.* per cent. per diem (£4 11*s.* 3*d.* per annum). In Ireland the trustees might place not more than one fifth of their deposits with bankers. Alterations as to England were made in 1817 and 1820, and in 1824 an act was passed covering both kingdoms. Between 1849 and 1857 the great frauds and defalcations in these banks had a tendency to destroy the confidence of the people in their stability. In 1861 the amount to the credit of depositors and the reserves of these banks were £41,546,475.—As early as 1806 Mr. Whitbread had proposed the establishment of savings banks in connection with the post office. In 1859, at the meeting of the social science association at Bradford, a paper was read on the subject by Mr. C. W. Sikes, of the Huddersfield banking company, which attracted the attention of the postmaster general and others; and finally a plan, to a great extent based upon Mr. Sikes's suggestions, was matured by George Chetwynd and Frank I. Seudamore, with the coöperation of Sir Rowland Hill. This plan, embodied in a bill, was carried through parliament by Mr. Gladstone, and became a law on May 17, 1861, and went into effect Sept. 17. By Dec. 31, 1862, the total balance on hand was £1,694,724. During the year 1873, 2,917,698 deposits were received, of the aggregate amount of £7,955,740, the average being £2 14*s.* 6*d.*

The total amount of deposits at the end of the year 1873 was £21,745,442. The rate of interest allowed is 2½ per cent., and the amounts received are from time to time paid over to the commissioners for decreasing the national debt, by whom they are invested in consols. Out of an amount due to depositors Dec. 31, 1872, of £19,860,874, but £301,070 remained on that date in the hands of the postmaster general. Similar systems have been successfully introduced into Australia and Canada. The rate of interest allowed by the ordinary savings banks of the United Kingdom is 3¼ per cent., and the deposits are invested in consols, which pay about 3·35 per cent. The total amount of deposits in these banks and post-office banks, as stated in parliament May 27, 1875, was £65,673,000.—In the United States the first savings bank was the "Philadelphia Saving Fund Society," suggested by Condé Raguet and organized in 1816. It still exists in a flourishing condition, and on Jan. 1, 1875, held deposits amounting to \$10,275,752 83. The second was established in Boston in the same year; the third in New York in 1819. In the various states there are laws regulating these institutions, and some of them are managed with great probity and have been eminently successful, although there have been very disastrous failures. Complete statistics of these banks are not accessible, but the following for 1874-'5 will give some idea of the business done by them in the United States:

STATES.	No.	Depositors.	Deposits.
Maine.....	90,898	\$29,556,498
New Hampshire.....	63	92,501	30,214,585
Vermont.....	16,200	5,751,002
Massachusetts.....	179	702,099	217,452,120
Rhode Island.....	98,124	46,617,164
Connecticut.....	205,510	72,205,624
New York.....	155	572,498	303,935,649
New Jersey.....	40	31,795,000
California.....	25	91,938	72,569,103

—In France the savings banks are under the surveillance of the state, and their funds are deposited in the *caisse des dépôts et consignations*, which is administered under guarantee of the public treasury, which pays the interest; but the depositors have no other security than the banks themselves. The earliest savings bank established in France was in Paris, July 29, 1818; there was one in Bordeaux in 1819, and one in Marseilles in 1821; these were joint-stock companies. Generally from 1821 they have been municipal institutions established by the town councils. In 1874 there were 508 savings banks in France, with 2,079,196 depositors, and deposits amounting to \$107,019,347. In 1875 a bill was discussed by the national assembly providing for post-office savings banks, but was rejected for several reasons, among others because the bill permitted women and minors to open accounts and withdraw deposits when no opposition was made by the husbands of the one or the parents of the

other class. Danger also was apprehended that if the government made itself responsible for too large sums of money payable on demand, difficulty might be experienced in their payment. In Belgium savings banks exist in most of the principal towns, and are under the direction of the towns themselves or of financial establishments. Switzerland has long been famous for its savings banks. In 1874 it had 303, with deposits amounting to \$57,600,000. In the various states of the German empire savings banks exist, one having been founded in Berlin as early as 1818. In Austria the deposits in these institutions amount to \$179,475,824. Throughout Europe the deposits in savings banks are estimated at \$1,180,000,000.

SAVOIE, a department of France. See SAVOY.

SAVOIE, Haute. See HAUTE-SAVOIE.

SAVONA, a fortified city of Italy, in the province, on the W. side of the gulf, and 23 m. S. W. of the city of Genoa; pop. in 1872, 24,851. It is very antique, has a large trade in silk, wine, and fruit, manufactures paper, cloth, firearms, soap, and glass, and is famous for its pottery. It has a cathedral dating from 1604, with fine wood carvings from an older one, a citadel, an arsenal, a naval school, a seminary, and a college. The port was filled up with hulks and stones by the Genoese in 1525-'8, but has been partly cleared out, and the work is still in progress (1875).

SAVONAROLA, *Girolamo*, an Italian reformer, born in Ferrara, Sept. 21, 1452, executed in Florence, May 23, 1498. In 1475 he became a Dominican at Bologna; and having completed his theological studies and received orders, he was sent in 1482 to the convent of San Marco in Florence to preach the Lenten station. His diminutive stature and harsh voice having caused him to fail in this, he was removed to the convent of Brescia, where he achieved such success as a pulpit orator that in 1489 he was recalled to San Marco in Florence. Applying the visions and prophetic denunciations of the Apocalypse to the vices and corruptions of the pagan renaissance in Italy, he assumed the character of a prophet. In 1493 he was appointed vicar general of his order in northern Italy, and was encouraged by the court of Rome to carry out a thorough reform in all Dominican houses. Soon afterward the pope made the reformed Dominicans of Tuscany an independent body under Savonarola. After the death of Lorenzo the Magnificent in 1492, the friar allied himself with the political party which favored the French domination in Lombardy, and his discourses pointed plainly to the speedy arrival of one who should liberate Florence from the yoke of the Medici and the corruptions of paganism. He was appointed one of a deputation to welcome Charles VIII. of France as the saviour of Italy, and to invite him to Florence in 1494. Thenceforward his influence was for a time all-powerful in the city. When the French evacuated Florence, a theocratic republic was proclaimed by his ad-

vice, in which Christ alone was to be sovereign, and legislation and public order were regulated on the ascetic principles of monastic life. He made war upon all amusements, proposed a rigid censorship of morals, and even demanded the deposition of the pope. A sentence of excommunication, which he disregarded, only increased his popularity. He continued his harangues, organized processions, and held public *autos da fê*, in which beautiful and licentious works of art were destroyed. But after a time the combination of the Medici with other powerful families, the hostility of the Franciscans, Savonarola's extravagant interpretations of Scripture, and the censure of the court of Rome, caused a sentence of banishment to be issued against him. He shut himself up in his convent of San Marco, but surrendered after a violent contest. Pope Alexander VI. demanded that he and his companions, Domenico Buonvicini and Silvestro Maruffi, should be sent to Rome. The Florentine council refused, but allowed the papal delegates to share in the trial. The prisoners were sentenced to death and strangled, and their bodies burned. Monuments to Savonarola's memory were erected in the convent of San Marco in 1873, and in Ferrara on the anniversary of his death, May 23, 1875. He left numerous ascetic and political writings and religious poems. In his *Triumphus Crucis* he strives to prove the truths of religion by philosophical arguments, and to bring the natural and supernatural together. In his work *De Divisione omnium Scientiarum* he rejects all pagan authors, and would substitute for these the study of the fathers. His works were partly published at Lyons (6 vols., 1633-'40), and portions have been translated into various languages. Among recent publications of his writings are *Prediche* (Florence, 1845), and *Poesie* (1862). His life has been written by Carle (Paris, 1842), Madden (London, 1853), and many others. The best biographies are by Perrens (2 vols., Paris, 1853; 3d ed., 1859), and by Villari (2 vols., Florence, 1859-'61; French translation by Gustave Gruyer, with collections of Savonarola's correspondence and poetry, 2 vols., 1874). Villari corrects the exaggerated accounts of his execution.

SAVOY (Fr. *La Savoie*), a territory of France, formerly an independent duchy and afterward part of the kingdom of Sardinia, between lat. 45° 4' and 46° 24' N., and lon. 5° 37' and 7° 15' E.; area, 3,888 sq. m.; pop. in 1872, 540,985. Its length from N. to S. is 92 m. and its greatest breadth from E. to W. 75 m. It is bounded N. by the canton and lake of Geneva; W. by the department of Ain, from which it is separated by the Rhône; S. W. by the departments of Isère and Hautes-Alpes, being divided from the former by the Guiers, a tributary of the Rhône, and from the latter by the Maurienne ridge, an offset of the Cottian Alps; and S. E. and E. by the Cottian, Graian, and Pennine Alps, with their ramifications projecting toward the lake of Geneva, which

separate it from Piedmont and the canton of Valais. This range contains the loftiest peaks and most magnificent glaciers in the whole Alpine system; among the former are Monts Blanc, Iséran, the Little St. Bernard, and Tabor; among the latter, Iséran and Chamouni. The country is intersected by several of its off-sets, viz.: the Alps of Savoy, branching from the Little St. Bernard, and covering with their ramifications most of the central and western districts; the Savoisan and Valaisian ridge, extending from the Pennine Alps to the lake of Geneva; and La Vanoire, which diverges from Mont Iséran and describes a curve toward the W. S. W. The streams generally rise in the main chain in the east, and flow directly or indirectly into the Rhône; the Dranse, which flows northward to the lake of Geneva, the Arve, Chéran, and Isère, flowing westward, are the most important. Besides its share of the lake of Geneva, Savoy has the smaller lakes of Bourget, Annecy, Morion, Haute-Luce, and Mont Cenis, and the subterranean lakes in the cave of Bauge. Mineral springs are abundant; those of Aix, St. Gervais, and Evian are the most famous; and there are intermittent springs at Pigros and Haute-Combe. Mines of argentiferous lead are wrought in various places, and there are mines of copper, iron, and lignite, anthracite, and bituminous coal, and quarries of marble, granite, slate, jasper, and porphyry. The forests furnish timber for ship building and other purposes. The extent of arable land is not considerable, but every acre is cultivated; the valleys, of which the most celebrated is that of Chamouni, present a succession of cultivated fields, orchards, and gardens; and the steepest declivities of the mountains are terraced and made productive. Wheat, oats, barley, rye, hemp, and fruits are extensively cultivated. Chestnuts form an important article of food among the poor. Vines thrive on the hills, and the wines are of good quality. Mulberry and walnut trees are cultivated, the nuts of the latter yielding oil. Numbers of cattle are reared. The rivers teem with fish, and the streams and lake at the foot of Mont Cenis, the Chéran, and the Guiers are famous for trout. The climate, though variable, is healthful and mild; the cold is severe only on the mountains. The inhabitants, in manners, language, and sympathies, have always been essentially French. They are kind, honest, hospitable, and intelligent, fond of their country and loath to leave it permanently, though as many as 30,000 of them find employment during the winters in France, Switzerland, Italy, and Spain. Nearly all of the non-migratory class are landowners, the soil being much subdivided. Agriculture is the chief pursuit, but there are many foundries and iron works, and linen, cotton, woollen, and other manufactories. Before its annexation to France, Savoy was divided into the provinces of Chablais, Faucigny, Genevois, Maurienne, Savoy Proper, Upper Savoy, and

Tarantaise. It now constitutes the departments of Savoie (the southern part) and Haute-Savoie. For the latter, see HAUTE-SAVOIE. The former has an area of 2,221 sq. m.; pop. in 1872, 267,958. It is divided into the arrondissements of Albertville, Chambéry, Moutiers, and St. Jean de Maurienne. Capital, Chambéry.—Savoy was originally inhabited by the Allobroges, Nantuates, and other tribes of Transalpine Gaul. Under the Romans it formed a part of Gallia Narbonensis. Subsequently it belonged to the kingdoms of the Franks and Burgundians. The last king of Arles, Rudolph III., early in the 11th century appointed Beroald, a descendant of the count of St. Maurice, as governor of Savoy. Count Humbert, however, who died about 1048, is generally regarded as the actual founder of the house of Savoy. He was a stepson of Rudolph III., and inherited the county of Maurienne, in addition to which he received from the emperor Conrad II., after the death of Rudolph and the permanent incorporation of Savoy with Germany in 1032, considerable fiefs, including Chablais and Vaud. His nephew Amadeus II., in right of his mother Adelaide, heiress to the marquisate of Susa, added a large part of Piedmont to the possessions of his house. Under Amadeus III. (1103-'48) the territory became in 1111 a county of the empire, and he was the first count of Savoy. Its domains were much enlarged under subsequent counts, especially Amadeus V. the Great (1285-1323). (See AMADEUS V.) Turin had become the capital previous to his reign. Amadeus VI., a chivalrous and adventurous prince, annexed Coni and other territories, and Amadeus VII. Nice. Under Amadeus VIII. (1391-1434) Savoy became a duchy in 1416 (see AMADEUS VIII.), and he reannexed Piedmont, which for about a century and a half had been in the possession of a younger branch of the family. Charles I. (1482-'9) conquered the marquisate of Saluzzo. Charles III. (1504-'53) became involved in the wars between Francis I. and Charles V., and lost nearly all his possessions, which were recovered by his son Emanuel Philibert (1553-'80), who also acquired additional domains. He was one of the most warlike princes of his house, commanded the Spanish army in the battle of St. Quentin (Aug. 10, 1557), after a struggle granted the Waldenses free exercise of their religion, and promoted agriculture, industry, and learning. The ambition of his successor, Charles Emanuel I. the Great (1580-1630), son-in-law of Philip II. of Spain, resulted in new spoliation on the part of France (see CHARLES EMANUEL I.); and his son Victor Amadeus I. (1630-'37) was soon after his accession obliged to conclude with his brother-in-law Louis XIII. of France the disastrous peace of Cherasco. The fortunes of the house of Savoy had been at a standstill for a long period when Victor Amadeus II. succeeded Charles Emanuel II., a peaceful prince, in 1675. After various

vicissitudes he recovered not only all its possessions, but acquired in 1713 a part of the duchy of Milan and the kingdom of Sicily, which he exchanged in 1720 for the island of Sardinia, with the title of king. (See VICTOR AMADEUS, and SARDINIAN STATES.) Thus, after having been counts and dukes of Savoy for 700 years in the aggregate, these princes were ranked among royal dynasties, allied with almost all the great houses of Europe, and finally the reigning king Victor Emanuel has become the ruler of all Italy. (See ITALY.) Except during the French domination under the republic and Napoleon I., Savoy remained a part of the Sardinian states till 1860, when by the treaty of Turin (March 24) it was ceded to France, together with most of the county of Nice, on condition that the inhabitants should approve of the transfer; and a large majority of affirmative votes having been cast at the election for that purpose, the county was formally annexed to France, June 12.

SAW, an instrument usually made of a steel plate with teeth along one edge, used for cutting wood, ivory, stone, and the softer metals. The ancient Egyptians used saws of bronze, and applied them to cutting out planks from logs. The saw was single-handed, and the log was placed on end and secured to posts set in the ground. The inventor of the saw was deified by the Greeks, and called by some Talus and by others Perdix. The saws of the Grecian carpenters were like the straight frame saws of modern times, the blade set across the middle of the frame, with the teeth perpendicular to its plane. The block of wood to be sawn was clamped down upon a bench, and the workmen stood on opposite sides of this, one at each end of the saw.—Saws are of various forms and sizes, according to their intended use. The older forms are straight strips of steel, either set in a frame, or simply provided with handles at each end, so as to be moved forward and back by two persons; or the plate is made stiff enough for a single handle to answer, when it is worked by one person holding it in one hand. In modern times saw blades are often circular, the teeth cutting as the saw revolves constantly in the same direction.—Steel plates intended for large saws are prepared from ingots carefully made to secure uniform quality, and after being rolled they are slit into the shapes for the different saws. The edge intended for the teeth is then ground true, and the teeth are cut by a punch at a fly press. The rough edges left by the punch are filed down and the teeth are sharpened. The blades are next heated in ovens to a red heat, and then immersed horizontally and edgewise into a trough containing oil with certain portions of melted tallow, beeswax, rosin, pitch, &c. To remove the excess of hardness they thus acquire, after wiping off a portion of the composition that adheres to them, the blades are held over a fire until that which remains ignites; this

is called "blazing off." The more that is removed of the composition before this burning, the harder is the blade; and thus its temper is regulated for the kind of saw required. To give it uniform density throughout, the blade is next hammered over its face upon an anvil or polished steel; this is called "planishing" or "smithing." The next process is grinding the surface, to reduce the thickness of the metal from the teeth toward the back edge. Small blades are held against the stone by means of a board laid upon them, and large saws are suspended at each end. The finishing processes are repetitions of the planishing and grinding, together with polishing by smooth stones and with emery.—The teeth are variously shaped for different saws. The most simple are made by angular notches, the angle at the apex of the notch being of 60°. This is most convenient for sharpening, as the common triangular or "three-square" file is just adapted to its figure. When the teeth are made with equal sides, they are said to have an upright pitch; and when they make a zigzag of alternating long and short lines, they are said to be flat or to have considerable pitch. The former are adapted for cross-cut saws, worked by two men, one at each end. Such teeth lack the chisel-like effect of those of a low pitch, and rather scrape away the wood than tear into it like the latter, which cut only when the saw is moved in the direction toward which the teeth point. Hand saws in the United States and England have the teeth pointed from the handle; in Asiatic countries and in Greece they have always been made with teeth pointed the other way. A straight cut upon a line can probably be made better by the thrusting cut, and in this the sawdust is thrown out more freely; but the force is certainly applied to better advantage as regards the saw in pulling it in the line of its greatest strength than in pushing; and for very slender saws, in which it is an object to dispense with all unnecessary width and thickness, as in the keyhole and other similar sorts, it would appear decidedly better to adopt the East Indian practice. Some large saws are notched at a sharper angle than 60°, and for these, special files made for the angle are used, and are known as mill-saw files. Teeth made at a low pitch in large saws would become clogged with sawdust unless the space between them were enlarged, and the various forms in which this is done give distinctive names to the teeth. In large mill saws and circular saws the space between the teeth, which may be 2 or 3 in., is hollowed out in a curve, and the outline is much like a fish hook in form, the shank of the hook bending back to make the back of one tooth, and the point curving round to form the under side or face of the next. All saws used for cutting wood require some provision against their liability to become jammed and the teeth clogged in the narrow passage they make for themselves. This is sometimes ef-

fectured by making the blade thinner toward the back, but the most effectual mode is in the "set" given to the teeth. In finishing the saw the last process is to bend half the teeth a little out on one side, and the other half on the other side. In eastern countries a group of a dozen teeth or thereabout are bent to one side, and the next group to the other. The operation is performed with a small hammer, the saw being held with the teeth resting on the rounded edge of a small anvil. The same may be done with the saw set, which is a bit of steel with slits suited to the different thicknesses of saw blades. The amount of set varies with the sort of service the saw is intended for. The more likely the material is to clog, the wider must be the spread of the teeth; but if it is an object to avoid the waste of the wood or the greater labor involved in a wide cut, the set should be as little as possible.—Circular saws were in use in 1790, and some forms have been employed for cutting the teeth of clock wheels ever since the time of Dr. Hooke. For cutting wood they were first brought into important service in the machines invented by M. I. Brunel for making ships' blocks, and adopted by the British admiralty board in Portsmouth in 1804. From that time they have continued in constant use and in various forms for different applications. Saws of this kind commonly run in a slit through a table, upon which the board or other material to be sawed is placed and pushed on against the descending teeth. They are made to revolve with great rapidity, and the teeth for those intended to work in soft wood and with the grain are made well apart and inclined and curved even to the fish-hook form. For harder wood the teeth are made smaller and more upright. Insertable teeth, now much used, are placed in notches in the periphery of the saw plate, and when worn down can be replaced. This contrivance is a great saving, and at the same time allows the dimensions of the saw to be preserved.—The oldest factory for large saws in the United States is probably that founded by William Rowland in Philadelphia in 1802. The largest saws in the world for sawing boards and plank are probably those made expressly for the California market, where they are wanted for the gigantic timber of that region. At the saw factory of Messrs. R. Hoe and co., in New York, circular saws are made of 80 in. diameter and a fourth of an inch thick, and mill and cross-cut saws 10 ft. long and upward. At this establishment are produced nearly all the varieties of saws in use, from circular saws of 4 in. diameter up, and from the common wood saw to the largest mill saws. Some of the articles are peculiar to the United States, as also the processes employed. The steel plates are almost entirely imported from England; some are received also from Philadelphia. Chain saws, made of solid links with serrated edges, the links being connected by rivets,

are in common use by surgeons for sawing bones when they are so situated that they cannot be operated upon with the common surgeon's saw. They are also sometimes used by mechanics under similar circumstances of position.—Band saws, made by serrating and setting the edge of a flexible steel band, are now largely used in shops for the working and carving of wood, making patterns, &c. They may be of almost any size, from that adapted to the sawing of scrolls in the thinnest boards to the sawing of lumber from logs, and they have the advantage of continuous motion in one direction. The band is moved by means of two rollers covered with leather or vulcanized caoutchouc, one of which is connected with the motor shafting.—The earliest notice of saws being run by power is contained in a manuscript of the 13th century in Paris, in which is a representation of the saw mill with a self action turned by a water wheel. Beckmann finds evidence of saw mills worked by water power in Augsburg, Germany, as far back as 1322. In the island of Madeira one is said to have been in operation in 1420, and the first one in Norway was built in 1530. In Holland they were in use more than 100 years sooner than in England; and the Dutch furnished the English with lumber. The operation of one at Lyons in 1555 is described by the bishop of Ely, then British ambassador at Rome. The first recorded attempt to establish a saw mill in Great Britain was made near London in 1663 by a Dutchman; but the enterprise was abandoned on account of the opposition of the hand sawyers. In 1700 the advantages offered by this improvement were set before the public by one Houghton; but no one ventured to introduce it till 1767 or 1768, when by the desire of the society of arts a saw mill was built at Limehouse by James Stansfield. It was soon destroyed by the mob. In the American colonies the importance of this expeditious means of obtaining sawed lumber was generally felt, and efforts were early made to obtain the necessary machinery, such as was used in Holland. In 1634 a saw mill was put in operation at the falls of the Piscataqua, between Berwick and the Cocheco branch of that river, and this is supposed to have been the first mill of the kind in New England. In New York as many as three mills were constructed by the Dutch West India company about 1633, to run by water power or by wind. One of them was on Nut or Governor's island, which was leased in 1639 for 500 merchantable boards yearly, half oak and half pine. Another was on Saw Mill creek, a small stream which flowed into the East river from the pond known as the Collect. On the Delaware saw mills were erected by the Dutch and Swedes before the arrival of Penn.

SAW FISH, a cartilaginous fish of the genus *pristis* (Lath.), the type of a family intermediate in position between the sharks and rays, though generally ranked with the latter. It

has the elongated and rounded form of a shark, with the mouth and gill openings on the ventral surface as in rays. Its distinguishing character is the long, flattened, narrow, and straight snout, set on the sides with teeth or strong bony spines, forming a double-edged saw-like weapon, whence the common name. The true jaw teeth are very small, and pavement-like as in the rays; the body is flattened in front of the pectorals, the posterior portion and the tail as in sharks; the skin is covered with small rough scales; the pectorals are distant from the head, and not extending to the ventrals; the tail has two dorsals, and a caudal fin prolonged as in the sharks. About half a dozen species are described, found in arctic, tropical, and antarctic seas, and one all along the coast from New England to Florida; they are rapid swimmers. The beak attains a length of from one fourth to one third the total length of the body; it is covered with a rough skin, and is narrower toward the end, which is rounded; this beak has been found driven deeply into the timbers of ships. They seem to have a natural antipathy to the larger cetaceans, and many voyagers have been witnesses to their victories over them. The jaw teeth are adapted for crushing crustaceans and similar animals upon which they feed, and not for tearing flesh. According to Owen, the beak is composed of the cartilages attached to the frontal, nasal, and vomerine bones blended into a horizontal flattened plate, which is more completely ossified than any other part of the skeleton; a series of deep sockets on each of the lateral margins contain the teeth, which are solid, the base being slightly concave and porous, and the spaces between them hollow and filled with a gelatinous medulla, rendering it light without diminishing its strength; vessels and nerves supply the teeth, which grow by constant addition of ossified pulp material at the base. Though the projections of the beak are implanted like teeth, they have no relation to the intestinal canal, and are turned outward like spines of the external or dermoskeleton; they form a very interesting transition between teeth and cutaneous spines. These teeth wound by repeated blows, and not by cutting like a saw; the Polynesians use this beak as a sword.—The common saw fish is the *P. antiquorum* (Lath.), which attains a length of 12 to 15 ft., of which the beak is about one third, with 20 to 30 teeth on each side; it is

Common Saw Fish (*Pristis antiquorum*).

blackish gray above, and lighter below; the eyes are large, the nostrils in front of the mouth protected by a membranous fold, and

two oval foramina behind the eyes. Klein says that in the embryo the sides of the snout are as smooth as the gums of a new-born infant; but according to Latham they grow very rapidly after birth, and are not shed and replaced like the teeth of mammalian jaws.

SAW FLY, the popular name of the *tenthredinidæ*, a very destructive family of hymenopterous insects. They are found on the leaves of plants, and live almost entirely on vegetable food; they are poor fliers and sluggish; the form is generally short and flattened, with broad head, and thorax widely joined to the abdomen, the antennæ short but of various forms, thread-like, knobbed at the end, feathered, notched, or forked; the wings overlap, cover the back, and are horizontal when closed. The females have two saws, lodged in a groove in the hind part of the body within two sheath-like pieces; they are placed side by side, with the ends directed backward, the form and the shape of the teeth varying; they usually curve upward, and are serrated along the lower or convex edges; each saw has a back to steady it, but the blade slides forward and backward on it; they are not only toothed on the edge

Elm Saw Fly (*Cimbex ulmi*).

but on the sides, acting as rasps as well as saws. With these they saw slits in stems, leaves, and fruits, in which their eggs are deposited; the wounds sometimes produce galls in which the young are hatched and grow. The larvæ look much like caterpillars, are cylindrical and greenish, with several pairs of legs, generally 18 to 22; most are naked, but some have a few prickles, others a white flaky substance, and a few a dark, slimy, slug-like skin. The larvæ also resemble caterpillars in habits; when fully grown they enter the ground and make a silken cocoon, but a few place their cocoons on plants or in crevices above ground; they remain thus during the winter, change to whitish chrysalids in spring, and soon come out winged insects; there are sometimes two broods, one going through all its changes during summer.—About 100 species are found in New England alone. The largest is the elm saw fly (*cimbex ulmi*, Peck), about $\frac{1}{2}$ in. long, with an expanse of wings of nearly 2 in.; the female resembles a hornet, with black head and thorax, hind body steel-blue with three or four yellowish spots on each

side, and smoky brown transparent wings. The male is very different, and is the *C. Americana* of Leach; the body is longer and narrower, without the spots on the sides. They appear from the last of May to the middle of June, the eggs being deposited on the American elm, whose leaves are eaten by the larvæ; these in August are nearly 2 in. long, thick-bodied, with 22 legs, rough skin, pale greenish yellow, with numerous transverse wrinkles and black dorsal stripe and spiracles; when at rest they lie on the side in a spiral, and eject a watery fluid from lateral pores when disturbed; they make a tough cocoon under dead leaves, in which they remain all winter, being transformed to chrysalids in spring. The fir saw fly (*lophyrus abietis*, Harris) is very destructive in the larva state to the fir family in New England. The male is about $\frac{1}{4}$ in. long and $\frac{2}{5}$ in. in expanse of wings; black above, brown below, the wings with changeable tints of reddish, green, and yellow; the legs dirty yellow; antennæ like short black feathers curled inward on each edge. The female is $\frac{3}{10}$ in. long and $\frac{1}{2}$ in. in expanse; yellowish brown above, with blackish stripe on each side of thorax; dirty yellow below; antennæ short

Fir Saw Fly (*Lophyrus abietis*).

and tapering, 19 jointed, serrated on the outside. They appear early in May, making slits for their eggs in the edges of the leaves; the larvæ come out in June and July, living in large swarms, curling the hind part of the body around the leaf while feeding, and throwing up the head and tail when disturbed; they are about $\frac{1}{2}$ in. long, the head and anterior parts black; body pale green with longitudinal stripes; below yellowish; they become almost yellow at last, and descend to the ground, where they make oblong grayish cocoons, $\frac{1}{10}$ in. long, escaping in the spring by a lid at one end. The most effective means of destroying them is showering the trees with soap suds or a solution of whale-oil soap. A nearly allied species, *L. pini* (Latr.), is very destructive to the pine and fir in Europe; the eggs are laid in slits in the leaves closed up by a viscid substance which issues from the mouth; whole forests in Germany have been stripped by the larvæ; among their enemies are insectivorous birds and mammals, like the woodpeckers, mice, and squirrels, and also ichneumon flies. The vine saw fly of the United States (*selandria vitis*, Harris) is black, with red thorax above, and fore legs and under sides of all the legs yellowish white; wings smoky; the

female $\frac{1}{4}$ in. long, the male smaller. They lay eggs in the spring on the lower side of the terminal leaves of the vine, the larvæ appearing in little swarms in July, feeding in company and eating the leaves even to the stalk; they are $\frac{1}{8}$ in. long when full grown, the head and tip of tail black, the body light green above with two rows of black dots on each ring, and yellowish below; they make cells of earth lined with silk, and come out perfect insects in about two weeks, when they lay eggs for a second brood, which eat, go into the ground for the winter, and come out flies the next spring. The best remedies are dusting air-slacked lime on the vines or showering them with strong soap suds. Another saw fly injurious to fruit trees will be noticed under SLUG WORM.

Vine Saw Fly
(*Selandria vitis*).

SAWYER. I. Thomas Jefferson, an American clergyman, born in Reading, Windsor co., Vt., Jan. 9, 1804. He graduated at Middlebury college in 1829, studied for the ministry, and in 1830 took charge of a Universalist society in New York. In 1845 he became the principal of the Clinton liberal institute, Oneida co., N. Y., and also taught classes in theology. In 1852 he resumed his former charge in New York, and soon afterward held a public debate with the Rev. Isaac Westcott, a Baptist clergyman, which was published under the title, "Discussion of the Doctrine of Universal Salvation" (12mo, 1854). He aided in founding the theological school at Canton, N. Y., and in the establishment of Tufts college at Medford, Mass., in which since 1869 he has been professor of theology. Harvard university conferred upon him the degree of D. D., and the Leipsic theological historical society has made him one of its members. **II. Caroline M. (Fisher)**, an American author, wife of the preceding, born in Newton, Mass., Dec. 8, 1812. Her contributions to the youth's department of the "Christian Messenger" have been collected in a series of volumes. She has edited the "Rose of Sharon," a Universalist annual, and the "Boston Repository," a Universalist monthly magazine, published many poems, and made numerous translations from the French and German.

SAXE, John Godfrey, an American author, born in Highgate, Franklin co., Vt., June 2, 1816. He graduated at Middlebury college in 1839, was admitted to the bar at St. Albans in 1843, and practised in his native county until March, 1850. From 1850 to 1856 he was editor and proprietor of the "Burlington Sentinel" newspaper, and in 1856 was state's attorney. In 1859 and 1860 he was the candidate of the democratic party of Vermont for governor. His published works include "Progress, a Satire" (New York, 1846); "New Rape of the Lock" (1847); "The Proud Miss McBride" (1848); "The Times" (1849); "The Money King and other Poems" (1859); "Clever Sto-

ries of Many Nations" (1864); "The Masquerade and other Poems" (1866); "Fables and Legends in Rhyme" (1872); complete "red-line" illustrated ed., 1874; and "Leisure Day Rhymes" (1875). Of the first collection of his poems (Boston, 1849) 40 editions have been issued. He now (1875) resides in Brooklyn, N. Y.

SAXE, Maurice, count de, a marshal of France, born in Germany in October, 1696, died at Chambord, Nov. 30, 1750. He was the natural son of Augustus the Strong, elector of Saxony and king of Poland, by the Swedish countess of Königsmark, and at 12 years of age served in the army of the allies commanded by Marlborough and Eugene. He was present at the sieges of Tournay and Mons, and before the age of 15 was placed by his father in command of a regiment of cavalry, with which he did good service at the siege of Stralsund. He fought under Eugene against the Turks in 1717-'18, went to Paris in 1720, and received from the duke of Orleans the commission of *maréchal-de-camp* with the command of a regiment, which he proceeded to discipline and manoeuvre according to a system of his own invention. For several years he studied mathematics and the art of war under Folard, and in 1726 proceeded to the north in the hope of being elected duke of Courland. The opposition of Russia and Poland compelled him to take refuge in France, notwithstanding he had secured his election. In 1728 he was recalled by the duchess, Anna Ivanovna, who had conceived an attachment for him, and with whom he might have shared the throne of Russia, to which in 1730 she was elevated, had not his inconstancy caused his dismissal. In 1733 he obtained a command in the French army, and for services at the siege of Philippsburg was appointed a lieutenant general. In the general war which broke out in 1740 he served with credit in the campaigns of Bohemia and on the Rhine, and in 1743 was appointed a marshal of France. In 1744, at the head of an army in Flanders, he held his ground against forces thrice as numerous as his own, retaining all the conquests previously made by the French; and in 1745 he was appointed general-in-chief of the forces in Flanders, amounting to 100,000 men. The campaign began with the siege of Tournay, and on the approach of the allies under the duke of Cumberland to the support of the town, Saxe gave them battle at Fontenoy (May 11, 1745), and after an obstinate contest gained a memorable victory, which led to the speedy conquest of nearly the whole of the Austrian Netherlands. On this occasion, though suffering so severely from an attack of dropsy as to be obliged to travel in a litter, he caused himself to be conveyed to all parts of the field. Louis XV. bestowed upon him the estates of Chambord, which yielded an annual revenue of 100,000 francs; and for the victory gained at Raucoux over the allies under Charles of Lor-

raine, Oct. 11, 1746, he was made marshal general of France. In the campaigns of 1747-'8 Saxe captured Lawfeld, Bergen-op-Zoom, and Maestricht, which with other successes led to the peace of Aix-la-Chapelle in 1748. He passed the rest of his life in princely style on his estate. Saxe was remarkable for his stature and bodily strength; he died prematurely from the effects of debauchery. He devoted several years to a work entitled *Mes rêveries* (5 vols. 4to, 1757), containing many useful hints on the art of war, which was translated into English by Sir William Fawcett (London, 1757). Numerous biographies of Saxe have been published, including one by Delabarre-Duparecq (Paris, 1850), and one by Karl von Weber (Dresden, 1863); and Carlyle has drawn a portrait of him in his "Life of Frederick the Great."

SAXE-ALTENBURG. See ALTENBURG.

SAXE-COBURG. See COBURG.

SAXE-COBURG-GOTHA, a duchy of the German empire, consisting of two principal parts separated from each other by Prussia and Meiningen. The northern division comprises the former duchy of Gotha, and is bounded by Prussia, Schwarzburg, Weimar, and Meiningen. The southern, comprising the duchy of Coburg, is bounded by Bavaria and Meiningen. Area, 760 sq. m.; pop. in 1871, 174,839, almost all Protestants. Both parts of the duchy are mountainous and have beautiful valleys and forests; the highest peaks of the Thuringian Forest are found in Gotha. The duchy is watered by the Gera, Nesse, Unstrut, and Ilm. Grain, flax, and timber are the chief products. In the mountainous parts of Gotha pitch, tar, and lampblack are made. There are manufactories of linen, woollen goods, cutlery, porcelain, and wooden toys, iron founderies, and beet-sugar refineries. The duchy has one vote in the federal council of Germany, and sends two deputies to the German Reichstag. The local diet or legislature consists of one chamber with 21 members, who are chosen by the special diets of the two duchies, Gotha choosing 14 and Coburg 7. The present duke, Ernest II. (born June 21, 1818), succeeded his father in 1844; as he has no children, the heir presumptive to the throne is his nephew Alfred, duke of Edinburgh, second son of the duke's brother Prince Albert and Queen Victoria of Great Britain. The ducal line of Gotha, which was founded in 1681, by Frederick, eldest son of Ernest the Pious of Altenburg and Gotha, became extinct in 1825. After protracted negotiations between the other Saxon houses, Gotha was given to the ducal line of Coburg-Saalfeld, which had been founded by a younger son of Ernest the Pious. The duke of Coburg-Saalfeld in turn ceded Saalfeld to the duke of Meiningen, and assumed the title of Saxe-Coburg-Gotha.

SAXE-LAUBURG. See LAUBURG.

SAXE-MEININGEN-HILDBURGHAUSEN, a duchy of the German empire, composed of the old duchy of Meiningen, the principalities of Hild-

burghausen and Saalfeld, and some smaller districts, bounded mainly by Prussia, Bavaria, Coburg, and Weimar; area, 953 sq. m.; pop. in 1871, 187,957, nearly all Protestants. Its surface is mountainous, several peaks of the Thuringian range rising to an elevation of nearly 3,000 ft. The Werra traverses the duchy, first W. and then N. W.; the other principal rivers are the Saale and Ilm. There are salt and mineral springs. The valleys are fertile. The manufactures consist principally of coarse cotton and linens, iron ware, pottery, and glass. The reigning duke George (born April 2, 1826) succeeded his father in 1866. The government is limited by a diet of a single chamber with 24 members. It has one vote in the federal council, and sends two deputies to the Reichstag. The principal towns are Meiningen, the capital, on the Werra, Saalfeld, Hildburghausen, Sonneberg, and Eisfeld.

SAXE-WEIMAR-EISENACH, a grand duchy of the German empire, composed of the principalities of Weimar and Eisenach, which are separated by Prussian Saxony and Coburg-Gotha, and of the district of Neustadt, separated from Weimar by Altenburg, and 12 smaller portions; area, 1,404 sq. m.; pop. in 1871, 286,183, of whom 9,404 were Roman Catholics, 1,120 Jews, and the rest Protestants. It has a diversified surface, being broken by branches of the Thuringian Forest and the Hohe Rhön, and is watered by the Saale, Ilm, Gera, Werra, Nesse, and Ulster. A large portion of the soil is adapted to agriculture, and produces grain, flax, and hemp; but the principal staple is wool. The reigning grand duke is Charles Alexander (born June 24, 1818), who succeeded his father in 1853. It has one vote in the federal council, and sends three deputies to the Reichstag. The local legislature or diet consists of one chamber with 31 members. The chief towns are Weimar, the capital, Jena, Apolda, Neustadt, and Weida.

SAXIFRAGE (Lat. *saxifraga*, from *saxum*, a rock, and *frangere*, to break), a plant, many species of which grow in the crevices of rocks, and were once supposed to disintegrate them; hence, according to the doctrine of signatures, the plants at one time were regarded as able to break up and remove stone in the bladder. The genus *saxifraga* gives its name to a family, the *saxifragaceæ*, which with the additions made by recent revisions is very large; it may be briefly described as very near *rosaceæ*, but generally without stipules, and with albuminous seeds. *Saxifraga* comprises about 160 species, found in temperate and arctic regions, and especially in alpine situations; nearly all are perennials, often with their radical leaves in a cluster; the usually small perfect flowers in a panicle or corymb, with a five-cleft calyx, five petals, and ten stamens; ovary of two more or less united carpels, with two styles, and frequently cohering with the calyx, ripening into two many-seeded follicles. The early or Virginian saxifrage (*S. Virginensis*) is in

all the northern states one of the earliest and most abundant of spring flowers, especially on dry hills and growing in the clefts of rocks with a warm exposure; it has a tuft of thickish obovate leaves, tapering into a broad petiole, and scollop-toothed on the margin; from the centre of the cluster rises a flower stem 4 to 8 in. or more high, at the top of which is a dense clustered cyme, which later becomes an open loose panicle; the difference in appearance between the plant when it begins to flower and later in the season has caused it to be described under several different names; the flowers are white, sometimes tipped with purple, and occasional specimens have double flowers. This species extends from Canada to the mountains of Georgia and west to Oregon, blooming from April to June. Some few alpine species are found only on Mt. Washington and other northern peaks.

The swamp saxifrage (*S. Pennsylvanica*) is a coarse species found in wet places, with flower stalks 1 to 2 ft. high, but without beauty; and several others are found in the eastern states. In the arctic and subarctic portions of the continent there are several interesting species, and some are peculiar to the Rocky mountains and other western ranges.—In England the climate allows of the cultivation of a large number of alpine species, which will not grow here on account of our hot summers. The most common in American gardens are the thick-leaved saxifrage (*S. crassifolia*) from Siberia, and several similar species, with fleshy, nearly evergreen leaves, 6 to 7 in. long; in very early spring they throw up a thick stalk, about a foot high, with a large cluster of bright rose-colored flowers, which is compact at first, but spreads later into an ample cyme; they bloom so early that they are apt to be caught by late frosts. *Saxifraga umbrosa* is a favorite plant

Early Saxifrage (*Saxifraga Virginensis*).

Thick leaved Saxifrage (*Saxifraga crassifolia*).

in English gardens. (See LONDON PRIDE.) The umbrella saxifrage (*S. peltata*) of California is remarkable for its large leaves, and is somewhat cultivated for its striking foliage. A species which multiplies by means of long runners (*S. sarmentosa*), introduced from China, is cultivated as a house plant, in window baskets, and in greenhouses, under the names of beefsteak and strawberry geranium, wandering Jew, mother of thousands, sailor plant, and various others; it has round-heart-shaped or kidney-shaped, hairy leaves, purplish below and mottled above with green and white; it forms thread-like runners, a foot or more long, at the end of which a bud and ultimately a new plant appears, which if it reaches the earth will take root, and if not will throw out other runners. The old plants throw up a stem which bears a panicle of irregular flowers, with two long hanging white petals, and three erect smaller ones, spotted with pink and yellow.

SAXO, surnamed GRAMMATICUS, a Danish historian, died about 1204. According to the common opinion he was provost of the cathedral of Røskilde, then the Danish capital, and was employed by Archbishop Absalon to write a history of Denmark. For times near his own, Saxo is an unexceptionable witness; but in describing remote periods he drew from popular tradition. His *Historia Regum Heroumque Danorum* was first printed in Paris (fol., 1514). A learned commentary on it has been written by Stephens (fol., Sorø, 1644).

SAXONS, a name first used by the geographer Ptolemy to indicate a branch of the Germanic race, now dominant in the northwestern lowlands of Germany, especially in the region of the middle and lower Elbe, between the Hartz and the northern slopes of the Thuringian Forest, and between the Weser and the Rhine. The Saxons mentioned by Ptolemy were a small tribe, who in his time (2d century A. D.) dwelt between the Eider, Trave, and Elbe, and upon several of the adjacent islands. The word Saxon is supposed by some to have been derived from *Sakaisuna*, sons of the Sakai, or Scythians, and by others from *sahs*, a flint knife or short sword. Eutropius, the next after Ptolemy who mentions them, says that the Saxons, united with the Franks, had become formidable against the Roman frontier. The exploits of the Saxons were chiefly at sea. A special Roman fleet was appointed to act against them, and the southern coast of Britain was placed under an officer styled *comes littoris Saxonici*. Carausius, a Belgian, who usurped the purple in A. D. 287, gave them ships, sent officers to teach them the science of navigation, and encouraged their depredations upon every coast which had not acknowledged his authority. Magnentius, who had seized Italy and Gaul, and assassinated the emperor Constans, likewise formed an alliance with them in 350; other tribes joined their standard; and at length they gave their name

to a powerful league rivalling that of the Franks, and embracing all the tribes between the Skager Rack and the limits of modern France, extending inland to the Saale, and beyond to the western frontier of Bohemia. In the middle of the 5th century Saxon tribes took possession of the coast land of modern Normandy as Roman allies and mercenaries, and others settled on the banks of the mouth of the Loire; but both hordes soon disappeared in the subsequent Frankish empire. In the 5th and 6th centuries they established themselves in Britain (see ANGLO-SAXONS) and on the continent, fought with the Thuringians, attacked the upper Rhine, and extended the scene of their spoils far inland. Charlemagne at last, after one of the most obstinate and destructive wars recorded in history (772-804), destroyed their aggressive power, and forced them to accept Christianity. (See CHARLES I. of Germany, vol. iv., p. 290.) Among the principal Saxon tribes were then reckoned the Westphalians, Eastphalians, Ditmarsians, and Holsatians. In the middle of the 9th century arose the duchy of Saxony, to which Thuringia was soon after annexed. Henry the Fowler, duke of Saxony, became king of Germany (919), and his son Otto I. gave the duchy to Hermann Billung, whose house ruled it for a century and a half. Mainly under it were founded the margraviates of Meissen, East Saxony, and others, in territories wrested from the Slavs and Danes. After the death of the last emperor of the house of Henry the Fowler, Henry II. (1024), the Saxon dukes often struggled against the emperors of the houses of Franconia and Swabia. Lothaire, of the Supplinburg family, becoming emperor in 1125, gave Saxony to Henry the Haughty of Bavaria, under whose son Henry the Lion the duchy was broken up. (See HENRY THE LION.)—Only a very small number of monuments of the Old Saxon language, properly so called, are extant. The most important and largest is the *Heliand* (the Saviour), of the 9th century, which gives in alliterated verses the gospel narrative of the life of Christ. Two manuscripts of it are in existence, one in Munich and the other in the British museum. It appears to be but a portion of an extensive work giving a versified paraphrase of the Old and New Testaments, made at the request of Louis le Débonnaire. The first edition of it, by Schmeller, appeared in 1830-'40. (See GERMANIC RACES AND LANGUAGES, and ANGLO-SAXONS, LANGUAGE AND LITERATURE OF THE.)

SAXONY (Ger. *Sachsen*), a kingdom of the German empire, between lat. 50° 10' and 51° 30' N., and lon. 11° 55' and 15° 5' E., bounded N. and N. E. by Prussia, S. E. and S. by Bohemia, S. W. by Bavaria, and W. by the Thuringian states and Prussia; area, 5,788 sq. m.; pop. in 1871, 2,556,244. Capital, Dresden. The southern part is traversed by spurs of the Fichtelgebirge and the Erzgebirge, the latter separating the country from Bohemia. The picturesque region where the spurs approach the

Elbe is called Saxon Switzerland. The Lusatian mountains on the right bank of that river connect the Erzgebirge with the Riesengebirge. The S. W. portion of the country is known as the Voigtland. About three fifths of the surface is level or slightly undulating. The principal rivers are the Elbe and its tributaries the Elster, Mulde, and Spree. The climate is salubrious, but severe in the mountains. Grain, fruit, and flax are produced in large quantities. Of the total area, 52·4 per cent. is under tillage, 13 per cent. meadows and pastures, 30·5 per cent. forests, and only 4·1 per cent. unproductive. Cattle are raised in great numbers. Saxony has long been celebrated for its fine wool; recently the sheep have declined in number, but improved in breed. The value of all private landed property rose from \$294,000,000 in 1830 to \$490,000,000 in 1858, and \$807,000,000 in 1874. Minerals abound, including coal, silver, iron, lead, tin, marble, porcelain clay, arsenic, &c. The amount of silver mined in 1870 was 64,000 lbs.; iron, 179,000 quintals; lead, 70,000 quintals. Nearly 30,000 persons are employed in mines and smelting. In 1871 there were 681 distilleries and 699 breweries, producing 40,800,000 gallons of beer. More than half the population is engaged in manufactures, producing fine linen, silk, and woollen goods, laces and embroideries, tin spoons, paints, straw goods, porcelain, musical instruments, iron and tin ware, machinery, and many other articles. The book trade and the fairs of Leipzig and the general commerce of Saxony are of great magnitude. (See GERMANY, and LEIPZIG.) Public education is as well provided for in Saxony as in Prussia. The university of Leipzig enjoys world-wide celebrity, and there are various academies in Dresden, a celebrated one for mining at Freiberg, and many gymnasiums and normal and special schools, besides the numerous common schools. The kingdom is divided into the districts of Dresden, Leipzig, Zwickau, and Bautzen (including the main part of Upper Lusatia).—Since 1831 Saxony has been a hereditary constitutional monarchy. The constitutional and electoral laws were perfected in 1849, 1851, 1860, 1861, and 1868. The king is a Roman Catholic, but 98 per cent. of the people are Protestants, of German race. In 1871 there were 3,357 Jews, and about 50,000 Wends, of Slavic race, almost all in Lusatia. Saxony holds the third rank in the federal council of Germany, having four votes, and is represented by 23 deputies in the Reichstag. The legislature consists of an upper chamber composed of royal princes, nobles, prelates, large landed proprietors, and the burgomasters of the eight chief towns (Dresden, Leipzig, Chemnitz, Zwickau, Plauen, Glauchau, Freiberg, and Meerane); and of a second chamber with 35 representatives of towns and 45 of rural boroughs. The executive government is exercised under the king by a council of state and six heads of departments constituting the minis-

try. The Saxon troops form the 12th corps of the German army. The only fortress of Saxony is the impregnable castle of Königstein, the commander of which is appointed by the emperor of Germany. (See KÖNIGSTEIN.) The public debt at the close of 1873 was about \$81,000,000. The revenue and expenditures were respectively estimated for 1874-'5 at \$11,000,000.—The Germanic Hermunduri are considered the original inhabitants of Saxony; they were followed by the Slavic Sorabs, who during the 9th and 10th centuries were overpowered by the Saxons. The latter founded the margraviate of Meissen (Misnia), which in the 12th century, under the house of Wettin, became one of the most flourishing states of Germany. A long intestine conflict was terminated in 1308 by the recognition of the margrave Frederick the Bitten as joint ruler of Meissen and Thuringia. A portion of Franconia was subsequently added, and in reward for services in the Hussite war, the house of Wettin in 1423 obtained the electoral dignity, which had been borne by Saxe-Wittenberg, one of the fragments of the old Saxon duchy (see SAXONS), under a branch of the Ascanian family. On the death of Frederick the Warlike, the first elector (1428), his sons divided his possessions, which, reunited for a time, were again divided by his grandsons (1485). Ernest received the western portions, including Wittenberg and Thuringia, with the electoral dignity, and Albert the eastern, embracing the main parts of the present Saxony, founding respectively the Ernestine and Albertine lines. Frederick the Wise (1486-1525) and John the Constant (1525-'32), sons of Ernest, were strong protectors of Luther. John Frederick, son of John the Constant, while defending Protestantism as one of the leaders of the Smalcald league, succumbed in the battle of Mühlberg (1547) to an alliance between his cousin Maurice, of the Albertine line, and the emperor Charles V. Maurice succeeded to the electorate, which remained attached to his dynasty, and obtained the larger part of the Ernestine possessions, the remainder of which, subsequently enlarged by cessions, was gradually split up into the various Thuringian states. The elector John George I. (1611-'56), by his vacillating course during the thirty years' war, plunged Saxony into inextricable difficulties. Augustus (Frederick) I. the Strong (1694-1733) became a Roman Catholic to qualify himself for the throne of Poland (as such Augustus II.). His warfare with Charles XII. caused Saxony to be invaded by the Swedes. The disreputable reign of his son Augustus (Frederick) II. of Saxony and III. of Poland (1733-'63), and the wars with Prussia, especially the seven years' war, entailed still greater disasters upon the country. A better era began under the regency of Prince Xavier (1763-'8), during the minority of Frederick Augustus III. (as elector, 1763-1806; I. as king, 1806-'27), and during the reign of the latter, who was sur-

named the Just. He declined the crown of Poland and refused to join the coalition against the French revolution, but after the declaration of war against France he furnished his contingent as a member of the German empire. In 1805 he remained neutral, but in 1806 joined Prussia against France, which resulted in Saxony being conquered by Napoleon, who transformed the country into a kingdom, to which he added in 1807 the duchy of Warsaw. He was a loyal vassal of Napoleon in the wars of 1809-'13. After the battle of Leipsic he was detained by the emperor Alexander as a prisoner of war, but allowed to reside at Presburg during the debates of the congress of Vienna, which restored to him half of his German possessions, the other half being given to Prussia and the duchy of Warsaw to Russia. Anthony (1827-'36), a brother of Frederick Augustus, in 1831 adopted a constitutional form of government, and shortly after joined the Zollverein. The reign of King Frederick Augustus II., a nephew of Anthony (1836-'54), was disturbed by religious animosities, which in 1845 culminated in a bloody riot at Leipsic, by the revolution of 1848, and by a sanguinary struggle of the democratic party for the recognition of the national constitution of Germany (May, 1849). He died without issue, Aug. 9, 1854, and was succeeded by his brother John, the translator of Dante. As he sided with Austria in the war of 1866, the Prussians invaded his country on June 16, while his army withdrew to Bohemia and took part in the battle of Sadowa. Prussia made peace with Saxony, Oct. 21, on receiving a large indemnity and the right of garrisoning the fortress of Königstein, and Beust, as the principal instigator of the war, was obliged to leave the Saxon for the Austrian service. In the same year Saxony joined the North German confederation; and in 1871 it was incorporated in the German empire, after taking a distinguished part in the Franco-German war under the crown prince Albert, who succeeded to the throne on the death of King John, Oct. 29, 1873. (See ALBERT, FRIEDRICH AUGUST.)

SAXONY, a central province of Prussia, bordering on the provinces of Brandenburg, Hesse-Nassau, and Hanover, Anhalt, the kingdom of Saxony, the Thuringian states, and Brunswick; area, 9,746 sq. m.; pop. in 1871, 2,103,174. It is generally flat, but it has the Hartz mountains in the west (with their highest peak, the Brocken), and the Thuringian Forest in the south. The principal rivers are the Elbe, in the east, and its tributaries the Saale, Mulde, Unstrut, Bode, and Havel. The soil is fertile and the best cultivated in Prussia. Cotton and woollen cloth, leather, linen, sugar, tobacco, and beer are manufactured. The congress of Vienna in 1815 transferred most of this province from the kingdom of Saxony to Prussia. It is divided into the districts of Magdeburg, Merseburg, and Erfurt. Capital, Magdeburg.

SAXTON, Joseph, an American inventor, born at Huntingdon, Pa., March 22, 1799, died in Washington, D. C., Oct. 26, 1873. In his youth he constructed a printing press and issued a small newspaper. At the age of 18 he went to Philadelphia, where he found employment with a watchmaker and afterward with an engraver. His first invention was a machine for cutting the teeth of chronometer wheels. Afterward he constructed the astronomical clock with compensating pendulum, now in the state house. In 1831-'7 he was in England, where he constructed a compound magnet which sustained a weight of 525 lbs.; a magnetic needle several feet in length with a mirror on its end, which exhibited for the first time by the movement of a reflected beam of light the daily and hourly variations of the magnetic force of the earth; the magneto-electric machine; the locomotive differential pulley; an apparatus for measuring the velocity of vessels; and a metal-ruling machine. On his return to Philadelphia he became connected with the mint, and constructed the large standard balances in use in all the United States mints and assay offices. In 1848 he removed to Washington, where he superintended the construction of standard balances, weights, and measures, and of different portions of the apparatus used in the operations of the coast survey, and invented an automatic instrument for recording the height of the tides.

SAY, Jean Baptiste, a French political economist, born in Lyons, Jan. 5, 1767, died in Paris, Nov. 16, 1832. After being engaged in commercial pursuits, he became connected with the *Courrier de Provence*, a newspaper edited by Mirabeau in Paris, and afterward was the secretary of Clavière, the Girondist minister of finance. In 1794, in conjunction with Chamfort, Andrieux, and Ginguené, he founded *La décade philosophique, littéraire et politique*; and after the 18th Brumaire he was appointed a member of the tribunate. Forced by Bonaparte to withdraw from political life, he established a cotton-spinning mill, but was obliged to abandon it in 1812. After the fall of Napoleon he published an improved edition of his *Traité de l'économie politique* (1st ed., 2 vols. 8vo, 1803), to which he added an *Épilogue des principes fondamentaux de l'économie politique*. In 1815 he prepared a *Catéchisme d'économie politique*. In 1821 he was appointed professor of industrial economy in the *conservatoire des arts et métiers*, and in 1830 of political economy in the *collège de France*. His lectures were published under the title of *Cours complet d'économie politique et pratique* (6 vols. 8vo, 1828-'30; new ed., with notes by his son, 2 vols. 8vo, 1852). He also wrote *Lettres à M. Malthus sur différents sujets d'économie politique* (1820), reprinted under the title of *Mélanges et correspondances d'économie politique* (1833), and various essays which have been collected in his *Œuvres diverses*. His *Traité* and *Catéchisme* have each

been twice translated into English.—His son HORACE ÉMILE (1794–1860) and his grandson LÉON (born 1826) also hold a prominent place among political economists. The latter is now (1875) minister of finance.

SAY, Thomas, an American naturalist, born in Philadelphia, July 27, 1787, died at New Harmony, Ind., Oct. 10, 1834. In 1815 he investigated the natural history of E. Florida; in 1818 he explored the islands and coast of Georgia; in 1819 he was appointed chief zoologist in Long's expedition to the Rocky mountains; and in 1823 he accompanied that to St. Peter's river in the same capacity. He removed to New Harmony in 1825. His complete writings on entomology were edited by Dr. J. L. Le Conte, with a memoir by George Ord (New York, 1859), and his work on conchology by W. G. Birney (New York, 1858).

SAYCE, Archibald Henry. See supplement.

SCABBARF FISH, a fish generally placed with the mackerel family, and in the genus *lepidopus* (Cuv.). The only species described is the *L. argyreus* (Cuv. and Val.), inhabiting the European seas, and met with even as far south as the cape of Good Hope. The body is very elongated, compressed, and ribbon-shaped, and without scales; the head is pointed; the dorsal, anal, and caudal fins are distinct from each other, the first extending the whole length of the body; the jaw teeth are in a single row, those on the palate and pharyngeal bones and branchial arches very small; six branchiostegal rays, a long cæcal stomach, numerous pancreaticæ caeca, and a narrow air bladder. In a specimen taken on the coast of England, between 5 and 6 ft. long, the body was only 4½ in. deep at the gills, 2 in. at the beginning of the anal and at the tail, with a weight of 6 lbs. without the intestines; the pectorals were rather small, and the ventrals a mere squamous appendage, the styloid pubic bone being felt through the skin. Though not uncommon in European seas, this fish was not known to naturalists until the end of the 18th century; it was described by Montagu as *xiphothea tetradens*. According to Risso, its flesh is eaten in Mediterranean ports, and is firm and delicate. It swims with great velocity, waving like a long and wide ribbon of silver.—The silvery hair-tail (*trichiurus lepturus*, Linn.; *T. argenteus*, Mitch.) differs from the preceding genus in having no vestige of ventrals, in the anal

Silvery Hair-Tail (*Trichiurus lepturus*).

being a series of spines scarcely protruding through the skin, and in the tail ending in a filiform point without a caudal fin, whence the name; it attains a length of 4 ft. It is found on the American coast from New England to South America. The whole armature of the jaws indicates carnivorous habits. Other spe-

cies are described in the Indian ocean. Both of these genera are occasionally called ribbon fish.

SCÆVOLA, the cognomen of several Romans. **I. Caius Mucius**, a legendary hero, who flourished at the close of the 6th century B. C. Porsena of Clusium, the protector of the expelled Tarquins, having besieged Rome and reduced the city to great distress, Mucius went to the hostile camp, where, mistaking the chief secretary for the monarch, he struck him a fatal blow. On being dragged before Porsena, he declared that his purpose was to assassinate the king, a deed which other Romans would still achieve; whereupon Porsena ordered him to be burned alive, unless he betrayed his fellow conspirators. Mucius, to show how little the threat affected him, thrust his right hand into a fire, and held it there while it was being consumed. Porsena, astonished at his fortitude, commanded him to be liberated; and Mucius informed him that 300 Roman youths had sworn to free Rome from so dangerous an enemy, or to perish in the attempt. Porsena thereupon made peace with the Romans; and Mucius, in consequence of the loss of his right hand, was ever after distinguished by the cognomen of Scævola, or the left-handed.

II. Quintus Mucius, called the augur, tribune of the people in 128 B. C., plebeian ædile in 125, prætor in 121, and consul with L. Cæcilius Metellus in 117. He was distinguished for his legal erudition and his modesty. He died soon after the outbreak of the civil war between Marius and Sulla. Cicero in his youth was a pupil of this Mucius, whom he makes an interlocutor in several of his dialogues. **III. Quintus Mucius**, the pontifex, was tribune of the people in 106 B. C., curule ædile in 104, consul with L. Licinius Crassus in 95, and afterward pontifex maximus. After his consulship he obtained the province of Asia, where a festival was instituted in commemoration of his virtues. He fell a victim to the Marian faction in 82, and was slain in the temple of Vesta. He was still more celebrated as a lawyer than his contemporary and namesake. He was the first to compose a scientific treatise on the *Jus Civile*, now lost; and he wrote also *Περὶ Ὁραν*, a work on legal definitions.

SCALA (Lat. SCALIGERI), an Italian family whose power in Verona was established in 1260 by Mastino I. della Scala, who was assassinated in 1279, and whose most celebrated successor was Cangrande, the friend of Dante. (See CANE I. DELLA SCALA.) After receiving in fief from the emperor Henry VII. Verona, which they greatly embellished, and other important cities, their power was extended under Cangrande's successors, the joint rulers Alberto II. and Mastino II., as far as Lucca; but they became involved in war with Venice and Florence. The power of the Scalas greatly declined after Mastino's death in 1351, and still more under Cangrande II. and other worthless rulers, and it was finally overthrown in 1387 by Giovanni Galeazzo Visconti.

SCALD. See BURNS AND SCALDS.

SCALE (Lat. *scala*, a ladder), a graduated line or slip of wood, ivory, metal, or paper, divided into parts equal or unequal, and used for transferring these parts by dividers in plotting. The most simple scale is that of equal parts, and this may serve not merely for giving proportional linear spaces, but also for laying down angles with greater accuracy, the table of chords being referred to to give the proportional length of the chord of any angle to the radius of the circle. The common six-inch ivory scale contains several scales, each of which presents a different division of the inch, as into quarters, and one of these into tenths, and each tenth by what is known as the diagonal scale into 10 parts; other divisions are into 3, $3\frac{1}{2}$, 4, $4\frac{1}{2}$, 5, and 6 equal parts, one of each of these being divided into tenths, and one of each of the principal divisions into twelfths. These scales are also sometimes furnished with trigonometrical lines, as scales of chords, rhumbs, sines, secants, and tangents. (See GUNTER, and SECTOR.) Scales of equal parts have of late been produced in a very convenient and cheap form upon paper, the divisions being of 12 inches, and a 18th inch which is divided into 20, 40, 50, and 60 equal parts. Other scales give different divisions.

SCALE, Musical. See MUSIC.

SCALES (of fishes). See COMPARATIVE ANATOMY.

SCALES. See WEIGHING MACHINES.

SCALIGER. I. **Julius Cæsar**, an Italian philologist, born, according to his own account, at Riva, on the lake of Garda, April 23, 1484, died in Agen, France, Oct. 21, 1558. He claimed descent from the Scaligeri (or family della Scala), sovereign princes of Verona from 1260 to 1387, and asserted that he began his classical and medical studies when he was between 30 and 40 years old. This story has been disproved by Scipio Maffei and Tiraboschi. The latter says he was the son of an illuminator of Venice, a native of Padua, named Benedetto Bordone, who assumed the name of Della Scala, and that the son studied at Padua in his youth. In 1525 Scaliger went to Agen as physician to the bishop of that city, and married into a noble family. His extraordinary fame as a scholar drew to Agen crowds of literary men. His vanity, however, was equal to his learning, and one of his first publications was a virulent attack upon Erasmus. He wrote Latin poetry and many commentaries on the classics, and translated Aristotle's "History of Animals" and other Greek works into Latin. His chief productions are: *De Causis Lingue Latine* (4to, Lyons, 1540), the first considerable modern treatise on Latin grammar, and *Poetices Libri VII.* (fol., Lyons, 1561). II. **Joseph Justus**, the 10th son of the preceding, born in Agen, Aug. 4, 1540, died in Leyden, Jan. 21, 1609. He studied Latin at Bordeaux and under his father, and Greek under Turnebus in Paris, and learned the prin-

pal oriental and European languages. He embraced the reformed religion in 1562, became tutor in the family of Louis de la Roche-posay, and travelled extensively. In 1578 he was teaching philosophy at Geneva, but soon afterward retired to the residence of his patron near Tours. In 1593 he succeeded Justus Lipsius as professor of belles-lettres at the university of Leyden. He was as vain and arrogant as his father, whom he surpassed in erudition, and his latter years were embittered by a controversy with Scioppius and others on the pretensions of his family, which he had revived. He was never married. His most valuable works were those on chronology, *Opus de Emendatione Temporum* (fol., Paris, 1583), and *Thesaurus Temporum* (Geneva, 1609). Two collections of his fragments and conversations were published after his death, under the titles of *Scaligerana Prima* and *Scaligerana Secunda*. A sketch of his life and literary activity has been published by Bernays (Berlin, 1855).

SCALLOP, a bivalve of the genus *pecten* (Turton), having the shell rounded, inequivalve, eared, with the upper margin straight and the hinge without teeth. The lobes of the mantle are widely separated, and include a glandular sac containing a gaseous fluid which enables the light shell to float easily and to change position with the tide; the mantle is reflected in a sub-marginal fold provided with tentacles, with numerous ocelli or eye spots near the margin. The mouth is jawless and toothless, with a tentacular labial border, the tentacles being short and separate from the branchiæ; they have only one adductor muscle; the foot is long and cylindrical; the branchiæ are disunited on the median line. They rest on the right side; some of the family attach themselves by a byssus, especially when young, but most are free, living on the bottom of the sea at moderate depths, moving by means of the hatchet-shaped foot and the recoil produced by suddenly opening and shutting the valves. In the common scallop (*P. concentricus*, Say) the shell is orbicular, the valves convex and nearly closed, with about 20 rounded ribs; it is dusky horn-colored, with alternating lighter and darker zones; the interior is shining white tinged with purplish, and grooved to correspond to the external ribs; the length and height are about $2\frac{1}{2}$ in., and the breadth 1 in. It is abundant about the extremity of Cape Cod, whence it extends southward, being very common on the New Jersey coast; it varies considerably in color, with different degrees of whitish, reddish, and purplish; it is often handsomely zoned, and was formerly much employed for making card racks, pin cushions, &c. The muscle of the shell forms a delicate article of food. The *P. Islandicus* (Chemn.) is another American species, larger, handsomer, redder, with more numerous ribs, and living more to the north; it is found on the banks of Newfoundland, where it is a favorite food of many fishes, especially the cod. Some of the

foreign species are very handsome, as the *P. pallium* (Lam.), or the duke's mantle, finely mottled with deep red; this is from the In-

Scallop (*Pecten Islandicus*).

dian seas. The more northern *P. Japonicus* (Gmel.) is also a beautiful reddish shell, though it varies much. A large species, *P. maximus* (Lam.), is common on the English coast in from 30 to 40 fathoms; the deeper shell was formerly used for scalloping oysters, giving the name to this favorite dish, and as a drinking cup. The scallop of St. James (*P. Jacobæus*, Lam.) is common in the Mediterranean, and was worn by pilgrims to the Holy Land.

SCALY ANT-EATER. See PANGOLIN.

SCAMANDER, a small river of Troas, celebrated by Homer, who says that the gods called it Xanthus, and men Scamander. It probably owed the former name to the yellow or brownish color of its water, which was believed to have the power of tinging the wool of sheep which drank of it. (See TROY.)

SCAMMONY (Gr. *σκαμμόνιον*), a medicinal drug, the concrete juice of *convolvulus scammonia*. This is a perennial species with a woody root, which in old plants is 2 or 3 ft. long and 3 or 4 in. thick; its stems are numerous, twining, and woody at base, furnished with arrow-shaped leaves, and bearing long peduncles, each of which produces several pale yellow flowers about an inch long and striped with purple. It is found in Asia Minor, Syria, and the neighboring countries, Smyrna and Aleppo being the principal places of export. In collecting scammony, an excavation is made to expose the root for 4 or 5 in.; the top of the root, or crown, with its attached stems, is removed by a slanting cut, and at the lower edge of this slope a mussel or other shell is stuck into the root to receive the juice; at the end of about 12 hours the flow ceases, the shells are collected, and at the same time the cut surface of the root is scraped to remove any of the partially dried juice that may remain. The products attained by these methods are mixed and dried. The purest form of scammony is that which is allowed to dry in the shells, but this is only to be seen in cab-

inets of materia medica; the mixed product from the shells and scrapings is nearly as good, and even in this state it is very rare. Scarcely any article of medicine is more persistently adulterated than scammony; the work begins with the peasants who collect it, and much of it is made over a third time before it enters commerce. Chalk, ashes, sand, and wheat flour and other farinaceous articles are added; and what is known as Montpellier scammony is made up of different resins and starchy substances, and contains no scammony. Pure scammony is in irregular resinous lumps, of which 88 to 90 per cent. is soluble in ether; but it is more commonly met with in the form of round flattened cakes and more or less impure, though called virgin scammony. It has a peculiar cheesy odor, especially in powder; the amount and kind of foreign material mixed with it is readily ascertained by the use of solvents and a microscope. The dried root has been sent to

Europe, where the resin has been prepared by exhausting the root with alcohol. Scammony was used before the present era, and was mentioned by the early writers; and though not employed to any great extent, it has long had a place in the various pharmacopœias. It is a powerful drastic purge, regarded as more active than jalap and less violent than gamboge; the dose of the pure drug is 10 or 15 grains. In this country it is rarely used alone;

Scammony (*Convolvulus scammonia*).

it enters into the compound extract of colocynth, which is the basis of the popular compound cathartic pill. For medical use the resin, which is officinal, is preferable on account of the uniformity of its composition. The scammony root is officinal in the British Pharmacopœia.

SCANDERBEG (Turkish, *Iskander Beg*), an Albanian prince, whose true name was George Castriota, born in Croia about 1410, died in Alessio, Jan. 17, 1467. He was the fourth son of John Castriota, a Christian prince of a small district of Albania, of which the capital was Croia. Prince John, having been made tributary by Amurath II., was obliged to deliver up his four sons as hostages. The three elder died young, and George was educated as a Mussulman, became a favorite with Amurath, received the name of Iskander (Alexander), and was made *sanjakbeg* or commandant

of a district, with a force of 5,000 horse. On the death of his father in 1432 his principality was made a province with a Turkish governor, and from that time Scanderbeg resolved upon its recovery. He served for several years in the Turkish armies, and commanded the force sent against Serbia in 1439. In 1443 he was second in command of the army sent into Hungary, and in a battle on the Morava purposely gave the victory to John Hunyady. In the confusion of defeat he extorted a firman for the government of Albania from the sultan's chief secretary, whom with his attendants he immediately afterward slew. Hastening with a few hundred followers to Croia, the gates of which were opened to him, he assumed his hereditary sovereignty and abjured Islamism. The Albanians rose at his call, and in 30 days he had become master of all the fortresses in the country, giving the Turkish garrisons their choice between massacre and baptism. Being appointed generalissimo, he soon collected an army of 15,000 natives, French, and Germans, with which he defeated one of 40,000 under Ali Pasha. He overthrew three other large armies, and in 1449, and again in 1450, worsted Amurath himself, compelling him in the latter year, though his army numbered 100,000 men, to raise the siege of Croia and retreat. Mohammed II. continued the war with energy but without success, though Scanderbeg was sometimes defeated, and was harassed by internal dissensions and treason. Peace was concluded in 1461 at the suit of the sultan, leaving Scanderbeg in full possession of his territories. At the solicitation of Pope Pius II., he then went to Italy to support Ferdinand of Naples against John of Anjou, and secured the victory of Troja, Aug. 18, 1462, which drove John out of Italy. The pope, at the instance of the Venetians, having proclaimed a crusade against the Turks in 1463, Scanderbeg broke the truce, renewed the war, defeated the Turks in several battles, forced Mohammed with an army of 100,000 to retreat in 1465, drove another army of 80,000 from before Croia, and during three days massacred its remains in the defiles of Tirana. He successfully resisted his enemies to the last, and it was not until after his death that Albania was reduced by the Turks. He was buried at Alessio, and when the Turks took the town soon after, the janizaries disinterred his bones and used them as amulets. He left a young son to the guardianship of the Venetians, whose descendants held a Neapolitan dukedom. His life has been written in Latin by his friend Marinus Barletius (Frankfort, fol., 1537; translated into French, Italian, Portuguese, Spanish, and German); in French by C. Paganel (1856); and in English by Dr. C. C. Moore (New York, 1850).

SCANDINAVIA, the ancient name of that portion of Europe now comprised in the kingdoms of Denmark, Norway, and Sweden, and the island of Iceland.

SCANORES (Lat. *scandere*, to climb), an order of birds, comprising such as have the toes in pairs, two before and two behind, the latter being the outer anterior and the hind toes. This arrangement facilitates climbing, as is seen in the families of parrots, toucans, cuckoos, trogons, and woodpeckers. (See ORNITHOLOGY.)

SCAPULAR (Lat. *scapula*, the shoulder blade), a part of the habit of most ancient religious orders, and in particular a badge worn by the guild of the scapular of our Lady of Mount Carmel, as a symbol of the wearer's connection with the Carmelite order. The full religious habit called scapular is an oblong piece of cloth with a hole in the middle for the head, and falling over the shoulders and breast below the knees. It varies in color in different orders, and the same variety of color attaches to the symbolic scapular, the scapular of the passion being red, that of the immaculate conception blue, &c. That of Mount Carmel is composed of two small square pieces of brown cloth connected by ribbons or strings, and bearing emblems or monograms of Christ and his mother. This confraternity was first instituted about 1250 by St. Simon Stock, sixth general of the Carmelites, and spread rapidly from England throughout Christendom. It counted among its members Kings Edward I. of England and Louis IX. (saint) of France. It was endowed by the popes with many privileges and indulgences, and is the most popular guild in the Roman Catholic church.

SCARABÆUS (Linn.), the representative genus of a large family of pentamerous lamellicorn beetles, having the antennæ generally terminated by a club, and either composed of leaflets or of box-like joints. Of the old family several thousand species were enumerated, of about 200 genera, but these are now separated into many distinct families. The proper *scarabæidæ* or *coprophagi* comprise those which live in and feed upon excrements, especially those of herbivorous animals. The form is generally short and thick, and their color shining black or brilliant metallic; they excrete an oily matter, which prevents the substances among which they live from adhering to them; they are able to dig very rapidly into the ground; in the spring they enclose their eggs in small balls of dung, which they roll along with the hind feet to holes in which they are to be deposited.—The type of this family is the genus *ateuchus* (Weber and Fabr.), equivalent to the genus *scarabæus* of McLeay; this is peculiar to the old world, and of more than 40 species nearly 30 belong in Africa. The body is rounded, flattened above, the four posterior limbs hairy and ending in a single spur; the external edge of the wing covers is nearly straight, and the head is lobed and festooned in front. Two species were worshipped by the ancient Egyptians, and often represented by their hieroglyphics and on their monuments; models of them, in the most precious materials,

were worn as charms and buried with mummies; the insects themselves have also been found in their coffins. The *A. (S.) sacer* (Oliv.) is black and about an inch long, and is found in S. Europe, W. Asia, and N. Africa. The *A. (S.) Egyptiorum* (Latr.) is larger and wider,

Scarabæus (Ateuchus) Egyptiorum.

green with golden tints, and is found principally in Egypt. They were considered symbolic of the world on account of the globular form of the egg balls; of the sun, from the ray-like projections of the head; and of a warrior, from the belief that all were males, whence they were also worn as symbols by the Romans. As typical of the sun, the source of fertility, they were worn by women to render them prolific.

SCARBOROUGH, a seaport town of England, in the North riding of Yorkshire, 39 m. N. E. of York; pop. in 1871, 24,259. It is situated on a rocky declivity and along the N. shore of an open bay of the North sea. Its mineral waters are esteemed, and the town is much frequented in summer for sea bathing. It has two public libraries, several fine churches, a theatre, and a remarkable bridge on piers 75 ft. high, and extending over a chasm 400 ft. wide between the town and the spa.

SCARLATINA. See FEVERS, vol. vii., p. 170.

SCARLATTI. **I. Alessandro**, an Italian composer, born in Trapani in 1649, died in Naples, Oct. 24, 1725. He was instructed in music by Carissimi, and the introduction of violin accompaniments to airs, the ritornel, and the *da capo* are ascribed to him. He is said to have produced 200 masses, 100 operas, and 3,000 cantatas. **II. Domenico**, a composer, son of the preceding, born in Naples in 1683, died in Madrid or Naples about 1759. He was chapel-master to the queen of Spain, and produced numerous operas, but is best known by his compositions for the pianoforte, 42 in number, the successful performance of which was long regarded as the greatest test of excellence in a pianist.

SCARLET FEVER. See FEVERS, vol. vii., p. 170.

SCARPA, Antonio, an Italian anatomist, born at La Motta, a village of Friuli, June 13, 1747, died in Pavia, Oct. 31, 1832. He was educated at Padua, in 1772 became professor of anatomy in the university of Modena, and in 1783 at Pavia, and in 1814 director of the faculty of medicine. His principal works, in which surgical anatomy was first clearly developed,

illustrated with engravings which are among the most exact and elegant of their kind, have been translated into many languages.

SCARPANTO (anc. *Carpathus*), an island of Turkey, in the Mediterranean, 28 m. S. W. of Rhodes, 27 m. long and 6 m. broad; pop. about 5,000. It consists chiefly of bare mountains, the highest about 4,000 ft. Game, cattle, marble, and iron abound. The coast is generally inaccessible, but there are a number of harbors for small craft. In antiquity it belonged to the Dorians and subsequently to Rhodes.

SCARRON, Paul, a French author, born in Paris in 1610, died in October, 1660. He led a gay and dissolute life in his youth, but the death of his father left him penniless, and disease distorted his whole frame. He then applied himself to literature, and soon acquired such a reputation by his caricatures and humorous sketches as to be styled the "emperor of the burlesque." What he earned by his pen, together with the proceeds of a benefice granted him by his friend Lavardin, bishop of Le Mans, and a pension from the private purse of the queen, enabled him to live at ease, and his house was the favorite resort of wits and noblemen. During the war of the Fronde he was one of the opponents of Mazarin, and wrote the *Mazarinade*, which cost him his pension. In 1652 he married Françoise d'Aubigné, afterward celebrated as Mme. de Maintenon. His comedies, among which are *Jodelet* (1645), *Don Japhet d'Arménie* (1653), and *L'Ecolier de Salamanque* (1654), were well received; but he was indebted for his greatest success to his burlesque of Virgil, *L'Énéide travestie*. His best work is *Le roman comique*, which was translated into English by Oliver Goldsmith (2 vols., London, 1775). There have been numerous translations of all his writings, including his letters. The best edition of his complete works is that of Bruzen de la Martinière (10 vols. 12mo, Paris, 1737).

SCAURUS, Marcus Emilius. **I.** A Roman senator and consul, born in 163 B. C., died between 90 and 88. He studied eloquence, gained distinction in the army, and was elected curule ædile in 123, prætor urbanus in 120, consul in 115, censor in 109, and consul again in 107. During his first consulship he obtained a triumph for victories over the Ligurians and other Alpine tribes, and was made *princeps senatus*. He afterward accumulated great wealth by peculation and bribery, for which he escaped punishment by his eloquence and diligent discharge of duty. An embassy to Africa in 112, with Scaurus at its head, to secure justice to Adherbal from Jugurtha, having failed, war was declared by Rome, and Scaurus accompanied the army as legate of the consul Bestia. Jugurtha secured peace by bribing the leaders, which raised a great outcry at Rome; but Scaurus, though one of the most guilty, escaped by contriving to be appointed one of the *quæsitores* ordered to investigate the offence. **II.** Son of the preceding, chiefly celebrated for

his mercenary crimes. He was stepson to Sulla, whose proscriptions enabled him to add immensely to his wealth. In the third Mithridatic war he served as quæstor under Pompey, and in Judea received a large bribe from Aristobulus for deciding in his favor against his brother Hyrcanus, but Pompey reversed his decision. Having made a predatory incursion into Arabia Petrea, he was bought off by Aretas, the king, for 300 talents. In 58 B. C. he was elected curule ædile, and expended all his wealth to celebrate the games, building a temporary theatre, decorated with 360 columns and 3,000 statues, and large enough to hold 80,000 persons. He was prætor in 56, and in 55 governed Sardinia, whose inhabitants he plundered to obtain the means for paying his debts and securing the consulship. For this he was brought to trial before a tribunal presided over by Cato; but though his guilt was undoubted, his defence by Cicero, Hortensius, and other advocates, and his own tears and appeals to the splendor of his ædileship, procured his acquittal. Some time later he was condemned for illegal efforts to obtain office. His residence on the Palatine hill was celebrated for its magnificence.—His son MARCUS ÆMILIUS accompanied Sextus Pompey, his half brother, to Asia, and after the loss of his fleet betrayed him to the generals of Antony; and his grandson MAMERUS, called by Seneca the last of the Scauri, a dissolute orator and poet, was in the reign of Tiberius accused of adultery with Livia, and committed suicide.

SCHADOW. I. Johann Gottfried, a German sculptor, born in Berlin, May 20, 1764, died there, Jan. 26, 1850. He studied the antique in Rome, and going to Berlin in 1788 attracted notice by a monument to Count von der Mark, natural son of Frederick William II. He was thenceforth extensively employed on monumental works, among which are a colossal statue of General Ziethen at Berlin, equestrian statues of Frederick the Great at Stettin and of Blücher at Rostock, and a statue of Luther at Wittenberg. For the last 28 years of his life he was director of the academy of fine arts in Berlin. He published several works on art. II. Friedrich Wilhelm von Schadow-Godenhaus, a painter, son of the preceding, born in Berlin, Sept. 6, 1789, died in Düsseldorf, March 19, 1862. He went to Rome when young, coöperated with Cornelius and Overbeck in founding a new German school of art, and became a Catholic. He became professor in the Berlin academy of fine arts, succeeded Cornelius in 1826 as director of the Düsseldorf academy, and was ennobled in 1843. Specimens of his style are: "Mignon" (1828), frequently engraved; the "Four Evangelists," in the Werder church, Berlin; the "Wise and Foolish Virgins," in the museum in Frankfort; the "Fountain of Life," and an allegorical series entitled "Paradise," "Purgatory," and "Hell." After the completion of the last named work he became blind, but afterward partially re-

covered his sight. During his last illness he dictated a volume of memoirs.

SCHÄFER, Heinrich, a German historian, born at Schlitz, Upper Hesse, April 25, 1794, died in Giessen, July 2, 1869. He was professor of history at Giessen from 1833 till his death. His principal works are *Geschichte von Portugal* (5 vols., Hamburg and Gotha, 1836-'54), and *Geschichte von Spanien* (3 vols., 1831-'67), of which Lembke wrote the first volume. Both works form part of Ukert and Heeren's *Geschichte der Europäischen Staaten*. Among his later writings is *Ueber heutige Aufgaben der Geschichtschreibung* (Giessen, 1864).

SCHAFF, Philip, an American scholar, born in Coire, Switzerland, Jan. 1, 1819. He studied at Tübingen and Halle, graduated at Berlin in 1841, travelled as a private tutor, and lectured on theology in Berlin in 1842. Being invited to the chair of theology at Mercersburg, Pa., he was ordained at Elberfeld, and came to America in 1844. In 1845 he was tried for heresy and acquitted, and afterward continued to teach and write at Mercersburg, in connection successively with Dr. Nevin and Dr. Wolff. In 1854 he lectured in Germany on America, represented the American-German churches at the ecclesiastical diet of Frankfurt and the Swiss pastoral conference at Basel, and received the degree of D. D. from the university of Berlin. In 1863 he was appointed secretary of the sabbath committee of New York, and removed to that city; and in 1869 he was appointed professor in the Union theological seminary there. From 1867 to 1874 he was acting secretary of the American branch of the evangelical alliance, visiting Europe thrice in the interval; and in 1872 he became president of the American committee of the company of revisers of the English Bible. In August, 1875, he attended at Bonn a conference of Old Catholics, Greeks, and Protestants, held with a view of promoting Christian unity among the churches there represented. He has published in German "The Sin against the Holy Ghost" (Halle, 1841); "On James and the Brothers of Jesus" (Berlin, 1842); "The Principle of Protestantism" (German and English, Chambersburg, Pa., 1845); "History of the Apostolic Church" (Mercersburg, 1851; 2d ed., Leipsic, 1854; translated into English, New York and Edinburgh, 1853); "German Hymn Book, with a Historical Introduction, Critical and Biographical Notes" (Philadelphia and Berlin, 1859); and "Four Lectures on the Civil War in America, and Overthrow of Slavery" (delivered and published in Berlin, 1865). His works in English are: "What is Church History? A Vindication of the Idea of Historical Development" (Philadelphia, 1846); "St. Augustine, his Life and Labors" (New York, 1853; German, Berlin, 1854); "Ancient Church History" (3 vols., 1853-'68); "America, its Political, Social, and Religious Character," translated from his lectures at Berlin in 1854 (1855); "Germany, its Universities and Divines" (Philadel-

phia, 1857); "History of the Christian Church of the first three Centuries" (New York and Edinburgh, 1858); "The Moral Character of Christ, or the Perfection of Christ's Humanity a Proof of His Divinity" (1860); "Christ in Song" (1868); "The Vatican Decrees" (1875); and reports of the sabbath committee, 1863-'9, and of the evangelical alliance, 1867-'73. He has now in press (1875) a "History of the Creeds of Christendom," in 3 vols. From 1848 to 1853 he edited the *Kirchenfreund*, a German-American monthly, and was for some time co-editor of the "Mercersburg Review;" and he is editor of the American edition of Lange's commentary, to be completed in 27 volumes, of which 18 have appeared (1875).

SCHAFFHAUSEN. I. A N. canton of Switzerland, bounded S. by the Rhine and the cantons of Zürich and Thurgau, and on all other sides by Baden; area, 116 sq. m.; pop. in 1870, 37,721, chiefly Protestants, and all of German origin. The canton is traversed by low ramifications of the Jura range in the wider sense. The climate is healthy and temperate. Agriculture is the principal occupation. The government is democratic. Schaffhausen joined the Swiss confederation in 1501.

II. The capital of the canton, on the slope of a hill, on the right bank of the Rhine, 45 m. N. by E. of Zürich; pop. in 1870, 10,303. It is walled and overlooked by an old castle. It has college, library, arsenal, and manufactories of steel ware, railroad carriages, chemicals, and tobacco. About 3 m. below the town are the falls of the Rhine, from 60 to 75 ft. high.

SCHARF, George. See supplement.

SCHAUFFLER, William Gottlieb, an American missionary, born at Stuttgart, Germany, Aug. 22, 1798. He resided in Russia from his 6th to his 27th year, when he went to Turkey as an independent missionary. Feeling the need of more education, he came to America, spent five years at Andover seminary, and in 1832 was sent back to Turkey by the American board of missions. He published in English, "Essay on the right Use of Property" (1832), and "Meditations on the Last Days of Christ" (1837; new eds., 1853 and 1858). He has translated the Bible into Hebrew-Spanish and Turkish. Of the latter version the New Testament has been published, and the Pentateuch and Isaiah are in course of publication in Germany under the author's supervision (1875). He received the degree of D. D. from the university of Halle in 1867.

SCHAUMBURG-LIPPE, a principality of the German empire, embraced between the Prussian provinces of Hanover, Hesse-Nassau, and Westphalia; area, 171 sq. m.; pop. in 1871, 32,059. The surface toward the north is level, but becomes hilly in the south, and the soil is very fertile. There are only a few small streams, tributaries of the Weser. A large forest, the Schaumburger Wald, is in the west, and the Steinhuder Meer, a small lake, in the north. Coal and limestone are found. It has one vote

in the federal council, and sends one deputy to the Reichstag. The local legislature or diet consists of one chamber with 15 members. The reigning prince is Adolphus (born Aug. 1, 1817), who assumed the reins of government in 1860. Capital, Bückeburg.

SCHEELE, Karl Wilhelm, a Swedish chemist, born in Stralsund, Pomerania, Dec. 19, 1742, died at Köping, near Stockholm, May 21, 1786. In 1777 he was appointed by the medical academy apothecary at Köping. With the exception of Priestley, he probably discovered more new substances than any other chemist, including tartaric acid, manganese, chlorine, barytes, the pigment called Scheele's green, and the coloring principle of Prussian blue. (See CHEMISTRY, vol. iv., p. 362.) In his "Chemical Observations and Experiments on Air and Fire" (Stockholm, 1777; translated into English by Kirwan), with no knowledge of the previous discovery of Priestley, he described oxygen under the name of "empyreal air."

SCHEFFER. I. Ary, a French painter, born in Dort, Holland, in 1795, died at Argenteuil, near Paris, in June, 1858. At 12 years of age he painted a historical picture which attracted much attention in Amsterdam. Subsequently he studied in Paris under Baron Guérin. His most characteristic works are devoted to religious subjects. These include his *Christus Consolator*, "Dead Christ," "Three Marys," "Christ weeping over Jerusalem," *Mater Dolorosa*, and the "Temptation." His several pictures of "Mignon," his "Francesca da Rimini," "Dante and Beatrice," and illustrations from "Faust," are widely known by engravings. He painted a few portraits, including those of Lafayette, Talleyrand, Béranger, Lamartine, and Charles Dickens. His life has been written by Mrs. Grote (London, 1860). In 1862 a monument was erected to him at Dort. **II. Henri,** brother of the preceding, born at the Hague, Sept. 27, 1798, died in Paris, March 15, 1862. He also was a pupil of Guérin, and among other celebrated pictures painted "Charlotte Corday protected against the Fury of the Populace by Members of the Convention," "The Battle of Cassel," "Joan of Arc at Orleans," and a large number of religious subjects and portraits. His daughter married Renan.

SCHELDT (Flem. *Schelde*; Fr. *Escaut*; anc. *Scaldis*), a river of France, Belgium, and Holland, having its source in a small lake near St. Quentin in the French department of Aisne. It first flows N. by Cambrai to Condé, then N. W. to the frontiers of West Flanders, Belgium, then N. N. E. between that province and Hainaut into East Flanders, E. through the latter province after passing Ghent, then N., forming the boundary between Antwerp and East Flanders, and finally turns W. by N., and enters the North sea in the Dutch province of Zeeland by two broad mouths called the Hond or West Scheldt (the main stream) and the East Scheldt, enclosing the islands of

North and South Beveland and Walcheren. The lower part is bordered with dikes. Its principal tributaries are the Heine, Dender, and Rupel on the right, and the Sensée, Scarpe, and Lys on the left. The chief towns on its banks, besides those named, are Valenciennes, Tournay, Oudenarde, Dendermonde, and Antwerp. Its length is 211 m., and it is navigable to within a few miles of its source. The canal of St. Quentin, 50 m. long, connects it with the Somme and the Oise.

SCHELLING, Friedrich Wilhelm Joseph von, a German philosopher, born at Leonberg, near Stuttgart, Jan. 27, 1775, died at Ragatz, Switzerland, Aug. 20, 1854. His father was pastor at Leonberg, and subsequently prelate at Maulbronn. Friedrich entered the university of Tübingen in 1790, and studied philosophy under Adler, a disciple of Wolf, and divinity with Storr. His essay for the doctorate of philosophy was on the origin of evil, as narrated in Gen. iii. His next treatise, in Paulus's *Memorabilia* (1793), was on myths and sagas. In 1795 appeared his first metaphysical essay, "On the Possibility of a Form of Philosophy," and a few months later his dissertation, *Vom Ich als Princip der Philosophie, oder über das Unbedingte im menschlichen Wissen*. In his *Philosophische Briefe über Dogmatismus und Criticismus*, in Niethammer's *Journal* (1795), he grapples with Kant's sundering of the respective spheres of the theoretical and practical reason, denouncing this dualism, and contending that there must be something unconditional, which is the common source of both the objective and the subjective. There is "an intellectual intuition" of the unconditional. Allowing the equal validity of both the subjective and objective, he already demands for both a higher unity. Thus at the age of 20, before he left the university, he had found the principle of his peculiar system, which was to supersede the critical philosophy of Kant and the subjective idealism of Fichte. After leaving Tübingen, he taught for two years at Leipsic, and wrote "Illustrations of the Idealism of the Theory of Science" (Fichte's). A severe nervous fever brought him to the borders of the grave. At the age of 24 he went to Jena, parted company with the idealism of Fichte, and began his more independent career in a series of brilliant lectures, which aroused the highest enthusiasm. At Jena he taught with Fichte and Hegel. The latter was older in years, but younger as a student. They edited the *Kritisches Journal der Philosophie* together, and were not yet sensible of their divergence. Here was developed the second stage of Schelling's speculations, in his philosophy of nature and transcendental idealism. In rapid succession he published *Ideen zu einer Philosophie der Natur* (vol. i., 1797, the only one published); *Von der Weltseele, eine Hypothese der höheren Physik zur Erklärung des allgemeinen Organismus* (1798; later editions contain also an essay *Ueber das Ver-*

hältniss des Realen und Idealen in der Natur); *Erster Entwurf eines Systems der Naturphilosophie* (1799); an "Introduction" to the last named; and *System des transcendentalen Idealismus* (1800). Most of these works were originally read as lectures, and some of them more carefully digested in the *Neue Zeitschrift für speculative Physik* (1802-'3). His choice of nature as the subject of his speculations indicated his revolt from the subjective tendency. He said: Nature is life, a living organism, replete with formative powers; there is an ideal in the real, a subject in the object, reason in matter. Nature is autonomic; there is a soul of the world, its immanent principle. Grasping this soul, we re-create nature. It is all one living organism, a perpetual process of production, through the whole series of inorganic and organic forms. All is pervaded by one law, the law of evolution; and that law is a law of polarity, of polar forces. These act and react perpetually, as is seen in the phenomena of magnetism, electricity, and chemical agency. The mechanical theory of nature was superseded by the idea of living forces. Experiment has verified some of Schelling's prognostications; but the progress of research has left to his system as a whole only the value of a bold attempt at the reconstruction of nature. He applied the same principle of polarity in a more universal sense in his "Transcendental Idealism," which gives the outlines of the philosophy of spirit. The attempt is here made to derive all parts of philosophy from the intellectual intuition, considered as an act of the subject bringing the objective before it, an act in which the highest freedom and the highest necessity concur. Here the theoretical and practical parts of philosophy are unfolded, including an outline of the course of history, as a drama, which one mind has poetized; but that one mind is not yet with Schelling a personal deity. The third division of this treatise is on the "Philosophy of Art," following out the hints contained in Kant's "Criticism of the Judgment." Art is well nigh deified; it is viewed as the highest product of man, the perfected union of the ideal and the real, of the subject and the object. The infinite embodied in the finite is in every work of art; the artist grasps the eternal idea and realizes it in a perfected form; he is a creative genius, and yet works under the law of necessity. These views are further unfolded in his elaborate essay *Ueber das Verhältniss der bildenden Künste zur Natur* (1807). By an inward and logical necessity Schelling was led on to another, the third stage of his system, known as the philosophy of identity. He had already considered nature by itself, and spirit by itself; but the two, in a complete system, cannot remain sundered. The ideal and the real, the subjective and the objective, he next says, are identical. This he attempts to show in his exposition of his system in the *Zeitschrift für speculative Physik*

(1801), in relation to nature—a fragment of his project; and in a more popular way, in his *Vorlesungen über die Methode des akademischen Studiums* (1803). In this doctrine of absolute identity we have the most enigmatical and obscure, not to say paradoxical stage of his philosophy, which at that time, as Hegel said, “he made before the public,” not yet waiting, as Kant always did, for his ripened statements. If taken as his whole and final system, it is a pantheistic mysticism; but Schelling, in his later account of it, says that it represents only the negative, abstract side of his philosophy, to be supplemented by its positive and historical portions. This system of absolute identity is constructed in the geometric method, following the example of Spinoza; and the ideal and real poles are in fact parallel with the two “modes” of thought and extension in the ethics of Spinoza. It is around this point that the subsequent speculations of Schelling revolve, though for many years he struggled in the vain attempt to reconcile the pantheistic tendencies of these earlier essays with the theistic and Christian positions which he gradually adopted and defended. In this transition period he was called from Jena to Würzburg (1803), where he taught for two years, in fellowship and sometimes in rivalry with Paulus and J. J. Wagner. In 1808 he became secretary of the academy of the arts of design in Munich; in 1820 he withdrew to Erlangen to write his *Philosophie der Mythologie* and *Philosophie der Offenbarung*, which form vols. ii., iii., and iv. of his collected works published after his death by his sons. In 1826, when the university of Landshut was removed to Munich, he accepted a chair, and attracted enthusiastic auditors from all parts of Germany, from France, England, and Greece. Several works which he had in the mean while published indicate the struggles and developments of his system. In his *Bruno, oder über das göttliche und natürliche Princip der Dinge* (1802), he discoursed, in the manner of the Platonic dialogue, upon the unity of the infinite and finite, the possible and the real, as these must be found in the eternal being; expressly denying that the knowledge of the absolute can be attained in “a merely logical way.” His work *Philosophie und Religion* (1804) develops the idea of divine freedom in relation to creation. Still maintaining (what he subsequently denied in his essay on “Freedom”) that the finite as such implies the fall, he here denies that there can be any emanation of the world from God, and says that the transition can only be made by a leap, by an act, and an act of free will. In his *Darlegung des wahren Verhältnisses der Naturphilosophie zur verbesserten Fichte’schen Lehre* (1806), the theosophic element becomes more prominent; the Christian mystics and Boehm affect his theories and statements. He was feeling his way to the position decisively taken in the introduction to the first volume of

his collected works (*Philosophische Schriften*, 1809), and in the *Untersuchungen über das Wesen der menschlichen Freiheit*, which forms the concluding treatise of that volume. In the preface he says the real antagonism of philosophy is found in the two ideas of necessity and freedom. The question of sin and its origin is the capital and decisive inquiry. God is viewed as a person and a will. There still remains a “dark ground” in deity, by which to explain creation and sin, but the personal deity (he alleges in his later expositions) is the *prius* and lord of this “nature in God.” Freedom in the creature is essentially the possibility of good and evil. Out of the *nexus* of cause and effect, beyond even the sphere of consciousness, each individual determines his nature by an act which, though “out of all time,” is still recognized as free by the sense of responsibility and guilt. In his *Denkmal* against Jacobi (1812) he denies that there can be two kinds of philosophy, and insists on the necessity of a scientific theism, which should recognize God as the absolute personality, and yet find in him the basis of all real existence. A “Reply to Eschenmayer” (in the *Allgemeine Zeitschrift*) refutes the objection that he, like Boehm, puts “Satan in God.” *Ueber die Gottheiten von Samothrake* (1816) is a classical fragment of his mythology, somewhat arbitrary in its hypotheses. Sixteen sheets of his *Vorlesungen über die Philosophie der Mythologie* were printed in 1830, but withdrawn from circulation. Nearly 20 years had now passed since he had published any marked work. Meanwhile Hegel had elaborated his system, with a more logical and constructive talent; introducing a principle of movement, which was not a personal will, into the absolute being, and identifying the logical process of the idea with the development of real being. Cousin wrote a slight sketch of German philosophy; Beckers put it into German; and Schelling broke his long silence by writing a preface, in which he accused Hegel of constructing his whole scheme upon a misunderstanding of the true sense and import of the system of identity. About ten years after Hegel’s decease his instructor became his successor at the university of Berlin (1841). The capital of Prussia greeted him with open arms. Frederick William IV., Neander, and Müller hailed him with encouragement. He was lauded as the *spiritus rector* of the century, who through philosophy was to lead philosophy back to Christ. The Hegelians accused him of recreancy to the “idea,” of theosophy, of mysticism. His lectures were published, without his consent, by both Frauenstädt and Paulus. But he lectured only a few semesters, and then withdrew from public life to perfect the details of his system. His physical constitution was vigorous, and his mental clearness was unimpaired to the last. Two of his sons, Karl Friedrich August and Hermann, have published an edition of his collected works (14

vols., Stuttgart and Augsburg, 1856-'61). The first ten volumes give all his writings in chronological order, including several treatises previously unpublished. The remaining volumes give the later system.—Fundamental in his system, in its latest exposition, is the distinction between the negative and the positive philosophy; between the abstract and the historical; between the philosophy of the idea and the philosophy of what is real. The negative philosophy gives the logical and metaphysical basis of the whole; it is the *prima philosophia*, the first, but not the highest, philosophy; the *quid sit*, but not the *quod sit*. He reviews the old metaphysics from Plato and Aristotle to Kant and Hume; and the result is the system of pure ideas, of being as such, but yet of being, not in its reality, but in its abstract and necessary possibilities. Logically antecedent to being, as one of its potences or powers, is the possibility of being (*das Seyn-Können*); then comes pure being itself (*purus actus—das reine Seyn*); and then the union of the two, as the subject-object, or spirit. These three potences are at the basis of all, in idea; they are the potences of absolute being, which as a principle of development can only be grasped as absolute spirit, absolute personality, absolute will. In other words, the transition from the absolute to the relative, from the infinite to the finite, cannot be deduced from being and its predicates, but can only be achieved by personal will. Yet in making this transition, these three potences of being are also the means or factors of the developing process. The three potences become distinct personalities in the process of creation, and work for a time separately and even in collision. Thus the Trinity is not a God in three Gods, but God in three personalities, and at the consummation of the process takes on a still higher form. Man was created with the possibility of good and evil; against God's will he chose the evil, and became subject to temporal and eternal death; and yet the ground for this evil is also found, says Schelling, in the first of the three principles of the Divine Being, passing through the "theogonic process," in conflict with the other principles. Satan is not eternal, and is not a creature; it is a principle, a spirit, which became personal, especially in the height of the conflict with Christ. The fall is before and beyond history; the narrative in Genesis is true on the mythological standpoint. After the fall came the mythological process, through which the second divine personality passes; the whole history of mythology is not an accidental but a necessary process. In the Old Testament he recognizes type and symbol as everywhere pointing to Christ, the Logos; mythology and Judaism unite in him. But in Christianity Christ is the centre, the very substance. The incarnation is not a parting with the divine glory and attributes, but a resuming of them. Christ as incarnate is not from, but in, two natures; there is

not a human personality, the only personality is divine. His sacrificial death was necessary to make expiation for sin; and through this death man again obtains freedom and justification. Justification precedes good works. So, too, the resurrection comes through Christ alone; without the resurrection, the soul, separate from the body, would be in an unnatural state, a state of comparative torpor. Through and by this process of redemption, the Trinity too is completed. God is no longer merely in three personalities (as in the creation), but there are now three persons, each of whom is God. Schelling also unfolds the philosophy of church history, making three stages, corresponding respectively to the apostles Peter, Paul, and John. We are now in the Pauline stadium; that of John will follow, and complete the whole. Paul is the apostle of the Son, and John of the Spirit. Schelling found many disciples and followers, and the development given by them to the principal doctrines has caused their philosophy to be designated as "New Schellingism." Schleiermacher and Hegel were in a measure pupils of Schelling, though they established philosophical schools of their own.—See Rosenkranz, *Schelling* (1848); Michélet, *Die neueste Deutsche Philosophie* (1848); Noack, *Die Philosophie der Romantik* (1860); and the histories of philosophy by Chalybäus, Ritter, Erdmann, Ueberweg, and Thilo. Erdmann has also published a valuable sketch of his negative philosophy. In Coleridge's "Biographia Literaria" will be found some account of Schelling's system in its absolute identity phase. Of special interest, particularly in regard to the history of the growth of Schelling's views, is *Fichte's und Schelling's philosophischer Briefwechsel* (1856). The "Introduction" to Schelling's *Erster Entwurf eines Systems der Naturphilosophie* has been translated by Davidson in the "Journal of Speculative Philosophy" (St. Louis, 1867). His life has been written by Plitt, *Aus Schelling's Leben* (3 vols., 1869-'71). See also *Friedrich Wilhelm Joseph von Schelling, eine Jubiläums-Gedächtnissrede*, by O. Pfeiderer (Stuttgart, 1875), and *Schelling's Geistesentwicklung*, by Hubert Becker (Munich, 1875).

SCHEMNITZ (Hun. *Selmecz-Bánya*), a town of N. W. Hungary, in the county of Hont, on the Schemnitz, a tributary of the Gran, 65 m. N. by W. of Pesth; pop. in 1870, 14,029. It is closely hemmed in by hills, and consists chiefly of one steep and narrow street and of several suburbs. It contains four Catholic churches and one for Protestants, and a mining academy founded in 1760. The gold, silver, lead, copper, iron, sulphur, and arsenic mines, long among the most important in Europe, have much fallen off in production, though still employing about 8,000 persons. All the government mines are connected with each other, and below them are two main adits, of which the lower one, the Joseph II. adit, is a magnificent work, 12 ft. high, 10 ft. wide, and ex-

tending 10 m. to the valley of the Gran, and is used for a canal and a railway.

SCHENCK, Robert Cumming, an American statesman, born at Franklin, Warren co., Ohio, Oct. 7, 1809. He graduated at Miami university in 1827, and was admitted to the bar in Dayton. In 1840-'42 he was a member of the Ohio legislature, in 1843-'51 a representative in congress, and in 1851-'3 minister to Brazil. In 1861 he served as a brigadier general and subsequently as major general of volunteers, and was wounded at the second battle of Bull Run (1862). He was again a member of congress from 1863 to 1871, and in the latter year was appointed minister to England, which post he still holds (1875).

SCHENECTADY, an E. county of New York, traversed by the Mohawk river, the Erie canal, and several railroads; area, 221 sq. m.; pop. in 1875, 24,895. The soil in the valley of the Mohawk is very fertile. The chief productions in 1870 were 5,006 bushels of wheat, 53,730 of rye, 103,533 of Indian corn, 233,199 of oats, 43,465 of barley, 67,651 of buckwheat, 322,902 of potatoes, 35,457 tons of hay, 4,700 lbs. of tobacco, 29,393 of wool, 557,770 of butter, and 42,020 of hops. There were 3,816 horses, 6,185 milch cows, 3,769 other cattle, 7,938 sheep, and 3,894 swine. The raising of broom corn and the manufacture of brooms are important industries; in 1870, 17 establishments produced \$325,148 worth of brooms and wisp brushes. Capital, Schenectady.

SCHENECTADY, a city and the county seat of Schenectady co., New York, on the S. bank of the Mohawk river, and on both sides of the Erie canal, 17 m. N. W. of Albany; pop. in 1850, 8,921; in 1860, 9,579; in 1870, 11,026; in 1875, 13,171. It communicates with the principal points in the state by means of the New York Central and Hudson River, the Schenectady and Saratoga, the Schenectady and Duaneburgh, and the Schenectady and Troy railroads. It is largely engaged in manufacturing, the principal establishments being numerous broom factories, extensive locomotive works, engine and boiler works, iron works, knitting mills, two manufactories of agricultural implements, one each of shawls, galvanized and corrugated iron, pumps and fire engines, steel springs and iron railing, artificial limbs, stoves, and wheelbarrows, and two planing mills. There are four banking establishments, with an aggregate capital of \$400,000, four principal hotels, three public halls, a union school and several branches, two daily and four weekly (one German) newspapers, and 17 churches, viz.: African, Baptist, Congregational, Episcopal (2), German Lutheran, Jewish, Methodist (2), Presbyterian (2), Reformed (3), Roman Catholic (2), and Universalist. Schenectady is the seat of Union college, one of the oldest institutions of learning in the country. Its buildings, three in number, are on the heights overlooking the city. (See UNION UNIVERSITY.)—The town was settled

by Arent Van Corlear in 1661, and a fort was built. On Feb. 9, 1690, the Indians and French massacred the inhabitants, sparing only 60 old persons and children; and in 1748 it was again taken and a large number of persons put to death. It was incorporated as a city in 1798.

SCHENKEL, Daniel, a German theologian, born at Dögerlin, Switzerland, Dec. 21, 1813. He studied in Basel and Göttingen, and in 1841 became a clergyman in Schaffhausen and a member of the grand council. In 1849 he went as professor of theology to Basel, and in 1851 to Heidelberg. His removal, demanded by a portion of the clergy in 1864 on account of his liberal views, was not granted by the authorities of Baden. In 1865 he was one of the most prominent founders of the German Protestant union. He edited the *Allgemeine Kirchenzeitung* from 1852 to 1859, and the *Allgemeine kirchliche Zeitschrift*, which he founded, from 1859 to 1872; and in 1867 he began to edit the *Bibelllexikon*, which he completed in 1875 (5 vols., Leipsic). His principal works are: *Das Wesen des Protestantismus* (3 vols., Schaffhausen, 1846-'51; 2d ed., 1861); *Christliche Dogmatik* (2 vols., Wiesbaden, 1858-'9); *Das Charakterbild Jesu* (1864; 4th ed., enlarged, 1874; English translation by W. H. Furness, 2 vols., Boston, 1866); and *Brennende Fragen* (1869).

SCHERIA, in the Odyssey, an island at the west end of the earth, inhabited by the Phæacæes, a people fond of the feast, the lyre, and the dance. The ancients identified it with Coreyra.

SCHERR, Johannes, a German author, born at Hohenrechberg, Würtemberg, Oct. 3, 1817. He graduated at Tübingen in 1840, and with his brother Thomas Ignaz, a prominent educator, conducted a school at Winterthur, Switzerland. After some years he established himself in Stuttgart, but his republican sympathies compelled him in 1849 to take refuge in Switzerland. He first resided in Zürich, but returned to Winterthur in 1852, and resided there till 1860, when he became professor of history at the polytechnic institute in Zürich. His principal works are: *Geschichte der deutschen Literatur* (2d ed., Leipsic, 1854); *Geschichte der englischen Literatur* (1854; 2d ed., revised and enlarged, 1874); *Geschichte der Religion* (3 vols., 1855-'7); *Allgemeine Geschichte der Literatur* (4th ed., Stuttgart, 1872); *Schiller und seine Zeit* (3d ed., 1862); *Geschichte der deutschen Frauenwelt* (2 vols., 2d ed., 1865); *Blücher, seine Zeit und sein Leben* (3 vols., 2d ed., 1865); *Studien* (3 vols., 1865-'6); *Hammerschläge und Historien* (Zürich, 1871); *Dämonen* (Leipsic, 1872); and *Goethe's Jugend: Die Frauenwelt geschildert* (Leipsic, 1874).

SCHERZER, Karl von, chevalier, a German traveller, born in Vienna, May 1, 1821. He learned the trade of a printer, and was employed by Brockhaus in Leipsic and in the government printing establishment in Paris.

In company with Moritz Wagner he travelled in the United States, Central America, and the West Indies, from 1852 to 1855; and from 1856 to 1859 he was a member of the Austrian Novara expedition round the world. In 1869 he was placed at the head of an expedition to eastern Asia, and before returning to Europe went alone from Japan to California, and spent some time in Guatemala. In 1872 he was appointed Austrian consul general at Smyrna. He published works on his American travels, partly in conjunction with Wagner (1854-'7); his principal subsequent works are: *Beschreibende Theile der Reise der österreichischen Fregatte Novara um die Erde* (3 vols. 4to, Vienna, 1861-'2); *Aus dem Natur- und Völkerleben im tropischen Amerika* (Leipsic, 1864); *Statistisch-commerzieller Theil der Novara-Expedition* (2 vols., Vienna, 1864; new ed., Leipsic, 1867, entitled *Statistisch-commerzielle Ergebnisse einer Reise um die Erde*); *Fachmännische Berichte über die österreichisch-ungarische Expedition nach Siam, China und Japan* (Stuttgart, 1868-'71); and *La province de Smyrne* (1875).

SCHEVENINGEN, a watering place of the Netherlands, on the seashore, 8 m. N. W. of the Hague; pop. about 8,000. It contains a fine old church, a royal pavilion, and a large hotel belonging to the corporation of the Hague. The inhabitants are engaged in fishing. The English fleet under Monk defeated in this vicinity the Dutch commanded by Van Tromp, who was killed, Aug. 10 (N. S.), 1653.

SCHICK, Gottlieb, a German painter, born in Stuttgart, Aug. 15, 1779, died there, April 11, 1812. He completed his studies in Paris under David and in Rome, where he finished in 1803 his "David before the angry Saul," followed in 1805 by "Noah's Thank Offering" and an admirable portrait of his friend Wilhelm von Humboldt. Among his other works are "Apollo among the Shepherds" (1807), landscapes, portraits, and Scriptural paintings.

SCHIEDAM, a town of the Netherlands, in the province of South Holland, near the junction of the Maas with the Schie, 4 m. W. of Rotterdam; pop. in 1873, 20,778. It is well built, has many canals, and contains one Catholic and five Protestant churches. The finest public building is the exchange. It is the centre of the trade in spirituous liquors. There are nearly 300 distilleries, chiefly of gin, celebrated under the name of hollands or Schiedam schnapps.

SCHILLER, Johann Christoph Friedrich von, a German poet, born at Marbach, Württemberg, Nov. 10, 1759, died in Weimar, May 9, 1805. He attended a Latin school at Ludwigsburg, to which town his parents had removed in 1768. His father then became inspector of the palace of Solitude, near Stuttgart, where Friedrich in 1773 entered the ducal military seminary, which in 1775 was transferred to Stuttgart as a military academy. Schiller was first destined for the church, and next for the law, but he

chose medicine, and in 1780 became a surgeon in the army. At an early age he had composed poetry and dramas, and for several years he had been engaged on the tragedy *Die Räuber*, which on its publication in 1781 created an immense sensation. The duke of Württemberg, fearing the effect of this work, which idealized brigandage, ordered the author to adhere to his profession. Schiller nevertheless remodelled the play for the stage, and was arrested at Stuttgart for stealthily witnessing its first performance at Mannheim. He escaped from Württemberg in October, 1782, to Baden, and subsequently found a refuge in the house of Frau von Wolzogen at Bauerbach, near Meiningen, whose sons had been his fellow pupils, and in September, 1783, became connected as a dramatist with the Mannheim theatre. He remained there about 18 months, during which he translated "Macbeth," and wrote the tragedies *Die Verschwörung des Fiesco* and *Kabale und Liebe*. He also founded the *Rheinische Thalia*, and published in that periodical the opening acts of his drama *Don Carlos* and some poems. About the same time appeared his *Philosophische Briefe*. In 1785 he went to Leipsic, and thence to Dresden, where he finished *Don Carlos*, and in 1787 to Weimar. Here he met Charlotte von Lengefeld (who afterward became his wife), Herder, and Wieland. In 1788 he for the first time saw Goethe, but their intimate acquaintance began several years later at Jena. In 1788 appeared the first and only volume of Schiller's unfinished *Geschichte des Abfalls der Niederlande*. In 1789 he was appointed professor of history at Jena, and in 1791 finished his "History of the Thirty Years' War," according to Carlyle "the best historical performance which Germany could boast of." Between these two works appeared his strange fragmentary story *Der Geisteseeher*. Another of his anomalous productions was *Der Verbrecher aus verlorener Ehre*. After recovering from a severe pulmonary attack, he continued to work with the same intensity as before, and became absorbed in Kant, whose philosophy suggested to him many profound æsthetic disquisitions. He also wrote essays and minor poems for the *Horen*, and edited the *Musenalmannach*, in which he and Goethe retorted upon their critics with metrical epigrams (*Xenien*). For some time he worked almost all night, taking stimulants, which undermined his health. His beautiful ballads appeared mostly during this period. In 1799 appeared his drama *Wallenstein*, one of his greatest works, upon which he was engaged for seven years. It is in three parts, *Wallenstein's Lager*, *Die Piccolomini*, and *Wallenstein's Tod*; the last two were translated by Coleridge. Soon afterward he removed to Weimar, where his genius was stimulated by a closer communion with Goethe. Between 1799 and 1801 he produced the dramas *Marie Stuart*, *Die Jungfrau von Orleans*, and *Die Braut von Messina*, and *Das Lied von*

der Glocke, besides many other exquisite poems. In 1804 he completed *Wilhelm Tell*, the last and one of the noblest of his dramatic works. Shortly before his death he said: "Many things are now becoming intelligible and clear to me." The grand ideal pervading all his writings is that of the highest intellectual and moral culture as a groundwork of liberty, and he expressed his thoughts in prose and poetry with impassioned eloquence and at the same time with artistic grace and felicity. As a picturesque dramatist, whose ideality and genius soared highest in depicting the triumphs of virtue, liberty, and patriotism, and in creating lofty types of womanhood and manhood, he imparted to others his own enthusiasm, and impressed the heart of the people more powerfully than any other German poet. In person Schiller was tall and spare, his complexion was pale, his brow high and instinct with thought, his nose aquiline, his mouth of exquisite beauty; his hair inclined to auburn, and his eyes were blue and full of fire. Dannecker's bust in the Weimar library is the best likeness of him. In 1827 his remains were removed to the prince's vault in the new Weimar cemetery. The finest statues of him are by Thorwaldsen in Stuttgart (1839) and by Rietschel in the Schiller-Goethe monument at Weimar (1857). The celebration of his centennial in 1859 resulted in a number of monuments being erected in his honor in Germany and elsewhere. Among the latest are those erected in 1871 in Berlin and in 1874 in Vienna; and one is to be erected in 1876 at Marbach. In 1859 the Schiller funds for relieving indigent authors were merged with the central association in Dresden, which in 1872 had a surplus of about \$300,000.—The complete and partial editions of Schiller's works, which include translations and adaptations, short historical sketches, and various fragments, are exceedingly numerous. The first, incomplete, was published by his friend Körner (12 vols., 1812-'15). The most recent and complete has been published under the supervision of Gödeke (1867-'75), and Schiller's youngest daughter published in 1867 *Schiller's Dramatische Entwürfe*. The most celebrated English versions of his poems are by Bulwer, J. S. Dwight, N. L. Frothingham, and W. H. Furness. The best English biographies of Schiller are Carlyle's (1825; German translation, with an introduction by Goethe, 1830) and Bulwer's (1847). The principal German biographies are by Schiller's sister-in-law, Caroline von Wolzogen (2 vols., 1830; new eds., 1845 and 1851), Hoffmeister (5 vols., 1837-'42; new ed. enlarged by Viehoff, 1846-'53; completed, 3d ed., 3 vols., 1873), Schwab (1840; 4th ed., 1859), and Pallaske (2 vols., 1858-'59; English translation by Lady Wallace, 1859; 5th German ed., 1872). See also *Schiller's Jugendjahre*, by Boas (2 vols.,

1856); *Goethe und Schiller*, by Gödeke (1859); *Schiller und seine Zeit*, by Scherr (1859); *Schiller's Kalender*, 1795-1805, by his daughter Emilie von Gleichen-Russwurm (1865); his correspondence with Goethe (6 vols., 1828; new ed., 1856, and one including Düntzer's *Schiller und Goethe*, 1859; English translation by G. H. Calvert, Boston, 1845), with Wilhelm von Humboldt (1830), with Körner (4 vols., 1847; new ed., enlarged by Gödeke, 1874); *Schiller's Briefe* (3 vols., 1846; with historical comments, 1854-'7); his correspondence with his sister Christophine and her husband Reinwald, edited by Maltzahn (1874); and *Schiller's Verhältnisse zu dem Publikum seiner Zeit*, by Oskar Brosin (1875).—Schiller's widow died in 1826. They had two sons and two daughters. The youngest of the latter, the baroness von Gleichen-Russwurm, died in 1872. His only surviving male descendant (1875) is his grandson, Friedrich Ludwig Ernst von Schiller, an officer in the Austrian army.

SCHILLING, Johannes, a German sculptor, born at Mittweida, Saxony, June 23, 1828. He studied in Dresden and Berlin, and spent several years in Rome. In 1868 he became professor at the royal academy of art in Dresden. His principal works are "Amor and Psyche," the Schiller monument in Vienna, and especially his four groups representing the seasons, for which he received a first prize in 1861, and which were placed in 1872 on the Brühl terrace in Dresden. In 1872 he also received the second prize of 1,000 thalers for his design for a projected national monument in the Niederwald. In 1874 he finished four life-size figures for the Schiller monument in Vienna.

SCHINKEL, Karl Friedrich, a German architect, born in Neu-Ruppin, Prussia, March 13, 1781, died in Berlin, Oct. 9, 1841. He studied in Berlin, in Italy, and in France, became known in 1808-'14 as a painter of dioramas, and afterward acquired celebrity as architect of some of the finest public works in Berlin, where he became professor in the academy of fine arts in 1820. He excelled also as a historical and decorative painter, and a special museum in Berlin bearing his name has been opened for his works. His *Sammlung architektonischer Entwürfe* (Berlin, 1820-'37) and *Werke der höhern Baukunst* (Potsdam, 1845-'6), have passed through many editions.—See *Aus Schinkels Nachlass*, by Wolzogen (4 vols., Berlin, 1862-'64), and the biographies by Kugler and others.

SCHIRMER, Johann W. See supplement.

SCHLAGINTWEIT, Hermann, Adolf, and Robert, German travellers, the first born in Munich, May 13, 1826; the second born Jan. 9, 1829, killed in Kashgar, Aug. 26, 1857; the third born Oct. 27, 1833. While at the university Hermann and Adolf made explorations of the Alps, and published the results in their *Untersuchungen über die physikalische Geographie der Alpen* (Leipsic, 1850). After spending some time in England and Scotland, they renewed in 1851 their explorations of the Alps,

visited Piedmont and Savoy, and devoted themselves especially to observations and measurements in the vicinity of Monte Rosa. They were the first to ascend the highest peak of this mountain (Aug. 23, 1851), and to make an accurate measurement of its elevation; and they remained for 14 days on its S. W. slope, at a height of 10,000 ft. In 1852 they explored the Bavarian Alps, where in 1853 also Adolf made geological observations. The results of their researches were published in *Neue Untersuchungen über die physikalische Geographie und die Geologie der Alpen* (illustrated, Leipsic, 1854). In the same year they produced two maps in relief of Monte Rosa and of the Zugspitze, the highest peak in Bavaria. At the suggestion of Bunsen and Humboldt, Hermann and Adolf were invited by the East India company to make an expedition for magnetic and other scientific observations in India; and they sailed from Southampton, Sept. 20, 1854, in company with their brother Robert, reaching Bombay Oct. 26. The most important result to magnetic science was the discovery that the isodynamic lines, which run due E. with little variation from the Arabian sea to the Indian archipelago, are violently deflected in central and southern India, and make a sharp southward curve. On March 25, 1855, Adolf and Robert started for the Himalaya mountains. After examining the glacier of Milum, more than 10 m. long and 3,000 ft. broad, they entered Thibet, and investigated the glaciers of Ibi-Gamin, one of its highest mountains, ascending to an elevation of 22,260 ft. Returning, the three brothers explored the country in different directions, and met at Simla in the spring of 1856. They set out together for new researches in the Himalaya, but soon took different courses, Adolf reaching Lanskar in Thibet on June 26, while his brothers proceeded across the Karakorum and Kuenlun ranges. They met at Serinagur, separated once more, and again came together on Nov. 17 at Rawal-Pindi. Robert then returned to Europe by way of Mooltan, Bhooj, and Bombay, and Hermann by way of Nepaul and Calcutta. Adolf decided to pursue his researches a year longer in Thibet and Turkistan, and proceeded to Kashgar, whence he intended to penetrate into Siberia, but was slain there, for some unknown reason, by the inhabitants. His journal, containing 135 pages of closely written notes, was recovered in September, 1861, by Lord William Hay, civil commissioner in Cashmere. The whole extent of the travels of the brothers Schlagintweit was about 18,000 miles. Hermann and Robert arrived safely in Berlin, and settled at Jägersburg near Forchheim, where they have deposited their valuable collections of about 2,000 minerals and fossils, a large herbarium, zoological and ethnographical specimens, embracing 275 casts of the faces and 37 of the hands and feet of the tribes which they visited, and an atlas of 750 original views. Re-

ports of their travels were published during their absence in the principal geographical journals of Europe. The surviving brothers are preparing a complete narrative in English entitled "Results of a Scientific Mission to India and High Asia, undertaken between the Years 1854 and 1858; with an Atlas of Panoramas, Views, and Maps." Five volumes of this work have been published: the first giving astronomical determinations of latitudes and longitudes, and magnetic observations (Leipsic, 1861); the second, the general hypsometry of India, the Himalaya, and western Thibet, edited by Robert (1862); the third, a route book, with geographical glossary, edited by Hermann (1863); and the fourth and fifth giving the meteorology and physical conditions of India (1866 and 1873). Hermann, who received in 1864 from the emperor Alexander II. the surname of Sakünlünski (Transkuenlunian), is now (1875) writing an elaborate work based on the results of his travels and those of his brothers, under the title of *Reisen in Indien und Hochasien*, of which 4 vols. have appeared (Jena, 1869-'74). Robert published in 1869 a collection of poems from various German poets, entitled *Poetische Bilder aus allen Theilen der Erde*; and after extended travels on the American continent, he wrote *Die Pacific-Eisenbahn in Nordamerika* (1870), and *Californien, Land und Leute* (1871).—EDUARD, another brother (born March 8, 1831, died in the battle of Kissingen, fighting in the Bavarian army, July 10, 1866), published a work based on his observations in the Spanish-Moroccan campaign of 1859-'60, entitled *Der spanisch-marokkanische Krieg* (Leipsic, 1863).—EMIL, a fifth brother (born July 7, 1835), has devoted himself to oriental studies, and written "Buddhism in Tibet" (in English, Leipsic, 1863), *Die Gottesurtheile der Indier* (Munich, 1866), and *Die Könige von Tibet, von der Entstehung königlicher Macht in Yärlung bis zum Erlöschen in Ladák* (or about 50 B. C. to 1834 A. D.), published by the royal Bavarian academy in 1866.

SCHLATTER, Michael, a Swiss missionary, born in St. Gall, July 14, 1716, died near Philadelphia in October, 1790. He was educated at St. Gall, became a clergyman, and in 1746 offered himself to the synods of North and South Holland as a missionary to the German Reformed emigrants in Pennsylvania. From 1746 to 1751 he was pastor of the Reformed churches of Philadelphia and Germantown, and organized churches among the scattered Germans in Pennsylvania, New Jersey, Maryland, and Virginia. He effected the organization of the synod of the German Reformed church in America in September, 1747. In 1751 he revisited Europe, and secured the services of six other ministers for the American churches. In 1757 he accompanied an expedition to Nova Scotia against the French as chaplain. When the revolution broke out he espoused the cause of the colonists, and was imprisoned in 1777.

SCHLEGEL. I. August Wilhelm von, a German scholar, born in Hanover, Sept. 5, 1767, died in Bonn, May 12, 1845. He was a son of the poet and clergyman Johann Adolf Schlegel, and studied at Göttingen, at first theology and afterward philology under Heyne. He had successfully cultivated poetry from his earliest boyhood, which led to his friendship with Körner, and he is said to have been the first to compose German sonnets. After three years' residence at Amsterdam as private tutor, he settled in Jena, where he became professor, and joined his brother Friedrich in writing essays which opened the era of the romantic school of literature. Having separated from his wife, a daughter of Michaelis, he removed in 1802 to Berlin, where he lectured on literature and the fine arts. In 1805 he accompanied Mme. de Staël in her travels. In 1808 he delivered at Vienna his celebrated lectures on dramatic art, which reveal his immense admiration for Shakespeare. They were published in 3 vols. (Heidelberg, 1809-'11), and several times translated into English. Visiting Stockholm in 1812, he became secretary to Bernadotte, the future king of Sweden. In 1815, after the second occupation of Paris by the allies, he joined Mme. de Staël, and remained with her till her death in 1817. From 1819 to the end of his life he was professor of history at Bonn. His second marriage in 1819, with a daughter of Paulus of Heidelberg, resulted like the first in a separation. His literary activity began at Jena, where he wrote for Schiller's *Horen* and other periodicals, edited in conjunction with his brother Friedrich the *Athenäum*, and began his translation of the plays of Shakespeare, of which he rendered 17, the rest being prepared by Dorothea Tieck, under the supervision of her father, and by Count Baudissin. In 1801 he published with his brother *Charakteristiken und Kritiken* (2 vols.), which was followed by his translations of Calderon's five principal plays (*Spanisches Theater*, 2 vols., 1803-'9), and of Spanish, Italian, and Portuguese poetry (*Blumensträuße der italienischen, spanischen und portugiesischen Poesie*, 1804). At the suggestion of Mme. de Staël he published in French in 1807 *Comparaison de la Phèdre d'Euripide avec celle de Racine*, which attracted much attention and aroused much indignation in France. In his *Poetische Werke* (2 vols., 1811) are contained his best poems, and in his *Kritische Schriften* (2 vols., 1828) some of his most profound æsthetical disquisitions. He was also remarkable as an oriental scholar, and as the first in Germany to master Sanskrit. His writings are comprised in his *Sämmtliche Werke* (12 vols., 1846-'7), *Œuvres écrites en français* (3 vols., 1846), and *Opuscula Latina* (1848), the last including his translation of the *Ramayana* and other contributions to Sanskrit literature. II. Friedrich Karl Wilhelm von, a German author, brother of the preceding, born in Hanover, March 10, 1772, died in Dresden, Jan.

12, 1829. He went to Leipsic to qualify himself for commerce, but soon entered the university of Göttingen, and completed his studies at Leipsic. In 1800 he established himself as *Privatdozent* of philosophy in Jena, and subsequently lectured also in Paris. Having with his wife, a daughter of Moses Mendelssohn, joined the Catholic church, he went in 1808 to Vienna, and in the following year accompanied the archduke Charles on the battle field as a secretary, issuing patriotic proclamations against Napoleon. Subsequently he was secretary of the Austrian embassy at Frankfort till 1818, when he returned to Vienna and resumed his lectures there, and in 1828-'9 lectured in Dresden. He shared with his brother and Tieck in the leadership of the romantic school, and was especially remarkable as a critic and thinker of great originality. His principal works are: *Griechen und Römer* (1797); *Geschichte der Poesie der Griechen und Römer* (1798); *Lucinde* (1799), a novel of which only one volume was published on account of its voluptuous character; *Alarcos*, a tragedy (1802); *Ueber die Sprache und Weisheit der Inder* (1808); *Vorlesungen über die neuere Geschichte* (1811); *Geschichte der alten und neuen Literatur* (2 vols., 1815); *Philosophie der Geschichte* (2 vols., 1829); and *Philosophie der Sprache* (1830). His works were collected in 15 vols. (1822-'46). He also published several works written by his wife. His "Lectures on Modern History," "Philosophy of History," "Philosophy of Life and Philosophy of Language," and other works, have been translated into English.

SCHLEICHER, August, a German philologist, born in Meiningen, Feb. 19, 1821, died in Jena, Dec. 6, 1868. He studied theology and comparative philology at Leipsic and Tübingen, and graduated at Bonn as doctor of philosophy in 1846. In 1850 he became professor at Prague, and in 1857 at Jena. He ranked next to Bopp in comparative philology, and was distinguished in the Indo-Germanic and particularly in the Slavo-Lettic group of languages. His works include *Zur vergleichenden Sprachengeschichte* (2 vols., Bonn, 1848-'50, vol. ii. entitled *Die Sprachen Europa's*); *Formenlehre der kirchenslavischen Sprache* (1853); *Handbuch der litauischen Sprache* (2 vols., Prague, 1856-'67); and *Compendium der vergleichenden Grammatik der indogermanischen Sprachen* (Weimar, 1862; 3d ed., 1871; English translation by H. Bendall, part i., "Phonology," London, 1874).

SCHLEIDEN, Matthias Jakob, a German botanist, born in Hamburg, April 5, 1804. He was professor of botany at Jena from 1839 to 1862, and of vegetable chemistry and anthropology at Dorpat in 1863-'4, subsequently residing at Dresden. His principal works are: *Grundzüge der wissenschaftlichen Botanik* (2 vols., Leipsic, 1842-'3; 4th ed., 1861; translated into English by Dr. Lankester, London, 1849); *Die Pflanze und ihr Leben* (6th ed.,

Leipsic, 1864; translated by Prof. Henfrey, London, 1848); *Baum und Wald* (1870); and *Die Rose* (1873).

SCHLEIERMACHER, Friedrich Daniel Ernst, a German theologian, born in Breslau, Nov. 21, 1768, died in Berlin, Feb. 12, 1834. His father was a Reformed minister, and chaplain of a Prussian regiment in Silesia. In 1788 he was placed in the educational establishment of the Moravians at Niesky, Upper Lusatia, and in 1785 in the Moravian college at Barby. He entered the university of Halle in 1787, where he lived in the house of his uncle, Prof. Stubenrauch. He attended the lectures of Semler and Wolf, made himself acquainted with modern languages and mathematics, and studied Spinoza, Kant, Fichte, and Jacobi. After a two years' course he left the university without a fixed system of religious opinions. In 1790 he passed the examination for license, and became private tutor in the family of Count Dohna, where he spent three years. In 1794 he took orders and became assistant to his uncle at Landsberg on the Warta. From 1796 to 1802 Schleiermacher was chaplain at the Charité hospital in Berlin; and during these six years he identified himself temporarily with the so-called romantic school of poetry. In 1799 he published *Reden über die Religion an die Gebildeten unter ihren Verächtern* (new ed., Leipsic, 1867), which marks the transition of German theology from speculation to the restoration of positive faith. His piety, however, was strongly tinctured with the pantheism of Spinoza. His *Monologen* (1800) is a description of the ethical ideal which floated before his mind, and was evidently influenced by the subjective idealism of Fichte. In 1802 he removed for two years to Stolpe in Pomerania as court preacher. There began his translation of Plato, which he had projected with Friedrich Schlegel in Berlin. Its partial completion in 6 vols. (1804-'28) gives him a place among the best Greek scholars in Germany. His *Grundlinien einer Kritik der bisherigen Sittenlehre*, which opened a new path in moral philosophy, belongs to the same period (1803). In 1804 he became extraordinary professor of philosophy and theology in Halle. After the temporary suspension of this university in 1806 he spent some time on the island of Rügen, then returned to Berlin as minister of Trinity church, and married the widow of his intimate clerical friend Willich (1809). When the university of Berlin was founded in 1810, he was elected its first theological professor, and continued in this post, combining with it his pastoral labors in Trinity church, during the rest of his life. In connection with his colleague Neander, his former pupil in Halle, he attracted students from all parts of Germany and Switzerland. Wilhelm von Humboldt says that Schleiermacher's speaking far exceeded his power in writing, and that his strength consisted in the "deeply penetrative character of his words, which was free from

art, and the persuasive effusion of feeling moving in perfect unison with one of the rarest intellects." He never wrote out his sermons, except the text, theme, and a few heads, but allowed them to be taken down during delivery and published after he had revised them. During the most critical and depressed period in the history of Prussia, he exerted a powerful influence to stir up in all classes of society those patriotic feelings which resulted in the war of deliverance and the final emancipation of Germany from French rule. He adhered to his liberal political principles during the period of reaction in favor of absolutism, which set in after the fall of Napoleon and the congress of Vienna, and subjected himself to strong suspicion in high quarters. He assisted in the union of the Lutheran and Reformed confessions in Prussia at the tercentennial celebration of the reformation (1817), and defended it, although he regarded himself as belonging rather to the Reformed type of Protestantism, and advocated in his own way even the Calvinistic scheme of a double predestination as subservient to an ulterior design of a final universal salvation. He favored strongly the introduction of the presbyterian and synodical form of government. He was one of the compilers of the new Berlin hymn book (1829), which opened the way for a hymnological reform in all parts of Germany. —Schleiermacher was small of stature, and slightly deformed by a humpback; but his face was noble, earnest, sharply defined, and highly expressive of intelligence and kindly sympathy; his eye keen, piercing, and full of fire; his movements quick and animated. His mind retained its vitality and freshness to the last. His productions, including the posthumous publications from his lectures, embrace philosophical ethics, dialectics, psychology, politics, pedagogics, church history, hermeneutics, Christian ethics, dogmatics, practical theology, sermons, and a large number of philosophical, exegetical, and critical essays. The Old Testament alone was excluded from his lectures. His literary remains were intrusted to his friend and pupil Dr. Jonas, and from them as well as from his published writings and numerous manuscripts of students a complete collection of his works has been published in three divisions, respectively entitled *Zur Theologie, Predigten, and Zur Philosophie*, including his lectures on psychology (1862) and *Das Leben Jesu* (1864); the whole publication embraces 81 volumes (1835-'64). His correspondence with J. Chr. Gass was edited in 1852 by W. Gass, and that with other friends appeared under the title *Aus Schleiermacher's Leben* (4 vols., 1853-'62). His autobiography, extending only to 1794, was first published in 1851 in Niedner's *Zeitschrift für historische Theologie*. His philosophical and theological views have been discussed by Braniss (1822), Delbrück (1827), Baumgarten-Crusius (1834), Rosenkranz (1836), Strauss (1839), Neander, Twe-

sten, Baur, and others. Among his biographers are Auberlen (1859), K. Schwartz (1861), Elisa Maier (1863), Dilthey (1867 *et seq.*), and Schenkel (1868). See also *Schleiermacher's Reden über die Religion und ihre Nachwirkungen auf die evangelische Kirche Deutschlands*, by Albrecht Ritschl (Bonn, 1874).

SCHLEIZ. See REUSS.

SCHLESTADT. See SCHLETTSTADT.

SCHLESWIG, or Sleswick (Dan. *Slesvig*). **I.** Formerly an independent duchy governed by the king of Denmark, now the N. part of the Prussian province of Schleswig-Holstein. It is bounded N. by Jutland, from which it is partly separated by the Konge Aa, E. by the Little Belt and the Baltic, S. by Holstein, from which it is separated by the Eider river and the Schleswig-Holstein canal, and W. by the North sea; extreme length 90 m., general breadth about 40 m.; area, 3,529 sq. m.; pop. in 1871, 409,907. (See SCHLESWIG-HOLSTEIN.)—Since the time of Charlemagne Schleswig has been a disputed possession between the Germans and the Danes. A margraviate erected here by Henry I. of Germany about 934, and reorganized by Otho the Great in 948, was yielded up to Canute the Great in 1027, when the Eider was agreed upon as the boundary between the two countries. Thenceforward Schleswig was usually bestowed upon the younger princes of the Danish reigning family. King Waldemar II. (1202-'41) invested with it his younger son Abel, whose descendants, closely allied with the counts of Holstein of the Schauenburg house, but usually hostile to the Danish kings, ruled it till 1375. During this period the foundation was laid for the union of the two territories, and in 1326 the so-called constitution of Waldemar was adopted, according to which Schleswig was never again to be united with Denmark under the same lord. After the extinction of Abel's line, the counts of Holstein laid claim to Schleswig under several treaties, and in 1386 Gerhard VI. received it as a Danish fief. Although Holstein was a fief of the empire, the history of the two countries is from this time united.

II. A city of Prussia, in the province of Schleswig-Holstein, formerly capital of the duchy of Schleswig, at the head of a shallow bay called the Schlei or Sley, about 20 m. from the Baltic, and 69 m. N. N. W of Hamburg; pop. in 1871, 13,850. It is almost surrounded by water, and is divided into three parts, the Altstadt, chiefly inhabited by fishermen, the Lollfuss, and Friedrichsburg. It has a cathedral with many monuments. Woollen goods, leather, lace, and china are made. The harbor is accessible to small vessels. Schleswig was in existence in 808, and for nearly 600 years it was an important commercial city. It declined from the gradual filling up of its harbor.

SCHLESWIG-HOLSTEIN, a province of Prussia, formed in 1866, and consisting of the former duchies of Schleswig and Holstein, bounded N. by Denmark, E. by the Baltic, Lübeck,

and Lauenburg, S. by the province of Hanover, from which it is separated by the Elbe, and W. by the North sea; area, 6,766 sq. m.; pop. in 1871, 995,873, chiefly Protestants. The inhabitants are a mixture of various races. In N. Schleswig Danish is spoken by about 145,000 people, who occupy nearly half of the former duchy of Schleswig. In S. Schleswig and Holstein nearly all the inhabitants speak German. The Frisian dialect is still spoken in some of the western parishes, but it is not used in either church or school. The district between and E. of the towns of Schleswig and Flensburg is known as the territory of the Angles. The province constitutes only one administrative district, called Schleswig. The principal towns are Altona, Kiel (the capital), Rendsburg, and Glückstadt in Holstein, and Schleswig and Flensburg in Schleswig. The chief rivers, besides the Elbe, are the Eider, which separates Schleswig from Holstein, the Trave, and the Stör, an affluent of the Elbe. A number of islands lie opposite the W. coast of Schleswig, of which Römö, Sylt, and Föhr are the most important. The islands of Alsen in the Little Belt and Femern N. E. of Holstein also belong to the province. The surface is mainly level; in the interior of Schleswig there is a slightly elevated sandy ridge covered with heath, which increases in height toward the north. The soil of Holstein is very fertile, and produces wheat, buckwheat, potatoes, hops, hemp, flax, and wood. The soil in the interior of Schleswig is light and stony; the W. side is bordered by a strip of rich marsh land, and artificial dikes and sluices are necessary to prevent its being overflowed. The province is noted for its fine horses, which are famous for heavy cavalry service and are exported in considerable numbers. The manufactures are not important; only Neumünster in Holstein can be called a manufacturing town. (See HOLSTEIN.)—In 1386 the counts of Holstein received Schleswig as a Danish fief. Their line becoming extinct, the estates of Schleswig-Holstein in 1460 elected Count Christian of Oldenburg to be their sovereign, who had in 1448 been chosen king of Denmark. It was stipulated that the duchies "should for ever remain together undivided," and the estates reserved the right to choose at any time a successor from among his descendants. The agreement to maintain the integrity of Holstein was soon broken, and in 1490, with the consent of the estates, two sovereign houses were founded. These were united again under Frederick I., but in 1544 three sovereign houses were founded. Since 1580 there have been three main branches of the family of Schleswig-Holstein: the royal Danish, called the Holstein-Glückstadt; that of Holstein-Gottorp, of which since 1762 the czar of Russia is the head; and the Holstein-Sonderburg, which had no territorial authority. In 1616 the estates yielded their right of election, and the law of succession became that

of primogeniture, with reversion to the collateral branches. In 1773 the future emperor Paul I., as duke of Holstein-Gottorp, ceded all his possessions and claims in Schleswig-Holstein to the king of Denmark, in exchange for the principality of Oldenburg, which he transferred to the youngest branch of the Holstein-Gottorp family. The ancient constitution of Schleswig-Holstein had since the 17th century fallen into abeyance, and in 1802-'6 the estates were formally abolished. In 1815 the king of Denmark had to enter the German confederation as duke of Holstein, and in 1823 the inhabitants of that province appealed to the German diet for the constitution of 1460, without effect; but in 1834 chambers were erected both for Schleswig and for Holstein. But still the repressive measures of the government, and a persistent effort to bring the German language into disuse in the churches, schools, and courts, created discontent. The Salic law had never been abolished in Schleswig or Holstein, and the royal house in the male line was about to become extinct when on July 8, 1846, appeared a proclamation of the king, extending the Danish laws of succession to all his dominions except a part of Holstein, at the same time expressing the intention of including even this in time. The collateral branches of the reigning family, the estates of the duchies, and the German diet protested; but on March 24, 1848, Frederick VII. proclaimed the incorporation of Schleswig with Denmark. This was the beginning of a three years' war, in which the duchies contended for their independence, and were for a time aided by Prussia. (See DENMARK.) In January, 1851, Austria and Prussia jointly intervened, disbanded the Schleswig-Holstein army, and on Feb. 18, 1852, surrendered Holstein to Denmark. At the London conference of May, 1852, the great powers and Sweden fixed upon Prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg as the next king. The other branches of the prince's family residing in Denmark renounced their claims in Prince Christian's favor, but those residing in Schleswig-Holstein did not. Neither the estates of the duchies nor the German diet became a party to this agreement. In 1854 constitutions were granted to both Schleswig and Holstein; but they were not satisfactory to the people, and in November, 1863, the parliament formally incorporated Schleswig with Denmark. In the same month the king died, and, in accordance with the London treaty, the prince of Sonderburg-Glücksburg ascended the throne as Christian IX. The prince of Schleswig-Holstein-Sonderburg-Augustenburg, whom the duchies regarded as the rightful heir, proceeded to Kiel to assume the government. In the mean time the German diet had declared the treaty of London broken by Denmark, and an Austro-Prussian army entered Holstein. After severe fighting the Danes were driven out of Schleswig, and even Jutland was occupied by

German troops. England attempted in vain to mediate, a second London conference came to nothing, and the Danes were completely subdued. At the treaty of Vienna, Oct. 30, 1864, Christian IX. renounced all his claims to Schleswig-Holstein, and also to Lauenburg. The convention of Gastein, Aug. 14, 1865, assigned the occupation of Holstein to Austria and of Schleswig to Prussia. After the war of 1866 both duchies came under Prussian rule, and were shortly after made a province of the Prussian monarchy. The article in the treaty of Prague between Austria and Prussia, providing for a restoration of Danish-speaking Schleswig to Denmark should the people vote for it, has thus far (1875) been disregarded. (See DENMARK.)—See Droysen and Samwer, *Die Herzogthümer Schleswig-Holstein und das Königreich Dänemark* (2d ed., Hamburg, 1850); Lüders, *Denkwürdigkeiten zur neuesten schleswig-holsteinischen Geschichte* (4 vols., Stuttgart, 1851-'3); Baudissin, *Geschichte des schleswig-holsteinischen Kriegs* (Hanover, 1862); Rüstow, *Der deutsch-dänische Krieg von 1864* (Zürich, 1864); *Der österreichisch-preussische Krieg gegen Dänemark* (Vienna, 1865); and Möller, *Geschichte Schleswig-Holsteins* (2 vols., Hamburg, 1865).

SCHLETTSTADT (Fr. *Schelestadt* or *Schlestadt*), a town of Germany, in Lower Alsace, on the left bank of the Ill, 25 m. S. S. W. of Strasbourg; pop. in 1871, 9,307, chiefly Roman Catholics. It contains several fine mediæval churches, a college, a public library, and a Catholic normal seminary opened in 1872. Leather, cotton goods, potash, and many other articles are manufactured; and there is trade in wine, tobacco, rape seed, hemp, and flax. Schlettstadt was a town in the 8th century, having been founded on the site of one destroyed by Attila, and was fortified and became a free imperial city in the 13th century. Agricola established a school here. It was taken by the Swedes in 1632, was annexed to France in 1648, and subsequently became the capital of an arrondissement in the department of Bas-Rhin. The fortifications, designed by Vauban, commanded the railway lines and the military road to Belfort and Besançon. The Germans captured it after a siege in October, 1870, and subsequently demolished the fortifications.

SCHLEY, a S. W. county of Georgia, drained by branches of Flint river; area, about 200 sq. m.; pop. in 1870, 5,129, of whom 2,851 were colored. The chief productions in 1870 were 3,889 bushels of wheat, 88,053 of Indian corn, 19,626 of sweet potatoes, 1,540 lbs. of rice, 3,657 bales of cotton, and 6,672 gallons of sorghum molasses. There were 317 horses, 621 mules and asses, 2,531 cattle, 486 sheep, and 4,371 swine. Capital, Ellaville.

SCHLIEMANN, Heinrich, a German traveller, born at Kalkhorst, Mecklenburg-Schwerin, in 1822. His father was poor, and placed him at the age of 14 in a grocer's store in Fürsten-

berg, where he remained for more than five years. He then obtained employment in a mercantile house in Amsterdam, and devoted his leisure hours to the acquisition of languages, learning very rapidly, as he relates, to speak and write English, French, Dutch, Spanish, Italian, and Portuguese, in addition to Latin, which he had learned in his childhood. His learning Russian was the foundation of his fortune. In the beginning of 1846 he was sent as an agent to St. Petersburg, where he established a business of his own, which within a few years brought him considerable wealth. In 1854 he mastered Swedish and Polish; and in 1856 he learned modern Greek, with the help of two Greek friends, in six weeks, and three months more sufficed him to learn enough of classical Greek to understand the ancient writers. He now devoted two years exclusively to the classics, reading the Iliad and Odyssey several times. In 1858-'9 he travelled in Sweden, Denmark, Germany, Italy, Egypt, and Syria, and learned Arabic. In 1863 he retired from business with the intention of exploring the Troad, but in 1864 he was induced to make a journey around the world, which occupied two years. He then settled in Paris, where he published in 1869 *Ithaque, le Péloponnèse et Troie* (German ed., Leipsic, 1869), giving an account of his travels in 1868 in Corfu, Cephalonia, Ithaca (where he supposed he had discovered genuine remains of the home of Ulysses, as seen by Homer), the Peloponnesus, and the plain of Troy, the result of studies of the so-called Cyclopean works of Argolis, and an examination of the topography of the Iliad. In the beginning of 1870 he returned to the Troad, accompanied by his wife, a Greek lady, and spent the seasons of 1871-'3 in excavating the plateau of Hissarlik, which he considers to have been the site of Troy. (See TROY.) His book, *Trojanische Alterthümer* (1874), a sort of diary of the progress of the excavations, has been translated into several languages; the English version, edited by Dr. Philip Smith (London, 1875), gives a selection of illustrations drawn from the large *Atlas Trojanischer Alterthümer*, consisting of 218 photographs of his discoveries, with explanatory text, which Schliemann published soon after. He produced much irritation at Constantinople by failing to send, as promised, half of the objects he discovered at Hissarlik to the imperial Ottoman museum. In 1874 he obtained from the Greek government permission to demolish at his own expense the Venetian tower in the acropolis of Athens, which covers about 1,600 sq. ft. of the Propylæa. But the permission was cancelled, probably on account of his pending suit with the Turkish government, and Schliemann thereupon induced the archaeological society of Athens to carry on the excavations for him.

SCHLOSSER, Friedrich Christoph, a German historian, born at Jever, Oldenburg, Nov. 17,

1776, died in Heidelberg, Sept. 23, 1861. He studied at Göttingen, and from 1817 till his death was professor of history at Heidelberg. His principal works are: *Geschichte des 18. Jahrhunderts*, continued to the overthrow of Napoleon I. (8 vols., 1823-'46; 5th ed., 1864-'6; English translation, with notes by D. Davison, "History of the Eighteenth Century," 8 vols., London, 1843-'52); *Weltgeschichte in zusammenhängender Erzählung* (9 vols., 1817-'24; 2d ed., 1839-'41); *Universalhistorische Uebersicht der Geschichte der alten Welt und ihrer Cultur* (3 vols., 1826-'34); and *Weltgeschichte für das deutsche Volk*, with the assistance of Kriegk (19 vols., 1842-'54; new ed., 18 vols., 1870-'74).

SCHLÖZER. I. August Ludwig von, a German historian, born at Gaggstedt, Württemberg, July 5, 1735, died in Göttingen, Sept. 9, 1809. He studied in Wittenberg and Göttingen, and became a private teacher in Sweden, where he published a work in Swedish on the history of trade and commerce (Stockholm, 1758). In 1759 he returned to Göttingen to study medicine, but in 1761 went with the Russian historiographer Müller to St. Petersburg, where he became a teacher at the academy, and was professor of history from 1765 to 1767, when he assumed the chair of political sciences at Göttingen. He wrote on northern and universal history, and extensively on politics, and translated Nestor's Russian chronicles to A. D. 980 (5 vols., 1802-'9). **II. Kurd von**, a German author, grandson of the preceding, born in Lübeck, Jan. 5, 1822. He was German minister in Mexico from 1869 to 1871, and subsequently in Washington. His works include *Geschichte der deutschen Ostseeländer* (3 vols., Berlin, 1850-'53); *Verfall und Untergang der Hansa* (1853); and *Friedrich der Grosse und Katharina II.* (1859).

SCHMALKALDEN. See SMALCALD.

SCHMID, Leopold, a German theologian, born in Zürich, June 9, 1808, died in Giessen, Dec. 20, 1869. He studied at Tübingen and Munich, became in 1839 professor of theology at Giessen, and in 1843 professor of philosophy. In February, 1849, he was nominated to the vacant see of Mentz, but Bishop Ketteler was substituted in his stead by the pope. In his principal work, *Der Geist des Katholicismus, oder Grundlegung der christlichen Irenik* (2 vols., Giessen, 1848-'50), he advocated the return of the Roman Catholics to the doctrines and practices of the primitive church, and urged the adoption of a broader spirit of charity in dealing with Protestant churches. In *Ultramontan oder katholisch?* (1867), he proposed as an axiom of state policy to refuse to treat the Roman Catholic hierarchy as the representatives of a distinct religious community, so long as they would not acknowledge the specific claims of the evangelical religion. He also attempted to reconcile science and faith in his *Grundsätze der Einleitung in die Philosophie* (1860) and *Das Gesetz der Persönlichkeit*

(1862).—See Schröder and Schwarz, *Leopold Schmid's Leben und Denken* (Leipsic, 1871).

SCHMIDT, Heinrich Julian, a German author, born in Marienwerder, March 7, 1818. He studied at Königsberg, and became a teacher and journalist in Berlin. Since 1863 he has devoted himself exclusively to literature. His principal works are: *Geschichte der Romantik im Zeitalter der Reformation und Revolution* (2 vols., Leipsic, 1850); *Geschichte der deutschen Literatur seit Lessing's Tod* (5th ed., 3 vols., 1865-'7); and *Bilder aus dem geistigen Leben unserer Zeit* (1870-'71; 2d series, 1873).

SCHNAASE, Karl, a German author, born in Dantzic, Sept. 7, 1798, died in Wiesbaden, May 21, 1875. He studied law, and held judicial offices in various localities from 1819 to 1857. In 1858 he established the periodical *Das christliche Kunstblatt*, and edited it with Grüneisen in Stuttgart and Schnorr von Karolsfeld in Dresden. After spending several years in Rome, he settled in 1867 in Wiesbaden. His principal works are: *Niederländische Briefe* (Stuttgart, 1834), and *Geschichte der bildenden Künste* (7 vols., Düsseldorf, 1843-'64; 2d ed. by Lützwow and Friedrichs, 1866 *et seq.*).

SCHNEIDER, Eugène, a French politician, born in Nancy in April, 1805, died in Paris, Nov. 27, 1875. He and his brother (who died in 1845) became managers of the iron works of Le Creuzot, and he was elected to the chamber in 1845. In 1851 he was minister of agriculture and commerce. In 1852 he was returned to the legislative body, of which he became vice president, and after Morny's death (1865) president, being repeatedly reelected. He was also regent of the bank of France.

SCHNEIDER, Hortense Catherine, a French actress, born in Bordeaux about 1835. She appeared on the stage in her 15th year, and was connected with various theatres in Paris for upward of ten years before she became celebrated in 1864 by her personation of Offenbach's *La belle Hélène*. She achieved still greater triumphs in *La grande duchesse* and similar operas.

SCHNEIDER, Johann Gottlob, a German philologist, born at Collmen, Saxony, Jan. 18, 1750, died in Breslau, Jan. 12, 1822. He studied at Leipsic, and in 1774 assisted Brunk in editing the Greek poets at Strasburg. In 1776 he became professor at Frankfort-on-the-Oder, and in 1811 at Breslau. He published a large critical Greek lexicon (2 vols., 1797-'8; 3d ed., with supplement, 1819-'21), annotated editions of many Greek authors, and also various works on natural history.

SCHNETZ, Jean Victor, a French painter, born in Versailles, May 15, 1787, died in Paris, March 15, 1870. He studied under David, Regnault, and Gros, and was director of the French academy in Rome for many years. He executed numerous historical, religious, and genre pictures; the most popular are: "The Gypsy foretelling the Future of Sixtus V.," "Christ calling little Children unto Him," "St. Gene-

viève," "Jeremiah," "The Capuchin Physician," "The Monk engaged in Prayer," and a pastoral scene from the vicinity of Rome.

SCHNORR VON KARLSFELD, Julius, a German painter, born in Leipsic, March 26, 1794, died in Dresden, May 24, 1872. He was the son of the painter Veit Hans Schnorr (1764-1841), and studied under his father, in Vienna, and in Italy. In 1817 he went to Florence and Rome, where Overbeck and Cornelius procured orders for him for frescoes, and he also executed there many oil paintings of religious subjects. In 1827 he became professor at the academy of Munich, and in 1846 removed as professor to Dresden, where he was also director of the picture galleries. He was the founder of a new school in opposition to the unconventional style of Kaulbach, and adhered to the most rigid rules of art. His most celebrated works are the frescoes and paintings of the *Nibelungen*, and his series of encaustic pictures illustrating the history of Charlemagne, Frederick Barbarossa, and Rudolph of Hapsburg, all in the royal palace at Munich; "Luther at the Diet of Worms," also in Munich; and his designs for the windows in St. Paul's cathedral, London. His best known designs for illustrated books are his *Bibel in Bildern* (Leipsic, 1852-'60), and those prepared in conjunction with Neureuther for the *Nibelungenlied*.—His brother LUDWIG FERDINAND (1788-1853), chief director of the Belvedere gallery in Vienna, was a good painter of the romantic school, and executed admirable designs for Goethe's *Faust*.

SCHELCHER, Victor, a French author, born in Paris, July 21, 1804. He early became known as an advocate of free institutions, visited Mexico, the United States, the West Indies, and the East, and the banks of the Senegal, and published *De l'esclavage des noirs et de la législation coloniale* (1833); *Abolition de l'esclavage* (1840); *Les colonies françaises* (1842); *Les colonies étrangères et Haïti* (2 vols., 1843); *Égypte en 1845* (1846); and *L'Histoire de l'esclavage pendant les deux dernières années* (2 vols., 1847). In 1848 he was appointed under-secretary of state for the navy, and at once procured the passage of a law for the abolition of slavery in the French colonies (April 27). He represented Guadeloupe in the constituent and legislative assembly till the *coup d'état* of Dec. 2, 1851, when, after an attempt at armed resistance, he took refuge in London, where he published several works, including a "Life of Handel" in English (1857). Despite successive amnesties, he did not return to Paris until after the downfall of Napoleon III. in 1870. During the siege of Paris he had command of the artillery of the national guard. The commune imprisoned him a few days for attempting to reconcile them with the government. At the general election of Feb. 8, 1871, he was returned in Paris, Martinique, and French Guiana, and took his seat for Martinique.

SCHÖFFER, or *Schoffler*, **Peter**, a German printer, born at Gernsheim, near Darmstadt, about 1480, died about 1503. In early life he was a copyist at Paris, but about 1450 became an assistant in the printing establishment of Faust and Gutenberg in Mentz. He introduced many improvements in the art of printing while in their employ, and after their separation in 1455 became a partner of Faust, whose daughter Christine he afterward married. The first book on which his name appears is the celebrated Psalter, August, 1457, reprinted in 1459. This was followed by a number of other works, all remarkable for their beauty of impression and clearness of type. In 1463 he accompanied his father-in-law to Paris to establish a depot for the sale of their books. After the death of Faust about 1466, Schöffler carried on the business alone, and was succeeded by his son Johann. The latter printed chiefly religious works between 1503 and 1531. A monument to Peter Schöffler was erected at Gernsheim in 1836.

SCHOFIELD, **John McAllister**, an American soldier, born in Chautauqua co., N. Y., Sept. 29, 1831. He graduated at West Point in 1853, and in 1860 became professor of physics in the Washington university at St. Louis. On Nov. 21, 1861, he was made brigadier general of volunteers, five days afterward brigadier general of Missouri militia, and on Nov. 29, 1862, major general of volunteers. He bore a part in the principal engagements of the Atlanta campaign, and after the capture of Atlanta, Sept. 1, 1864, was placed under Gen. Thomas in command of the forces which opposed the movement of Gen. Hood toward Nashville. He commanded at the battle of Franklin, Nov. 30, for which he was made brigadier general in the regular army, and afterward brevet major general; and he led a corps in the subsequent engagements before Nashville, Dec. 15, 16, and in the pursuit of the remnant of Gen. Hood's army. As commander of the department of North Carolina he took possession of Wilmington, Feb. 22, 1865; fought successfully at Kingston, March 8-10; and then advanced to Goldsboro', where on March 22 he united with the army of Gen. Sherman. During the political complication of 1868 Gen. Schofield was appointed secretary of war, May 30. In March, 1869, he was assigned to command the department of the Missouri, and in April, 1870, the division of the Pacific.

SCHOHARIE, an E. county of New York, drained by Schoharie and Catskill creeks; area, 675 sq. m.; pop. in 1870, 33,340. A branch of the Catskill mountains occupies the S. and W. part, and a ridge called the Helderberg mountains extends along the E. border. Iron ore, limestone, and sandstone are found, and there are sulphur springs in the northwest. It is traversed by the Albany and Susquehanna and two or three short railroads. The chief productions in 1870 were 66,440 bushels of wheat, 82,452 of rye, 113,097 of Indian corn, 750,091

of oats, 40,127 of barley, 231,230 of buckwheat, 329,488 of potatoes, 95,520 tons of hay, 126,903 lbs. of wool, 2,190,668 of butter, 112,421 of cheese, 1,610,457 of hops, 84,811 of flax, 69,986 of maple sugar, and 16,998 of honey. There were 8,634 horses, 23,256 milch cows, 15,087 other cattle, 29,293 sheep, and 6,200 swine; 6 manufactories of agricultural implements, 4 of brooms, 10 of carriages and wagons, 2 of cement, 5 of cheese, 12 of cooperage, 1 of cotton goods, 10 of iron castings, 15 of leather, 3 of paper, 12 flour mills, and 10 saw mills. Capital, Schoharie.

SCHOLASTICISM. See **PHILOSOPHY**, vol. xiii., p. 439.

SCHOLTEN, **Johannes Hendrik**, a Dutch theologian, born at Vleuten, near Utrecht, Aug. 17, 1811. He was minister at Meerkerk from 1838 to 1840, and afterward professor of theology at the Athenæum of Franeker till 1843, when he was transferred to the university of Leyden. He is the founder of the new school of Dutch Protestant theology, and claims for it the utmost independence in the application of scientific principles. His works include *Geschiedenis der Godsdienst en wijsbegeerte* (Leyden, 1853; French translation by Réville, *Manuel d'histoire comparée de la philosophie et de la religion*, Paris, 1861); *De leer der hervormde kerk in hare grondbeginselen* (2 vols., Leyden, 1848-'50; 4th ed., 1861-'2); *De vrye wil critisch onderzoek* (1859); *Over de oorzaken van het hedendaagsche materialisme, and Het critisch standpunt van Mr. C. W. Opzoomer* (Amsterdam, 1860); *Het evangelie naar Johannes* (Leyden, 1864; German translation by Lang, Berlin, 1864); *De oudste getuigenissen aangaande de schriften des Nieuwe Testaments* (Leyden, 1866; German translation by Manchot, Bremen, 1867); *De evangelien naar Mattheus en Marcus* (1867); and *Supernaturalisme in verband mit Bijbel, christendom en protestantisme* (1867).

SCHOMBERG, **Frederick Hermann**, duke of, an English soldier of German origin, born in Heidelberg about 1616, fell in battle, July 1 (N. S. 12), 1690. He was a son of the German count Johann Meinhardt von Schomberg, and his mother was an English lady, a daughter of Sir Edward Sutton, Lord Dudley. In early life he served in the armies of the Netherlands and other countries, and in 1650 entered that of France. As commander in Portugal he compelled Spain in 1668 to recognize the Portuguese dynasty of Bragança. In 1675 Louis XIV. made him marshal for his services in Catalonia, and in the following two years he forced the enemies of France to raise the siege of Maestricht and Charleroi. He left the French army on the revocation of the edict of Nantes in 1685, and sought employment from other governments. The prince of Orange, under whom he had formerly served, appointed him as his second in command on his departure for England in 1688, and in 1689 created him duke of Schomberg in the Eng-

lish peerage, and made him master of the ordinance, while parliament granted him £100,000. He was sent to Ireland, and in 1690 took a heroic part in the battle of the Boyne, in which he lost his life.—His second son Meinhardt became duke of Leinster, and succeeded his brother Charles as third duke of Schomberg. He died without male issue in 1719, when all the titles became extinct.

SCHOMBERG, Henri de, count, a French soldier, born in Paris in 1573 or 1575, died in Bordeaux, Nov. 17, 1632. He was descended from the German Schombergs. After holding various high offices he became in 1619 superintendent of finance and grand master of artillery, and assisted in reducing the Protestant strongholds in Languedoc and Guienne. From 1621 to 1624 he was omnipotent as prime minister, and excited the jealousy of Richelieu, who had him displaced, but raised to the rank of marshal. He expelled the English from the island of Ré in 1627, and distinguished himself during the siege of La Rochelle; took Pinerolo in 1630, and forced the duke of Savoy to raise the siege of Casale; in 1632 commanded the army against the insurgents in Languedoc, on Sept. 1 defeated and captured the duke of Montmorency at Castelnaudary, and was made governor of Languedoc. He published *Relation de la guerre d'Italie* (Paris, 1630).—His son CHARLES (1601–56) served under him in Italy and Languedoc, succeeded him as governor of the latter province, defeated the Spaniards at Leucate in 1637, received the rank of marshal, took Perpignan in 1642, and commanded the army which invaded Catalonia in 1648. He acquired the title of duke by his first wife, the duchess of Halluin. His second wife, Marie de Hautefort (1616–91), was a favorite of Louis XIII., and one of the most celebrated women of her day, best known as *maréchale de Schomberg*.

SCHOMBURCK, Sir Robert Hermann, an English traveller, born at Freiburg-on-the-Unstrut, Prussia, June 5, 1804, died at Schöneberg, near Berlin, March 11, 1865. In early life he was for some time partner in a tobacco manufactory in Virginia. In 1830 he went almost penniless to the West Indies, and explored the little island of Anegada, one of the Virgin group. His valuable reports on the dangerous coasts procured him in 1834 from the English geographical society and some botanists the means of exploring British Guiana, where he spent four years. He published "Description of British Guiana, Geographical and Statistical" (London, 1840); "Views in the Interior of Guiana" (1840); and reports to the geographical society, translated into German by his brother Otto, with a preface by Alexander von Humboldt (*Reisen in Guiana und am Orinoco*, Leipsic, 1841). The great *Victoria regia* lily was discovered by him on this journey. From 1841 to 1844 he was at the head of a commission to survey

the frontier between British Guiana and Brazil, and to make further geographical and ethnological investigations. He was joined by his brother Moritz Richard, who published an account of the journey in German (3 vols., 1847–8). Robert was knighted in 1845, and from 1848 to 1857 he was British consul and chargé d'affaires to the Dominican republic, and afterward till 1864 consul general at Bangkok, Siam. Besides the works mentioned, he published "History of Barbadoes" (1847), and "The Discovery of the Empire of Guiana by Sir Walter Raleigh" (1848).

SCHÖNBEIN, Christian Friedrich, a German chemist, born at Metzingen, Würtemberg, Oct. 18, 1799, died in Baden-Baden, Aug. 28, 1868. He was early apprenticed to a manufacturer of chemical products, and was conscripted, but was exempted from military service by the king, who assisted him in completing his education at Tübingen and Erlangen. In 1824–5 he taught chemistry and physics at Keilhau near Rudolstadt. In 1828 he became professor at the university of Basel. In 1839 he discovered the allotropic condition of oxygen known as ozone (see OZONE), and in 1845 he produced gun cotton. His most noteworthy works are: *Das Verhalten des Eisens zum Sauerstoff* (Basel, 1837); *Beiträge zur physikalischen Chemie* (1844); *Ueber die Erzeugung des Ozons* (1844); and *Ueber die langsame und rasche Verbrennung der Körper in atmosphärischer Luft* (1845).—See *Christian Friedrich Schönbein*, by Hagenbach (Basel, 1869).

SCHOOL BROTHERS AND SCHOOL SISTERS, the collective name of numerous associations in the Roman Catholic church, devoted to the education of youth. The first of these associations, the Ursulines, arose in 1537 at Brescia, under the direction of the first Jesuits; the "Sisters of the Congregation of Our Lady" were founded in 1597 by Pierre Fourier; the "Piarists" or "Fathers of the Pious Schools," in the same year; the "Visitation Nuns" in 1610; and the "Brothers of the Christian Schools" in 1679. In 1863 there were in France 58,883 members of sisterhoods employed in teaching, and 3,073 more directing orphan asylums and agricultural or industrial schools, while the total number of school brothers in the same year was upward of 9,000. I. SCHOOL BROTHERS. Under this name we treat solely of those congregations whose members are not priests, the "Fathers of the Pious Schools" being treated under PIARISTS. The following are the most important school brotherhoods: 1. The "Brethren of the Christian Schools," founded in 1679 by Jean Baptiste de la Salle. (See BRETHREN OF THE CHRISTIAN SCHOOLS.) 2. The "Christian Brothers," founded by the Rev. E. Rice at Waterford, Ireland, with their central house and superior general in Dublin, and numerous establishments in Great Britain, Ireland, and the British colonies. 3. The "Brothers Marists" or "Christian Brothers of the Society of Mary," founded

at Bordeaux, France, in 1817, by Abbé Guillaume Joseph Cheminade, approved by Pope Gregory XVI. in 1839, introduced into the United States in 1849 by Archbishop Purcell of Cincinnati, and having in 1874 23 establishments in Ohio, Illinois, New York, Pennsylvania, Maryland, Louisiana, and Texas. 4. The "Lamennaisian Brothers" or "Congregation of Christian Instruction," founded in Brittany in 1820, by Abbé Jean de Lamennais, whose purpose is to teach in the poorest localities. In 1875 they reckoned about 800 members and 150 establishments in France. 5. The "Brothers of the Sacred Hearts of Jesus and Mary," founded in 1821 at Le Puy, France, by Abbé Coindrin. They opened their first house in the United States at Mobile in 1847, and in 1874 had other establishments in Mississippi, New Orleans, Kentucky, and Indiana. 6. The "Xaverian Brothers," founded at Bruges, Belgium, in 1839, by Théodore Jacques Ryken, with a special view to labor for education in the United States. They were first introduced into Louisville in 1854 by Bishop (afterward Archbishop) Spalding, and in 1875 had charge of six schools there, of one in Baltimore, and of the St. Mary's industrial school for boys near that city. 7. The "Brothers of Charity," founded in 1809, in Belgium, by Canon P. Triest, for the education of the blind and deaf mutes, and the training of orphans. In January, 1874, they took charge of the industrial school of the Angel Guardian in Boston, Mass. Besides these, there are in the United States and Canada congregations of men forming an integral portion of religious orders comprising priests. Such are the "Josephites" or "Brothers of St. Joseph," who are only a branch of the congregation of the Holy Cross, founded in 1834 at Le Mans, France, by Abbé Moreau, the various communities of Franciscan brothers belonging to the third order of St. Francis, and dependent on the Franciscan priests, and the "Clerks of Saint Viator."

II. SCHOOL SISTERS. Of these congregations the most important are the following: 1. The Ursulines. (See *URSULINES*.) 2. The "Sisters of the Visitation of Our Lady," founded in 1610 at Annecy in Savoy, by St. Francis of Sales and St. Jeanne Françoise de Chantal. The order numbered 87 establishments at the death of the latter in 1641, and 160 in 1700, with 6,600 members. It was approved by Pope Urban VIII. in 1626. The first establishment in the United States was made in Washington in 1808, and the order has now (1875) other monasteries and schools in Maryland, Virginia, West Virginia, Kentucky, New York, Delaware, and Minnesota. 3. The "Sisters of Notre Dame," or "School Sisters of the Blessed Peter Fourier," founded by him and Alice Leclerc at Mataincourt, France, in 1597, abolished in 1789, revived at Ratisbon in 1832, confirmed by Pope Pius IX. in 1854, and first introduced into the United States in 1847. In 1875 they had establishments in Maryland,

New Jersey, New York, Kentucky, Illinois, Michigan, Missouri, Wisconsin, Iowa, and Minnesota. 4. The "Sisters of Notre Dame de Namur," founded at Amiens, France, in 1804, by Père Joseph Désiré Varin, Julie Billiart, and Marie Louise Françoise Blin de Bourdon, and transferred to Namur, Belgium, in 1809. Its object is to educate girls of the middle classes, and it was approved June 28, 1844, by Pope Gregory XVI. It spread rapidly through Belgium, France, Great Britain, and Ireland. The English government intrusted to the order the direction of normal schools for Roman Catholic pupil-teachers. They were called to Cincinnati in 1840 by Bishop (afterward Archbishop) Purcell, to Oregon by Archbishop Blanchet in 1843, to California in 1851, and to Guatemala in 1859. In 1871 this sisterhood owned 82 establishments, of which 20 were in the United States, with a total of 26,000 pupils. 5. The "Sisters of the Congregation of Notre Dame," founded at Montreal, Canada, in 1653, by Marguerite Bourgeoys, and approved by Bishop de Laval of Quebec, and now the most numerous teaching body in Canada. The mother house is at Montreal. At the close of 1874 the order numbered 569 professed sisters and 88 novices, with 56 establishments in Canada and the United States. 6. "Ladies of the Sacred Heart." (See *SACRED HEART, LADIES OF THE*.) The preceding congregations have for their primary object the instruction of young girls. Others combine with the labor of teaching the care of orphan asylums, the visitation of the sick and poor, and the direction of hospitals. Such are: 1. The "Ladies of the Incarnate Word," founded in 1625 by Jeanne Marie Chézard de Matel, and approved by Urban VIII. in 1633. Their sole object at first was education; they assumed the direction of hospitals in 1866. They have many establishments in France, and eight in Texas. 2. The "Poor Handmaids of Jesus Christ," founded Aug. 15, 1849, at Dernbach, Nassau, by Katharine Kaspar, approved by Pius IX. in 1860, and confirmed in 1870. Their first establishment in this country was at Fort Wayne, Ind., in August, 1868. They numbered 45 sisters and five houses in 1875. 3. The "Sisters of Our Lady of Charity," or "Eudist Sisters," founded in 1641 at Caen in Normandy, by Abbé Jean Eudes. In 1835 a modification of the rule enabling them to take charge of penitent women was introduced at Angers, the establishment there becoming known as the "House of the Good Shepherd." The change was approved by Pope Gregory XVI., and the order thereafter was called the "Sisters of Our Lady of Charity of the Good Shepherd." They have numerous establishments in Europe, came to the United States in 1842, and have opened houses in the principal cities of the Union and in Canada. 4. The "Presentation Nuns," founded at Cork, Ireland, in 1777, by Miss Nano Nagle, for the visitation of the sick and poor and the instruc-

tion of poor children. They have since forborne from visiting the sick, and become strictly cloistered. Their rules were approved by Pius VII. in 1805. Their first establishment in America was at St. John's, Newfoundland, and the first in the United States was made in New York city, Sept. 8, 1874. 5. The "Sisters of Mercy." (See MERCY, SISTERS OF.) 6. The "Sisters of Charity." (See CHARITY, SISTERS OF.) 7. The "Gray Nuns" or "Sisters of Charity of Montreal," founded there in 1745 by Mme. d'Youville, and trained to take charge of hospitals, asylums, and schools. The 24 houses dependent on Montreal in 1875 numbered 225 professed nuns and 51 novices, laboring in Canada and the United States. The houses dependent on the central establishment in Quebec numbered 107 sisters. 8. The "Sisters of St. Joseph." There are several congregations bearing this name. The principal one was founded at Le Puy, France, in 1650, by Abbé Jean Pierre Médaille, and introduced into the United States by Bishop Rosati of St. Louis in 1836. In 1875 they had establishments in the principal eastern and western states. Besides these, several less numerous congregations have originated in America, which are chiefly devoted to education. Among them are: the "Sisters of Charity of Nazareth," founded in 1812 in Kentucky, by Bishop David; the "Sisters of Loreto," founded in Kentucky in 1812, by the Rev. Charles Nerinckx, and now having establishments in nearly all the western states; the colored "Oblate Sisters of Providence," founded at Baltimore in 1825 by the Rev. H. Joubert, approved by Pius VIII. in 1831, and now increasing in numbers in consequence of the mission to the blacks intrusted to the missionary society of St. Joseph, under the guidance of the Oblates of St. Charles (see OBLATES OF ST. CHARLES); and the "Sisters of Charity of the Blessed Virgin," founded at Philadelphia by the Rev. T. C. Donaghoe, and removed afterward to Iowa, where they have several establishments. In Canada there are the "Sisters of St. Anne," founded at Vaudreuil near Montreal in 1848, by the Right Rev. Ignace Bourget, bishop of that city, approved by Pius IX. in 1860, and introduced into Oswego, N. Y., in 1866; they are exclusively school sisters.

SCHOOLCRAFT, a county of the upper peninsula of Michigan, bounded N. by Lake Superior and S. E. by Lake Michigan; area, about 2,300 sq. m.; pop. in 1874, 1,290. It is drained by the Manistique river and other streams. The surface is rough and broken, and mostly covered with dense forests of pine. Lumbering is the chief occupation. In 1870 there were two blast furnaces and four saw mills in operation. The "Pictured Rocks," a perpendicular wall many miles long and 200 to 300 ft. high, curiously stratified, are in this county, on the S. shore of Lake Superior. Capital, Onota.

SCHOOLCRAFT, Henry Rowe, an American author, born in Watervliet (now Guilderland),

Albany co., N. Y., March 28, 1793, died in Washington, D. C., Dec. 10, 1864. He studied at Union college, and under Prof. F. Hall of Middlebury college, Vt., learned the art of glass making, made a mineralogical and geological tour in the west in 1817-'18, was geologist of an exploring expedition in the Lake Superior copper region and on the upper Mississippi in 1820, travelled as Indian commissioner in Illinois and along the Wabash and Miami rivers in 1821, and in 1822 was Indian agent at Sault Ste. Marie and Michilimackinac. In 1823 he married the granddaughter of an Indian chief. He was a member of the Michigan legislature from 1828 to 1832, and founded the Michigan historical society and the Algic society at Detroit. Before the latter he read two lectures on the Indian languages, for which he received a gold medal from the French institute. In 1832 he conducted the expedition which discovered the source of the Mississippi, and in 1836 secured the cession by the Indians of 16,000,000 acres of land to the United States. He was appointed acting superintendent of Indian affairs in 1836, and chief disbursing agent for the northern department in 1839. In 1845 he made a census of the Six Nations of New York for the state legislature, and in 1847 removed to Washington, and engaged under the appointment of the government in the preparation of a work entitled "Historical and Statistical Information respecting the History, Condition, and Prospects of the Indian Tribes of the United States" (6 vols. 4to, with 336 plates, Philadelphia, 1851-'7). He also published, in connection with his researches, "A View of the Lead Mines of Missouri" (8vo, New York, 1819); "Travels in the Central Portions of the Mississippi Valley" (1825); "Narrative of an Expedition to Itasca Lake, the actual Source of the Mississippi" (1834; republished, with the account of the expedition of 1820, under the title "Narrative of an Exploratory Expedition to the Sources of the Mississippi River in 1820, completed by the Discovery of its Origin in Itasca Lake in 1832," Philadelphia, 1853); "Algic Researches" (2 vols. 12mo, New York, 1839; republished under the title "The Myth of Hiawatha and other Oral Legends," 8vo, Philadelphia, 1856); "Oneota, or Characteristics of the Red Race of America" (New York, 1844); "Notes on the Iroquois" (Albany, 1848); "Personal Memoirs of a Residence of Thirty Years with the Indian Tribes" (8vo, Philadelphia, 1851); and "Scenes and Adventures in the Semi-Alpine Regions of the Ozark Mountains" (Philadelphia, 1853). "The Indian Fairy Book" has been compiled from his manuscripts by C. Mathews (New York, 1868).

SCHOOLS. See COLLEGE, COMMON SCHOOLS, EDUCATION, INFANT SCHOOLS, MILITARY SCHOOLS, NORMAL SCHOOLS, REFORMATORIES, and UNIVERSITY.

SCHOPENHAUER, Arthur, a German philosopher, born in Dantzic, Feb. 22, 1788, died in

Frankfort, Sept. 21, 1860. His father was a banker, and left him a fortune; and his mother, Johanna Frosina (1770–1838), was a novelist of merit. He studied at Göttingen and Berlin, and in 1813 maintained at the university of Jena a thesis entitled *Ueber die vierfache Wurzel des Satzes vom zureichenden Grunde*, which contained the germs of his future philosophy. In 1814 he spent the winter at Weimar with Goethe, who initiated him into his own studies on colors, and Schopenhauer in 1816 published *Ueber Sehen und Farben*. From 1814 to 1818 he lived at Dresden, and brought his philosophical views into a system, exhibited in *Die Welt als Wille und Vorstellung* (1819; English translation by Franz Hüffer, London, 1874). (See PHILOSOPHY, vol. xiii., p. 442.) In 1820 he lectured for six months at the university of Berlin, and in 1831 settled at Frankfort. His remaining works are: *Ueber den Willen in der Natur* (1836); *Die Freiheit des menschlichen Willens* (1839) and *Das Fundament der Moral* (1841), which were combined and revised under the title *Die beiden Grundprobleme der Ethik* (1860); and *Parerga und Paralipomena* (1851), a collection of essays and his most popular work. A complete edition of his works has been published by Julius Frauenstädt (6 vols., Leipsic, 1874), who has also written *Schopenhauer, Lichtstrahlen aus seinen Werken*, with a biography (3d ed., Leipsic, 1874).—See also *Philosophie de Schopenhauer*, by Th. Ribot (Paris, 1875).

SCHRADER, Julius, a German painter, born in Berlin, June 16, 1815. He studied in Düsseldorf, and in 1844 received the great academical prize in Berlin, which provided him with a three years' pension during his residence in Rome. In 1851 he became professor at the Berlin academy, and member of the academical senate. He excels in painting nude figures, drapery, and costumes. His best known works are: "The Death of Leonardo de Vinci," "The Surrender of Calais," the fresco in the new Berlin museum of the "Consecration of the Church of St. Sophia in Constantinople by the Emperor Justinian," "Charles I. saying Farewell to his Family," "Esther in the presence of Ahasuerus," "Lady Macbeth walking in Sleep," "Cromwell at his Daughter's Deathbed," and the portraits of Alexander von Humboldt, Cornelius, Ranke, and Moltke.

SCHREVELIUS, or Schrevel, Cornelius, a Dutch scholar, born in Haarlem in 1615, died in Leyden, Sept. 11, 1664. He succeeded his father as rector of the college in Leyden in 1642. He published *variorum* editions of many classical authors, and a *Lexicon Manuale Græco-Latinum et Latino-Græcum* (1654), which, often republished, has been more extensively used than almost any other work of the kind.

SCHREYER, Adolph, a German painter, born in Frankfort in 1828. He completed his studies of the horse in Stuttgart, Munich, and Düsseldorf, accompanied the Austrian army in 1854 to the Danubian principalities, travelled

through Turkey, Hungary, and southern Russia, and in company with Prince Thurn and Taxis through Egypt, Syria, and Algeria; and he subsequently resided in Paris. His pictures of animals, especially of horses, and also those of human beings and of landscapes, are remarkable for vigor and brilliant coloring. Among the most celebrated are an "Artillery Attack at Traktir," "Horses frightened by Wolves," "The Dying Horse," "The Wallachian Stud," "The Wallachian Extra-Post," and "The Csikós driving his Horses across the Plain." He has repeatedly received medals at the Paris exhibition.

SCHRÖCKH, Johann Matthias, a German church historian, born in Vienna, July 26, 1733, died in Wittenberg, Aug. 2, 1808. He was successively professor of philosophy, of poetry, and of history at Wittenberg. His most important works are *Christliche Kirchengeschichte* (35 vols., Leipsic, 1768–1803; 2d ed. by Tzschirner, vols. i.–xiv., 1772–1825), and *Kirchengeschichte seit der Reformation* (8 vols., Leipsic, 1804–'9; 2 vols. added by Tzschirner, 1812).

SCHRÖDER. I. Antoinette Sophie, a German actress, born in Paderborn, Feb. 29, 1781, died in Munich, Feb. 25, 1868. She was a daughter of the comedian Bürger, and became a celebrated tragedian, excelling as Phædra, Medea, and Lady Macbeth, and successively performing at Hamburg, Vienna, and Munich. Her last public appearance was at the Schiller centenary in 1859, when she recited the "Song of the Bell." She was separated from her first husband, the actor Stollmers or Smets, soon after their marriage in 1795; the singer Friedrich Schröder, who married her in 1804, died in 1818; and she did not live long with her third husband, the actor Kunst.—See *Sophie Schröder*, by P. Schmidt (Vienna, 1870).

II. Wilhelmine Schröder-Devrient, a German singer, daughter of the preceding, born in Hamburg, Dec. 6, 1804, died in Gotha, Jan. 26, 1860. In her childhood she performed as a ballet dancer; in her 15th year she appeared at Vienna in Racine's *Phèdre*; and in the following year she displayed great genius as a singer, and soon eclipsed all other prima donnas by her powerful voice and her excellent acting, especially in *Fidelio*, *Euryanthe*, *Norma*, *La sonnambula*, as Romeo, as Desdemona, and as Valentine in the "Huguenots." In 1828 she was separated from her first husband, Karl August Devrient, and subsequently at Dresden from her second husband, the Saxon officer Döring, after which she married the Livonian nobleman Von Bock.—See *Wilhelmine Schröder*, by Wolzogen (Leipsic, 1863).

SCHRÖDER, Friedrich Ludwig, a German actor, born in Schwerin, Nov. 3, 1744, died in Hamburg, Sept. 3, 1816. In his childhood he performed in the strolling company of his parents, and before the age of 30 he had become one of the greatest German tragedians. In 1771 he assumed the management of the theatre at Hamburg, and wrote plays, besides translating

several of Shakespeare's, which he was the first to introduce upon the German stage. His *Dramatische Werke* were edited by Bülow, with an introduction by Tieck. His life was written by F. L. W. Meyer (2 vols., Hamburg, 1810), and by Brunier (Leipsic, 1864).

SCHRÖDTER, Adolph, a German painter, born in Schwedt, Prussia, June 28, 1805. He studied copperplate engraving in Berlin seven years, and subsequently resided as a painter at Düsseldorf and Frankfurt. In 1859 he became professor at the polytechnic school in Carlsruhe. He is distinguished for his humorous pieces, especially his "Wine Tasters" (1832), "Auerbach's Cellar" (1848), and more recently "Hans Sachs" and "Falstaff and the Page," and for genre pictures of a serious character.

SCHUBART, Christian Friedrich Daniel, a German poet, born at Obersontheim, Swabia, March 26, 1739, died in Stuttgart, Oct. 10, 1791. After a dissolute and adventurous life, he was driven from Augsburg, where he had established the *Deutsche Chronik* (1774-'7), for deriding the clergy, and transferred it to Ulm; and for publishing there a false report of the death of Maria Theresa he was imprisoned about ten years. Schiller visited him during that period, and the king of Prussia obtained his release in 1787. In Stuttgart, where he became musical director and director of the theatre, he continued his periodical under the title of *Vaterlands-Chronik*. He wrote *Gedichte aus dem Kerker* (1785), *Hymnus auf Friedrich den Grossen* (1786), an autobiography, and a large number of religious songs. His *Gesammelte Schriften und Schicksale* appeared in 8 vols. (Stuttgart, 1839-'40).—See *Schubart's Leben in seinen Briefen*, by David Friedrich Strauss (2 vols., Berlin, 1849).

SCHUBERT, Franz, a German composer, born at Lichtenthal, near Vienna, Jan. 31, 1797, died in Vienna, Nov. 19, 1828. His father was a school teacher, from whom he received his first lessons. Having a fine voice, he was admitted to the academy of the "Konvict," and became a member of the imperial chapel choir, then conducted by Salieri, whose favorite pupil he was. While at school he experimented on almost every variety of music, to some of which he gave curiously mournful titles, as "The Parricide" and the "Corpse Fantasia." Leaving the academy in 1813, he assisted his father in teaching for three years, but did not neglect his music, for during 1815 alone he wrote more than 100 songs, six operas and operettas, and some symphonic pieces, besides church and chamber music. In 1818 he was engaged by Count Esterházy to teach his two daughters; and while living with this family he composed many of his best quartets and songs. His music was not popular with the Viennese public, and he constantly experienced the mortification of seeing inferior works preferred to his own. In the spring of 1828 he gave his first and only concert. Intense enthusiasm was awakened, but the encourage-

ment that might have proved his salvation some years before came too late, and after a life of disappointment, embittered by failing health, he died at the age of 31. He left an astonishing number of compositions, including nine symphonies, several operas, masses, overtures, a great deal of chamber and pianoforte music, and about 600 songs. Of all this music but little was published during his life, and he heard but a very small portion of it publicly performed, being known to his contemporaries mostly as a song writer. He raised the German *Lied* to a place in musical art which it had not previously occupied. His fame is almost wholly posthumous, and has constantly gained strength since his death. Biographies of Schubert have been written by Kreissle von Hellborn (Vienna, 1864; English translation by E. Wilberforce, London, 1866) and Reissmann (Berlin, 1874).

SCHUBERT, Gotthilf Heinrich von, a German mystic, born at Hohenstein, Saxony, April 26, 1780, died at Laufzorn, Upper Bavaria, July 1, 1860. He studied theology at Leipsic and medicine at Jena, practised medicine at Altenburg, Freiberg, and Dresden, was director of an educational institution in Nuremberg from 1809 to 1816, tutor to the children of the grand duke of Mecklenburg-Schwerin till 1819, and professor of the natural sciences at Erlangen till 1827, and subsequently at Munich. He was a disciple of Schelling, and published numerous works embodying mystical interpretations of natural phenomena, and forming a system of objective idealism. Among them are: *Ahnungen einer allgemeinen Geschichte des Lebens* (3 vols., Leipsic, 1806-'20); *Ansichten von der Nachtseite der Naturwissenschaften* (1808; 4th ed., 1840); *Symbolik des Traums* (1814; 4th ed., 1862); *Geschichte der Seele* (1830; 2d ed., 1833); and *Altes und Neues aus dem Gebiete der innern Seelenkunde* (5 vols., 1817-'44). He also published manuals of natural history, narratives of travel in France, Italy, and the Levant, several volumes of tales and biographies, and an autobiography (3 vols., Erlangen, 1853-'6).

SCHULTE, Johann Friedrich, a German theologian, born at Winterberg, Westphalia, April 23, 1827. He graduated at the university of Berlin in 1851, and practised law in Berlin, Arnberg, and Bonn. In 1855 he was appointed professor of canon law in the university of Prague, and in 1863 a member of the Austrian council of instruction. During the Vatican council he declared himself opposed to the declaration of pontifical infallibility; and after the proclamation of the dogma he took sides with Dr. Döllinger and the Old Catholics. In 1871 he published at Prague a pamphlet entitled "The Power of the Roman Popes over Princes, Countries, Peoples, and Individuals examined by the light of their Doctrines and Acts since the reign of Gregory VII., to serve for the appreciation of their Infallibility, and set face to face with contradictory doctrines of

the Popes and Councils of the first Eight Centuries." To this Bishop Fessler of St. Pölten replied in "The True and False Infallibility" (English ed., London and New York, 1875). Dr. Schulte, having resigned his offices in the university of Prague and the consistorial court, was in 1872 appointed by the German government professor in the university of Bonn. His principal works are: *System des katholischen Kirchenrechts* (Giessen, 1856); *Die Lehre von den Quellen des katholischen Kirchenrechts* (1860); *Lehrbuch des katholischen Kirchenrechts* (1868); *Lehrbuch der deutschen Reichs- und Rechtsgeschichte* (2 vols., Stuttgart, 1861-'70); *Die Rechtsfrage des Einflusses der Regierungen bei den Bischofswahlen* (Giessen, 1869); and *Die Macht der römischen Päpste*, &c. (Prague, 1871).

SCHULTZ-SCHULTZENSTEIN, Karl Heinrich, a German physiologist, born at Alt-Ruppin, Prussia, July 8, 1798, died in Berlin, March 27, 1871. He graduated at Berlin, where he became in 1825 extraordinary, and in 1833 ordinary professor of physiology. His works relating to his microscopical investigations of the movement of sap and the internal organization of plants include *Die Natur der lebendigen Pflanze* (2 vols., Berlin, 1823); *Sur la circulation et sur les vaisseaux lactifères dans les plantes* (1839), crowned by the French academy; *Die Cyclose des Lebenssaftes in den Pflanzen* (Bonn and Breslau, 1841); *Ueber Anaphytose oder Verjüngung der Pflanzen* (Berlin, 1843); *Neues System der Morphologie der Pflanzen* (1847); and *Die Verjüngung im Pflanzenreich* (1851). In animal physiology his most important works are *Ueber die Verjüngung des menschlichen Lebens* (Berlin, 1842) and *Die Verjüngung im Thierreich* (1854). He endeavored to found a new system of psychology in his treatises *Die Bildung des menschlichen Geistes durch Cultur der Verjüngung* (1855), *Die Moral als Heilwissenschaft und Culturwissenschaft* (1863), and *Die Physiologie der Verjüngung des Lebens im Unterschiede von dynamischen und materialistischen Stoffwechseltheorien* (1867). He also wrote on the history of medicine and the theory of disease.

SCHULTZE, Max, a German anatomist, born about 1825, died in Bonn, Jan. 16, 1874. He was professor at Bonn, where he superintended the establishment of the new anatomical laboratory. From 1858 to 1861 he elaborated the protoplasm theory. (See PROTOPLASM.) His works comprise *Innere Bewegungserscheinungen bei Diatomeen* (in Troschel's *Archiv für Naturgeschichte*, 1860); *Ueber Muskelkörperchen* (1860); *Das Protoplasma der Rhizopoden und der Pflanzenzellen* (1863); and *Zur Anatomie und Physiologie der Retina* (1866).

SCHULZE, Ernst Konrad Friedrich, a German poet, born in Celle, March 22, 1789, died there, June 29, 1817. He studied theology at Göttingen, and afterward graduated in philology, but his friend Bouterwek turned his at-

tention to æsthetic and classical studies. He wrote *Cécilie*, a romantic poem (2 vols., new ed., Leipsic, 1822), idealizing Cécilie Tychsen, a deceased lady to whom he had been attached. After participating in the war against France in 1814, he wrote *Die bezauberte Rose* (11th ed., Leipsic, 1867), which has been translated into English and French. His collected works have been edited by Bouterwek (4 vols., Leipsic, 1822) and Marggraff (5 vols., 1855).

SCHUMACHER, Heinrich Christian, a Danish astronomer, born at Bramstedt, Holstein, Sept. 3, 1780, died Dec. 28, 1850. He was educated at Kiel, Jena, Copenhagen, and Göttingen, resided from 1807 to 1810 in Altona, and in 1810 became extraordinary professor in the university of Copenhagen. In 1813 he became superintendent of the observatory at Mannheim, and in 1815 ordinary professor of astronomy and superintendent of the observatory at Copenhagen. In 1816 he was employed to measure the territory of Hamburg, and in 1817 to measure the degrees of latitude from Lauenburg to Skagen, and the degrees of longitude from Copenhagen to the W. coast of Jutland. In 1821 he received the direction of the survey and mapping of Holstein and Lauenburg, and from that time lived in Altona. In 1824, in connection with the English board of longitude, he determined the difference of longitude between the observatories of Greenwich and Altona, and in 1830 he made at the castle of Göldestein the observations in regard to the length of the seconds pendulum which served as the base of the Danish scale of measures. In 1822 he published accurate accounts of the distances of Venus, Jupiter, Mars, and Saturn from the moon. In 1821 he began his *Astronomische Nachrichten*, which is still continued; and in conjunction with other astronomers, especially Bessel, he undertook at Stuttgart in 1836 the editing of an *Astronomisches Jahrbuch*.—His nephew CHRISTIAN ANDREAS, born Sept. 6, 1810, has published a course of lectures on astronomy, and a Danish translation of Humboldt's *Kosmos* (1847), and since 1848 has edited at Copenhagen the scientific and industrial journal *Nordlyset*.

SCHUMANN, Robert, a German composer, born in Zwickau in 1810, died at Endenich, near Bonn, July 29, 1856. His father was a bookseller and publisher. At the age of eleven he wrote little choral and orchestral works. His musical education was to a great extent self-directed, and it was not until he went to the university of Leipsic in 1828 that he received intelligent instruction in music from Friedrich Wieck. In 1829 he attended lectures at Heidelberg, returning to Leipsic in 1830 to receive instruction in counterpoint and composition from Heinrich Dorn. Here he acquired that systematic knowledge of thorough bass which he had thought unnecessary in his early years, and for want of which his earlier compositions lack grace of form and freedom of expression. With a view to obtaining flexibility of the

muscles of his hand, and to shortening the months of practice necessary to acquire technical facility, he experimented upon his fingers with a machine of his own invention, which finally deprived the sinews of the third finger of his right hand of their natural elasticity, and made it impossible that he should ever become a pianist. In April, 1834, in connection with several friends, he founded the *Neue Zeitschrift für Musik*, which he long conducted in a broad, generous, and noble spirit. The years from 1837 to 1840 were rendered unhappy by the resistance of Friedrich Wieck to the marriage of Schumann with his daughter Clara, an eminent pianist. Schumann finally appealed to the law to compel the father's consent, and obtained a favorable decision from the royal court of appeals; and the marriage took place in September, 1840. Up to this period nearly all his compositions had been for the piano. During this year he devoted himself to compositions for the voice, producing 138 songs, some for one and some for more voices; very many of these have become classic. In this year also he was made doctor of philosophy by the university of Jena. Between 1840 and 1854 he produced those great works upon which his fame chiefly rests: his symphonies, his quintet opus 44 and quartet opus 47, "Paradise and the Peri," "The Pilgrimage of the Rose," and many other works of large scope. In 1850 he succeeded Ferdinand Hiller as director of music at Düsseldorf; but he lacked many of the essential qualities of a good conductor, and in 1853 his engagement terminated. Even before this time the mental malady that darkened his closing years had begun to develop itself. In February, 1854, he threw himself into the Rhine. He was rescued and removed to a private asylum at Eendenich, but never recovered his reason. His works embrace almost every variety of composition for voice and instruments. A second edition of his *Gesammelte Schriften über Musik und Musiker* appeared in Leipsic in 1875 (2 vols.).

SCHURZ, Carl, an American statesman, born at Liblar, near Cologne, Prussia, March 2, 1829. He was educated at the gymnasium of Cologne and the university of Bonn, which he entered in 1846. At the outbreak of the revolution of 1848 he joined Gottfried Kinkel, professor of rhetoric in the university, in the publication of a liberal newspaper, of which for a time he was the sole conductor. In the spring of 1849, in consequence of an unsuccessful attempt to promote an insurrection at Bonn, he fled with Kinkel to the Palatinate, entered the revolutionary army as adjutant, and took part in the defence of Rastadt. On the surrender of that fortress he escaped to Switzerland. In 1850 he returned secretly to Germany, and with admirable skill and self-devotion effected the escape of Kinkel from the fortress of Spandau, where he had been condemned to 20 years' imprisonment. In

the spring of 1851 he was in Paris, acting as correspondent for German journals, and he afterward spent a year in teaching in London. He came to the United States in 1852, resided three years in Philadelphia, and then settled in Madison, Wis. In the presidential canvass of 1856 he delivered speeches in German in behalf of the republican party, and in the following year was defeated as a candidate for lieutenant governor of Wisconsin. During the contest between Mr. Douglas and Mr. Lincoln for the office of United States senator from Illinois, in 1858, he delivered his first speech in the English language, which was widely republished. Soon after he removed to Milwaukee and began the practice of law. In the winter of 1859-'60 he made a lecture tour in New England, and aroused attention by a speech delivered in Springfield, Mass., against the ideas and policy of Mr. Douglas. He was an influential member of the republican national convention of 1860, being largely instrumental in determining that portion of the platform relating to citizens of foreign origin, and spoke both in English and German during the canvass which followed. President Lincoln appointed him minister to Spain, which post he resigned in December, 1861, in order to enter the army. In April, 1862, he was commissioned brigadier general of volunteers, and on June 17 assumed command of a division in the corps of Gen. Sigel, with which he took part in the second battle of Bull Run. He was made major general, March 14, 1863, and at the battle of Chancellorsville commanded a division of Gen. Howard's corps (the 11th), which was routed by Jackson. He had temporary command of the 11th corps at the battle of Gettysburg, and subsequently took part in the battle of Chattanooga. On the close of the war he returned to the practice of law. In 1865-'6 he was the Washington correspondent of the New York "Tribune," and in 1866 he made a report, as special commissioner appointed by President Johnson, on the condition of the southern states, which was submitted to congress. In the same year he removed to Detroit, where he founded the "Detroit Post;" and in 1867 he became editor of the *Westliche Post*, a German newspaper published in St. Louis. He was temporary chairman of the republican national convention in Chicago in 1868, and labored earnestly in the succeeding canvass for the election of Gen. Grant. In January, 1869, he was chosen United States senator from Missouri, for the term ending in 1875. He opposed some of the leading measures of President Grant's administration, and in 1872 took a prominent part in the organization of the liberal party, presiding over the convention in Cincinnati which nominated Horace Greeley for the presidency. He visited Europe in 1873, and again in 1875, being received with much consideration in his native country. On his return he took part in the political canvass in Ohio, in which he opposed

strenuously the increase of the national currency. Among his more celebrated speeches are: "The Irrepressible Conflict" (1858); "The Doom of Slavery" (1860); "The Abolition of Slavery as a War Measure" (1862); and "Eulogy on Charles Sumner" (1874). A volume of his speeches was published in 1865 (12mo, Philadelphia).

SCHUYLER. I. A S. W. county of New York; area, 352 sq. m.; pop. in 1870, 18,989. The southern portion of Seneca lake, and Little, Mud, and other small lakes, are within its borders. It is traversed by the Chemung and Elmira, Jefferson, and Canandaigua railroad and the Chemung canal. The surface is hilly and the soil fertile. The chief productions in 1870 were 238,803 bushels of wheat, 21,408 of rye, 178,074 of Indian corn, 520,160 of oats, 269,945 of barley, 118,986 of buckwheat, 42,410 tons of hay, 221,749 lbs. of wool, 853,374 of butter, 40,579 of cheese, and 32,374 of honey. There were 5,665 horses, 7,440 milch cows, 6,471 other cattle, 40,237 sheep, and 3,515 swine; 5 manufactories of agricultural implements, 10 of carriages and wagons, 6 of cooperage, 1 of hinges, 3 of iron castings, 2 of marble work, 1 of machinery, 1 of malt, 12 of saddlery and harness, 1 of stone and earthen ware, 3 of woollen goods, 9 tanneries, 9 flour mills, and 10 saw mills. Capital, Havana.

II. A W. county of Illinois, bordered S. E. by the Illinois river and S. W. by Crooked creek; area, 420 sq. m.; pop. in 1870, 17,419. The surface is undulating and the soil excellent. The chief productions in 1870 were 221,945 bushels of wheat, 20,841 of rye, 440,975 of Indian corn, 119,359 of oats, 13,361 tons of hay, 4,866 lbs. of tobacco, 52,532 of wool, 213,030 of butter, 13,045 of honey, and 35,144 gallons of sorghum molasses. There were 6,479 horses, 4,192 milch cows, 8,441 other cattle, 15,419 sheep, and 23,357 swine; 7 manufactories of carriages and wagons, 1 of woollen goods, and 12 saw mills. A branch of the Chicago, Burlington, and Quincy railroad enters it. Capital, Rushville. III. A N. E. county of Missouri, bordering on Iowa, bounded W. by Chariton river and drained by the N. fork of Salt river and the head streams of Fabius river; area, 324 sq. m.; pop. in 1870, 8,820. It is traversed by the Missouri, Iowa, and Nebraska, and the St. Louis, Kansas City, and Northern railroads. The soil is rich, and the surface diversified by woodland and prairie. The chief productions in 1870 were 49,727 bushels of wheat, 279,460 of Indian corn, 125,442 of oats, 6,313 tons of hay, 22,094 lbs. of tobacco, 47,717 of wool, 129,451 of butter, and 19,755 gallons of sorghum molasses. There were 3,686 horses, 1,002 mules and asses, 3,206 milch cows, 4,185 other cattle, 15,961 sheep, and 11,928 swine. Capital, Lancaster.

SCHUYLER, Eugene. See supplement.

SCHUYLER, Philip, an American general, born in Albany, N. Y., Nov. 22, 1733, died there, Nov. 18, 1804. He inherited, according to the

law of primogeniture, the whole of his father's estate, but divided it equally among his brothers and sisters. He entered the army in 1755, and accompanied Sir William Johnson to Fort Edward and Lake George. After the peace he was a member of the colonial assembly of New York. In 1775 he was a delegate to the continental congress, which appointed him a major general and placed him in command of the army in New York and the preparations for an expedition against Canada; but he was taken sick, and the command devolved upon Montgomery. He subsequently conducted the operations against Burgoyne, but after St. Clair's evacuation of Ticonderoga suspicions against Schuyler caused him to be superseded by Gates. His conduct was afterward fully approved by a court of inquiry, but he refused to resume command, though continuing to render important services in the military operations in New York. He was a member of the continental congress from 1778 to 1781, and United States senator from 1789 to 1791, and was again appointed to that office in 1797, but did not serve.--See "Life and Times of Philip Schuyler," by Benson J. Lossing (2 vols. 12mo, New York, 1860-'62; enlarged ed., 1872).

SCHUYLKILL, a river of E. Pennsylvania, rising in the carboniferous highlands of Schuylkill co. and flowing S. E. into the Delaware river at Philadelphia; length, 120 m. It has slack-water navigation to Port Carbon, 3 m. above Pottsville. The tide ascends to Fairmount dam in Philadelphia.

SCHUYLKILL, an E. county of Pennsylvania, drained by the Schuylkill river, bounded S. E. by Kittatinny or Blue mountain, and traversed by the Broad, Sharp, and Mahanoy mountains; area, 750 sq. m.; pop. in 1870, 116,428. The surface is very mountainous, and the soil except along the streams generally poor. Anthracite coal and iron are extensively mined; the production of the former in 1870 was 3,860,144 tons, valued at \$10,289,043. Several railroads pass through it. The chief agricultural productions in 1870 were 115,831 bushels of wheat, 86,410 of rye, 267,560 of Indian corn, 288,356 of oats, 234,374 of potatoes, 33,154 tons of hay, 6,685 lbs. of wool, and 383,495 of butter. There were 3,712 horses, 5,883 milch cows, 5,255 other cattle, 3,100 sheep, and 10,831 swine; 4 manufactories of forged and rolled iron, 4 of pig iron, 23 of castings, 15 of tanned and 11 of curried leather, 22 of machinery, 47 flour mills, and 21 saw mills. Capital, Pottsville.

SCHWAB, Gustav, a German poet, born in Stuttgart, June 19, 1792, died there, Nov. 4, 1850. He studied in Tübingen, where he was tutor in the theological seminary till 1817, when he became professor of ancient literature in the upper gymnasium of Stuttgart. From 1837 to 1845 he was a clergyman near and in Stuttgart, and subsequently he became chief councillor of studies and of the evangelical consistory. His Swabian romances and

ballads rank next to those of Uhland. His principal poetical works are: *Gedichte* (2 vols., 1828-'9); *Fünf Bücher deutscher Lieder und Gedichte* (1835; 5th ed., 1871); and *Neue Auswahl* (1838; 4th ed., 1851). Prominent among his prose writings are *Die schönsten Sagen des klassischen Alterthums* (3 vols., 1838-'40; 4th ed., 1853), and *Schiller's Leben* (1840; 2d ed., 3 parts, 1841-'4).

SCHWALBACH, or **Langenschwalbach**, a watering place of Germany, in the Prussian province of Hesse-Nassau, 8 m. N. W. of Wiesbaden; pop. in 1871, 2,643. It adjoins Schlangenbad, and is celebrated as having the strongest of all chalybeate springs. A new bath house was established in 1866. The number of visitors annually is about 6,000. Large quantities of the water are exported.

SCHWANTHALER, **Ludwig Michael**, a German sculptor, born in Munich, Aug. 26, 1802, died there, Nov. 15, 1848. He studied under his father, and became in 1835 professor at the academy of Munich, after several visits to Rome. His works are numerous, including the frieze for the Barbarossa hall at Munich, more than 200 ft. long; the model for the images of the 12 ancestors of the house of Wittelsbach, in the new palace at Munich; the 15 statues of the "Battle of Arminius" for the Walhalla; the colossal statue of Bavaria, at Munich, which he left unfinished; and the statue of Mozart in Salzburg.—See *Schwanthaler's Reliquien*, by Trautmann (Munich, 1858).

SCHWARTZ, **Marie Sophie**, a Swedish novelist, born at Borås, July 4, 1819. She is a daughter of Johan Birath, a merchant, and married in 1839 Prof. Gustavus Magnus Schwartz, a physiologist, who died in 1858. Since that date she has published numerous novels, of which a complete German translation has appeared in Stuttgart (54 vols., 1865-'71). Some of them have been published in English in the United States, including "Gold and Name," "Birth and Education," and "Guilt and Innocence."

SCHWARTZENBERG. See **SCHWARZENBERG**.

SCHWARZ, **Berthold**, a German alchemist, whose real name was believed to be Konstantin Ancklitz, born in Freiburg, Breisgau, probably in the beginning of the 14th century. He was a Franciscan monk either at Mentz or at Nuremberg, and his cloistral name was Berthold. The surnames of Schwarz ("black") and "the Black Barthel" were given him on account of his partiality for the black art; and he is said to have discovered gunpowder while in prison on a charge of sorcery. According to other versions, he discovered it either at Cologne or at Goslar. Whether he made an original discovery of the composition of gunpowder, or merely devised its application to war and the chase, is equally uncertain; but the latter is more probable, as gunpowder is supposed to have been known in 1330, and before other dates assigned to his alleged discovery; and he may have acquired information about it from manuscripts in the monasteries.

A monument to his memory was erected at Freiburg in 1853.

SCHWARZ, **Christian Friedrich**, a German missionary, born at Sonnenburg in Brandenburg in October, 1726, died in Tanjore, Hindostan, Feb. 13, 1798. He studied Tamil to aid Schultz in translating the Bible, was ordained at Copenhagen in 1749, and in 1750 sailed for Tranquebar. He removed thence to Trichinopoly, and finally to Tanjore, where he spent the last 20 years of his life. The rajah of Tanjore committed to him the education of his son and successor; and Hyder Ali received him as an ambassador after refusing all others. When the latter invaded the Carnatic, and the inhabitants and garrison of Tanjore were reduced almost to starvation, Schwarz induced the native farmers to bring in their cattle, pledging his word for their payment. After his death the rajah of Tanjore and the East India company each erected a monument to his memory.

SCHWARZBURG-RUDOLSTADT, a principality of the German empire, bordering on the Saxon duchies, the Prussian province of Saxony, and Schwarzburg-Sondershausen; area, 364 sq. m.; pop. in 1871, 75,523, nearly all Lutherans. It is divided into the upper lordship of Rudolstadt, which is mountainous, and the lower of Frankenhausen, which is less so. The main rivers are the Saale, Ilm, and Schwarza. The principal products are minerals and timber. Horses and cattle abound. Linen, woollen, and other goods are manufactured. The diet consists, according to the modified constitution of 1870, of 16 members, 4 chosen from the largest taxpayers and 12 elected by the people. The principality has one vote in the German Reichstag. The local princes, whose house is one of the oldest in Thuringia, became in 1699 independent of Saxony. The reign of the present prince, George Albert (born 1838), began in 1869. Capital, Rudolstadt.

SCHWARZBURG-SONDERSHAUSEN, a principality of the German empire, bordering on Prussian Saxony, the Saxon duchies, and Schwarzburg-Rudolstadt; area, 323 sq. m.; pop. in 1871, 67,191. It consists of the upper lordship of Arnstadt and the lower of Sondershausen; is mountainous in the S. part, and is watered by the Gera, Ilm, and other tributaries of the Saale. The main products are flax, timber, and minerals. Trade and industry have lately much increased through railway traffic. The prince names 5 members for the local diet, and the other 10 are chosen half by the largest taxpayers and half by general election. In the German Reichstag the principality has one vote. The reigning prince, Gunther Frederick Charles (born 1801), succeeded in 1835 on the resignation of his father. Capital, Sondershausen.

SCHWARZENBERG, **Friedrich Johann Joseph Celestianus von**, an Austrian cardinal, born in Vienna, April 6, 1809. He was made bishop of Salzburg Feb. 1, 1836, was proclaimed cardinal Jan. 24, 1842, and was promoted to the pri-

matial see of Prague Dec. 13, 1849. At the beginning of the Vatican council he signed the petition to the pope, drawn up by Cardinal Rauscher, praying that the doctrine of pontifical infallibility should not be discussed in the council; he made a discourse against the opportuneness of a dogmatic definition, but afterward accepted the decision of the council.

SCHWARZENBERG. I. Karl Philipp, prince, and duke of Krumau, an Austrian field marshal, born in Vienna, April 15, 1771, died in Leipsic, Oct. 15, 1820. He distinguished himself under Lacy in the war against the Turks, and also in the war against France. In 1794, at the battle of Cateau-Cambrésis, he cut his way at the head of his regiment and of 12 British squadrons through a line of 27,000 men. After the victory of Würzburg he was made major general, and in 1799 lieutenant field marshal; and in 1805 he commanded the Austrian right wing at Ulm. In 1808 he was appointed ambassador at St. Petersburg. He was present in the following year at the battle of Wagram, commanding the rear guard on the retreat, and after the peace of Vienna was sent to France as ambassador. There he conducted the negotiations in regard to the marriage of Napoleon with the archduchess Maria Louisa. He gave a ball in honor of it, which was broken up by a terrible conflagration resulting in the death of his sister-in-law the princess Pauline of Schwarzenberg, and the empress barely escaped with her life. In the campaign of 1812 against Russia, he commanded the Austrian contingent of the French army; and at the request of Napoleon the emperor Francis created him a marshal. In 1813 he was in Paris attempting to negotiate a peace between France and Russia. After his return he received the supreme command of the allied troops of Russia, Austria, and Prussia, gained the victory of Leipsic, and marched to Paris. On the return of Napoleon from Elba he received the command of the allied army on the upper Rhine, and a second time entered France after the battle of Waterloo. At the end of the campaign he was made president of the imperial military council, and was presented with several estates in Hungary. **II. Felix Ludwig Johann Friedrich**, prince of, an Austrian statesman, nephew of the preceding, born at the estate of Krumau in Bohemia, Oct. 2, 1800, died in Vienna, April 5, 1852. He became a captain of cuirassiers, and in 1824 went to St. Petersburg as attaché to the Austrian embassy. Two years later he was sent with despatches to London, joined the extraordinary mission to Brazil under Baron Neumann, and after his return to Europe was employed in diplomacy. While in London in 1830, he eloped with Lady Ellenborough, who was divorced from her husband. He became a major general in 1842, and in 1848 commanded a brigade under Nugent in Italy, and was made lieutenant field marshal before the battle of Custoza. He was recalled

to Austria by the troubles in the capital, and after the suppression of the October revolution in Vienna was made prime minister, which post he retained till his death. During his term of office the aid of Russia was obtained for the suppression of the Hungarian revolution, and a daring policy pursued in Germany. (See AUSTRIA.) He died of apoplexy.

SCHWARZWALD. See BLACK FOREST.

SCHWEGLER, Albert, a German historian, born at Michelbach, Württemberg, Feb. 10, 1819, died in Tübingen, Jan. 5, 1857. He studied at Tübingen, and became a follower of Baur and one of the principal exponents of the Tübingen school; but on account of the objections of the authorities to his *Montanismus* (1841), he abandoned theology, and in 1843 became *Privatdocent* of philosophy and classical philology at Tübingen, and in 1848 professor. Subsequently he filled the chair of history there. His principal works are: *Das nach-apostolische Zeitalter* (2 vols., 1846); editions of the Clementine homilies (1847) and of Aristotle's "Metaphysics," with German annotated translations (4 vols., 1847-'8); *Geschichte der Philosophie* (1848; 7th ed., 1870; English translation by Prof. J. H. Seelye, New York, 1856); an edition of the church history of Eusebius (2 vols., 1852); *Römische Geschichte*, extending only to the Licinian laws (3 vols., 1853-'8; 2d ed., 1867); and the posthumous *Geschichte der griechischen Philosophie*, edited by Köstlin (1859; 2d ed., 1870).

SCHWEIDNITZ, a fortified town of Prussia, on the Weistritz, in the province and 30 m. S. W. of the city of Breslau; pop. in 1871, 16,998. During the seven years' war Schweidnitz was repeatedly besieged by the Prussians and Austrians, the Prussian siege of 1762 being the most memorable. In 1807 it was taken by the French, who demolished the outer defences.—The former principality of Schweidnitz was ruled by local princes from 1290 to 1353; and it was afterward a crownland of Bohemia till 1741, when it was incorporated with Prussia.

SCHWEIGGER, Johann Salomon Christoph, a German physicist, born in Erlangen, April 8, 1779, died in Halle, Sept. 6, 1857. He studied at Erlangen, was *Privatdocent* there from 1800 to 1802, became professor of mathematics and physics at the gymnasium of Baireuth in 1802 and at the polytechnic institute of Nuremberg in 1811, and from 1819 was professor of physics and chemistry at Halle. After the announcement of Oersted's discovery of electromagnetism in 1819-'20 he devised an electromagnetic multiplier (see GALVANISM, vol. vii., p. 593), which bears his name. He contributed to Gehlen's *Journal der Chemie, Physik und Mineralogie* (vol. vii., 1808) an article entitled *Ueber Benutzung der magnetischen Kraft bei Messung der elektrischen* (published separately in Berlin in 1874), containing statements in regard to electro-magnetism from which his friends claim for him the credit of being the original discoverer.

SCHWEINFURT, or *Schweinfurth*, a town of Bavaria, in the district of Lower Franconia, on the Main, 23 m. N. N. E. of Würzburg; pop. in 1871, 10,325, chiefly Protestants. It is enclosed by old walls, and has a Catholic and several Lutheran churches, a gymnasium, and manufactures of leather, linen, and woollen cloths. Schweinfurt was a free imperial city from 1130 to 1803.

SCHWEINFURTH, Georg August, a German traveller, born in Riga, Sept. 29, 1836. He studied in Heidelberg, Munich, and Berlin, devoting himself especially to botany, and set out in 1864 on a journey through the valley of the Nile and the Egyptian coast lands on the Red sea, for the purpose of investigating the flora and fauna in those regions. He returned to Cairo in 1865, and made a second expedition up the Blue Nile as far as Khartoom. Reaching Europe again in July, 1866, he spent two years in Berlin in classifying and describing the botanical, zoological, and geological specimens collected in his travels. Going again to Khartoom in 1868, he explored the White Nile and the Gazelle, and penetrated inland to the west as far as lon. 26° E., and to the south as far as Munza, about lat. $3^{\circ} 30'$ N., through the little known regions of the Shellooks, Dinkas, and Niam-Niam, and the kingdom of Monbuttoo. These travels occupied three years, and after spending a season in Sicily, Malta, and Rome, he arrived in Germany in July, 1872. In 1875 the khedive made him president of an Egyptian geographical society, which is to issue a monthly journal. He has published *Versuch einer Vegetations-skizze* (Berlin, 1862); *Plantæ quædam Niloticæ* (1862); *Beitrag zur Flora Aethiopiens* (1867); *Reliquiæ Kotschyaræ* (1868); and *Im Herzen von Afrika* (2 vols., Leipsic, 1874; English translation, "The Heart of Africa," 1874). This work contains the first trustworthy account of the pygmy race of Africa, the Akka. (See PYGMY.)

SCHWEINITZ, Lewis David von, an American botanist, born in Bethlehem, Pa., Feb. 13, 1780, died there, Feb. 8, 1834. He was educated in Germany, and remained there till 1812, when he went as a Moravian minister to Salem, N. C., and in 1821 to his native town. He described nearly 1,400 new species of plants, of which more than 1,200 were of North American fungi, previously little studied. His works include *Conspectus Fun-*

gorum Lusatiæ (Leipsic, 1805); *Synopsis Fungorum Carolinæ Superioris*, edited by Dr. Schwegrichen (1818); *Specimen Floræ Americæ Septentrionalis Cryptogamicæ* (Raleigh, 1821); "Monograph of the Linnæan Genus *Viola*" (published in Silliman's "Journal," 1821); "Catalogue of Plants collected in the N. W. Territory by Say" (Philadelphia, 1824); "Monograph upon the American Species of the Genus *Carex*" (New York, 1825); and *Synopsis Fungorum in America Boreali Media Degentium* (Philadelphia, 1832).

SCHWENKFELD, Kaspar von, the founder of a religious sect, born in Ossig, Silesia, in 1490, died in Ulm about 1561. He was a nobleman of ancient lineage, councillor to the duke of Liegnitz and an eager advocate of the reformation. He differed with Luther especially on the deification of the body of Christ; and he was persecuted by both Roman Catholics and Protestants. His character was never impugned by any of his opponents, and his numerous writings (including *Bekanntnus und Rechenschaft von den Hauptpunkten des christlichen Glaubens*, 1547, and nearly 100 treatises) are among the most valuable sources of the history of the reformation. His adherents, called Schwenkfelders or Schwenkfeldians, lived mostly in Silesia. In 1734 a considerable number emigrated to Pennsylvania, where they settled principally in Montgomery, Berks, Bucks, and Lehigh counties. They still number there about 300 families and 800 members, and have five churches and school houses.—See *Ausführliche Geschichte Kaspar von Schwenkfeld's*, &c. (Lauban, 1861).

SCHWERIN, a town of Germany, capital of the grand duchy of Mecklenburg-Schwerin, on

Palace of Schwerin.

the W. side of the lake of the same name, 18 m. S. of its seaport Wismar; pop. in 1871, 26,804. It consists of the Altstadt and the

Neu-, Vor-, and Paulstadt, the last three being of modern origin and the most attractive. The grand ducal palace is an imposing building on an island in the lake, on the same spot where there was a castle in the 12th century, which was restored by Wallenstein. The new palace was begun in 1845 and finished in 1858, and is surrounded by beautiful pleasure grounds. The *Dom* or cathedral, recently restored, is a fine Gothic structure. Tobacco manufacture is the principal industry. It is a place of great antiquity, and is mainly indebted for its embellishments to the grand duke Paul Frederick (1837-'42), whose statue by Rauch stands in front of the theatre.

SCHWERIN, Kurt Christoph von, count, a German field marshal, born in Swedish Pomerania, Oct. 16, 1684, killed at the battle of Prague, May 6, 1757. He was an ensign in the Dutch army at the age of 16, fought under Marlborough and Eugene, and entered the service of Prussia in 1720, with the rank of major general. On the accession of Frederick the Great (1740) he was made field marshal with the title of count, and in 1741 gained the decisive battle of Mollwitz, by which the Prussians secured possession of Silesia. In 1744 he took Prague, and in the seven years' war fell in the great battle before that city.

SCHWIND, Moritz von, a German painter, born in Vienna in 1804, died in Munich, Feb. 8, 1871. He studied under Cornelius, and in 1839 designed frescoes for the art hall at Carlsruhe. In 1847 he became professor at the academy of Munich. His best known productions are the designs for St. Michael's church, London, and for the Vienna opera house. He excelled in fairy and fanciful subjects. His best and last work was "The Beautiful Melusina."

SCHWYTZ, a N. E. canton of Switzerland, bordering on the cantons of Zürich, St. Gall, Glarus, Uri, Unterwalden, Lucerne, and Zug; area, 350 sq. m.; pop. in 1870, 47,705, nearly all Germans and Roman Catholics. It is traversed by chains of mountains with offsets in every direction. The Rossberg, which is partly in this canton and partly in Zug, is 5,188 ft. above the sea; in 1806 a portion of it fell with most destructive effect. The other points of greatest elevation are the Drusberg, in the east, 7,430 ft.; the Mythen, near the centre, 6,250 ft.; and the Rigi, in the west, 5,902 ft. The whole canton belongs to the basin of the Rhine, and the drainage flows into the Limmat and the lakes of Zürich on the north and Lucerne on the west, mainly by the rivers Sihl and Muotta. The minerals are not valuable; there is some iron, and formerly the sands were washed for gold. The climate is milder than in many other parts of Switzerland, as none of the mountains rise above the limit of perpetual snow. Very little of the soil is arable; the country is almost wholly pastoral, and the finest cattle in Switzerland are reared here. Schwytz is one of the

three original cantons that resisted Austria and formed the primitive confederation; and it gave a name to the whole country. The inhabitants made spirited efforts to resist the French in 1798, and suffered severely in 1799, when the war was carried into their country. —**SCHWYTZ**, the capital, is built at the foot of the rocky eminences Kaken and Mythen, 55 m. E. by N. of Bern; pop. in 1870, 6,154. In the council house are portraits of 43 grand bailiffs of the canton, dating from 1534. Other places of historical interest are Küssnacht, Brunnen, and Einsiedeln.

SCIACCA, a town of Sicily, on the S. W. coast, in the province and 30 m. N. W. of Girgenti; pop. about 14,000. It is on the verge of a lofty cliff, is surrounded by walls with towers, and has a cathedral with a famous echo, and numerous other churches. Pottery is manufactured. It was anciently called *Thermæ Selinuntiae*, from the hot sulphur and saline springs at the foot and on the summit of Mt. San Calogero, outside the present walls, and from its vicinity to Selinus.

SCIATICA. See NEURALGIA.

SCIGLIO, or *Scilla* (anc. *Scyllæum*, or *Scylla*).

I. A promontory of S. Italy, in Calabria Ulteriore, on the strait of Messina, in lat. 38° 14' 30" N., lon. 15° 45' E. It is a bold headland, 200 ft. high, the rocks at the base being deeply scooped out by the action of the waves, and is crowned by an ancient castle. It is in the narrowest part of the strait, opposite the rocks and shoals of Charybdis, and was the terror of ancient mariners. (See CHARYBDIS AND SCYLLA.) **II.** A town on the promontory, 9 m. N. by E. of Reggio; pop. about 6,700. It has extensive silk manufactures, an active commerce, and considerable fisheries, and its wine is celebrated. It is said to have been founded by Anaxilus, tyrant of Rhegium. It was nearly destroyed and half its inhabitants were lost by an earthquake, Feb. 5, 1783.

SCILLY ISLANDS, a group at the W. entrance of the English channel, belonging to the county of Cornwall, about 30 m. W. S. W. of Land's End; lat. of the lighthouse on St. Agnes, 49° 53' N., lon. 6° 20' W.; pop. in 1871, 2,090. The group is circular, about 30 m. in circumference, and contains about 140 islands and islets, besides numerous rocks. St. Mary's, Treco, St. Martin's, St. Agnes, and Bryher are the only ones with more than 100 inhabitants. They have steep and bold shores, on which many ships have been wrecked; but between the islands the water is shallow, and some of them are connected by strips of land at low water. The inhabited islands have an aggregate area of about 3,500 acres, but the soil is generally barren, and trees grow only in sheltered spots. Some oats and potatoes are raised on St. Mary's, and there is a little pasture land on the others. The inhabitants are mostly fishermen, pilots, and sailors. The local government consists of a court of 12 principal inhabitants presided over by a mili-

tary officer. The largest of the group is St. Mary's, with the capital, Hughtown. On the W. side of the island is Star Castle, and a garrison with numerous batteries.—The Scilly islands are generally supposed to be the Cassiterides or Tin islands of the ancients; but as that metal is not now found upon them, it is thought that the western extremity of Cornwall was also included under that name. The group was sometimes used by the Romans as a place of banishment, and was called by them *Sellinæ* or *Silurum insulæ*. They were annexed to the English crown in the 10th century.

SCINDE. See **SINDE**.

SCINDIA, or **Sindia**. See **GWALIOR**.

SCIO, **Skio**, **Chio**, or **Khio** (anc. *Chios*; Turk. *Sakis-Adassi*), an island of Asiatic Turkey, in the Grecian archipelago, off the coast of Asia Minor, from which it is separated by the strait of Scio, 4 m. wide in its narrowest part; area, about 400 sq. m.; pop. about 50,000, most of whom are Turks. The surface is rocky and uneven, being traversed by limestone ridges, and the scenery is picturesque. There are beautiful valleys and several small streams, but much of the irrigation is by means of water obtained from wells; and the country presents a scene of perpetual verdure, though only a small part of the land is arable. The chief productions are silk, cotton, wool, fruit, oil, and gum mastic, the last of which is the staple of the island. The wine of Chios was highly esteemed in antiquity, and still enjoys some repute.—Chios is said to have been anciently peopled by Tyrrhenian Pelasgians and Leleges, after whom it was occupied by an Ionian colony; and the chief city, also called Chios, claimed the honor of being the birthplace of Homer. It was invaded by the Persians and devastated in 494 B. C. After the battle of Mycale (479) it became a member of the Athenian league; in 358 it recovered its independence; in 201 it was taken by Philip V. of Macedon, and it afterward became subject to Rome. In the early part of the 14th century the Turks captured the capital and massacred the inhabitants. From 1346 to 1566 it was in the hands of the Genoese. It then again fell under the dominion of the Turks, and, excepting a short interval during which it was subject to Venice, it has since been in their possession. During the Greek revolution its inhabitants rose against the Turks (1822), but were soon subdued. Within two months 23,000 Sciotes, without distinction of age or sex, were put to the sword, 47,000 were sold into slavery, and 5,000 sought safety in other parts of Greece. By the end of August the former Christian population of nearly 104,000 was reduced to 2,000. In June, two months after the massacre, Canaris attacked the Turkish fleet in the harbor of Scio with fire ships, and destroyed the vessel of the capudan pasha, who perished in the flames. In 1827 a Greek force under Col. Fabvier, a French philhellene, landed in Scio and attacked the Turk-

ish garrison, but were compelled to withdraw.—**SCIO**, or **Kastro**, the capital, is near the middle of the E. coast; pop. 14,500. It has a harbor, is defended by a castle, and manufactures velvet, silk, and cotton.

SCIOTO, a river of Ohio, rising in Hardin co., and flowing first nearly E. and then S. by E. to Columbus, thence S. to the Ohio, which it joins at Portsmouth. It is about 200 m. long, and navigable 130 m. Its principal tributaries are the Olentangy or Whetstone river, which unites with it at Columbus, and Darby, Walnut, and Paint creeks. The Ohio and Erie canal follows its lower course for 90 m. The Scioto valley is famed for its fertility and wealth.—The Little Scioto is a small stream which flows into the Ohio 8 m. above Portsmouth.

SCIOTO, a S. county of Ohio, bounded S. by the Ohio river and watered by the Scioto and Little Scioto rivers and branches; area, about 500 sq. m.; pop. in 1870, 29,302. The surface is uneven and the soil fertile. In the E. part of the county iron is plentiful, and large furnaces and foundries are in operation. The Portsmouth branch of the Marietta and Cincinnati railroad traverses it. The chief productions in 1873 were 73,365 bushels of wheat, 818,603 of Indian corn, 116,569 of oats, 60,701 of potatoes, 7,179 tons of hay, 2,619 lbs. of tobacco, 204,384 of butter, and 11,232 of wool; 91,266 bushels of coal and 27,576 tons of iron ore were mined, and 14,876 tons of pig iron manufactured. In 1874 there were 5,579 horses, 12,886 cattle, 6,979 sheep, and 13,976 swine. In 1870 there were 8 manufactories of carriages and wagons, 5 of charcoal, 10 of cooperage, 7 of furniture, 2 of forged and rolled iron, 1 of nails and spikes, 6 of pig and 3 of cast iron, 4 of tanned and 2 of curried leather, 1 of engines and boilers, 3 of marble and stone work, 6 saw mills, 2 planing mills, 2 flour mills, and 2 woollen mills. Capital, Portsmouth.

SCIPIO, a Roman patrician family belonging to the Cornelia gens. The tomb of the Scipios, discovered in 1616 and excavated in 1780, is near the modern gate of St. Sebastian. The most distinguished members of the family are:
I. Publius Cornelius Scipio Africanus Major, a Roman general, born about 234 B. C., died about 183. He was the son of P. Cornelius Scipio, who with his brother Cneius Cornelius Scipio was defeated and killed in Spain by the Carthaginian generals Mago and Hasdrubal (211). He is first mentioned at the battle of the Ticinus in 218. In 216 he was at the battle of Cannæ, and Livy and other writers ascribe to his influence the prevention of the scheme entertained by the Roman nobles after that disastrous day of fleeing from Italy; but better authorities attribute this to Varro, the defeated general. In 212 he was made curule ædile. After the defeat and death of his father in Spain, being then 24 years of age, he offered to take command of the Roman armies in that province as proconsul. He arrived in Spain in the summer of 210, and found the three Car-

thaginian generals, who were on ill terms with each other, in different parts of the peninsula. At the head of 25,000 foot and 2,500 horse, he made a rapid march from the Iberus (Ebro) to New Carthage (Cartagena), the centre of Punic power in Spain, in which were the Carthaginian treasure, magazines, and hostages. The city, remote from all succor, and ill defended by a garrison of 1,000 men, was soon taken. The captive Spaniards were dismissed with kindness, and in this manner Scipio began his work of conciliating the natives. He returned to Tarraco, and, strengthened by an alliance with several of the Spanish tribes, in 209 took the field against Hasdrubal, over whom he is said to have gained a great victory at Bæcula, but failed to prevent him from marching to the assistance of his brother Hannibal in Italy. In 207 Scipio, at the head of 45,000 foot and 3,000 horse, defeated a superior force of the enemy under Hasdrubal, the son of Gisco, and Mago, near a town called Silpia or Elinga, and put an end to the power of the Carthaginians in Spain. Scipio, anxious to carry the war into Africa, gained over Masinissa, the Numidian ally of the Carthaginians, who had come to Spain; and to win the support of Syphax, the king of the Massæsylians in Numidia, he crossed over with only two quinquiremes to negotiate with him personally. There he found Hasdrubal, the son of Gisco, present with a similar intention, and the Carthaginian prevailed principally through the charms of his daughter Sophonisba. On his return Scipio found Spain in a general revolt, but put it down in a short campaign marked by the merciless treatment of Illiturgi, and the desperation of the inhabitants of Astapa, who fell to a man. He quelled a mutiny which had broken out while he was confined by a severe illness in the Roman camp on the Suero (Jucar), and defeated the Spaniards, who had taken the same opportunity to revolt. In a short time the Carthaginians abandoned Spain entirely, and in 206 Scipio handed over the government to his successor, and returned to Rome. There he was received with enthusiasm, and was elected consul for the following year. He had now an opportunity of attacking the Punic power in Africa; but the senate would only allow him to go to Sicily, with the right of crossing into the Carthaginian territory if advantageous, but denied him an army. Volunteers, however, flocked to his standard, and in 204 he sailed with his army from Lilybæum, and landed near Utica, where he was joined by Masinissa. The Romans began the siege of Utica, but the approach of a vast Carthaginian and Numidian army compelled them to abandon the project. During the winter he amused Syphax with negotiations in regard to peace, but early in 203 by a stratagem burned the camps and almost annihilated the armies opposed to him. The Carthaginians collected another army, which suffered another total defeat, and thereupon they recalled Hannibal

and Mago from Italy, and made a truce. Hannibal was not indisposed to peace, but was compelled to take the field, and the two armies met near Zama (202). A complete victory for the Romans ended the second Punic war and the power of Carthage. Scipio returned to Rome in 201, and was welcomed with extraordinary enthusiasm. The surname of Africanus was given him, but he declined the distinction of statues in the public places, and took no part in the government for a few years. He was censor in 199, and consul a second time in 194, and several times received the title of *princeps senatus*. In 193 he was one of the three commissioners sent to mediate between Masinissa and the Carthaginians. In 190 he accompanied his brother Lucius (afterward known as Asiaticus) as *legatus* in the war against Antiochus the Great of Syria. On their return to Rome in 189, after the close of the war, his brother was accused of taking bribes from Antiochus, and appropriating the public moneys to his own use. In 187, at the instigation of M. Porcius Cato, Lucius was required by the tribunes to give an account of the sums he had received. He prepared to do so, but Africanus snatched the papers from his hands and tore them up before the senate. During the same year Lucius was tried, found guilty, and carried to prison, but was rescued by his brother. The tribune, Tiberius Gracchus, released Lucius from his sentence of imprisonment, and his friends paid the fine. His adversaries now ventured to attack Africanus himself. Scipio made no defence, but simply recounted his services to the state, and thus triumphed over his enemies. He spent the remainder of his days on his estate at Liternum. The accounts of Scipio's life are confused and contradictory. Cornelia, the mother of the Gracchi, was his daughter. **II. Publius Cornelius Scipio Æmilianus Africanus Minor**, a Roman general, born about 185 B. C., died in 129. He was the son of L. Æmilius Paulus, the conqueror of Macedon, and was adopted by P. Scipio, the son of Africanus Major. He was with his father at the battle of Pydna in 168, in 151 went as military tribune to Spain, where he gained a high reputation, and in 150 was sent to Africa to obtain elephants from Masinissa. In 149, on the breaking out of the third Punic war, he accompanied the army to Africa as military tribune, and saved it from the disasters which would naturally have resulted from the incapacity of Manilius. In 147 he was elected consul, and in the spring of 146 he took the city of Carthage, and ended the third Punic war. He returned to Rome, celebrated a triumph, and received the surname of Africanus. In 142 he was made censor, and endeavored to repress the growing luxury of the Roman people. In 139 he was tried on the charge of *majestas*, but was acquitted. After this he went on an embassy to Egypt and Asia, and in 134 he was elected to the consulship in order to carry on the war in Spain. Having brought the disor-

ganized troops into a proper state of discipline, he took Numantia in 133, after a memorable siege and desperate defence, ending in the self-immolation of nearly all its inhabitants; for this he received the surname of Numantinus. During this time the civil troubles in Rome had culminated in the murder of Tiberius Gracchus, whose sister Scipio had married; a deed which he approved, notwithstanding their relationship. The people were consequently estranged from him, and in 129, on the day following his speech against the agrarian law, he was found dead in his chamber. He was one of the most accomplished literary men of his time, well acquainted with Greek philosophy and literature, and the friend and patron of the historian Polybius, the philosopher Panætius, and the poets Lucilius and Terence. **III. Quintus Cæcilius Metellus Pius**, a Roman general, killed himself in 46 B. C. He was the son of P. Cornelius Scipio Nasica and the adopted son of Metellus Pius, and in consequence he has been called P. Scipio Nasica, or Q. Metellus Scipio. In 63 B. C. he came to Cicero by night to inform him of the conspiracy of Catiline. He became tribune in 60, was accused of bribery by his opponent and defended by Cicero, and in 53 was a candidate for the consulship and one of the leaders of the Clodian mob opposed to Milo. When the senate allowed Pompey to be made sole consul, that leader, who was his son-in-law, chose him (August, 52) as his colleague. He labored assiduously to destroy the power of Cæsar, and the breach between the aristocratic and democratic parties at Rome and the civil war were largely due to him. He grossly misgoverned the province of Syria, assigned to him, joined Pompey in Greece after Cæsar's repulse at Dyrrachium, and after the battle of Pharsalia fled to Africa, where he took command of the army of Attius Varus, and where he also practised extortion and oppression. In December, 47, Cæsar crossed the Mediterranean, and in April, 46, routed the forces of Scipio and Juba, king of Numidia, at the battle of Thapsus; and Scipio stabbed himself and sprang into the sea to escape capture.

SCIRE FACIAS, in law, a judicial writ founded upon some record, and requiring the person against whom it is brought to show cause why the person bringing it should not have the advantage of such record, or (in the case of a *scire facias* to repeal letters patent) why the record should not be annulled and vacated. It is so called from the words of the writ (when in Latin, as all writs originally were) to the sheriff: *Quod scire facias præfato*, &c., and can only issue from the court having the record upon which it is founded. It is most commonly used for the purpose of reviving a judgment after the lapse of a certain time, or on a change of parties, or otherwise to have execution of the judgment, in which cases it is merely a continuation of the original action. It is used more rarely as a method of proceeding against a debtor's bail, when the original debt-

or has absconded, commanding them to show cause why the plaintiff should not have execution against them for his debt or damages and costs; and also on a recognizance to the commonwealth, as well as to obtain execution against the indorser of an original writ, in case of the avoidance or inability of the plaintiff to pay the costs recovered against him by the defendant. It also lies where an execution has been returned into court as satisfied by means of a levy, but it afterward appears that the lands levied upon did not belong to the judgment debtor, or the levy was otherwise imperfect or insufficient; and in England it may be obtained by the patron or owner of an advowson for the purpose of removing a usurper's clerk improperly admitted by the bishop. It is further used as a means of repealing letters patent which have been obtained by fraud or issued improvidently, and in this case it is an original proceeding or action.—The action of *scire facias* is the proper method of proceeding to ascertain judicially and enforce the forfeiture of a charter by a corporation for default or abuse of power, when such corporation is a legally existing body capable of acting, but which has abused its power; though when the corporation is a body *de facto* only, and on account of a defect in the charter or for any other reason cannot legally exercise its powers, the proceeding is by *quo warranto*.

SCLOPIS DE SALERANO, Paolo Federigo, count, an Italian jurist, born in Turin in 1798, died March 8, 1878. He studied law at Turin, distinguished himself in drawing up the Sardinian civil code of 1837 and in other departments of jurisprudence, became in 1848 minister of justice and ecclesiastical affairs, and presided over the committee for framing more liberal laws for the press; but he soon exchanged his place in the cabinet for the chamber of deputies. At the close of 1849 he took his seat in the senate, of which he was president till 1861, and subsequently held the same office in the senate of Italy till 1864. In 1872 he was appointed by Victor Emanuel arbitrator at Geneva on the part of Italy under the treaty of Washington, and he was made president of the court of arbitration. The American government sent him a service of silver plate in 1874. His principal work is a history of Italian legislation (3 vols., Turin, 1840-'57).

SCOLITHUS, a supposed fossil burrowing worm of the *arenicola* family, whose long vertical holes are very common in the Potsdam sandstones, of the lower Silurian period. These holes, now filled with rocky material, were for a long time believed to be the re-

Scolithus linearis.

mains of a fucoid plant, and afterward until recently to indicate the existence of a long marine worm, which inhabited the sands not far below tide level. The most common form has been named *S. linearis*, and, whatever it be, is one of the earliest fossils. Since attention has been paid to the habits of sponges, especially to those of *cliona* and its allies, which mine and perforate shells, some palæontologists are disposed to attribute the scolithus marks to these rather than to marine worms. Sponges are known to have existed at the period of the Trenton limestone, next above the Potsdam sandstone, and it is highly probable that most if not all of these burrows are due to ancient mining sponges.

SCOPAS, a Greek sculptor, born in the island of Paros, flourished during the first half of the 4th century B. C. He was a contemporary of Praxiteles, and with him stands at the head of the later Attic school of sculpture. Among his most famous works are the slabs from the mausoleum of Halicarnassus representing a battle of Amazons. The celebrated group of Niobe and her children in the Uffizi gallery, Florence, and the Venus of Milo in the Louvre, are also attributed to Scopas, though the latter probably belongs to the school of Phidias. He was employed on the temples of Athena Alea in Arcadia and of Diana at Ephesus. His masterpiece, according to Pliny, was a group representing Achilles conducted to the island of Leuce by sea divinities.—See *Skopas's Leben und Werke*, by Ulrichs (Greifswald, 1863).

SCORESBY. **I. William**, an English navigator, born at Cropton, Yorkshire, May 3, 1760, died in 1829. He was bred a farmer, and at the age of 29 entered on a seafaring life; and he became an adventurous and successful whaling master, having held command in 30 voyages. He made numerous improvements in whaling apparatus and operations, and invented the observatory attached to the maintopmast, called the "round topgallant crow's nest," which was generally adopted by arctic navigators. **II. William**, an English arctic explorer and clergyman, son of the preceding, born at Cropton, Oct. 5, 1790, died in Torquay, March 21, 1857. At the age of 10 he ran away to sea in one of his father's ships, and in his 16th year attained the rank of chief mate. He was second officer of the *Resolution*, commanded by his father, which in 1806 sailed to lat. 81° 30', the northernmost point that had then been reached. After several years spent in study, partly at the university of Edinburgh, he became in 1810 captain of the *Resolution*. Some communications which he made to Sir Joseph Banks resulted in the series of explorations in the north which have distinguished the present century. He was the first to attempt scientific observations on the electricity of the atmosphere in high northern regions. He explored in the ship *Baffin* in 1822 the E. coast of Greenland, and after his return devoted himself to study, graduating at Cambridge as bachelor of

divinity in 1834, and subsequently received the degree of D. D. After serving as chaplain of the mariners' church in Liverpool, he was appointed in 1839 vicar of Bradford in Yorkshire. Here he labored until his failing health obliged him to retire to Torquay, where he engaged in scientific and philanthropic labors. He visited the United States in 1847, and shortly before his death made a voyage round the world, reaching home Aug. 14, 1856. He was a member of the royal society. His principal works are: "An Account of the Arctic Regions" (2 vols. 8vo, 1820); "Journal of a Voyage to the Northern Whale Fishery" (1823); "Discourses to Seamen" (1831); "Magnetical Observations" (3 parts, 8vo, 1839-'52); "American Factories and their Female Operatives" (1848); "Zoistic Magnetism" (1849); "Sabbaths in the Arctic Regions" (1850); "The Franklin Expedition" (1850); "My Father" (1851); and "Voyage to Australia and round the World for Magnetical Research," edited by Archibald Smith (1859). His life has been written by his nephew, R. E. Scoresby-Jackson (London, 1861).

SCORPION, an articulate animal of the class *arachnida* or spiders, division *pulmonaria* or those which breathe by air sacs, order *pedipalpi*, and genus *scorpio* (Linn.). The body is long, the head and thorax in a single piece, the thorax and abdomen intimately united and followed by six joints of nearly equal breadth, and then by six others very narrow, and forming what is called the tail; the last joint ends in a sharp curved sting connected with a gland secreting an oily, whitish, poisonous fluid, which is discharged by two small openings near the end; the body is clothed with a firm, coriaceous skin composed of chitine. The mandibles, according to Siebold, are wanting, the parts usually called such being only antennæ transformed into prehensile and masticatory organs; the cheliceres have three joints, move vertically, and under them have the first pair of jaws changed into long prehensile palpi, like extended arms, ending in a didactyle claw or pincer, as in the lobster, endowed with a delicate sense of touch; there are eight legs, three-jointed, ending each in a double hook; the eyes are six or eight, one pair of which is often median and larger than the others; at the base of the abdomen are two laminated organs, called combs. On the lower and lateral parts of the abdomen are eight spiracles or stigmata, opening into as many pulmonary sacs, each enclosing 20 delicate laminae for respiratory purposes; the heart consists of eight chambers, and at each end is prolonged into an arterial trunk; there is also a venous system; the blood is colorless, and contains a few cells and granules; no blood vessels have been discovered on the pulmonary laminae, and the blood is probably effused into the parts surrounding these sacs or lungs. The intestine is straight and narrow, with the anal opening on the penultimate caudal segment; the liver is very

large, and salivary glands distinct; the urinary organs are ramified tubes opening into the cloaca; the reproductive organs are double, at the base of the abdomen, and the sexes distinct; the two ventral nervous cords proceeding from the head form eight ganglia, the last four belonging to the tail. Scorpions feed on insects, which they hold by their palpi and sting to death, and then suck the blood; they are generally found in dark places in warm climates, and in some tropical parts of the old world render whole districts uninhabitable; they live on the ground, concealing themselves under stones, in ruins, in the interior of houses, and even in beds; they run very fast, keeping the tail elevated and ready to strike in any direction; the females are larger and less numerous than the males. Under certain circumstances they kill and devour their own progeny; they renew their skin several times, and can live very long without food; gestation is said to continue nearly a year, the young being born alive and in succession. The scorpion has been known from the earliest antiquity, as its place in the ancient zodiac proves; on Egyptian monuments Anubis is often represented as facing it as if to destroy its influence; Pliny gives a long account of the fabled powers of this animal.—The *S. Europæus* (Linn.), of southern Europe, is about an inch long, brown, with the feet and end of tail yellowish, and the palpi angular and heart-shaped; the female produces her young alive in succession, carrying them on her back for a few days and protecting them for about a month; it has six eyes, and nine teeth in the comb; its sting is harmless. The reddish scorpion (*S. occitanus*, Latr.) is a little larger, yellowish red, having the tail a little longer than the body with raised and finely notched lines; there are eight eyes, and more than 30 teeth in the comb; it is found in Spain and in N. Africa, but not with the preceding species; its sting is more to be feared, and may be dangerous to persons of weak constitution. The black scorpion (*S. afer*, Linn.) is blackish brown, with the claws

Black Scorpion (*Scorpio afer*).

rough and a little hairy and the anterior edge of the corslet strongly emarginated; there are eight eyes, and 13 teeth in the comb. It is found in Ceylon and other parts of the East Indies, and attains a length of 5 or 6 in.; the sting is sometimes fatal; the best remedy has

been found to be ammonia externally and internally, to neutralize the poison in the first case, and to guard against prostration in the other; other caustics and stimulants are used, and embrocations of various kinds of oil.—Nearly allied to the scorpions are the small book scorpions (*chelifer*), common in old books and neglected drawers. Small scorpions of the genus *bruchus* are found in our southern states.

SCOT, Reginald, an English author, died in 1599. He was educated at Oxford, but never took a degree, and passed the greater part of his life on his paternal estate near Smeeth in Kent. His "Discoverie of Witchcraft" (1584), in which he combats the popular opinion that the devil has the power of controlling the course of nature, was burned by the common hangman. James I. wrote his "Demonologie," he informs us, "chiefly against the damnable opinions of Wierus and Scot, the latter of whom is not ashamed in public print to deny there can be such a thing as witchcraft." Scot's work passed through three editions, and was translated into French and German. It is now exceedingly rare. In 1576 he published a "Perfect Platform of a Hop Garden."

SCOTER. See DUCK, vol. vi., p. 291.

SCOTLAND, a N. E. county of Missouri, bordering on Iowa, and intersected by the Wyconda, North Fabius, and Middle Fabius rivers; area, 400 sq. m.; pop. in 1870, 10,670, of whom 129 were colored. The surface is mostly prairie, and the soil fertile. It is traversed by the Missouri, Iowa, and Nebraska railroad. The chief productions in 1870 were 95,862 bushels of wheat, 30,035 of rye, 736,703 of Indian corn, 350,516 of oats, 45,246 of potatoes, 18,328 tons of hay, 10,972 lbs. of tobacco, 110,698 of wool, 327,960 of butter, 19,450 of honey, and 42,556 gallons of sorghum molasses. There were 5,898 horses, 919 mules and asses, 5,326 milch cows, 10,089 other cattle, 29,957 sheep, and 24,849 swine. Capital, Memphis.

SCOTLAND, the N. part of the island of Great Britain, and one of the three kingdoms of the British empire in Europe. It consists of a mainland and several groups of islands on the N. and W. coasts, and is bounded N. and E. by the North sea, S. by England, from which it is partly separated by the river Tweed, and the Irish sea, and W. by the Atlantic ocean. The mainland extends from lat. 54° 38' to 58° 40' 30" N., and from lon. 1° 45' to 6° 15' W. The extreme N. point of the islands is Unst, in the Shetland group, lat. 60° 50', and their most westerly point St. Kilda, in the Hebrides, lon. 8° 35'. The greatest length of the mainland, from Dunnet Head in the north to the Mull of Galloway in the south, is about 280 m.; and its greatest breadth, from Buchan Ness in the east to Ardnamurchan point in the west, about 170 m. The seacoast is extremely irregular, and so frequently and so deeply indented that its total extent is estimated at 3,000 m. By these indentations the breadth of the mainland is in some places greatly re-

duced, the distance between Alloa on the E. coast and Dumbarton on the W. coast being only 32 m., and between Loch Broom on the west and the Dornoch frith on the east only 24 m. On the north are the Orkney and Shetland islands, each group containing a population of about 31,000. On the west are the Hebrides or Western islands, divided into the outer and inner groups, with a total population of about 99,000. (See **HEBRIDES**, **ORKNEY ISLANDS**, and **SHETLAND ISLANDS**.) The island of Stroma lies between the Orkneys and the mainland. On the E. coast are May, Inchkeith, and Inchcolm islands, in the frith of Forth, and Inchcape or Bell Rock, off the frith of Tay.—The mainland of Scotland is geographically divided into two distinct regions, the highlands N. of the Grampian mountains, and the lowlands S. of that range; but there is scarcely any part of the country in which mountain ranges are not visible. There are five principal chains nearly parallel to each other, and having a general direction from N. E. to S. W. 1. The northern highlands commence in detached groups at the southern border of Caithness, and cover a large portion of the counties of Sutherland, Ross, and Inverness. They separate the streams which flow into the Atlantic from those that reach the North sea through the Moray frith. The principal summits are Ben Attow, 3,998 ft.; Ben Wyvis, 3,420; Ben Dearg, 3,656; Ben More, 3,230; Ben Clibrich, 3,165; and Morven, 2,331. 2. The Grampians, extending from Loch Awe on the Atlantic coast to near Stonehaven and Aberdeen on the coast of the North sea, with their ramifications, form in general the boundary between the highlands and lowlands, with a height of from 2,000 to 4,000 ft. The principal summits are Ben MacDhui, 4,296 ft.; Cairntoul, 4,245; Cairngorm, 4,090; Ben Avon, 3,826; Ben-y-Gloe, 3,690; Schiehallion, 3,564; and Ben Lomond, 3,192. Ben Nevis, N. of the W. extremity of the Grampians, and sometimes reckoned as belonging to them, is 4,406 ft. (according to older measurements 4,370 ft.) high. 3. The Ochil and Sidlaw range is separated from the Grampians by the valley of Strathmore, and consists of three small chains which extend from Forfarshire to Stirlingshire, and form the N. watershed of the basins of the rivers Tay, Forth, and Clyde. The Sidlaw hills extend from the river Dean to Perth on the Tay. Their highest summit, King's Seat, is 1,149 ft. high. The Ochils, between Stirling and the frith of Tay, attain an elevation of 2,350 ft., and the Campsie Fells in Stirlingshire are 1,500 ft. high. 4. The Lammermoor and Pentland range is separated from the third range by the frith of Forth, and forms the S. boundary of the Forth basin. This range consists of the Lammermoor hills between Haddington and Berwick, with an elevation of 1,750 ft.; the Moorfoot hills, a western continuation of the Lammermoors; the Pentland hills in Midlothian, 1,838 ft. high; and lastly Tinto

hill in Lanarkshire, 2,308 ft. high. 5. The Cheviot and Lowther range, or the southern highlands, extends from the English border to Loch Ryan, and separates the basins of the Clyde and the Tweed on the north from those of the Solway and the Tyne on the south. The highest summits of this range are Broadlaw, 2,741 ft.; Cheviot peak, 2,677; Hart Fell, 2,638; and Lowther hill, 2,520. The glens or deep and rocky valleys among the Scottish mountains are famous for the wild beauty and grandeur of their scenery. Chief among them is Glenmore, the "great glen," which extends in a straight line nearly 60 m. from Loch Eil on the W. coast to Beaully frith on the E. It contains three long lochs or lakes, whose aggregate length is 37 m.—The rivers are comprised in nine principal basins, those of the Tweed, the Forth, the Tay, the Dee and Don, the Spey, the Ness and Nairn, the Linnhe, the Clyde, and the Solway. The first six discharge their waters into the North sea, and the remaining three into the Atlantic. The principal rivers are the Tay, Clyde, Forth, Tweed, South Esk, and Dee. They are not navigable by large vessels for any considerable distance above their estuaries, with the exception of the Clyde, which has been rendered navigable to Glasgow by artificial deepening and embankment. The lakes (or lochs, as they are called in the Scottish dialect) are numerous, and are mostly in the glens of the highlands. They are generally of a length altogether disproportioned to their breadth, and the scenery around them is celebrated for grandeur and beauty. The following are some of the most noted, with the number of square miles in the area of each: Lomond, 45; Ness, 30; Awe, 30; Shin, 25; Maree, 24; Tay, 20; Archaig, 18; Shiel, 16; Lochy, 15; Laggan, 12; Morrer, 12; Fannich, 10; Eriicht, 10; Naver, 9; Earn, 9; Leven, 7; Ken, 6; and Katrine, 5. A still more characteristic feature of the country are the sea lochs, or friths or firths as they are called, deep inlets which indent the coast. The most extensive on the E. coast are the friths of Forth, Tay, Moray, and Dornoch. Between the last two is Cromarty frith, celebrated for its beauty and for its excellence as a harbor of refuge. On the N. coast is Loch Eriboll, also a good harbor, and on the W. coast the two lochs Broom, Loch Ewe, Loch Torridon, Loch Carron, Loch Alsh, Loch Sunart, and Loch Linnhe. The frith of Clyde is the largest and most useful of these inlets, of which only a few have been mentioned.—Geologically Scotland is divided into three distinct regions: 1. The southern or older palæozoic, which includes the region between the southern boundary and a line running E. N. E. from Girvan on the frith of Clyde to the Siccar point on the E. coast. It consists chiefly of lower Silurian strata, which have been forced up in various anticlinals and convolutions, and broken through in several places by felspar porphyries, trap rocks, granite, and sye-

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

nite. The mountain range called the southern highlands, which crosses the island from St. Abb's Head on the North sea to Loch Ryan, is formed by these strata. These mountains seldom rise above 2,000 ft., and are clothed to the summit by grass or moss. On the English border are the Cheviots, a group consisting of feldspar porphyry and trap rocks. The principal valley of this region is that of the Tweed, which embraces some very fertile land. West of the valley of the Tweed are the vales of the Liddel, Esk, and Annan, the lower portions of which are peat bogs, the site of ancient forests, which have been in great part drained and cultivated. 2. The central or newer palæozoic region embraces the basins of the friths of Clyde, Forth, and Tay, and has an area of about 5,000 sq. m. It consists of the Devonian or old red sandstone and the carboniferous formations, with the surface extensively covered by trap rocks. The coal measures are largely productive in rich beds of bituminous coal, iron ores, and fire clay. Much of the coal is cannel, and is largely exported for gas works and domestic consumption in other countries. The boghead cannel is especially famous for producing gas and coal oil. The iron ores are worked on an immense scale, especially the variety known as the black band; and the product of the blast furnaces of this region has long been exported in large quantities to the United States, where it is known by the name of Scotch pig. South of the Forth are the Pentland hills, and north of it the Kilpatrick, Campsie, Ochil, and Sidlaw hills, a range of trap rocks. Among the remarkable isolated trap hills in this district are Arthur's Seat and the Lomond hills, and the rocks on which are built the castles of Edinburgh, Stirling, and Dumbarton. 3. The northern division, or the region of the crystalline and metamorphic rocks, comprises the whole of Scotland N. and W. of the central division, or beyond a line drawn from the frith of Clyde on the S. W. to Stonehaven on the opposite coast. This region has an area of 19,000 sq. m., and comprises the highlands. Its southern boundary is a narrow zone of clay slate, which is extensively quarried for roofing slates. North of this is an irregular band of mica slate, which begins in the peninsula called the Mull of Cantyre, and extends in a N. E. direction to the E. coast. Beyond this is an extensive formation of gneiss covering about 11,000 sq. m. This is throughout broken by granite, sometimes in small veins and in other places in huge mountain masses, forming some of the highest summits in Scotland. Among the other igneous rocks of this region, the most important is porphyry, which forms the mountains of Glencoe and the summit of Ben Nevis, the highest point of the British islands. Next on the W. coast is the red sandstone formation, with the superposed quartzite and limestone, constituting a series of lofty mountains, of which the principal peaks are about 3,000 ft.

high. The N. and E. extremity of the mainland is mostly covered by the old red sandstone or Devonian formation, which spreads N. over the Orkneys and part of Shetland. On the N. E. coast are newer secondary deposits of limited extent, the most important of which are patches of lias and oölite in Aberdeenshire, Elgin, Cromarty, and Sutherland, and greensand and chalk flints in Aberdeenshire. Lias and oölite beds are widely diffused on the W. coast and around the shores of some of the islands. In the islands of Skye, Mull, and Morven, and in Lorn on the mainland, these beds are covered by trap rock, showing that for a long period this part of Scotland was subject to volcanic action.—The climate is so tempered by the influence of the ocean that, notwithstanding the high northern latitude of the country, the thermometer rarely falls to zero, nor does it often rise above 80° in summer; the mean temperature is 47°. The prevalent winds are from the west, and the record of meteorological observations shows that during more than two thirds of the year the direction of the wind is from N. W. or S. W. In some places among the mountains the annual fall of rain is nearly 100 inches, while in other parts of the country it is only 24 inches. Observations made at 55 stations during 1872 showed the following results: highest temperature in the shade 85·3°, lowest 10°; mean day temperature 52·6°, mean night temperature 41·1°, mean temperature 46·9°; number of rainy days, 217; rainfall, 54·15 inches; mean barometer, 29·698. Easterly winds prevailed 112 days, and westerly 147 days.—The flora of Scotland does not differ materially from that of England, though there are some peculiar plants which grow only in certain restricted localities. The number of flowering plants and ferns is estimated at 1,200. Among those of a peculiarly Scottish type are the globe flower, crowberry, *trientalis Europæa*, *primula farinosa*, *haloscias Scoticum*, and *Mertensia maritima*. There are 37 species of indigenous land quadrupeds, among them the red, fallow, and roe deer, the hare, rabbit, fox, badger, otter, wild cat, weasel, and hedgehog. Bears and wolves have been exterminated, the last wolf having been killed in 1680. A few specimens of the native wild cattle are preserved in a park belonging to the duke of Hamilton. Of birds about 270 species have been noted, one half of them water birds, of which great numbers are found on the coast. The golden eagle inhabits the mountains, and the pheasant, ptarmigan, blackcock, grouse, and partridge are abundant. Reptiles are almost unknown. Fish abound in the lakes, rivers, and adjacent seas, and a great variety of shell fish occurs, among which is a mussel found in the rivers containing in some cases tolerably large pearls.—Politically, the kingdom is divided into 33 counties, grouped in eight geographical divisions. The population of these counties according to the official cen-

sus returns of 1871, and their shire towns, are given in the following table :

COUNTIES.	Pop. in 1871.	SHIRE TOWNS.
NORTHERN.		
Shetland.....	31,608	Lerwick.
Orkney.....	31,274	Kirkwall.
Caithness.....	39,992	Wick.
Sutherland.....	24,317	Dornoch.
NORTHWESTERN.		
Ross and Cromarty.....	80,955	{ Dingwall and Cromarty.
Inverness.....	87,531	Inverness.
NORTHEASTERN.		
Nairn.....	10,225	Nairn.
Elgin (or Moray).....	43,612	Elgin.
Banff.....	62,023	Banff.
Aberdeen.....	244,603	Aberdeen.
Kincardine.....	34,630	Stonehaven.
EAST MIDLAND.		
Forfar.....	237,567	Forfar.
Perth.....	127,768	Perth.
Fife.....	160,735	Cupar.
Kinross.....	7,198	Kinross.
Clackmannan.....	23,747	Clackmannan.
WEST MIDLAND.		
Stirling.....	93,218	Stirling.
Dumbarton.....	53,357	Dumbarton.
Argyle.....	75,679	Inverary.
Bute.....	16,977	Rothsay.
SOUTHWESTERN.		
Renfrew.....	216,947	Renfrew.
Ayr.....	200,809	Ayr.

Linlithgow.....	40,635	Linlithgow.
Edinburgh.....	323,379	Edinburgh.
Haddington.....	37,771	Haddington.
Berwick.....	36,476	Greenlaw.
Peebles.....	12,330	Peebles.
Selkirk.....	14,005	Selkirk.
SOUTHERN.		
Roxburgh.....	53,974	Jedburgh.
Dumfries.....	74,893	Dumfries.
Kirkcudbright.....	41,859	Kirkcudbright.
Wigtown.....	33,830	Wigtown.

The total area is 30,463 sq. m., of which the islands comprise about 5,000. The population has been steadily increasing for more than a century, chiefly by natural growth. In 1700 the number of inhabitants was estimated at 1,000,000; in 1755, at 1,265,000. The first government census was in 1801, and the result was 1,608,420 inhabitants. By the successive censuses at intervals of 10 years it was found that the population increased in each decade from 10 to 13 per cent. The enumeration of 1811 gave 1,805,864; of 1821, 2,091,521; of 1831, 2,364,386; of 1841, 2,620,184; of 1851, 2,888,742; of 1861, 3,062,294; and of 1871, 3,360,018, of whom 1,603,143 were males and 1,756,875 females; 161,909 lived on the islands. Scotland contains 168 cities and towns, of which 70 are royal and 79 municipal burghs. Edinburgh is the capital and the seat of the chief courts, but Glasgow is the largest city. Besides these the following, arranged in the order of their populousness, had each in 1871 more than 25,000 inhabitants: Dundee, Aberdeen, Greenock, Paisley, Leith, and Perth;

and the following more than 10,000 inhabitants: Kilmarnock, Arbroath, Kirkcaldy, Ayr, Coatbridge, Airdrie, Dumfries, Dunfermline, Montrose, Inverness, Stirling, Hamilton, Dumbarton, Hawick, Port Glasgow, and Galashiels. The kingdom in 1872 contained 887 parishes. The people are divided into two great and distinct stocks, differing in language, manners, and dress, viz.: the highlanders and the lowlanders, the former living in the mountainous north and the latter in the south. The highlanders wear a short coat, a vest, and a kilt or fillibeg, a kind of petticoat reaching scarcely to the knees, which are left entirely uncovered, the lower part of the legs being covered with short hose. These garments are usually of tartan, a kind of checkered stuff of various colors. On the head is worn a peculiar covering called a bonnet. Sometimes the plaid, a large piece of tartan, is worn around the body in the manner of the Roman toga. The language of the highlanders is the Erse or Gaelic, a Celtic dialect bearing no analogy to the English. (See CELTS, LANGUAGES AND LITERATURE OF THE.) Both the peculiar language and the peculiar costume of the highlands are gradually falling into disuse, the people adopting the manners, dress, and dialect of the lowlands. The clans or tribes into which they were formerly divided have also ceased to have any legal existence, and the hereditary chiefs who once governed them with almost absolute sway have no longer any authority. The highlanders, who at no very remote period were noted for their warlike and predatory habits, have ceased to carry arms about their persons, and are as peaceable and orderly as any other part of the British population. But they are still fond of military life, and enlist in great numbers in the British army, of which they form some of the most distinguished regiments. The peculiar language of the lowland Scots closely resembles the English, though some regard it as a dialect of the Scandinavian. It is mixed with Anglo-Saxon words and idioms, and with a few French terms which have not found their way into English. This dialect prevails not only in the lowlands, but in Caithness, Orkney, and Shetland in the north. The lowlanders, especially those of the towns, do not differ much from the English, and the two nations have been rapidly assimilating during the present century. Among the peasantry, however, many traits are preserved of a character essentially Scotch. They are marked by an athletic, bony frame, broad and high cheek bones, and a hard, weather-beaten countenance. No people have shown a more resolute determination in defence of civil and religious freedom. Their chief vices are intemperance and unchastity. In 1872, out of a total of 118,873 births in the kingdom, 10,817 or more than 9 per cent. were illegitimate; and in eight counties, Kincardine, Kinross, Aberdeen, Kirkcudbright, Wigtown, Elgin, Dumfries, and Banff, the proportion was above 12 per cent. In

Banff it was 16·4 per cent. Notwithstanding the smallness of its population, Scotland has produced an array of names eminent in literature and science which scarcely any other nation can boast of surpassing.—The agriculture of Scotland has attained to a high pitch of excellence, and in many parts of the country is conducted with a skill and energy not surpassed anywhere in the world. The climate is in many respects unfavorable to agriculture, its chief defects being the low summer temperature, the lateness of the spring, the occasional prevalence of N. E. winds and fogs, and heavy rain in the latter part of summer, which often causes great damage to the crops, and a cold, wet harvest. Still, the Lothians, the carse of Stirling, Falkirk, and Gowrie, the Mearns, Clydesdale, and Strathearn, large portions of Fifeshire, Strathmore, Annandale, Nithsdale, Kyle, Cunningham, and of the low grounds along the Moray and Cromarty friths, are so well tilled and productive that they bear comparison with the best lands in England. The whole system of cultivation in them is generally very perfect. The grain is usually sown by the drill, and much of the crop is reaped and all of it threshed by machinery. In the rich and level plains of the Lothians and Stirlingshire, where the climate is comparatively dry, the land is worth more in crop than as pasture, and the following is the common rotation: 1, oats; 2, beans or potatoes; 3, wheat; 4, turnips; 5, wheat or barley; 6, grass. In these districts guano and other light manures are liberally applied to the crops. In the higher and more moist districts a different system prevails; the land lies longer under pasture, the following being the rotation of a six years' course: 1, oats; 2, turnips; 3, oats or barley; 4, 5, and 6, grass. Rearing and feeding of cattle are carried on to a large extent in these districts, as the most profitable way of consuming the grass and green crops. In the mountains, heaths and natural grasses occupy the soil, affording a scanty herbage for sheep or cattle. Much care has been taken and great skill shown in improving the breeds of stock and in distributing them over the most eligible pasture lands. The black-faced highland sheep is kept in the wildest and stormiest mountain region of the north, as best suited to withstand the climate. The Cheviot breed is little inferior in the same respect, and has been largely introduced into the north. These animals are exposed to great hardships during snow storms, and usually receive no other food than what they find on the hills. In 1871 the total number of acres under all kinds of crops, bare fallow, and grass, was 4,516,090. The number of live stock was as follows: horses used solely for agriculture, 174,484; cattle, 1,070,107; sheep, 6,882,747; pigs, 195,642.—The mineral wealth of Scotland consists chiefly of coal and iron. In 1870 there were 411 collieries at work in the counties of Lanark, Ayr, Fife, Clackmannan, Haddington,

Edinburgh, Linlithgow, Stirling, Dumbarton, Renfrew, Dumfries, Peebles, and Perth, the aggregate product of which was 14,934,553 tons of coal. In the same year the iron works, mostly in Lanark and Ayr, produced 1,206,000 tons of pig iron. There were also in 1870 six lead mines in Argyle, Kirkcudbright, Lanark, and Dumfries, which yielded 2,390 tons of lead and 5,680 oz. of silver. Granite is largely quarried and exported from Aberdeen, Peterhead, and the coast of Mull.—The fisheries constitute a very important branch of Scottish industry. Before the export of salmon to England grew to be considerable, in some parts of the country domestic servants were accustomed to stipulate that they should not be compelled to eat it more than two or three times a week. The fishery is now chiefly in the Tweed, Forth, Tay, Dee, Don, Findhorn, Spey, Ness, and other rivers on the E. coast. The herring fishery has long been important. In 1870 the total product of this fishery was 928,613 bbls., of which 833,160 were cured. In the same year the cod and ling fisheries yielded 227,224 cwt. The herring, cod, and ling fisheries in 1870 employed 14,935 boats, of the aggregate tonnage of 103,946. The whole number of persons engaged in these fisheries was 89,790. The total value of the boats, nets, and lines employed was £953,814.—The linen manufacture was the earliest and once the most important branch of the manufacturing industry of Scotland. Its principal seats are in the counties of Fife, Forfar, and Perth. In 1870 there were 191 factories, with 330,599 spindles, and 17,419 power looms; hands employed, 49,917, of whom 13,555 were males and 36,362 females. In recent years the cotton manufacture has excelled that of linen in extent and value. It is carried on chiefly in the counties of Lanark and Renfrew, and it all centres in or is dependent upon the city of Glasgow. In 1870 there were 98 cotton factories, with 1,487,871 spindles and 25,903 power looms, employing 30,960 hands, of whom 5,148 were males and 25,812 females. The woollen manufacture, though less considerable than either the linen or the cotton, is more widely diffused, being carried on in 27 of the 33 counties, but most largely in Aberdeen, Ayr, Clackmannan, Dumfries, Lanark, Peebles, Perth, Renfrew, Roxburgh, Selkirk, and Stirling. The cloth made is chiefly coarse. In 1870 there were 218 factories, with 469,524 spindles and 10,543 power looms, employing 23,000 hands, of whom 8,515 were males and 14,485 females. In the same year there were 28 worsted factories, with 71,556 spindles and 1,201 power looms, employing 5,968 hands, of whom 2,605 were males and 3,363 females. There were also four silk factories in Paisley and Glasgow, with 12,643 spindles and 243 power looms; and 2 hemp, 48 jute, 3 hosiery, and 5 hair factories. Whiskey and ale are manufactured to a large extent. In the year ending in March, 1871, 14,501,983

gallons of spirits were distilled, and 2,435,247 bushels of malt were consumed by brewers. Edinburgh is the chief seat of the beer manufacture, and Campbeltown in Argyshire, Glenlivet, and Lochnagar of the distillery business. Other important manufactures are paper, leather, soap, earthenware, glass, hardware, hats, and combs. Ship building is carried on extensively, and large numbers of steamboats, steam engines, and other machinery are made, especially on the Clyde. The principal ship yards are at Aberdeen, Banff, Dundee, Glasgow, Greenock, and Port Glasgow. In 1872 there were built, exclusive of foreign orders, 216 vessels of 145,181 aggregate tonnage, of which 159 were of iron, 53 of wood, and 4 composite; 60 were sailing vessels of 19,414 aggregate tonnage, and 156 steamers of 125,767 tons. Besides these there were built for foreigners 39 vessels of 33,810 tons, all but two of which were steamers.—The shipping of Scotland on Dec. 31, 1872, comprised 2,568 sailing vessels of 689,768 tons burden, and 657 steam vessels of 267,337 tons. The number of sailing vessels entered coastwise in 1872 was 12,881, tonnage 987,304; steam vessels 8,658, tonnage 2,022,801. The number of sailing vessels entered from the colonies in 1872 was 546 (49 foreign), tonnage 369,187; cleared, 623, tonnage 380,113. In the same year 48 steamers, of 45,139 tons, entered from the colonies; cleared 116, of 101,976 tons. The number of sailing vessels entered from foreign ports in 1872 was 6,402 (1,685 British), of 1,071,762 tons; cleared for foreign ports, 6,721 (1,366 British), of 678,687 tons. The number of steamers entered from foreign ports the same year was 1,368 (183 foreign), tonnage 684,383; cleared for foreign ports, 1,509 (206 foreign), tonnage 744,139.—Scotland is well supplied with roads, canals, and railways. Her turnpike roads, of which more than 7,000 m. are open, are among the best in the world. The greatest of her canals is the Caledonian, which affords a passage for ships from the North sea to the Atlantic ocean. (See CANAL.) Another canal connects the opposite coasts of the island, and extends from Glasgow to Edinburgh in two divisions: the Forth and Clyde canal, finished in 1790, 38 m. long; and the Union canal, finished in 1822, 31 m. long. Paisley canal, from Glasgow through Paisley to Johnstone, is 11 m. long; Monkland canal, between Glasgow and Airdrie, 12 m.; Glenkens canal, from the mouth of the Dee through Loch Ken to Dalry, 26 m. The first railway in Scotland was opened in 1810 between Kilmarnock and Troon, 10 m. On Dec. 31, 1873, 2,612 m. of railway were in operation. The aggregate authorized capital of all the companies was £76,461,819. During 1873 the passage receipts amounted to £1,963,979; freight receipts, £4,343,809; total, £6,307,788. The total working expenditure for the same year was £2,943,518. Most of the smaller railway

lines are leased or worked by the great trunk lines, of which there are five: the Caledonian, which monopolizes half the trade of Scotland, particularly on the E. side, and controls 11 branch roads; the Glasgow and Southwestern, between Carlisle and Glasgow, with several branches; the Great North of Scotland, from Aberdeen to Torres, where it connects with the Highland, and which works four other roads; the Highland, from Perth to Inverness and Golspie, which is extending its line further north, and which works three other roads; and the North British, from Carlisle to Edinburgh *via* Hawick, which works six other lines and has many branches. The principal ports are connected by lines of steamers with each other and with many ports of the world.—In general government Scotland forms an integral part of the United Kingdom, and stands on the same footing with England except in regard to law and law courts and the form of church government, upon which points express stipulations exist in the articles of union between the two kingdoms. To the imperial parliament the Scottish nobles elect of their own number 16 peers to represent them in the house of lords. In 1874 Scotland was represented in the house of commons by 60 members, of whom 32 were elected by the counties, 26 by the parliamentary burghs, and 2 by the four universities. The number of electors on the register in the same year was 280,308, of whom 82,807 were county voters, and 187,991 borough electors. At the head of the judiciary in Scotland is the court of session, which is supreme in civil matters, and consists of 13 judges. The court holds two terms annually, during which it sits five days in the week. The court of justiciary, which is supreme in criminal causes, consists of five of the judges of the court of session. The high court of justiciary sits in Edinburgh, but circuit courts are held to the number of four in Glasgow and two in the other circuit districts annually. This court has jurisdiction in all important criminal charges, and the decisions of its high court are without appeal. Its presiding officer is the president of the court of session, who when sitting in this court is termed the lord justice general. Causes are tried by the verdict of a jury of 15 persons, who are not required to be unanimous, and who, when the case is not clear, can bring in a verdict of "not proven," which leaves the accused liable to be tried again for the same offence should additional evidence be found. The judges of this court when upon circuit possess a civil jurisdiction by way of appeal. The chief local courts are those of the sheriffs, of which there is one in each county, the business of the court being conducted before an officer called the sheriff substitute, acting for a sheriff principal, who has within certain limits a power to revise his proceedings, while there are certain acts both judicial and executive which must be performed by the sheriff

principal. The counties have been grouped into districts, and one sheriff principal serves for all the counties in a district. The sheriff's court has no jurisdiction in questions of land rights nor of personal *status*, as marriage or legitimacy, but in other matters of civil right there is no limit in pecuniary value to the causes that may come before it. The proceedings in the civil department of this court are chiefly conducted in written pleadings. The sheriff has a separate court for the recovery of small debts, in which the procedure is oral and summary. The magistrates of municipal corporations and justices of the peace appointed by the king have jurisdiction both in civil and criminal matters in a limited sphere. In many particulars the law of Scotland differs from that of England, and bears much affinity in theory and practice to the systems of the continent, especially to the old systems of judicature in France, on which it was modelled.—The public revenue of Scotland for the year ending March 31, 1874, was £7,138,543, and was derived from customs, excise, stamps, land and assessed taxes, property and income tax, and the post office. The assessed taxes comprise duties on inhabited houses, servants, carriages, horses, dogs, game, &c., for the support and relief of the poor. In 1872, out of a total of 117,611 poor persons, 74,752 were classed as paupers and 42,859 as dependants. The whole amount received from poor rates was £888,002, of which £862,171 was expended in relief. In the same year 3,042 criminals, of whom 2,354 were males and 688 females, were committed for trial. Of these 2,259 were convicted, and 744 acquitted.—The established church of Scotland is the Presbyterian, from which there are several seceding bodies, the most important of which are the Free church and the United Presbyterian church. In 1874 the established church had 16 synods, 84 presbyteries, 1,280 congregations, and about 1,300 ministers; the Free church, 16 synods, 77 presbyteries, 954 congregations, and 957 ministers; and the United Presbyterian, 31 presbyteries and 611 congregations (including those in England). The Independents had 119 ministers; Episcopalians, 6 bishops and about 220 clergy; and Roman Catholics, 3 vicars apostolic and 228 clergy. In 1695 it was enacted "that there be a school founded and a schoolmaster appointed in every parish by advice of the presbyteries; and to this purpose that the heritors do in every congregation meet among themselves and provide a commodious house for a school, and modify a stipend to the schoolmaster, which shall not be under 100 merks (£5 11s. 1½d.), nor above 200 merks (£11 2s. 2½d.), to be paid yearly at two terms." This was the foundation of a system of common schools, under which the Scottish people in the 18th century became more generally educated than any other in Europe. In 1803 the salary of the schoolmaster was raised so that it should not be less than

£16 13s. 4d. per annum. In 1828 it was again raised so that it should not be less than £25 13s. 3½d. A further increase was made in 1859, dependent somewhat on the price of oatmeal. In addition to the salary fixed by law, the teachers receive fees commonly averaging for each pupil not more than 5s. a year. Besides the parish schools there are many schools maintained by the "Society in Scotland for Propagating Christian Knowledge," and by the established church and other denominations. There are also a large number of private schools. In the cities and larger towns there are grammar or high schools and academies, and there are several normal schools for the training of teachers. In 1873 the number of primary schools inspected by the government inspectors was 2,108, of which 1,379 belonged to the established church, 577 to the Free church, 86 to the Episcopal church, and 66 to the Catholic church. The average number of children in attendance was 225,178, number of certificated teachers 2,657, and number of pupil and assistant teachers 3,623. The income of these schools from government grants was £100,370, from endowments £28,853, from voluntary contributions £66,921, from school pence £115,706, and from other sources £802; total income, £312,652. The total number of schools under inspection was 2,507, with 241,798 pupils present at annual inspection. The whole number of children in Scotland from 5 to 13 years of age in 1871 was 629,235, of whom 494,860 were receiving education. The number of reformatory schools was 12, with 791 boys and 257 girls; the number of industrial schools 27, with 2,493 boys and 992 girls. The higher seats of education in Scotland are the universities of Edinburgh, Glasgow, Aberdeen, and St. Andrews, for accounts of which see the articles on those cities. The periodical press of Scotland has long been distinguished for its vigor and ability. The "Edinburgh Review," "Blackwood's Edinburgh Magazine," the "North British Review," and "Chambers's Journal" stand in the front rank of that species of literature; and the first two especially attained in the first half of this century a reputation that has no superior of its kind. As a place of publication Edinburgh is the only rival of London in the British empire, and has long been celebrated for its issues of books.—Scotland was known to the Romans by the name of Caledonia, and was inhabited by 21 savage tribes of shepherds and hunters of Celtic race, who were polygamists and idolaters, their religion being druidical, and their habits so disorderly that the Roman writers call them robbers. They were exceedingly brave and hardy, and their arms were short spears, daggers, and shields. Their habitations were miserable huts, and they disdained the use of clothes. To their Roman invaders they offered a fierce and obstinate opposition. In the reign of Titus (A. D. 79–81) Julius Agricola led a Roman army beyond the friths of Forth and Clyde, pene-

trated to the frith of Tay, and in 84 defeated the Caledonians under Galgacus, while his fleet explored the coasts, and first made certain that Britain was an island. He was unable to complete the conquest of the country, and finally withdrew his forces behind a wall and chain of forts with which he had connected the friths of Forth and Clyde. Several other attempts were made by the Romans to subdue the north of the island, the most memorable of which was that of the emperor Septimius Severus, who in 209 led an expedition as far as Moray frith, where he made a peace with the Caledonians. But on his withdrawal to the south they rose in insurrection, and a second expedition was preparing to march for their subjugation when the emperor died at York (Eboracum) in 211. During his residence in Britain Severus reconstructed a wall originally built by Hadrian between the Tyne and the Solway; and shortly before the final abandonment of Britain by the Romans in the early part of the 5th century, they repaired this rampart and that between the friths of Clyde and Forth. From this period for several centuries the predominant race of Scotland is known in history as Picts. (See PICTS.) Between the two walls in the province of Valentia (Northumberland, Dumfriesshire, &c.) dwelt five tribes who had become practically Romanized and civilized, and after the withdrawal of the Romans formed a union and established a kingdom which was called *Regnum Cumbrense*, and is also known as the kingdom of Strathclyde. Of this kingdom at the beginning of the 6th century the famous Arthur Pendragon was the sovereign. In this half fabulous period of Scottish history 38 Pictish kings are enumerated, from Drest, who succeeded to the throne in 451, to Brud, who died in 843. The most important event of this period was the arrival in Scotland of the Saxons in 449, and their eventual conquest and settlement of the lowlands, where one of their leaders, Edwin, founded the present capital, Edinburgh (Edwinsburgh). About 503 Scotland was also invaded by the Scots, a Celtic tribe from Ireland, who settled on the W. coast and established a kingdom beginning with the reign of Fergus, one of their chiefs, and continuing under a series of kings, of whom little is known till the accession of Kenneth Macalpin in 836, under whom the Scoto-Irish or Scotch became the dominant race in the country, which now began to be called Scotland. During the reign of Kenneth the Picts disappeared as a people, being according to some authors massacred by the orders of Kenneth, but according to a more probable theory amalgamated with and absorbed by the Scots. The most important event of the Pictish period was the conversion of the natives to Christianity in the 6th century by St. Columba and other missionaries from Ireland. In 866, under the reign of Constantine I., the second of the successors of Kenneth, the Danes, led by

the vikings, began to invade Scotland. Their incursions for plunder and conquest continued with little intermission, in spite of frequent repulses, till 1014, when, after a series of defeats by King Malcolm II., they gave up the contest. Meantime the Scottish kingdom was gradually enlarged by the peaceful annexation of Cumberland about 950, by the conquest of Strathclyde about 970, and of Lothian from England in 1018. This last acquisition was owing to the valor and energy of Malcolm II., who after a vigorous reign was succeeded in 1033 by his grandson, the "gracious Duncan" of Shakespeare, who six years later was killed by Macbeth at Bothgowanan, near Elgin. Macbeth himself was defeated and slain in 1056 or 1057, after a vigorous reign, and was succeeded by Malcolm III. in 1057. During his reign England was conquered by the Normans, and Malcolm, who had married the Saxon princess Margaret, sister of Edgar Atheling, the heir of the Saxon line, invaded and ravaged the north of England. In retaliation William the Conqueror invaded Scotland in 1072 with so powerful a force that Malcolm submitted without a struggle, and performed homage to William as his feudal superior for, as the English subsequently alleged, his whole kingdom, though the Scotch maintained that the homage was rendered only for the 12 manors which Malcolm held in England. The question was long a source of dissension between the two kingdoms, and led to a war between Malcolm and William Rufus, in which, in 1093, the Scottish king was slain in a battle near Alnwick castle. Of his successors the most conspicuous were Alexander I., David I., Malcolm IV., William the Lion, Alexander II., and Alexander III., in whose reign, terminating in 1286, Scotland made rapid progress in power and civilization. The reign of William the Lion, which lasted 48 years, from 1165 to 1214, was memorable for his capture by Henry II. of England, and his disgraceful treaty with that monarch in 1174, by which he regained his liberty and surrendered the independence of Scotland, agreeing to become the vassal of Henry and to receive English garrisons in Edinburgh, Stirling, and other important places. This state of dependence continued till the death of Henry in 1189, when his successor, Richard Cœur de Lion, anxious to obtain money for his crusade to the Holy Land, agreed for the sum of 10,000 marks to renounce all claim on the part of the English crown to supremacy over Scotland. William the Lion was succeeded by his son Alexander II., one of the wisest and most vigorous of the Scottish monarchs, whose son Alexander III., dying in 1286, left the crown to an infant granddaughter, Margaret, daughter of Eric, king of Norway. On her voyage from Norway to take possession of the throne, Margaret died in one of the Orkneys. Various competitors for the crown appeared, the principal of whom were John Balliol and Robert Bruce. Edward I. of England offered or was

invited to mediate between them, for which purpose a conference was held at Norham in 1291 between the English monarch and the principal nobility and clergy of Scotland. Edward awarded the crown to Balliol, on condition that he should do homage to him as his feudal superior. He swore allegiance, but when called upon soon after to aid Edward against France, he renounced his allegiance and declared war, upon which Scotland was overrun by a powerful English army, Balliol taken prisoner and sent to the tower of London, and the principal strongholds of the kingdom captured. At this juncture, when nearly all the great nobles had submitted to the conqueror, Sir William Wallace of Ellerslie appeared in arms at the head of a small band of followers, and continued the contest with heroic energy for several years, until he was at length betrayed into the hands of Edward, who caused him to be cruelly executed at London (1305). The struggle was continued by Robert Bruce, grandson of the competitor of Balliol, at first with marked ill fortune, but finally culminating in the great battle of Bannockburn, June 24, 1314, where the English under Edward II. were utterly routed and dispersed by a much inferior force of Scots. The war continued 14 years longer, during which England was 12 times invaded and scourged with fire and sword, until, by a treaty ratified in 1328, Edward III. renounced his claim of sovereignty. Bruce died in 1329. During the century which succeeded the sceptre was swayed by three kings, one of whom, Robert II. (1371-90), was the son of the steward of Scotland, whence the origin of the name of the royal house of Stuart, of which he was the first sovereign. His successor, Robert III. (1390-1406), devolved the cares of government upon his eldest son, the duke of Rothesay, who quarrelled with his uncle, the duke of Albany, and was starved to death by order of that powerful magnate. The king's second son, James, on his voyage to France in 1405, was captured by the English and carried a prisoner to England, where he was detained for 19 years, during the greater part of which the government of Scotland was administered by Albany as regent. In 1424 the captive prince was released, and returning to Scotland began a brief reign of great energy, devoted mainly to reducing to order the powerful and turbulent nobility. He made many great reforms, instituted the court of session and other tribunals, and introduced law and order in the place of license and turbulence. He was assassinated in 1437, and was succeeded by his son James II., a boy of six years, during whose minority the kingdom was torn by factions, one of which was headed by the earl of Douglas, whose immense possessions made him the most powerful baron of Scotland. The king on attaining his majority assumed the reins of government with vigor and decision, and effectually humbled the house of Douglas, whose

chief he stabbed with his own hand in the castle of Stirling in 1452. The king subsequently took part in the civil wars of England on the side of Henry VI., and was accidentally killed while besieging Roxburgh in 1460. His son James III. was then in his eighth year, and during his minority the country, in spite of the turbulence of the nobles, was comparatively prosperous, while after his accession civil war raged almost constantly between the king and his brother the duke of Albany, who assumed the title of Alexander, king of Scotland, and was supported by the Douglasses, by the lord of the Isles, and many other great nobles. Albany was finally defeated in 1483; but a new rebellion broke out a few years later, the chiefs of which arrayed the king's son, a youth of 16, against his father, and the latter was defeated and slain at Sauchie-burn in 1488. The rebellious son, who succeeded under the title of James IV., maintained a magnificent court, promoted the civilization of the country, and curbed the power of the nobles and of the great highland chiefs, the most considerable of whom, the lord of the Isles, having rebelled, was promptly subdued and stripped of his extensive dominions, which were forfeited to the crown. In 1513 he was imprudently led by French influence, which had long been very great in Scotland, to declare war against Henry VIII. of England, and to invade that kingdom with a powerful army. He was met by the earl of Surrey at Flodden, Sept. 9, and defeated and slain, together with so many chiefs, nobles, and common soldiers, that all Scotland was plunged in mourning; and to this day the defeat is regarded by the Scotch as the greatest disaster in their national annals. A long series of misfortunes followed during the minority of James V., the son of James IV., whose mother, Margaret Tudor, daughter of Henry VII. of England, was made regent, and speedily became involved in quarrels with the nobles. She had rashly married the earl of Angus, the head of the house of Douglas, and that faction retained possession of the young king's person till in his 17th year he freed himself from their yoke and assumed the reins of government, and, after a struggle in which the Douglasses were supported by England, succeeded in driving them into exile. During his reign Protestantism made great progress in Scotland, though severely persecuted by Cardinal Beaton, the Catholic primate. In 1542 James became involved in war with England, and died in the same year of a broken heart caused by the mutinous conduct of the nobles, which had led to a disgraceful defeat of his army at Solway Moss. The crown descended to his only child, a daughter a few days old, the celebrated and unfortunate Mary queen of Scots. (For the history of Scotland during her reign, see MARY STUART.) Mary was driven into exile in England in 1568, and her absence left her natural brother, the regent Murray, mas-

ter of the kingdom. Her son James VI. had been crowned king in 1567, while yet an infant. During his minority, after Murray's assassination in 1570, the earls of Lennox, Mar, and Morton were successively regents, till in 1581 Morton was tried and executed for treason, and the king took the government into his own hands. During all this period the kingdom was distracted by civil war, which had gradually assumed a religious character from the contest between Catholicism and Protestantism for supremacy, in which the Protestants were finally successful, and Presbyterianism became the established religion of Scotland. James, by his descent from Margaret Tudor, the mother of James V., was the heir to the English crown on the death of Queen Elizabeth, and accordingly in 1603 he succeeded to the throne of England. This event, which united the two nations under one head, closed the history of Scotland as a separate kingdom, though it was not till 1707 that the countries were legislatively united. During the great civil wars of England in the 17th century Scotland was the scene of many important events, to which reference has been made in the article ENGLAND. Since the union the most remarkable occurrences in her annals are the two rebellions of 1715 and 1745, the object of which was the restoration of the exiled Stuarts to the throne.—See "History of Scotland during the Reigns of Mary and James VI.," by William Robertson (2 vols. 4to, 1759); P. F. Tytler's "History of Scotland" (9 vols., 1828-'43); and "History of Scotland from Agricola's Invasion to the Revolution of 1688," by John Hill Burton (7 vols., Edinburgh and London, 1867-'70).

SCOTLAND, Church of. See PRESBYTERIANISM.

SCOTT, the name of 11 counties in the United States. **I.** A S. W. county of Virginia, bounded S. by Tennessee and intersected by Clinch river and the N. fork of Holston river; area, about 450 sq. m.; pop. in 1870, 13,036, of whom 524 were colored. The Clinch mountain and several parallel ridges traverse it. The soil is generally good, and adapted to grazing. Bituminous coal and iron abound. The "Natural Tunnel," perforated through a lofty ridge by a branch of the Clinch river, is in this county. The chief productions in 1870 were 53,583 bushels of wheat, 222,254 of Indian corn, 68,730 of oats, 16,557 lbs. of tobacco, 24,249 of wool, 95,354 of butter, 6,645 of flax, 31,818 of maple sugar, 22,539 of honey, and 13,980 gallons of sorghum molasses. There were 2,528 horses, 2,991 milch cows, 4,430 other cattle, 13,415 sheep, and 10,076 swine. Capital, Es-tillville. **II.** A central county of Mississippi, drained by several tributaries of Pearl river; area, about 600 sq. m.; pop. in 1870, 7,847, of whom 3,167 were colored. There are large forests of pine, and the soil is sandy and sterile. It is intersected by the Vicksburg and Meridian railroad. The chief productions in 1870 were 131,775 bushels of Indian corn, 9,450 of oats,

and 3,560 bales of cotton. There were 988 horses, 567 mules and asses, 2,343 milch cows, 956 working oxen, 3,296 other cattle, 2,399 sheep, and 11,429 swine. Capital, Hillsboro.

III. A W. county of Arkansas, drained by the Fourche la Pave, Petit Jean, and other tributaries of the Arkansas river; area, about 800 sq. m.; pop. in 1870, 7,483, of whom 121 were colored. The surface is uneven and the soil generally fertile. The chief productions in 1870 were 13,141 bushels of wheat, 304,408 of Indian corn, 9,940 of oats, 30,411 lbs. of tobacco, 3,128 of wool, 71,530 of butter, and 678 bales of cotton. There are 2,514 horses, 296 mules and asses, 3,057 milch cows, 1,218 working oxen, 4,374 other cattle, 2,268 sheep, and 21,753 swine. Capital, Waldron. **IV.** A N. E. county of Tennessee, bordering on Kentucky, and drained by the Big South fork of the Cumberland river; area, 300 sq. m.; pop. in 1870, 4,054. It is traversed by the Cumberland mountains, and has an abundance of timber and coal. The chief productions in 1870 were 88,311 bushels of Indian corn, 17,793 of oats, 9,283 lbs. of tobacco, 12,560 of wool, 71,810 of butter, and 22,268 of honey. There were 824 horses, 1,400 milch cows, 2,537 other cattle, 6,589 sheep, and 13,189 swine. Capital, Huntsville. **V.** A N. county of Kentucky, drained by tributaries of the Kentucky river; area, 240 sq. m.; pop. in 1870, 11,607, of whom 3,955 were colored. The surface is generally hilly and the soil extremely fertile. Fine blue limestone is found in great abundance. The Louisville, Cincinnati, and Lexington railroad crosses the S. portion. The chief productions in 1870 were 47,770 bushels of wheat, 26,774 of rye, 573,620 of Indian corn, 76,156 of oats, 32,900 lbs. of tobacco, 31,329 of wool, 70,499 of butter, and 10,338 gallons of sorghum molasses. There were 3,728 horses, 1,413 mules and asses, 2,242 milch cows, 5,171 other cattle, 7,743 sheep, and 16,397 swine. Capital, Georgetown. **VI.** A S. E. county of Indiana, drained by affluents of White river; area, about 200 sq. m.; pop. in 1870, 7,873. The surface is flat, except in the west, where are some high hills called the Knobs. The soil is good. The Ohio and Mississippi and the Jeffersonville, Madison, and Indianapolis railroads traverse it. The chief productions in 1870 were 41,756 bushels of wheat, 213,475 of Indian corn, 69,235 of oats, 5,729 tons of hay, 16,700 lbs. of tobacco, 28,007 of wool, 131,080 of butter, and 30,814 gallons of sorghum molasses. There were 2,342 horses, 1,509 milch cows, 2,309 other cattle, 9,652 sheep, and 8,815 swine; 5 manufactories of carriages and wagons, and 11 saw mills. Capital, Lexington. **VII.** A W. county of Illinois, bounded W. by Illinois river and intersected by Plume and other creeks; area, 255 sq. m.; pop. in 1870, 10,530. The surface is mostly level and well timbered, and the soil very fertile. Coal and limestone abound. It is traversed by the Rockford, Rock Island, and Pacific, and the Toledo, Wabash, and West-

ern railroads. The chief productions in 1870 were 266,123 bushels of wheat, 752,771 of Indian corn, 13,462 of oats, 12,457 of potatoes, 4,735 tons of hay, 21,174 lbs. of wool, and 45,570 of butter. There were 3,257 horses, 2,151 milch cows, 5,958 other cattle, 6,077 sheep, and 17,285 swine; 5 manufactories of carriages and wagons, 5 of stone and earthen ware, and 4 saw mills. Capital, Winchester.

VIII. A S. E. county of Minnesota, bounded N. W. by the Minnesota river; area, about 420 sq. m.; pop. in 1870, 11,042. The surface is undulating, with a variety of prairie land and large forests, and the soil is fertile. Timber is a valuable product. The St. Paul and Sioux City and the Hastings and Dakota railroads traverse it. The chief productions in 1870 were 362,406 bushels of wheat, 186,012 of Indian corn, 165,247 of oats, 19,700 tons of hay, 13,446 lbs. of wool, 319,142 of butter, and 8,750 of hops. There were 2,042 horses, 4,262 milch cows, 6,993 other cattle, 3,863 sheep, and 6,654 swine; 3 manufactories of carriages and wagons, 3 of lime, 1 railroad repair shop, 4 breweries, and 5 saw mills. Capital, Shakopee.

IX. An E. county of Iowa, bounded E. and S. by the Mississippi, which separates it from Illinois, and N. by the Wapsipinicon; area, 450 sq. m.; pop. in 1870, 38,599. It has an elevated, rolling surface, thinly timbered, and a fertile soil. Coal and limestone are found. It is traversed by the Davenport and St. Paul railroad, and the Iowa division of the Chicago, Rock Island, and Pacific. The chief productions in 1870 were 620,954 bushels of wheat, 1,855,226 of Indian corn, 538,102 of oats, 638,440 of barley, 361,647 of potatoes, 34,376 tons of hay, 13,635 lbs. of wool, 702,706 of butter, 55,640 of cheese, and 11,726 of honey. There were 9,386 horses, 9,846 milch cows, 11,771 other cattle, 3,721 sheep, and 32,757 swine; 5 manufactories of agricultural implements, 1 of boats, 5 of brick, 26 of carriages and wagons, 19 of men's clothing, 4 of cooperage, 13 of furniture, 3 of iron castings, 3 of lime, 13 of saddlery and harness, 16 of cigars, 1 of woollen goods, 8 flour mills, 7 saw mills, and 9 breweries. Capital, Davenport.

X. A S. E. county of Missouri, separated from Illinois by the Mississippi river; area, about 440 sq. m.; pop. in 1870, 7,217, of whom 326 were colored. The surface is uneven, and the soil generally fertile. There are vast cypress swamps in the S. part. It is traversed by the St. Louis and Columbus division of the St. Louis and Iron Mountain railroad, and the Cairo, Arkansas, and Texas railroad. The chief productions in 1870 were 77,020 bushels of wheat, 428,857 of Indian corn, 19,291 of oats, 22,659 of potatoes, 6,440 lbs. of tobacco, 4,932 of wool, and 6,531 gallons of sorghum molasses. There were 1,780 horses, 764 mules and asses, 1,777 milch cows, 2,687 other cattle, 3,225 sheep, and 17,343 swine; 1 flour mill, and 6 saw mills. Capital, Benton. **XI.** An unorganized W. county of Kansas, watered by

affluents of Smoky Hill river and of Walnut creek, a tributary of the Arkansas; area, 720 sq. m. The surface is rolling and the soil fertile.

SCOTT, David, a Scottish artist, born in Edinburgh, Oct. 10 or 12, 1806, died there, March 5, 1849. He was an engraver and painter, and engraved after Stothard a series of illustrations for Thomson's "Scottish Melodies." He painted in 1828 "The Hopes of Early Genius dispelled by Death," and in 1830 sent to the British institution his "Lot and his Daughters fleeing from Sodom," which was rejected. In 1831 he exhibited the "Monograms of Man," a series of outline etchings, and the first of 25 illustrations of Coleridge's "Ancient Mariner." In 1832 he painted "Sarpidon carried by Sleep and Death," and "Discord, or the Household Gods destroyed," and subsequently "Ariel and Caliban," "The Alchymist," "Silenus praising Wine," and his masterpiece, "Vasco da Gama encountering the Spirit of the Cape." He also illustrated the "Pilgrim's Progress," and contributed to "Blackwood's Magazine" a series of essays on the "Characteristics of the Great Masters" (1840). His journal in Italy, with poems, notes on art, and other papers, have been published with a memoir by his brother, W. B. Scott (8vo, London, 1850).

SCOTT, Julian. See supplement.

SCOTT, Michael, a reputed Scotch wizard of the 13th century, born probably in Fifeshire, died, it is supposed, in 1291. He was probably educated at some foreign university, and resided for some time at the court of the emperor Frederick II., at whose request he wrote a number of works. A few treatises on natural history, the occult sciences, and other subjects are attributed to him. His reputation was European; traditions of his wonderful powers are still extant in Scotland. Dante introduces him in the *Inferno*, and he is mentioned by Boccaccio and other Italian authors. Camden says in his *Britannia* that in his time Scott's magic books were still preserved at Ulme, in Cumberland, and adds that he was a monk of that place about the year 1290, who from his reputation for abstruse learning was commonly looked upon as a conjurer.

SCOTT, Thomas, an English clergyman, born at Braytoft, Lincolnshire, Feb. 16, 1747, died at Aston Sandford, Buckinghamshire, April 16, 1821. He was ordained in 1773, became a curate in Buckinghamshire, and through the influence of John Newton was converted to Calvinism. In 1781 he removed to Olney, and in 1785 to London, where he was chaplain of Lock hospital. In 1801 he was appointed rector of Aston Sandford. He published "A Commentary on the Bible" (6 vols. 4to); "Defence of Calvinism" against Bishop Tomline; and a small work entitled "The Force of Truth," many times reprinted.

SCOTT, Sir Walter, a Scottish author, born in Edinburgh, Aug. 15, 1771, died at Abbotsford, Sept. 21, 1832. He was a younger son of

Walter Scott, a writer to the signet, allied to the Scotts of Harden, an offshoot from the house of Buccleuch. His mother was Anne, daughter of John Rutherford, a medical professor in the university of Edinburgh. Being delicate, he was sent at three years of age to reside on his paternal grandfather's farm of Sandyknowe, in Roxburghshire. In 1779 he returned to Edinburgh greatly improved in health, with the exception of a lameness which appeared in his second year and never left him. Soon after he entered the high school of Edinburgh, whence, in October, 1783, he was transferred to the university. He was apprenticed in May, 1786, to legal business in the office of his father, and was called to the Scottish bar in July, 1792. His earliest publications were metrical versions of Bürger's "*Leonora*" and "*Wild Huntsman*" (4to, 1796). Subsequently he composed the ballads "*Glenfinlas*," "*The Eve of St. John*," and "*The Grey Brother*," published in 1799 in Lewis's "*Tales of Wonder*." About the same time he produced a translation of Goethe's *Götz von Berlichingen*. He had meanwhile (December, 1797) married Charlotte Margaret Carpenter, a young lady of French extraction, and was in the enjoyment of a comfortable income. In 1799 he was appointed sheriff depute of Selkirkshire. In 1802 appeared the first two volumes of his "*Minstrelsy of the Scottish Border*," a collection of ancient ballads, in 1803 the third volume, and in 1804 his annotated edition of the ancient poem of "*Sir Tristrem*." These works were preliminary to "*The Lay of the Last Minstrel*," of which the first draught had been written in the autumn of 1802, and which on its appearance in 1805 met with an enthusiastic reception. Scott's appointment in 1806 to one of the principal clerkships in the Scottish court of session, with a salary of £800 (subsequently increased to £1,300), enabled him to devote himself entirely to literature. He produced a collection of "*Ballads and Lyrical Pieces*" (1806), and edited a complete edition of the works of Dryden, with a life of the poet (1808). In 1808 appeared "*Marmion, a Tale of Flodden Field*," followed in 1810 by "*The Lady of the Lake*." His succeeding poems, "*The Vision of Don Roderick*" (1811), "*Rokeby*" (1812), a tale of the English civil wars, "*The Bridal of Triermain*" (anonymous, 1813), "*The Lord of the Isles*" (1814), "*The Field of Waterloo*" (1815), and "*Harold the Dauntless*" (1817), are far inferior, though having occasional passages of great beauty. In the summer of 1814 some mislaid sheets of a novel designed to illustrate highland scenery and customs in the era of 1745, which had been commenced in 1805, but laid aside, fell in his way. The second and third volumes were written in three weeks, and in July of the same year the work was published anonymously under the title of "*Waverley, or 'tis Sixty Years Since*." The publication marked an era in the history of English fiction. He had been

in the habit of passing his summers at Ashiestiel on the Tweed, near Selkirk, an estate belonging to a kinsman, and in 1811 he purchased a small farm on that river, within a few miles of Melrose, to which he gave the name of Abbotsford, and which by successive purchases, often made at exorbitant prices, gradually expanded into a large domain. The modest dwelling first erected upon it grew in the course of a few years into a large Gothic castellated mansion; and it was the owner's chief occupation, in the intervals of literary labor or of hospitable duties, to add to the embellishments of both house and grounds. He now produced his novels in rapid succession; and perhaps one reason for maintaining his incognito was his unwillingness to impair his standing as a landed proprietor by allowing it to be known that he was an author writing for fortune. To "*Waverley*" succeeded in 1815 "*Guy Mannering*," and in 1816 "*The Antiquary*," both "by the author of *Waverley*." His next tales, "*The Black Dwarf*" and "*Old Mortality*" (1816), constituted the first series of the "*Tales of my Landlord*," while "*Rob Roy*" (1817) was "by the author of *Waverley*." In 1818 appeared "*The Heart of Mid-Lothian*," and in 1819 "*The Bride of Lammermoor*" and "*A Legend of Montrose*," forming additional series of "*Tales of my Landlord*." "*Ivanhoe*" (1819), which was to have appeared under a new incognito, was, in consequence of the publication of a novel in London pretending to be a fourth series of "*Tales of my Landlord*," announced as "by the author of *Waverley*." "*The Monastery*" and "*The Abbot*" appeared in 1820, "*Kenilworth*" and "*The Pirate*" in 1821, "*The Fortunes of Nigel*" in 1822, "*Peveril of the Peak*," "*Quentin Durward*," and "*St. Ronan's Well*" in 1823, "*Redgauntlet*" in 1824, and "*Tales of the Crusaders*," comprising "*The Betrothed*" and "*The Talisman*," in 1825, all "by the author of *Waverley*." Down to the end of 1825 he was engaged in a variety of miscellaneous enterprises besides those specified. In 1809 he edited the "*State Papers and Letters of Sir Ralph Sadler*," in 1809-'12 "*Lord Somers's Collection of Tracts*" (13 vols. 4to), and in 1814 the works of Swift in 19 volumes, with a life of the author. An excursion to the continent after the battle of Waterloo furnished the materials for "*Paul's Letters to his Kinsfolk*." He was also an occasional contributor to the "*Edinburgh*" and "*Quarterly*" reviews and other periodicals, including the "*Edinburgh Annual Register*," the historical department of which he conducted in 1814-'15. To these must be added his dramatic sketches, "*Halidon Hill*" (1822) and "*Macduff's Cross*," and the articles on "*Chivalry*," "*Romance*," and the "*Drama*," for the "*Encyclopædia Britannica*." With the increase of his prosperity he kept state at Abbotsford like a wealthy country gentleman, and from March to December it was the resort of in-

numerable visitors of every rank and degree. His mornings until 11 o'clock were devoted to composition, and the rest of the day to the superintendence of the works of improvement on his grounds, or the entertainment of his guests and family. In spite of his lameness he was an indefatigable walker and rider. His winters were passed at his house in Edinburgh. His literary fame, greatly enhanced by the steadily growing belief that he was identical with the author of "Waverley," seems never to have disturbed his equanimity; and the baronetcy conferred upon him by George IV. in 1820 was probably received with more satisfaction than the praises of the public. In January, 1826, Constable and co. of Edinburgh, his publishers, were obliged, in consequence of a commercial crisis, to suspend payment, and Scott was found to have incurred liabilities to their creditors to the amount of £72,000. In his eagerness to enlarge and embellish Abbotsford, and to maintain his style of living, he had been in the habit of receiving from Constable and co. large sums in anticipation of works in progress or which he proposed to write, and was thus led, on the principle of mutual accommodation, to give the firm counter acceptances or to indorse their bills. This disaster was almost immediately followed by the failure of the printing house of James Ballantyne and co., which had printed Scott's works since 1802, and of which, it was now discovered, he had been a secret partner since 1805. The affairs of the two firms had become badly involved with each other; and Scott was found to be liable, as partner of Ballantyne and co., for the total amount of the debts of the firm, which somewhat exceeded £100,000. As about half of the £72,000 due to the creditors of Constable and co. was included in the debts of Ballantyne and co., his actual liabilities on account of both firms amounted to a little less than £150,000. He refused the composition which his creditors offered him, and, having procured an extension of time, at the age of 55 set about the task of reimbursing them by his literary labors. He surrendered his town house and most of his available assets, but still clung to Abbotsford, although obliged to live there in humbler style. In 1826 appeared "Woodstock," a novel written during the crisis of his financial troubles, and in 1827 "Chronicles of the Canongate, First Series," and the "Life of Napoleon Bonaparte," the latter of which produced for his creditors £18,000. At a dinner given for the benefit of the Edinburgh theatrical fund on Feb. 23, 1827, he finally threw off the mantle of disguise, which he observed to a friend had become somewhat tattered, and declared himself to be the sole author of the "Waverley novels," a fact long before established to the public satisfaction. His remaining works are the "Chronicles of the Canongate, Second Series" (1828); "Tales of a Grandfather," first, second, and third series

(1827-'9), devoted to Scottish history; "Anne of Geierstein" (1829); "The Doom of Devoirgoil" and "The Auchindrane Tragedy" (1830); a "History of Scotland" (2 vols., 1829-'30), in Lardner's "Cabinet Cyclopædia;" "Letters on Demonology and Witchcraft" (1830), published in Murray's "Family Library;" another series of "Tales of a Grandfather" (1830), on French history; and a fourth series of "Tales of my Landlord" (1831), containing "Count Robert of Paris" and "Castle Dangerous." He also furnished the notes and prefaces for a cheap uniform series of the Waverley novels, commenced in 1829 by Robert Cadell, who had purchased half of the copyright; and the profits of the new edition aided very considerably the liquidation of his debts. In his later works he began to give evidence of mental exhaustion, and his bodily health declined under the influence of incessant mental application and confinement. In the winter of 1830-'31 symptoms of gradual paralysis, a disease hereditary in his family, began to be manifested. Abstinence from literary labor was enjoined upon him, and in October, 1831, he sailed for Italy in a ship furnished by the admiralty. Honors seldom paid to literary men awaited him at Naples, Rome, and elsewhere. Feeling that his strength was rapidly failing, he requested to be conveyed at once to his native country, that he might die within sight and sound of the Tweed. The journey was accomplished too rapidly for his strength, and on his arrival in London in June, 1832, he had become insensible to the presence of his friends and relatives. He reached Abbotsford on July 11, seeming to revive a little in the presence of familiar scenes and faces, but soon after relapsed into insensibility, in which condition, after occasional intervals of consciousness, death finally overtook him. He was buried in an aisle in Dryburgh abbey, which had belonged to one of his ancestors, and his memory is perpetuated by a noble Gothic tabernacle erected in Edinburgh in 1844-'6. He had paid at the time of his death upward of £100,000 of his debts, and soon afterward, chiefly through the liberal advances of Cadell, who received in return Scott's share of the profits accruing from copyright property in the Waverley novels, the claims of all his creditors were fully satisfied. His two sons and two daughters survived him, but have since died, leaving no male issue. His eldest daughter was married to John Gibson Lockhart, and their daughter was married to James Robert Hope, who by act of parliament assumed the name of Hope-Scott. She died in 1858, and her only surviving child, Mary Monica, born in 1852, is the last lineal descendant of Walter Scott and the present owner of Abbotsford. The centenary of Scott's birth was celebrated in the principal towns of Scotland in 1871.—Scott was tall and vigorous, and in walking betrayed his lameness only by a slight sinking of the right limb. His head was long and cylindrical, his

complexion fair, and his eyes, surmounted by large bushy eyebrows, small and gray. The expression of his countenance was somewhat heavy, but in conversation or in moments of relaxation it lightened up with great animation. Of his generosity, his affability, his passion for field sports, his love of dogs and horses, and the innumerable little traits which endeared him to the domestic circle, as well also as of his strong prejudices, particularly on political subjects (his opinions being strongly tory), many details may be found in the biography by Lockhart, which is the most complete record of his life. A new life of Scott, by Francis Turner Palgrave, was prefixed to a new edition of his poems (London, 1867). His novels have been translated into nearly all the European languages.

SCOTT, Winfield, an American general, born in Petersburg, Va., June 13, 1786, died at West Point, N. Y., May 29, 1866. He was educated at William and Mary college, studied law, was admitted to the bar in 1806, and in 1808 entered the army as a captain of light artillery. While stationed at Baton Rouge, La., in 1809, he was court-martialled for remarks on the conduct of his superior officer, Gen. Wilkinson, and was suspended for one year, which he devoted to the study of military tactics. In July, 1812, he was made lieutenant colonel, and ordered to the Canada frontier. Arriving at Lewiston while the affair of Queenstown heights was in progress, he crossed the river, and the field was won under his direction; but it was finally lost, and he and his command were taken prisoners, from the refusal of the troops at Lewiston to cross to their assistance. In January, 1813, he was exchanged and joined the army under Gen. Dearborn, as adjutant general with the rank of colonel. In the attack on Fort George, May 27, he was severely hurt by the explosion of a powder magazine. In the autumn he commanded the advance in Wilkinson's descent of the St. Lawrence—an operation directed against Montreal, but which was abandoned. In March, 1814, he was made a brigadier general, and established a camp of instruction at Buffalo. On July 3 Scott's and Ripley's brigades, with Hindman's artillery, crossed the Niagara river and took Fort Erie and a part of its garrison. On the 5th was fought the battle of Chippewa, resulting in the defeat of the enemy (see *CHIPPEWA*), and on July 25 that of Lundy's Lane, or Bridgewater, near Niagara Falls, in which Scott had two horses killed under him, and was twice severely wounded (see *LUNDY'S LANE*). His wound of the left shoulder was critical, his recovery painful and slow, and his arm was left partially disabled. At the close of the war Scott was offered and declined a seat in the cabinet as secretary of war, and was promoted to be major general, with the thanks of congress and a gold medal for his services. He assisted in the reduction of the army to a peace establishment, and then visited Europe

in a military and diplomatic capacity. He returned to the United States in 1816, and in 1817 married Miss Mayo of Richmond, Va. A part of his time he now devoted to the elaboration of military manuals. In 1832 he set out with a detachment to take part in the hostilities against the Sacs and Foxes, but the capture of Black Hawk ended the war before Scott's arrival on the field. In the same year he commanded the federal forces in Charleston harbor during the nullification troubles, and his tact, discretion, and decision did much to prevent the threatened civil war. In 1835 he went to Florida to engage in the war with the Seminoles, and afterward to the Creek country. He was recalled in 1837, and subjected to inquiry for the failure of his campaigns, the court finding in his favor. In 1838 he was efficient in promoting the peaceful removal of the Cherokees from Georgia to a new reservation beyond the Mississippi. The threatened collision with Great Britain, growing out of the disputed boundary line between Maine and New Brunswick, was averted in 1839, mainly through the pacific efforts of Scott, and the question was finally settled by the Ashburton treaty of 1842. By the death of Gen. Macomb in 1841 Gen. Scott became commander-in-chief of the army of the United States. In 1847 he was assigned to the chief command of the army in Mexico. Drawing a portion of Taylor's troops and assembling his force at Lobos island, on March 9 he landed 12,000 men and invested Vera Cruz. On the 26th the castle of San Juan de Ulua capitulated, and on the 29th the garrison of 5,000 men grounded their arms outside of the city. On April 8 Scott advanced toward Jalapa, and on the 18th fought the battle of Cerro Gordo, driving Santa Anna from his strong position in the defile formed by the Rio del Plan, and capturing Jalapa on the 19th, Perote on the 22d, and Puebla May 15, where he remained for reinforcements till Aug. 7. On the 10th his force, numbering 10,748 men, was in front of Mexico. Advancing by the Acapulco road, he was opposed by Gen. Valencia with 7,000 picked men supported by a reserve of 12,000 under Santa Anna, but on Aug. 20 successively carried Contreras and Churubusco (see *CHURUBUSCO*), and could have taken the capital; but an armistice till Sept. 7 was agreed upon, to allow the peace commissioner, Mr. N. P. Trist, an opportunity to negotiate. At its close operations began on the S. W. avenue of the city, defended by 14,000 Mexicans occupying the wooded and strongly fortified eminence of Chapultepec. On Sept. 8 Gen. Worth with 3,500 men attacked this position, capturing much matériel and more than 800 prisoners, but losing one fourth of his command, including 58 officers. On the 13th Chapultepec was stormed and carried, and on the morning of the 14th Scott's army marched into the city and ran up the United States flag on the national palace. There was some street fighting and firing upon the

troops from the buildings, but this was soon suppressed, order was established, and a contribution levied on the city of \$150,000, two thirds of which Gen. Scott remitted to the United States to found military asylums. Taxes were laid for the support of the army, and a civil organization under the protection of the troops was created. The treaty of Guadalupe Hidalgo, negotiated by Mr. Trist, was signed on Feb. 2, 1848, and soon after Mexico was evacuated by the United States troops. A court of inquiry into the conduct of the war only redounded to the fame of Scott. In 1852 he was the candidate of the whig party for the presidency, and received the electoral votes of Vermont, Massachusetts, Kentucky, and Tennessee, all the other states voting for the democratic candidate, Gen. Pierce. In 1859 Gen. Scott as commissioner successfully settled the difficulty arising from the disputed boundary line of the United States and British America through the straits of Fuca. Age and infirmity prevented him from taking an active part in the civil war, and on Oct. 31, 1861, he retired from service, retaining his rank, pay, and allowances. Soon afterward he made a brief visit to Europe, and he passed most of the remainder of his days at West Point, where he was buried.—He was the author of a pamphlet against the use of intoxicating liquors (1821); "General Regulations for the Army" (1825); "Letter to the Secretary of War" (1827); "Infantry Tactics," translated from the French (1835); "Letter on the Slavery Question" (1843); and "Memoirs of Lieut. Gen. Scott, written by Himself" (2 vols. 12mo, 1864). Biographies of him have been written by E. D. Mansfield (1846), J. T. Headley (1852), and O. J. Victor (1861). See also "Campaign of Gen. Scott in the Valley of Mexico," by Lieut. Raphael Semmes (1852).

SCOTGAL, Henry, a Scottish clergyman, born at Saltoun, East Lothian, in June, 1650, died in Aberdeen, June 13, 1678. He was the son of Patrick Scougal, bishop of Aberdeen. In 1669 he became professor of philosophy there, and in 1674 professor of divinity. His chief work is "The Life of God in the Soul of Man," edited by Bishop Burnet (1671), which has been many times reprinted.

SCRANTON, a city of Luzerne co., Pennsylvania, on the left or S. E. bank of the Lackawanna river, 105 m. N. by W. of Philadelphia; pop. in 1853, about 3,000; in 1860, 9,223; in 1870, 35,092, of whom 15,887 were foreigners, including 3,056 Germans, 1,445 English, 6,491 Irish, and 4,177 Welsh. It occupies the plateau at the confluence of Roaring brook and the Lackawanna, is handsomely laid out, with wide straight streets, and is lighted with gas and well supplied with water. It contains many fine residences and public buildings, but its general appearance is sombre. Its importance

is due to its situation in the most northern of the anthracite basins and to its railroad facilities. Five lines centre here, viz.: the Delaware, Lackawanna, and Western, the Pennsylvania coal company's railroad, the Lehigh and Susquehanna, the Delaware and Hudson, and the Lackawanna and Bloomsburg. The trade in mining supplies is extensive, and the shipments of coal are immense. Its manufactures, especially of iron, are also large. There are blast furnaces, rolling mills, founderies, machine shops, saw mills, flouring mills, breweries, gunpowder works, &c. The city has 12 banking institutions, with an aggregate capital of \$1,351,450; a hospital and a home for friendless women and children; excellent public schools, with about 7,500 pupils; several private schools and academies; two daily and seven weekly (two German and one Welsh) newspapers; and 31 churches, in five of which the services are in German and in seven in Welsh.—Scranton was incorporated as a borough in 1854 and as a city in 1866. It has grown with great rapidity, its site having been occupied by a farm and a swamp previous to 1844, when a rolling mill was started.

SCREAMER, the name of a group of South American wading birds, of the subfamily *palamedeina*, so named from the loudness and shrillness of the voice. The bill is short, elevated, and curved like that of a gallinaceous bird; nostrils large and exposed; wings long, with the shoulder armed with two or three strong spurs; tail moderate and rounded; tarsi long, strong, with numerous small scales; toes long, the anterior united by a short membrane, and the claws long and curved.—In the genus *palamedea*

Horned Screamer (*Palamedea cornuta*).

medea (Linn.), the third and fourth quills are the longest, and the forehead is ornamented by a slender cylindrical horn; the lores are feathered. The horned screamer (*P. cornuta*, Linn.), or *kamichi*, is larger than a goose, about 3½ ft. long, blackish with a red spot on each shoulder,

and lower parts from the breast white; the bill is black and $2\frac{1}{4}$ in. long, the horn 3 in. and movable in all directions, and the largest spur $1\frac{1}{2}$ in. They live generally in pairs in the undated districts of Brazil and Guiana, especially near the sea; they are shy and timid, and have a very piercing voice, uttered at the slightest alarm; they occasionally perch on trees; the food consists of aquatic seeds and plants, and perhaps of reptiles. They are strictly monogamous. The nest is made on or near the ground, in the form of an oven; the eggs are two, as large as those of a goose, and the young are abroad by January or February; the flesh of the young is good eating.—The faithful screamer (*channa chavaria*, Ill.) is nearly 3 ft. long, of a blackish lead color, with a white spot at the back of the wings and another at the base of some of the large quills; there is no horn on the head, and the occiput is adorned with a circle of erectile plumes, the other feathers of the part being downy; the collar is black. It possesses the singular power of inflating the skin of the body and legs with air. It is a native of South America as far south as Paraguay, and the food consists of aquatic plants. They are easily domesticated.

SCREW, a device constituting one of the mechanical powers. It is in two forms: one, known as the external, convex, or male screw, is a cylinder of wood or metal surrounded with either a spiral groove or ridge, which makes equal angles with lines parallel to the axis of the cylinder; the other, called the interior, concave, or female screw, is a hollow cylinder with grooves around its interior fitted to the ridges of the corresponding solid screw. When very short and used as a fastening upon the external screw, it is called a nut. The spiral ridges are called the thread of the screw, and these are made more or less close together according to the purposes for which the screw is designed. The action of the screw is indefinitely extended and its power increased by adding to it a wheel and axle, so arranged that the teeth of the wheel engage in the threads of the screw and are brought round continually while the screw is made to turn in a fixed position against the wheel. In this arrangement it is known as the endless screw. (See MECHANICS.) The small screws in general use, answering instead of nails, are commonly known as wood screws, and are made of all sizes from 3 or 4 in. in length to $\frac{1}{4}$ in. or less. Screws of the same character for the special uses of the watchmaker and instrument maker are of still smaller sizes. The wood screw tapers slightly from the head downward, and the thread usually occupies about two thirds of the length from the point. The under side of the head is of a true taper, and when the screw is set in its place accurately fits the hole that has been rimmed out for it to the same taper. The upper side is flat, and is crossed by a narrow slit for the edge of the screw driver, by which it is turned

round. The most approved form has the gimlet point, which allows of the screw entering the wood without first boring a hole for its reception. The thread is a thin fillet left by removing the intervening metal.—Several methods have been devised for making screws. By one, now rarely used, the cylindrical lengths cut from rolled iron or iron wire were at a red heat headed in dies, and the thread was then cut by a file, its place being previously marked around the cylinder by one of several devices employed for this purpose. By the machine process in use in Birmingham, England, the first operation consists in clipping off the pieces from a coil of wire and striking up each piece at one end to form the head. The blanks thus formed are in the next operation placed one at a time in a lathe, and proper shape is given to the head and neck by cutting away the superfluous metal. Each blank is then placed by hand in a receptacle which holds it firmly, and is raised by a lever so as to present the head to a steel circular saw, which cuts in an instant the slit for the screw driver. The cutting of the thread, called worming, is done in a lathe, the mandrel of which at one end carries an iron box which works upon a fixed regulating screw. This gives the required longitudinal movement to the blank which is secured to the other end of the mandrel, and is pushed by the revolution point first through the steel cutters. These are made by levers to press more or less firmly upon the blanks, and their action is to turn out a shaving of the metal, leaving a sharp thread or worm. By other methods the cutters are dies having the same thread as the required screw, and corresponding for external screws to the nut or tap, except that they are either in two or four parts, which may gradually be brought together to close the circle while the shank of the blank is worked down in them to the size required. Each variety of screw in this method of cutting requires its own die, and various sizes are cut by hand with dies. Internal screws are cut by steel tools called taps, having the thread of the corresponding external screw, but partly cut away along the whole length in order to produce cutting edges and afford room for the escape of the shreds of metal removed.

SCREW PROPELLER. See STEAM NAVIGATION.

SCRIBE, Augustin Eugène, a French dramatist, born in Paris, Dec. 24, 1791, died there, Feb. 20, 1861. He studied law, and produced at the age of 20 *Les dervis*, a light comedy, which failed. His next attempts were scarcely more successful, and some of his plays were hissed. Finally he wrote, in conjunction with Delestre Poirson, *Une nuit de la garde nationale*, which succeeded. In 1816 he brought out *Le nouveau Pourceaugnac* and *Le solliciteur*, which Schlegel thought better than Molière's *Misanthrope*. A new theatre having been established in 1820 by his friend Poirson, he was engaged to write exclusively for it, and
